WHEREAS: The address of Prof. R. B. Stoltz on "Constituents of an Ice Cream Mix" contained a great deal of valuable data and practical information that can be used to advantage in advertising copy.

RESOLVED: That the address be printed and mailed to all the members of the association, to the secretaries of other state associations and the national association, and to the several trade papers.

RESOLVED: That the thanks of the association be given to the Cleveland ice cream manufacturers and the Cleveland convention bureau for the splendid manner in which the convention was handled, the entertainment provided and the hospitality that was shown.

It Takes a Winner to Pick a Winner!

The list of users of SCOTCH BOB reads like a page from "Who's Who in the Ice Cream World"—

But there are still a few missing—you may be one!

SCOTCH BOB Butter Scotch Ice Cream gives you a chance to bolster up winter sales, build friendlier business relations with your dealers and thus lay a firmer foundation for increased business later on.

In fairness to yourself you should know more about this wonderful new flavor with all the old-fashioned goodness of butter scotch candy — popular since the industry wore knee-pants!

KAY-WHITE PRODUCTS, Inc.

"A Good House to Deal With"

8 West Broadway New York, N. Y.

ask us to send you the ten-dollar trial keg. It makes enough BUTTER SCOTCH ICE CREAM for a thorough testing and gathering of opinions. Your money back if you think you could have invested the ten-spot any better way.

STAR speaks with authority on the subject of vanilla!

Every ice cream manufacturer is bound to respect *thirty-five years continuous experience* with Vanillas and Vanilla Compounds.

If some manufacturers would only confer with us, how much money we could save them each season!

Our accumulated knowledge is free to all, — customers and non-customers alike.

Put your flavoring problems up to men of experience!

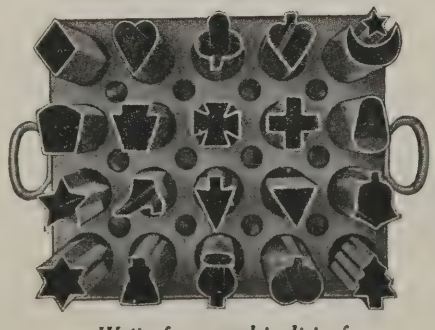
that ice cream with a high fat and high solids content weighing 4½ pounds to the gallon gives more food value than weighing 5 pounds to the gallon, and also felt that there should be a certain limitation on weight. The committee's statement to the officials in Washington was that they could not impose any law that could not be lived up to; that there was no equipment which would enable the manufacturers to determine in advance the weight of their finished product, and that they would have to permit a great variation from any standard they might set.

Mr. Hovey then stated that the ice cream manufacturers furnish a market that is needed by the American grower of corn, and that corn sugar is more healthful than cane sugar. The use of corn sugar by ice cream manufacturers would probably tend to stabilize the price of cane sugar.

IT WAS the national committee's opinion that a proper fat standard could better be judged by food experts than by officials or ice cream manufacturers, and that statements from health experts all over the country, which are now on file in the office of the national association, affirm that an 8 per cent standard for ice cream produces a produce that is better food than an ice cream of a higher fat content. The Washington officials had no good reasons for higher butterfat content in ice cream except that the public prefers rich ice cream. The arguments of the national committee were, that just because the people prefer rich foods is no reason why they should be required to eat rich foods, and that ice cream should be marketed as a dairy product and sold to the public with the thought that ice cream is the best health investment they can make. This is not possible if a higher fat standard is accomplished. Mr. Hovey thinks there is a possibility of a 10 per cent standard, but rather questions the possibility of an 8 per cent standard. It was his opinion that the secretary of agriculture in Washington is never going to sign and make effective any standards law or regulations which are unsatisfactory to any considerable number of states. The committee on definitions and standards does not feel privileged to set a standard that is not universally satisfactory. Mr. Hovey thinks it is doubtful if the committee will care to go to the secretary of agriculture with any recommendation at all, unless the ice cream industry expresses itself as desirous of really going after a standard, and questions the advisability of a federal standard.

MR. HOVEY then explained the activities of the national association in attempting to get a lower express billing rate. But they did not get the support from the members it should have had. Regardless of the opinion of any official, the consumer of ice cream is interested in the purchase of volume. If a housewife wishes to serve a certain number of people, she has in mind a certain portion that will serve that many people. The public is generally interested in the purchase of ice cream by volume and not by weight. The national association is doing what it can to protect the interests of its members along this line.



The big activities of the national association are in connection with the accounting work. It is now working on an accounting system that it hopes to offer to the 1925 convention in Detroit. There is a committee appointed which is made up of fifty or sixty of the best accountants in the United States in the ice cream industry, which committee will work on this system of accounting. Mr. Hovey stated that the system must be workable, and it must be simple for the smaller manufacturer. The system which will be offered next fall will be one that will decrease the manufacturers' office expenses and give him the information he wants. He then explained the activities of the service bureau. This bureau sends a man to the manufacturer's plant to find out whether the costs in that particular plant are higher than in others, which service is very valuable to the industry. In this manner comparisons can be made and a lot of unnecessary expense can be done away with.

Mr. Hovey emphasized the value of the use of the ice cream slogan. It must be made worth-while and given a lot of publicity, and if it has enough publicity it will have a great deal of value. Mr. Hovey said:

"The ice cream industry is standing still, which isn't a healthy condition. If you find your sales are decreasing, you are worried. I think the ice cream industry is not making the progress that it should. The milkman can give you figures showing that the consumption of milk is very greatly increased as a result of national advertising. Every man, woman and child will say that they believe milk is the most perfect food. Parents believe that if their children drink milk, it will make strong boys and girls. I believe that ice cream must be marketed as a milk product. If we can convince parents that when they give children five or ten cents for an ice cream cone, they are getting food value, more ice cream will be sold. When we have convinced people that ice cream is a healthful investment for their children, you will sell more ice cream. I think every manufacturer should be willing to support the campaign for national advertising of ice cream."

Regarding the use of the national slogan and emblem, Mr. Hovey stated that all who contribute to the national advertising organization should be permitted to use it. It is the desire of the national association that the slogan should be used in such a way that it will mean something to the people when they see it, and that it must conform to the original design.

TELLING'S LATEST

(THE NATIONAL SLOGAN)

Serve It and You Please All

In addition to the long tubes used extensively by the large Manufacturers throughout the country for making Fancy Center Brick Cream, the smaller dealer may now secure all these designs in 1 qt. lengths with covers, neatly packed one dozen in a box, assorted if desired, at $15.00 per dozen.

Those using the Sealright container may secure these in one quart, three pint or two quart lengths, one end being closed to allow the removing by pouring a little water in the tube so it will lift out easily by a conveniently arranged handle, after which the space is filled with any color cream, sherbet, water ice or whipped cream, to carry out the design and color scheme, making a very beautiful portion when served. These sell at $17.00 per dozen.

C. B. TELLING 10325 EMPIRE AVENUE **Cleveland, Ohio**

This is our STOCK ROOM,

when you *want* doors in a hurry you *get* them in a hurry!

This is the third view in an excursion thru the Jamison Plant, being conducted by Mr. Jamison and the photographer. Your own eyes could see more perhaps—but not more truly.

VOLUME—that's the big barrier between big prices and Jamison Doors. The quality of our products depends on us—but it takes volume to make prices stay put. In other words, with less volume we could give you the same quality—***but not at the same prices.***

Suppose you place an order for 10 doors of a standard size. Our first step is to set the machinery to produce the parts. But setting the machinery takes time and costs money—so once set for a particular size, instead of making parts for 10 doors, we make parts for 100. Thus the manufacturing overhead is carried, not by 10 doors, but by 100. And the other ninety we hold in our warehouse for future orders. The numbers are arbitrary, of course, but they illustrate the principle. And a mighty good principle it is—***for it saves your money.***

Another big advantage in this system is that it enables us to keep stocks on hand. Then, when you suddenly face a need for doors, you get them as fast as the freights can travel. And there are frequent occasions when a ***saving of time*** on our part means a ***saving of money*** for our customers. So volume means both better prices and better service. Consequently, we go after volume—***and get it.***

Immediate Shipments NOW!

Our stock room now is well filled, just as you see it. We can make immediate shipments on a considerable range of standard sizes. If you are considering repairs or replacements, our special price list on doors-in-stock may prove helpful. Drop us a line for this or any other information you desire.

JAMISON COLD STORAGE DOOR COMPANY
HAGERSTOWN, MARYLAND, U. S. A.

SPEAKING on "The Relation Between the Department and the Ice Cream Industry," C. V. Truax, director of the department of agriculture, Columbus, O., stated that there is a very close relationship between the association, the department of agriculture and the farmers of Ohio. The manufacturers of ice cream are dependent upon the farmers for their supply of raw materials; the farmers are dependent upon the manufacturers for that portion of the dairy products which they purchase. The department is charged with the enforcement of the statutes and regulatory measures pertaining to the production of the raw material, and to the manufacturing and distributing of the finished product. The annual consumption of ice cream in Ohio, based on per capita consumption, is 13,000,000 gallons. This would represent an annual expenditure of around $27,000,000 for this food product. Of this amount the producers or farmers receive nearly $3,000,000. Thus the farmers or producers are vitally interested in the future development of the ice cream industry. The state of Ohio has 630 ice cream manufacturers that are listed with the department. These are assessed the annual license fee of $1.50 per freezer gallon capacity. The legal requirement for butterfat is 8 per cent. Not more than 1½ per cent of stabilizer can be used to give the proper consistency to the ice cream mix. As an indication of how the industry has progressed in the improvement of the quality of this product, during the past year, out of 300 samples collected by the division of foods and dairies, the average fat content was 11.1 per cent. Only in one instance during the past two years, has more than the legal requirement of stabilizer been found in ice cream in Ohio. No cases of illness have been reported to the department from the eating of ice cream. General conditions are far better than they were a few years ago.

The regulation of the ice cream industry is only one of several that come under the activities of the division of foods and dairies. Mr. Truax stated that the ice cream manufacturer owes a certain duty and responsibility to the farmer in the production of materials, and the farmer owes a certain responsibility to the association. Too many people make a distinction between agriculture and industry. Agriculture is industry. He presented figures showing that the total investment in agriculture is $78,000,000,000 and the total investment in all other industries combined is only $73,000,000,000. Today agriculture is our biggest industry.

Mr. Truax pointed out the fact that the price of every commodity has advanced from 50 to 100 per cent, and that farm products had only increased 15 to 20 per cent, due to high freight rates, high taxes, etc. However, farm conditions are better now than ever before in Ohio; in fact, better than any state in the Union. What is needed more than anything else is a rational marketing system. The farmer needs higher prices for his commodities. He then explained how the department of agriculture protects the farmer, even before the seed is in the ground; helps him sell his crops through the division of markets, and in various other manners. Inspections are made every month by the division of foods and dairies.

Manufacture and sale of ice cream is not only profitable for those directly engaged in the business, but promotes permanent prosperity of the farmers by furnishing an outlet for farm products that take little fertility from the soil, Charles H. Allen of Defiance, president of the Farmers' Sugar Company, told the Ohio association.

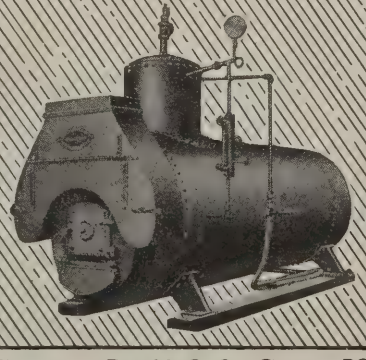
To cream, milk, eggs, sugar and corn starch that compose ice cream, Mr. Allen added bacon and wool as farm crops whose production should be stimulated because they do not rob the soil of its fertility. He contrasted these with wheat, which he said is always sold at a loss when the value of its mineral content is considered.

"Ohio last year produced 80,000,000 pounds of sugar on 40,000 acres of land in northwestern Ohio devoted to this crop," Mr. Allen pointed out. "This is enough to last Ohio only a month and a half. The amount produced is limited by the capacity of the factories. There is enough suitable land in northwestern Ohio so Ohio could produce all she eats if there were enough beet sugar factories or 'threshing machines' to handle the beets the farmers can grow."

THE banquet and entertainment given by the Ohio Dairy Products Association was the biggest feature of the convention from an entertainment viewpoint. "Doc" Rouche of the Telling-Belle-Vernon Company acted as toastmaster in place of J. H. Coolidge, who, on account of the sad news of the death of his mother, was unable to be present.

The principal speaker was Richard F. Grant, president, United States Chamber of Commerce. "Good Business" was the subject of Mr. Grant's stirring address. He presented to his listeners food for thought about our country's present business conditions. He explained the good work accomplished by the United States Chamber of Commerce and expressed his regret that so few people knew or realized the importance of this institution to their daily lives, be they engaged in farming or business.

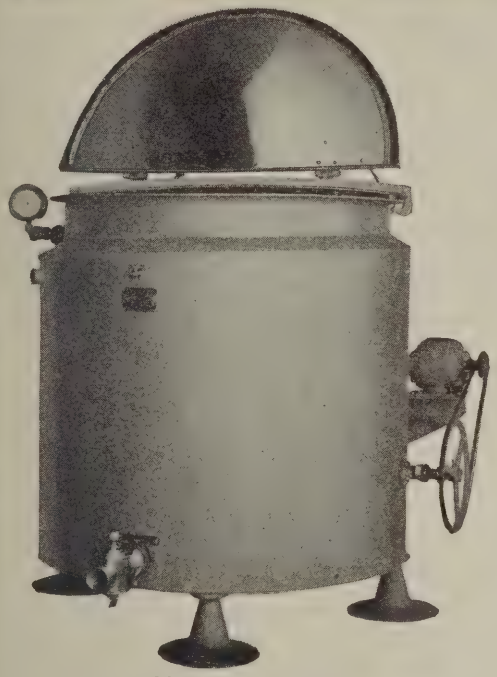
The musical features were provided by the Telling-Belle-Vernon orchestra, conducted by "Doc" Rouche.



for Safety—

Leffel Creamery Boilers

Absolute safety is assured the users of Leffel Creamery Boilers by the materials and workmanship that go into them. Shells, heads, and fire box are made of the highest grade open hearth steel boiler plate guaranteed to bend double when cold, when hot, or after heating red hot and plunging into cold water. Every boiler is thoroughly inspected and tested before being shipped, and a signed certificate of test is given the purchaser. Creameries, dairies, and ice cream factories appreciate this feature.



Leffel Creamery Boilers are made in sizes from 6 H. P. to 100 H.P. and conform to all state boiler laws.

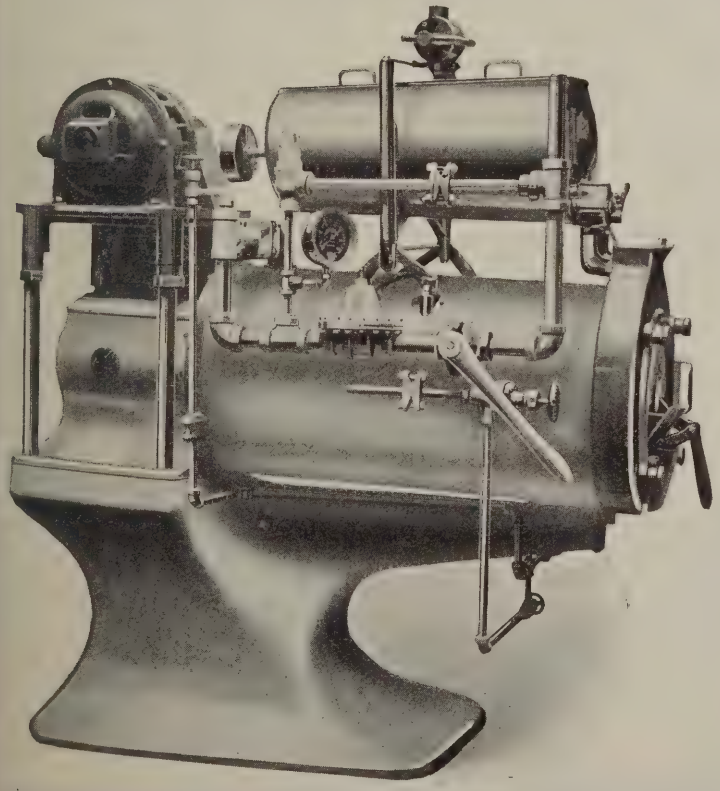
GLASCOTE

Type "J" Tank

The "Glascote Type 'J' Tank" has proven its worth in all operations as a pasteurizing unit, its proportions, heating efficiency, agitation and dependency has made it an extremely popular piece of equipment especially where 500 gallons or less are to be handled. The modern readily cleansed spray coil and the scientific jacket construction not only insure a most positive cooling operation but present the ideal conditions for holding.



In purchasing Glass Lined Tanks for Pasteurizing, see that the proper spray coil for checking the heat at the fixed temperature you wish for your pasteurizing standard has been incorporated. Without this proper spray coil you cannot arrive at the definite temperature which is essential to keep and preserve your cream line. This is done perfectly in "Glascote Type 'J' Tanks."

Constituents of Ice Cream Mix

Quality of Product Today Far Superior to That of Five Years Ago

*By PROF. R. B. STOLTZ**

THERE are two kinds of papers that may be prepared today for an association of this kind: First—The history or fundamentals of the ice cream industry or fundamentals of new phases of the industry.

Second—To write up results of an experiment that one has worked out in the laboratory or a new theory that one has to present.

Younger men of the industry probably derive the most good from the first kind of a paper, while those of you who have been in the business practically all of your lives are not interested in hearing the fundamentals discussed pro and con, but will be anxious to hear of new discoveries and receive new ideas. I do not have any new discoveries or new theories to present to you, but there are some thoughts about ice cream that have not been emphasized sufficiently or have been overlooked which I hope will be of interest to both the inexperienced and the experienced men of the industry.

I will discuss briefly the following constituents: Milk solids not fat made up of mineral matter, casein, albumen and milk sugar, gelatine, flavoring extracts and butterfat. I have attempted to name these in order of their importance as I desire to have you consider them.

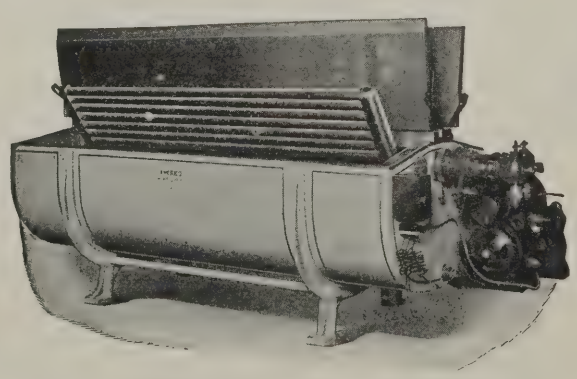
Milk Solids Not Fat: Let us assume that milk solids not fat makes up from 11½ to 12 per cent of the ice cream mix. This milk solids not fat is in turn made up of ash or mineral matter about 1 per cent, casein 3.5 per cent, albumen ⅔ per cent and milk sugar 6⅔ per cent. If you remember the percentage of constituents in the average milk you will see that there is ⅓ to ½ more of each of these constituents (ash, casein, albumen and milk sugar) in ice cream than there is in milk.

Ash or Mineral Matter: The ash or mineral matter is made up of phosphates of calcium or lime, potassium, iron and magnesium and rodium chloride, which go to make bone, teeth, hair, fingernails, etc. Both the casein and albumen are nitrogenous substances and are proteins. They go to make muscle and are used in the body to produce energy. The casein is in suspension and gives the milk its white opaque color. The albumen is soluble or in solution and coagulates, forming a scum when milk is boiled.

ICE CREAM contains all of the constituents that are found in milk. The nutrition specialists tell us that milk is the best food for growth and for repair of tissues, not because it contains butterfat, but because it contains large quantities of protein and mineral matter. Dr. J. F. Lyman, professor of agricultural chemistry at Ohio State University, nutrition specialist, makes the following statement: "There is no other food which contains protein and all the salts in sufficient amounts to meet the needs of the body." He states further that: "A careful study of foods has revealed the fact that most of the common articles of diet are very low in lime, and that probably one-fourth of the people of the United States suffer impaired health and vigor because their daily food does not supply sufficient lime. Ther is therefore reason to believe that lime deficiency is more common than protein deficiency."

Ice cream is especially rich in lime, containing from 30 to 50 per cent more than does milk. One-half pint of ice cream contains as much line as 1½ pounds of bread, 4 pounds of meat or 3⅓ pounds of potatoes. It is well known that growing children require a high precentage of lime in order to produce bone and other tissues. If the raisin people can sell raisins by advertising the fact that they contain iron, then the ice cream people can sell ice cream for the same reason, because one-half pint of ice cream contains as much iron as a 4 ounce box of raisins.

Milk Sugar: Is a carbohydrate. Is used in the body to produce heat and fat. Very similar to cane sugar, but not so sweet. The characteristic that an ice cream manufacturer is most interested in is that milk sugar will crystallize out when it is too concentrated. For each pound of milk sugar it is necessary to have about 11 pounds of water to keep the milk sugar in solution.



*With dairy department, Ohio State University. This was one of the principal addresses before the past Ohio convention.

Gentlemen:-

I thought it might be interesting to you to know the results we have obtained from the "AMERICO" combination machine you installed in our plant as per order.

After thoroughly trying it out in the Pasteurization of milk, Ripening of cream for butter making, producing commercial buttermilk and useing it as a Holder for fresh milk over night, I am thoroughly convinced it is entitled to the name you gave it, "The Four in One".

In all respects it has proven itself superior to any other Pasteurizer or Buttermilk machine we have ever used.

As soon as it is practical for us to do so, we will replace all our present Pasteurizers with the "AMERICO".

Yours very truly,

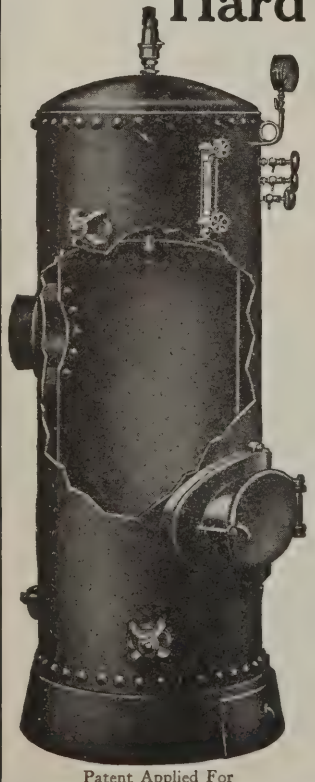
THOMPSON'S
MALTED FOOD CO.
Waukesha, Wisconsin

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

This depends upon the temperature at which it is held. The lower the temperature the more water is required per pound of milk sugar. Too much milk sugar in proportion to water causes crystallization of milk sugar or sandy ice cream. It will be seen, therefore, that on account of the presence of the milk sugar in the milk solids not fat the percentage of milk solids not fat will be limited to the amount so that each pound of milk sugar will have enough water to keep the milk sugar from crystallizing out and forming sandy ice cream. The milk solids not fat have often been overlooked in making ice cream. It is the milk solids not fat that gives your ice cream that smooth texture and good body. It is the lack of solids not fat that gives your thin milky ice cream.

If you desire to sell ice cream as a dessert and a delicacy make it rich in butterfat and low in milk solids not fat. If you desire to sell ice cream as a food, something on which you can make a meal, a dish which will satisfy all of the body requirements, then make an ice cream that is more similar to the solids found in milk. Such a mixture would give you an ice cream in the proportion of 5 per cent B. F. and 12 per cent M. S. N. F., or 8 per cent B. F. and 19 per cent M. S. N. F., or 10 per cent B. F. and 24 per cent M. S. N. F. This high solids not fat is impracticable because the milk sugar will crystalize and form sandy ice cream. It is, therefore, advisable to keep the percentage of milk solids not fat down below the danger point, which is 12 per cent.

WHEN ice cream was first made, we knew nothing about the extraction of water from milk. No doubt they tried to make ice cream from whole milk and found that it was rough and watery. The only method that they had at that time of obtaining a milk product with less water was to use cream, because milk contains about 13 per cent solids and a 20 per cent cream contains about 27 per cent solids, or twice as much as milk. At this stage of the game ice cream was only used by the wealthy people and was served at weddings or on some special occasion. Later on the common people and especially the children found a liking for ice cream and instead of using cream which contained 27 per cent total solids, they started to use milk which had some of the moisture taken out, which was condensed milk.



Probably without knowing it the ice cream manufacturer in Ohio has followed the composition of milk as near as is practicable. If you were to extract 170 pounds of water from 270 pounds of the average milk you would have 100 pounds of milk containing 10 per cent B. F., 24 per cent M. S. N. F. and 34 per cent T. S. This mixture would contain such a high percentage of milk sugar that it would form crystals and cause sandy ice cream. The manufacturer, therefore, replaces 12 of the 24 pounds of M. S. N. F. with 12 pounds of cane sugar and has removed nothing from the 270 pounds of milk except 170 pounds of water and a little more than 5 pounds of ash, casein and albumen. The 7 pounds of milk sugar have been replaced by cane sugar which is the same as milk sugar so far as food value is concerned.

Twenty-five years ago some of the ice cream manufacturers were ashamed to admit that they used concentrated or condensed milk and some firms even went so far as to advertise that their ice cream contained no condensed milk, naturally the public had the idea that condensed milk was a cheap substitute for cream, and that false idea still remains with a large number of the consuming public, and too many people who are in phases of the dairy business or closely related to the ice cream industry still have that belief.

IT IS not my intention to leave the thought that butterfat is not an important constituent in ice cream, but it is not necessary for anyone to tell people how important the butterfat is when the majority of people think of nothing else but the butterfat content. Would you feed your child 10 per cent milk? The answer would be no. Why? Not because the butterfat is injurious, but because they would obtain too much butterfat in proportion to the solids not fat. A child needs protein and mineral matter more than any other substances. By actual experience it has been found that people can assimilate and will eat more ice cream in which the butterfat and milk solids not fat closely resemble the proportion in which it is found in milk. Sweet cream is consumed by mixing it with some other foods that contain little or no fat, such as cereals, etc. If you were to eat your ice cream on bread, oatmeal or any other roughage, then it would be all right to have a very high fat in proportion to the M. S. N. F., but so long as ice cream is to be served by itself, it should be as closely similar to the composition of milk as is practicable.

Gelatine: Another constituent of ice cream that has not been used to advantage is the gelatine. The general impression among some people is that gelatine is added to ice cream in order to cut down the cost of manufacture. If you are using gelatine in your ice cream to prevent water crystallization, which is the accepted reason for using gelatine, it is more economical to use the higher grade which costs from 55 to 65 cents a pound. A great number of people think that gelatine is put into ice cream because it is cheaper than any other of the solids. As a matter of fact it is the most expensive solid that you put into your mix. It has not been a great many years ago when people used gums and other colloids or stabilizers and advertised to the

LEADERSHIP

Not many years ago the gelatine industry in the United States was in a most unsatisfactory condition, its greatest weakness being lack of standardization. But the entry of DELFT gelatine into the field established new and higher standards and practices, as other manufacturers followed the lead of DELFT.

Some of the features back of DELFT leadership are:

A certificate of analysis with every shipment.
Unqualified endorsement by Food Control officials.
Never rejected; always better than the law requires.
Uniformity, solubility and freedom from liquifying and harmful bacteria.

***Send for samples and put them to every test. You will find DELFT leadership a FACT, not a phrase—and* facts are stubborn things.**

Ask any Food Control official about DELFT

CERELOSE

CERELOSE is a pure white refined corn sugar which has been found to be of advantage to ice cream manufacturers for use in conjunction with cane sugar in the proportion of 25 to 50% Cerelose instead of 100% cane sugar, for the following reasons:

1.—Cerelose emphasizes the richness of the butter fat with the result that Cerelose develops the natural flavor of ice cream.

2.—Cerelose produces a smoother cream.

3.—Cerelose is the new solid builder for ice cream because it improves the body and texture. It will not crystallize nor form sandy cream.

4.—Ice cream made with Cerelose is more digestible than when made entirely with cane sugar because Cerelose is a dextrose sugar being directly assimilated by the blood, therefore, more ice cream may be consumed, particularly by infants and invalids.

5.—Cerelose is approximately 25% cheaper in price than cane sugar.

Cerelose should be used in the same manner as cane sugar, the amount depending upon the type of cream desired. 25 to 50% is recommended.

consuming public that their ice cream contained no gelatine. This made the consuming public believe that the presence of gelatine in ice cream was a detriment and something to be shunned. Little has been done to tell the consuming public different. Is there any question in the consumer's mind about the advisability of feeding convalescents ice cream? Isn't ice cream given to an invalid or a convalescent as their first food? If ice cream is a food that can be given first at the end of a fast or after a patient has been unable to take food for three or four days, it is surely a safe food for a growing child or a normal adult. Why is it different than other foods?

Last year Dr. Downey presented a paper at your annual convention giving some very interesting details on adding gelatine to milk and ice cream in order to make it more digestible and so we have added gelatine to ice cream in order to prevent water crystals and unknowingly we have made an ice cream more edible and digestible.

Flavor: Flavor of ice cream is an important factor in the constituents of an ice cream mix. Do not think, however, that you can use any other than the best dairy products and obtain a good flavor by means of a good flavoring extract. A poor flavoring extract is ruinous and detrimental to your ice cream, but the background of the flavor must come from the flavor of your milk product constituents. There are few ice cream companies in this state but what use the very best materials obtainable. I do not know of any large ice cream manufacturers in Ohio that use milk powder and the smaller companies that use powder only use it when it is impossible to obtain the fresh product. Is there anything about milk powder that is not pure and as sanitary as condensed milk? I should say that a good powder is just as sanitary and just as nutritious, but the quality of ice cream in Ohio is such that an ice cream plant making its ice cream from milk powder could not compete in Ohio. The fresh condensed milk has the fresh milk flavor and the fresh sweet cream gives the excellent flavor which is more pleasing than the quality of vanilla or other flavoring extracts that may be added. In the future, no doubt, milk powder will be manufactured that will be equal to condensed milk in value.

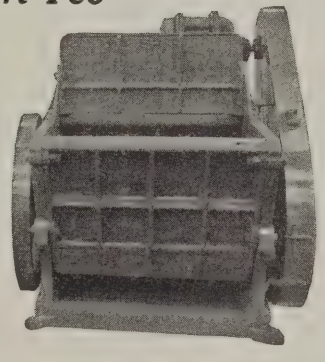
If you are making your ice cream from milk powder and sweet butter, no matter under what sanitary conditions it may be produced, and if you are using the most expensive extracts or the strongest compound, your product will not be as good as that ice cream made from fresh condensed milk with sweet cream. In adding flavoring you must have the right kind of materials. A poor flavoring extract may spoil the flavor, but a good flavoring extract cannot make ingredients, which are not of the best, good.

If the dispenser of ice cream knew more about its constituents he might be better able to spread the Gospel to the consumer. Have you ever heard the remark that the ice cream that we used to make at home was superior to the ice cream that is manufactured today? This statement will not stand investigation. The ice cream that was made at home did not contain the food value of the ice cream that is made today. People have told me of their home made ice cream which was superior to commercial ice cream and after you ask them what per cent of solids or butterfat it contains, they answer that they know nothing about the solids, but that it is much richer in butterfat than commercial ice cream. Upon further questioning you find out their formula, and the usual discrepancy is that if they had a gallon of 4 per cent milk and a quart of 20 per cent cream they assume that the finished mix will test about 20 per cent, while as a matter of fact it will test about 6½ per cent. The only fair way to judge ice cream of the past and present is to place them side by side and taste the two, one after the other.

How many of you remember the time when the water from your spring was the only water that quenched your thirst? Any other water was flat or tasted too strong of minerals, and after you had left that home and had become accustomed to river or lake water, this old spring which was filled with sulphur and iron produced water that was not fit to drink. The water had not changed, but your taste had changed, and so it is with the taste of ice cream.

PRACTICALLY all of the regularitory laws that have been passed in regard to ice cream only refer to the minimum amount of butterfat and the maximum amount of gelatine. The reason for this is two-fold:

First—The ice cream manufacturer has always sold his ice cream on the percentage of butterfat that it contained, saying nothing about the presence or value of the milk solids not fat.



Second—Ice cream manufacturers educated the people against using gelatine in ice cream. The manufacturer is, therefore, responsible for this belief and the consuming public will naturally believe statements, whether false or true, until they have been told different.

Last week I was reading an article in the Literary Digest which was very interesting. I had always been told that an ostrich burrowed his head in the sand when it desired to hide. This fact has been told to us as youngsters and pictures showing ostriches with their heads buried in the sand made us quite confident that

Whether You Use Little or Much Broken Ice

it will pay you to install a

Creasey Ice Breaker

It reduces a cake of ice to just the size wanted for freezing or packing ice cream, or cooling foods or drinks. Heavy manual labor, waste and untidiness from flying pieces of ice, noise and loss of time are all eliminated.

There are more than 20 styles and sizes from small hand machines up to capacities of 50 tons per hour. Also machines arranged with individual motor drives so that they can be located where most convenient, regardless of shafting or belting.

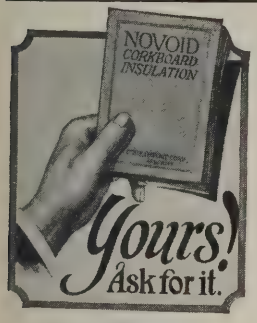
FOR insuring the correct per cent. of serum solids in the mix, Merrell-Soule Powdered Milk is ideal because of its uniformity.

Its use saves time and trouble for the ice cream manufacturer and improves the quality of his product.

In addition, Merrell-Soule Powdered Milk has several other distinct uses in the ice cream plant—each one of which is an advance over old-time methods of handling milk and cream.



Send formulae and methods of mixing. Let us discuss your problem from a new — highly modern — angle.

Always sweet
Guaranteed pure

MEMBER THE ASSOCIATION OF ICE CREAM SUPPLY MEN

MERRELL-SOULE CO. **SYRACUSE, NEW YORK**

Every Sheet 12" x 36". All material crated—no breakage

Plants of Manufacturas de Corcho

The **third** of a series; read it and watch for the next!

No "Hit or Miss" with NOVOID!

While it is true that every insulation job requires a certain number of odd sized pieces, yet each must be of that exact size and shape to fit the particular space at hand. It is simpler and quicker for the workman to cut from a **standard** sheet than to search thru piles of corkboard for an odd sized piece that may be somewhere the size needed. On the other hand, it is a waste of labor to find a certain percentage of the corkboards in the hands of erectors of odd widths, or lengths, or both, which either throw off the **plan** of erection and cause unnecessary filling in and bad joints, or make it necessary that these "odds" be again laid aside to be used or not used as the opportunity may occur.

It is a well understood **fact** that these "odds" represent a definite item of cost-of-erection on every job where they are included in the shipment. To avoid this "hit or miss' factor, and its consequent additional cost, it is necessary that **every sheet** of corkboard be furnished **full standard 12"x36".**

NOVOID CORKBOARD, marketed in conformity with this principle of every sheet full size, —one of six basic principles followed by Manufacturas de Corcho, S. A., at their modern plants in Spain, home of cork,—is justly entitled to be known as a UNIFORM HIGH QUALITY insulation, absolutely dependable in **actual** service. Molded and baked in sheets 24½"x36½", SPLIT and finished full standard 12"x36" in 1", 1½", 2", 3" and 4" thicknesses. NO OTHER CORKBOARD is made in this way, with **complete** protection to user against dangerous and costly "green-centers."

Then, too, proper processing eliminates all voids between particles and confines the "dead-air" entirely to the hermetically sealed microscopic air cells contained in the cork bark itself. Thus, one more barrier is raised against the ever present destructive forces encountered in cold storage temperatures, and another good reason is noted for the wide use of Novoid Corkboard for all cold rooms.

this was a fact. Someone who has studied ostriches and knows their habits says this is false, and that the ostriches do not burrow their heads in the sand for the purpose of hiding. You are not interested in what the ostrich does or how he hides, but you should be interested in having the consuming public change the erroneous opinion which the majority of them have in regard to the presence of the milk solids not fat and gelatine in ice cream. These erroneous opinions are not only among the people who are not connected with the dairy industry, but it includes people of all classes. Not long ago a resolution was presented to a group of people who are all interested in educational phases of the dairy industry and they went on record as recommending an ice cream with a high fat content. I will grant that none of them were ice cream men, but it is time that the ice cream industry educate men of the dairy industry to the fact that butterfat is not the only constituent in ice cream as it is in butter.

Let us educate everyone connected with the industry from the can washer, the salesman, the supply man and all who come in touch with the industry.

THE ice cream industry is still young. The quality of the product is far superior today than it was five or ten years ago. The time of hit or miss practices is passed and although there are a great many things about the manufacture of ice cream that we do not understand, it is rapidly becoming a science. I do not believe that there is an ice cream manufacurer here who is not desirous of producing an ice cream of the best quality that is made in the state or in the United States. Do the people from your town know what fine ice cream you make? Do they boost the industry or knock it? If they say uncomplimentary things about the quality of the ice cream it is probably because you have hid your light under the bushel.

Ohio stands out as an ice cream state, both in quantity and quality. You men have continually improved your product. You are desirous of producing the best and I know of no better way of your being of greater service to your community in particular and humanity in general than to serve a high quality ice cream to your community.

FOR SALE

On account of recent purchases we are offering the following equipment from stock, for prompt shipment.

2—40-qt. Emery Thompson brine freezers with 3 phase, 60 cycle, 220 volt motors. One used 3 weeks.
2—40-qt. Cherry brine freezers and motors.
2—40-qt. Emery Thompson belted freezers.
2—300-gal. per hour viscolizers.
1—300-gal. Cherry Model No. 1 batch mixer.
2—300-gal. Cherry coil pasteurizers, steel bodies.
1—300-gal Cherry coil pasteurizer, wood body.
2—400-gal. Cherry Jensen cream ripeners.
1—400-gal. Cherry I. C. batch mixer.
50 and 100-gal. Cherry upright batch mixers.
2—De Laval Alpha Acme cream separators.
1—No. 12 De Laval cream separator.
1—Ft. Atkinson ice cream can washer and sterilizer.
1—900-lb. tubular milk cooler.
2—Champion No. 11-H hopper type ice crushers.
1—No. 125 white enameled 2 compartment cabinet.
3½ ft. and 5 ft. copper vacuum pans.
15, 20 and 90 ton shell and coil brine coolers.
30,000 lineal feet of 2 in. hardening room piping.
Refrigerating and ice-making systems can be furnished from our own stock of good used equipment.

PRESIDENT OF BIG CREAMERY COMPANY DIES.

Huston Wyeth, president and one of the founders of the Blue Valley Creamery Company, died at Miami, Fla., January 25. Mr. Wyeth has been in poor health during the past year.

Deceased was president and principal owner of the Wyeth Hardware Manufacturing Co. of St. Joseph, Mo., one of the largest wholesale hardware and saddlery concerns of the country. A man of exceptional business ability and of large affairs, he was deeply interested all his life in promoting prosperous agriculture. This led him to become interested in dairy farming and in 1900 he, with L. C. Hamilton, also of St. Joseph, and J. A. Walker and C. J. Walker, then of Marysville, Kans., organized the Blue Valley Creamery Company, being its president ever since.

The broad vision, high ideals of quality and service and the financial genious of Mr. Wyeth have been great factors in placing Blue Valley on a sound and solid foundation and building up the large organization it is today. His passing brings deep sorrow to all blue valley officials but, never active in the direct management of the company, the death of Mr. Wyeth will in no way affect its business.

Mr. Wyeth was 62 years old. He leaves a widow, two daughters and two sons, William M. and John, both of whom are actively engaged in the management of the Weyth Hardware & Manufacturing Co. William M. Wyeth is also a director in the Blue Valley Creamery Co.

The funeral took place at St. Joseph, Mo., Friday, Jan. 30, in the presence of a great assembly of friends and associates, including officials of the Blue Valley Creamery Co., all joined together in loving tribute to a great leader, a wise counsellor and a true friend. As a mark of respect all blue valley creameries and offices were closed between the hours of 12 and 4 on the day of the funeral.

ICE CREAM CODE SUBJECT OF PUBLIC ADDRESS.

A Milwaukee ice cream manufacturer told some members of his public some interesting facts about ice cream recently. William F. Luick, head of the Luick Ice Cream Co., addressed the Milwaukee Rotary Club members at luncheon early in February, telling them how the National Association of Ice Cream Manufacturers has taken steps to maintain the purity and wholesomeness of ice cream in accordance with food laws, by making this the first article in the code of ethics adopted by the association.

Moore, Krombholz, and other scientists advocate the systematic inclusion of protective and emulsifying agents, such as gelatine and albumin, in the dietaries of normal adults, in order that fats may be maintained in finely divided emulsified condition and thereby be more amenable to the action of the digestive enzymes.

More pure milk, vanilla, shortening and other pure ingredients are used in making one CREMO Cone than in three "plain ice cream cones."

LEADERS in the Ice Cream Industry, concerns that spend millions to advertise their respective brand of Ice Cream, recommend and supply to their trade Cremo Cones exclusively. They do this even though many cones that are supposed to be just as good can be bought for one-half the price of Cremos. It required over twenty years to learn to make Cremo Cones—the finest Cone in America. That's why the **Big fellows** want their particular Ice Cream served in Cremo Cones.

HOW THE ICE CREAM INDUSTRY CAN PROFIT FROM A PRINCE'S LESSON.

(Continued from page 14)

advancement is the organization of that industry. There must be unity of effort, and agreement as to goal, and the only way to arrive at these is through organization.

Then there has to be an "engineer." It seems true, as Mr. Everett said that

"Sometimes he exists right in an industry. He does not know he is an 'engineer.' If he were called one he might be insulted, because there are engineers and engineers, and one may not know whether he is being classified with the engineer of a steam shovel or a mechanical or chemical engineer with seven letters behind his name and memberships in famous technical societies to his credit.

"But whether he would recognize himself by the name or like it, he has a **flair** for looking at his business—and at the businesses of all the other men in his same line—from the point of view of the other fellow, or more strictly speaking, from the point of view of the other fellow in the mass; that is, of thousands of the other fellow rolled into one. It worries some psychologists profoundly that they cannot explain the tremendous difference between the actions of the human mind in single play and the actions of a thousand human minds in common play.

"None of us has a catching of the throat and strong emotional impulses if he hears a funny German band play the Star-Spangled Banner in an alley, but a thousand of us together in a public square with flags waving and some soldiers swinging by, will tear our hats off, shout and choke, no matter if the funniest collection of musicians in the world should tell us that 'our flag still waves.' Singly we seldom want to go to all the well-worn but effective properties of the occasion set, let some word wizard move our emotions for an hour and we will go to war or endow a fondling hospital.

"Our 'engineer' of an industry has the faculty somehow developing of thinking of his business in the terms of a thousand of the other fellow all in one. Then, he has something else besides.

"He has an instinct for presenting his industry to this thousand-minded other fellow in the way he would like to have the many-minded individual regard it.

"He proceeds to so present it. The tools of his effort are publicity, advertising, honest educational measures, development of quality in product, so that the quality will do some talking for itself, elimination of uneconomic methods in his industry, so that more resources are released to back up his 'engineering' measures.

"If he is really a good 'engineer' he will work to make his industry honest, not merely in the production of a quality product but in its daily methods. In our private moments we must have all admitted that some of the cant and flim-flam and beating-the-devil-sanctimoniously-around-the-bush that passes today for business 'smartness' is enough to make us glad that an unmerciful, unfearing satirist like old Dean Swift is not alive. He could take that prize production of the generations, a certain type of twentieth century business man, and flay him utterly."

This is not by any means a new game. Politicians are quite familiar with this sort of thing. Mr. Everett does not insinuate that we have to use the politicians' methods. Some politicians insist that the public can't be fooled. Other extremists are foolish enough to believe that the public has no intelligence whatsoever. Somewhere in the middle ground lies the truth, to quote Mr. Everett, who insists that "the industry that is honest, gives the public what is rightfully its own in valuation of purchase," and will soon enough come to be thought of as dependable by the public."

There can be no greater asset than this condition, with which we all agree.

Packaged Ice Cream Sundaes

Will Packaged Sundaes Aid Merchandising Efforts?

PACKAGES have been uppermost in the minds of ice cream manufacturers for the past several months more than anyone a few years ago would have thought possible. This is especially true of the recent winter months, when the subject was discussed at many ice cream conventions.

The sundae package has come in for its share of discussion. It is being urged upon the trade as a means of opening up new business, attracting new customers to ice cream. While some ice cream manufacturers do not believe that the sundae package in itself is profitable others say they are making profits from this business, the sundae package serves a useful purpose in advertising the product.

IT IS true that 75 per cent of the ice cream business today is done at the sundae fountain. But proponents of the idea argue that through making ice cream easier to handle more of it will be sold in containers, and in this way consumption will be more greatly developed. Others believe that whether or not package ice cream is boosted, it should not be advertised in such a way as to reflect upon the purity of ice cream served at the soda fountain, nor upon the sanitary surrounding conditions under which ice cream is dispensed at the soda fountain.

The Ice Cream Review has not passed any judgment on this matter. In line with its regular policy, The Ice Cream Review has made inquiries into the situation, and attempted to bring out helpful information upon a matter that now is of more than passing interest.

WE SHOULD be glad to have our readers write us more fully about this matter. It is only in this way that ice cream manufacturers can arrive at a logical conclusion. It is generally realized in the ice cream industry that the big thing is to promote more intelligent, more intensive merchandising.

The ice cream manufacturer has reached the conclusion that he must do merchandising just the same as the dealers. That is the urge in virtually every other line of business. Manufacturers of many different commodities today, representing to themselves that they must take part in work leading to the actual selling of their goods to the ultimate consumer.

THE sundae package has been represented to the industry as a step in that direction. The same is true of the general idea of selling packaged ice cream, which was introduced several years ago.

We are presenting at this time thoughts on the matter by different men in the industry, letting these men speak for themselves as to the real place in the industry of the sundae package.

We believe this will be of interest to our readers. We hope it will lead others to speak up and let us know what they think of the matter.

ENGLAND HAS HOUSE-TO-HOUSE DELIVERY OF ICE CREAM

House-to-house delivery of ice cream is now being carried out in London. A device with insulated chambers fitted between the side wheels of tricycles, of which a certain enterprising ice cream concern in London has a fleet of 400, enables this manufacturer to deliver ice cream in the homes. The householders use a method similar to that used in this country in ordering milk. They display a card in the window bearing the initial letter of the firm. The salesman makes delivery two or three times a day, while orders can be given to him for deliveries to be made at a future time.

By no means overlook the tremendous demand for a 10c Package of Ice Cream

More than 100,000,000 small size packages of ice cream have been sold during the past thirty months. The sales are in their infancy. The volume is increasing all the time. Ice cream manufacturers, seeking to increase their profits, are catering to the tremendous demand for the 10c package of ice cream. The 10c package nets the manufacturer a greater profit than received for bulk ice cream. The increase averages greater than 57c per gallon. A portion of this increased sales volume and added profit awaits every ice cream manufacturer.

Does the Packaged Sundae Lead More of the Public to "Sample" Ice Cream

Leading Ice Cream Manufacturers Have Given Their Opinions on Sundaes in Packages

CONTINUING its inquiry into the situation regarding packaged sundaes, The Ice Cream Review constantly sees brought up the suggestion that the package is the means of getting ice cream "sampled" by the public. Manufacturers who have different ideas on the subject seem to agree on that point.

J. A. Whitfield, president of Zero Products, Inc., Washington, D. C., thinks the ten-cent package is profitable, and "likes it very much." He includes overhead in figuring the profits in this phase of his business. He says:

"We try to look upon the five and ten-cent packages as specialties that carry some prestige and advertising value that reaches right to the consumer in each case," he said. "The sundae package business develops a large gallonage for the first plant to introduce it in a city. Shortly after, when all dealers are putting out sundaes, they cease to be a maker of new business for gallonage."

This manufacturer is inclined to think the packaged sundae is permanent business, "if for no other reason than that they become more attractive to the small manufacturer as the big manufacturer shows a disposition to discontinue selling them."

THROUGH the aid of the five-cent package the American Ice Cream Co., Cincinnati, increased its total gallonage, it was reported by B. Marchioni, manager of that plant. This was made possible," he said, "through its easy selling plan and also because of its advertising qualities." He likes the packaged sundae because "it enables us to place our name and business directly with the consumer. And also, because of its sanitation and desirability in selling, ideal carry-home pails causing no uncleanliness whatever."

"The individual sundae container in the ten-cent size only is all right for schools, picnics, small stands, etc.," according to M. I. Alfred, vice-president Alfred Pure Ice Cream Co., Los Angeles, which company has been in the sundae business a little more than a year, in that time selling only to the schools. He continued:

"It is hard to state whether or not the sundae has been profitable, as our price has fluctuated somewhat due to competition. It would be necessary to have a tremendous volume before the profit would be as it should. The sundae package helps to develop a large gallonage by getting your name before the public on the package, which cannot help but be read by the person seeing the package or eating the sundae."

W. E. Telling, president of the Telling-Belle-Vernon Co., Cleveland, speaking from experiences up to the latter part of December of last year, reported that up to that time his sundae had not been a success. "It is not what we would call a summer commodity in a sense

because of the tremendous amount of work and the space they require in our coolers," said Mr. Telling. "This is only a little experiment with us, and doubt very much whether or not it is profitable. In a few cases, the ten-cent package seems to be more of a success."

THE Maryland Ice Cream Co., Baltimore, reported that the ten-cent package increased trade and that it has been profitable. It says that profits compare about the same proportion with brick ice cream. This company believes that the sundae has enabled it to make an increase of one per cent in business. This company could not see that it has proved an advertisement for its business. The official said that the sundae container would be permanent business, because "some good trade will insist on the sundae package."

Robert P. Smith, Smith & Clark Co., Scranton, Pa., reports that his company has been using a two-flavor sundae package since October 4, 1924 and has "every reason to believe that it was a very good move for the winter season."

He continued:

"We are using the the five-cent package, * * * using no fruit or topping, one-half ice cream and one-half orange ice. This we ran for two months, with sales constantly increasing for a period of six weeks at which time sales dropped appreciatively. We are now running them with changed flavors, one-half chocolate and one-half vanilla. We have reason to believe here that the changing of the flavors will stimulate the sale.

"Our net earnings during the months we ran the individual package were a great deal more this year, over previous years when we had no special package. * * * Net profit is not so great as it is on bulk ice cream or brick but it will run about .07 as great as that on regular ice cream. This includes overhead entirely.

"We consider the ice cream in the individual five-cent package in developing greater gallonage due to the fact that we use a goodly amount of ice cream, the new idea stimulating the sales and we feel that any additional gallonage outlay with these different novelties containing ice cream, if spread over a period of time will produce a marked difference in gallonage.

"It naturally is good advertising due to the fact that it is new, novel, everyone talking it, cartons and caps in conspicuous places whereby one will readily assume that the ————or whatever name it may have, is a big seller.

"As to the permanency of the individual package, we cannot say. We do feel, however, that with the proper amount of advertising and merchandising and keeping it before the public in a stimulating way that it can be carried on for a goodly period of time, beneficial to all."

Inviting!

THE FIRST ICE CREAM.

Italy does not grant France the honor of having introduced ice cream first into the world's menus. The Italians claim that they manufactured sorbets during the fourteenth century. The sorbet was the juice of fruits which was frozen on icy snow. This drink became so popular in Italy that toward the end of the eighteenth century all sorts of ice were called sorbet.

An international congress of cooks was held in Italy at that time. This congress fixed the names of various dishes and it especially pointed out that only a mixture consisting of white wine, liquor, fruit juice and ice could be called a sorbet. The Italians had besides their sorbet the spongato, a frozen, beaten mass of frothy cream, and the gramolata, a half liquid delicate dessert prepared with ice. The latter was invented in the province of Toscana. Gramolata is composed of several fruit juices and wine, and it contains less sugar than does the ordinary sorbet.

Making Ice Cream Easy To Buy

Ice Cream Becomes Definite Merchandise When Handled in Packages, by Plan of Snow & Palmer Co.

This Method Makes it Easier for the the Dealer and the Housewive, Particularly the Latter

MAKING it easier for the customer to buy ice cream is a matter the ice cream industry only recently has begun to appreciate in its fullest light. Much importance now is being attached to putting up ice cream so it can be conveniently handled from store to the household, which is our greatest undeveloped market. This purpose is served by containers—variously styled cartons, packages, boxes, etc.

Packaged ice cream gives to this product the same advantages that bottled milk gives to milk buyers. This thought is seized upon by the Snow & Palmer Co., Bloomington, Ill., in impressing upon patrons the fact that it is easier to take ice cream out of the store now than it was in the past. The Snow & Palmer Co. drives home this thought in a little pamphlet they have issued concerning its Cream-Pak, in which it issues bulk ice cream packed at its freezers. The pamphlet does more than call attention to the ease and convenience in buying ice cream in this way; it also does much to draw the attention of the public to the soda fountain.

This has long been realized to be of much importance in view of the number of things in the drug store that compete with ice cream in drawing the buyer's eye.

The ice cream industry is learning that other business men have used to good purpose trade-marked packaged goods, such as raisins, milk, canned goods, etc.

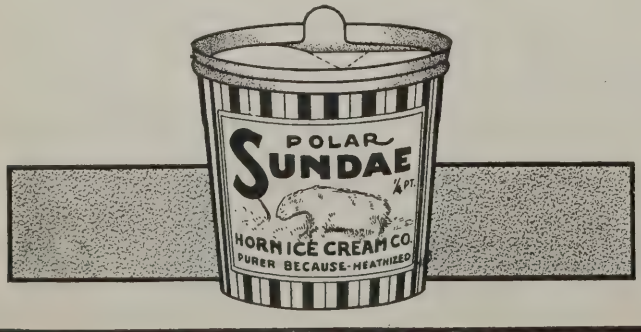
IN ONE of the pamphlets of the Snow & Palmer Co., the old way of serving ice cream is likened to the old way of serving milk, when the milk once bought for the table was dipped—not bottled. The reader was reminded that the milkman once measured out a pint or quart of milk with the cover top of his milk can, and poured the white liquid out into a pail or bowl that the housekeeper kept for that purpose.

While the analogy is not exactly accurate, it is generally recognized by ice cream manufacturers that there are many disadvantages to the scoop system. For one thing, it takes up too much of the retailer's time.

THE industry now is much concerned with developing salesmanship among retailers. It is realized that through this every effort should be made to keep the retail salesmen interested in ice cream. This is not so easy to do when he feels that the work of dispensing ice cream is much of a bother to him. It is human nature for the dispenser, or any kind of salesman for that matter, to wish to dispose of articles of commerce which are easy to handle. Another disadvantage is this allows too many opportunities for the retail shop not to give full measure, which is not the case when packaged ice cream is put up at the factory and delivered to the dealer ready to pass over the counter to the public.

Cream-Pak is distinctly a Snow & Palmer creation, according to officials of this company.

"Not satisfied with having set the highest possible standard of quality, purity and deliciousness in the ice cream sold under our name," say officials of the company, "we are now offering Cream-Pak, what we believe to be the newest convenience and sanitation in the method of marketing ice cream."



The Perfect Package for Packaged Sundaes—

This attractive paper package will increase your sales volume—bring added profits. Used extensively by Ice Cream Manufacturers everywhere. Made of pure white paper—unwaxed. Nest when empty. Furnished printed in one or more colors with your own label.

IS THE TRAIN AN OUTLET FOR ICE CREAM?

POSSIBILITIES of building up an outlet for ice cream on trains are suggested in an article in the February issue of the "Business Builder," published by the Citrus Products Co., entitled, "A timely and interesting discussion on taking ice cream to the people." The article was written by J. J. Mojonnier, secretary-treasurer of Mojonnier Bros. Co. of Chicago, who related an experience while traveling from Portland, Ore., to Los Angeles:

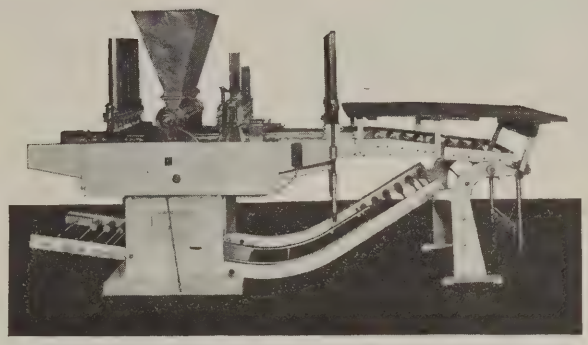
"The train stopped for a few minutes in a small California town. In front of the railroad station an enterprising inhabitant was calling out, 'Ice cream, ten cents a box.' He had brought a five-gallon packer filled with ice cream in individual packages, already packed, to the station.

"Inside of five minutes people from all parts of the train had rushed to his impromptu stand and in short order the vendor's entire supply was purchased and eaten. If this man had not met this train with a supply of ice cream in convenient packages for quick service, surely this rapid turnover would not have been feasible."

While at first blush, disposing of ice cream on trains may seem like "small pickings," consideration of the matter will show that in cities through which there is considerable railroad travel, such a business could be made to mean something. This will likely depend upon just how the matter could be handled. For instance, the average manufacturer would not be willing to handle any such business as this through ordinary "depot hawkers." In some cases it may be that such a plan could be worked out in co-operation with dealers, one ice cream manufacturer believing that a large dealer in the neighborhood of a railroad station could make arrangements with someone to dispose of ice cream on the trains as they come and go.

It was pointed out in the article by Mr. Mojonnier that a large part of ice cream is sold upon the basis of the consumer coming to get it at the fountain. For this reason the fountain is absolutely essential to the sale of sodas, sundaes and bulk ice cream, but—

"There is no question as to the innumerable opportunities for selling more ice cream by taking ice cream in a convenient package to the consumer. More ice cream can be sold if served just as the consumer wants it and when he wants it.



"Taking packaged ice cream to the people eliminated the difficulty of providing suitable service for quick sales."

SLOGAN RESTRICTIONS.

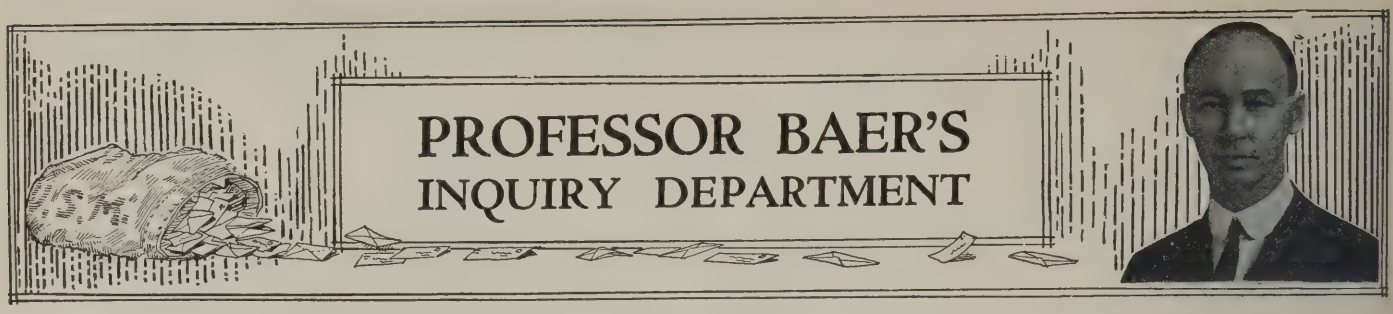
Restrictions covering the use of the ice cream trade slogan, "Serve it and You Please All," were outlined in a bulletin recently issued by V. F. Hovey, president of the National Association of Ice Cream Manufacturers, who recently announced that the executive committee had decided for the use of the slogan to be confined to ice cream manufacturers who belong to the national association, and to members of The Association of Ice Cream Supplymen who will use the slogan exactly as adopted by the association.

"In other words," according to the bulletin, "they will not be permitted to use the design if changed in any way, either by adding to or taking from the design."

BERGMANN ICE CREAM PACKAGING MACHINE—

¶ The practical machine for filling and sealing Packaged Sundaes. Fast, efficient, fool-proof and rustless. Reduces labor costs to a minimum. Used by prominent ice cream manufacturers.

¶ Automatic operation. Motor driven. Sanitary. Handles tray of 30 cups, filling and capping six cups at one time. Capacity 6000 cups per hour. Ice cream controlled by vacuum and gravity which maintains maximum run of freezer.



¶ The expansion of the demand for small size packages of ice cream necessitates this machine. Its use places profits on a new level. If you are marketing packaged sundaes you are interested in the Bergmann Machine. We'll be pleased to send complete information.

BERGMANN PACKAGING MACHINE CO.

SALES OFFICES

487 ORANGE STREET NEWARK, N. J.

Dear Sir:—We are having considerable trouble with our mix. We cannot control the overrun, getting too much—as high as 115 per cent. Finished cream tastes smooth, but looks course and has neither a good body nor a real good flavor.

The following is our complete mix—120 gallons.

84 pounds sugar.
3 pounds gelatine.
63 pounds butter (84%.)
42 pounds skim milk powder.
108 pounds Armour's evaporated milk.
300 pounds water.

We pasteurize the entire mix, with the exception of the flavor, to 145 degrees, hold 30 minutes before emulsifying, then age 24 hours before freezing. We have a horizontal C. and B. brine freezer, speed 175 r. p. m., brine 15 degrees.

At about what temperature is it advisable to hold in the hardening room? And also the brine to freezer?

Any help you can give us on this matter will be greatly appreciated.—A. M. H.

Reply: I have your letter discussing the considerable trouble you appear to have with your ice cream mix, especially in getting too high an overrun and getting a course produce.

I have made an analysis of your mix and you will find the calculations given below in table one. The calculations on your mix show that there is nothing wrong with the balancing of the various ingredients.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
84.00 lbs. sugar	.....	.....	79.80
3.00 lbs. gelatine	.....	.....	2.85
63.00 lbs. butter	52.92	.....	52.92
108.00 lbs. Evaporated milk	8.64	19.44	28.08
300.00 lbs. water	.....	.....	.....
42.00 lbs. skim milk powder	.....	39.90	39.90
600.00 lbs. mix	61.56	59.34	203.55
Per cent sugar	14.00		
Per cent	10.26	9.89	33.90

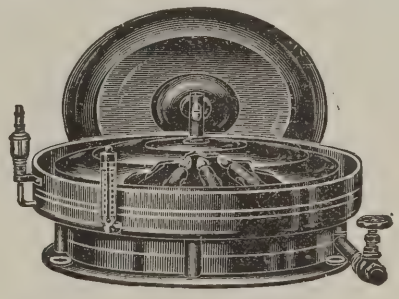
I believe that your trouble is rather in your method of freezing and handling. You stated that you were operating your freezer with a brine temperature of 15 degrees. That is a rather high temperature of brine. I would suggest that you try to run your freezer with an 8 degree brine and freezing your mix a little faster. Ten or twelve minutes should be sufficient time to freeze a batch. I believe you can in that way reduce the apparently high overrun and also get a little smoother product. The temperature of the hardening room should be somewhere near zero. It will not be objectionable to have the temperature 10 or 15 degrees below zero at night and it should not go higher than 5 and at least not higher than 10 above zero.

If you are not able to get a satisfactory smooth product without the use of some improver I would suggest you try using a little improver along with your gelatine.

You stated you also had trouble in getting a real good flavor in your ice cream. The flavor of your ice cream depends upon the flavor of your raw material. It is possible that the difficulty in the flavor comes from the butter you are using or comes from the evaporated milk which has a heated flavor.

* * *

Dear Sir:—One of our very old customers has been reading with considerable interest The Ice Cream Review. In fact, copies are on his desk continually and he has asked me to do him a favor and ask Prof. Baer in the department which you are operating to make an analysis of his mix.



He gave me the following formula as being the one which he was using at that time:

350 pounds 40 per cent cream.
350 pounds 3 per cent milk.
160 pounds condensed milk.
140 pounds sugar.
6 pounds gelatine.

Also advise to what extent he should add water and powdered milk to still maintain the very high butterfat content of his product, providing he uses milk powder in place of the condensed. He would also like the same

SINCE 1864

analysis made of a mix in which the milk powder is used.

Reply: I have made an analysis of the mix which you state one of your customers was using, showing the calculations of this mix in which condensed milk was used. You will notice that this mix tests 15 per cent butterfat and 9.15 per cent serum solids. If the condensed milk was replaced by milk powder and water, the ingredients are given below in table two.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
350.00 lbs. 40% cream	140.00	18.69	158.69
350.00 lbs. 3% milk	10.50	30.21	40.71
160.00 lbs. cond. milk	.....	43.20	43.20
140.00 lbs. sugar	.....	.....	133.00
6.00 lbs. gelatine	.....	.....	5.70
1,006.00 lbs. mix	151.15	92.10	381.30
Per cent	15.06	9.15	37.80

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
350.00 lbs. 40% cream	140.00	18.69	158.69
350.00 lbs. 3% milk	10.50	30.21	40.71
140.00 lbs. sugar	.....	.....	133.00
6.00 lbs. gelatine	.....	.....	5.70
44.00 lbs. skim powder	.....	43.20	43.20
116.00 lbs. water	.....	.....	.....
1,006.00 lbs. mix	151.15	92.10	381.30
Per cent	15.06	9.15	37.80

The formula in table two will have exactly the same composition as the one your customer is now using.

* * *

Dear Sir:—We would like your opinion on the following mix, which is figured in gallons instead of pounds. The mix is as follows:

50 gals. 18% homogenized cream.
30 gals. 4% milk
12 gals. 8% evaporated milk.
140 lbs. sugar.
6 lbs. gelatine.
1 lb. meloine.

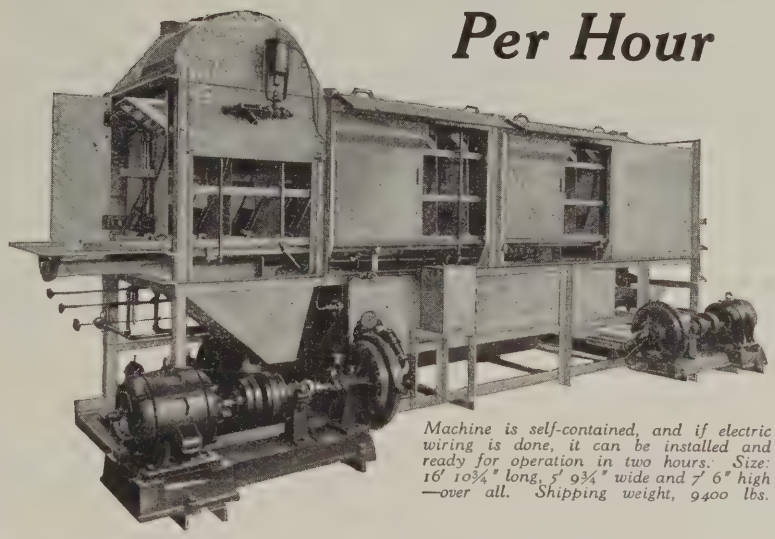
The above is pasteurized to 145 degrees F., held for 30 minutes and run through emulser, cooled down to 40 and held for 15 hours.

Would you please calculate this in pounds, and how much finished product should it make, also state fat, Serum solids, and total solids?

We also want your criticism on same, and any suggestions for improvement will be appreciated, as we would like to produce a first class product. In fact, the best could be made to test 10 per cent. You may also suggest a formula for 12 per cent mix. J. G.

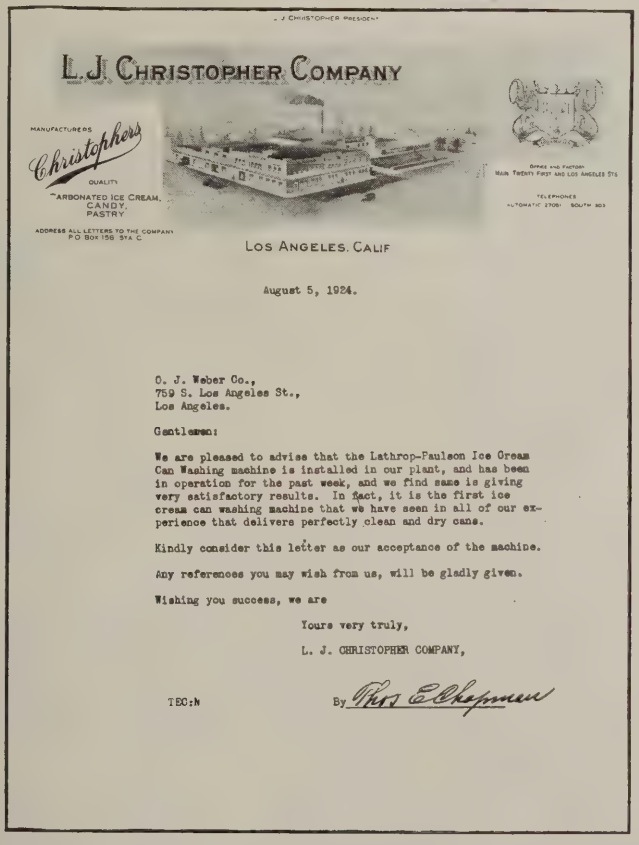
Reply: I have calculated the ingredients of your mix and you will find the figures below in table one:

Table One.



Ingredients	Fat	Serum Sol.	Total Sol.
50 gal. or 415.00 lbs. 18% cream,	74.70	30.26	104.96
30 gal. or 255.00 lbs. 4% milk	10.20	21.80	32.00
12 gal. or 108.00 lbs. evap. milk.	8.64	19.44	28.08
140.00 lbs. sugar			133.00
6.00 lbs. gelatine			5.70
1.00 lb. meloine			.95
925.00 lbs. mix	93.54	71.50	304.69
Per cent	10.0	7.7	32.9
Per cent sugar	15.4	.....	.....

You will notice that while your per cent of butterfat is about 10, the serum solids have not been brought up very much with the evaporated milk. You will also notice that your sugar content is 15 per cent.



If I were to suggest changes in your formula I would reduce the sugar to 14 per cent, and possibly use skim milk powder to bring the serum solids to about 10 per cent, by using less evaporated milk and making up the

600 Cans and Covers or Brick Pans *Per Hour*

Absolutely clean, sterile and dry. Washes all size cans and covers from 20 qt. down to 4 qt. Cans are fed in and delivered at the same end of machine. Small cans may be washed together with larger cans, increasing the capacity to 1200 per hour. Has two speeds. Each can receives 17 distinct intensive treatments.

Machine is self-contained, and if electric wiring is done, it can be installed and ready for operation in two hours. Size: 16′ 10¾″ long, 5′ 9¾″ wide and 7′ 6″ high —over all. Shipping weight, 9400 lbs.

Los Angeles.

Gentlemen:

We are pleased to advise that the Lathrop-Paulson Ice Cream Can Washing machine is installed in our plant, and has been in operation for the past week, and we find same is giving very satisfactory results. In fact, it is the first ice cream can washing machine that we have seen in all of our experience that delivers perfectly clean and dry cans.

Kindly consider this letter as our acceptance of the machine.

Any references you may wish from us, will be gladly given.

Wishing you success, we are

Yours very truly,

L. J. CHRISTOPHER COMPANY,

TEC:N By Thos E Chapman

L.-P.

ICE CREAM CAN WASHER & DRIER

Only two men are required to operate the machine at maximum speed, and one man can handle the work efficiently at the 300 speed. Cans are washed on outside as well, freeing the cans, lids, pans and covers from brine. This machine eliminates the necessity of washing cans and covers separately. Cans which have been stored and coated with oil do not have to be brush washed. They come out ready for service, or may be piled in storage racks without danger of rust. Machine will also handle brick tanks up to 12 qt. size. All cans are placed in machine upright, and are delivered **absolutely clean, sterile and dry.**

The machine is sturdily constructed and heavily galvanized. Temperatures are thermostatically controlled. Soda solution is automatically controlled by L.-P. Patent Soda Regulator.

Machine is sold on a results-guaranteed basis. Names of users will be gladly submitted upon request. It will not obligate you to obtain full information and price. Send the coupon today.

weight with skim milk powder until you have it properly adjusted.

If I can be of assistance to you in this matter I should be glad to help you figure this out if you will indicate just what you should like to do, especially with the use of skim milk powder.

I would suggest also that you secure from The Olsen Publishing Company, Fifth and Cherry Sts., Milwaukee, Wis., a copy of a little book entitled, "Ice Cream Mix," which you can purchase for $1.00. This will give you many ice cream formulas, among which you would undoubtedly find a number suitable for your use.

* * *

Dear Sir:—Our trade demands an ice cream or custard containing 16 per cent fat, as a special.

Since the fat is 4 per cent higher than our plain ice cream, it becomes necessary to prepare a special mix to meet the requirement. We are willing to do this.

But, so far, I have found it difficult to properly make a 16 per cent cream that is satisfactory, so I am herewith sending you my formula, and asking your advice. Formula:

57 lbs. cream, 36%.
57 lbs. milk, 3%.
19½ lbs. cane sugar.
1⅓ lbs. egg yolk.
(3 lbs. sweetened skim condense (42% sugar, 28% ser. sol.)
½ lb. gelatine, good grade, vanilla, color, etc.

I pasteurized mix and homogenized at approximately 1,800 pounds. After thirty-six hours' aging the body and viscosity was not apparently restored; the mix poured almost as free as water. Why?

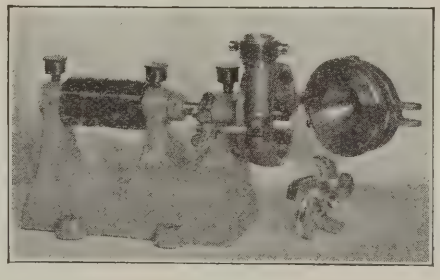
I then froze one freezer. temperature of mix was 34; temperature of brine, 4 above zero, and the freezing was very rapid. At 100 per cent overrun the cream was stiff enough to draw. I cut off brine, and drew, but before my freezer would empty the cream beat down and became too stiff to fill voids in cans and pans.

I warmed mix temperature to 40 degrees, and brine temperature to 10 degrees. Froze another freezer with same results. I then left remainder of mix to age twelve hours longer. Then froze mix at temperature of 40 degrees; brine temperature of freezer at zero; another at 8 degrees; but the results were no better. The cream beat down and became so stiff that it had to be forced or jarred into cans, and lightest weighed 24½ pounds net to five gallons. But on starting to draw my overrun tester showed 100 per cent overrun.

My plain ice cream formula contains:
12% butterfat.
13.5% sugar (7.056% in condense.
(6.444% added sugar.
.5% gelatine.
.5% egg yolk.
16.8% sweetened condensed skim (42% sugar.
(28% serum solids.

My butterfat is derived from sweet milk and sweet butter, as my sweet cream supply is small and uncertain. Do you think it would be practical to weigh off a certain quantity of this plain ice cream mix and add to it "a require dmix to make the 16 per cent formula?" and how would you suggest this might be done?

Would you advise using coconut fat in any per cent, to increase the 12 per cent to 16 per cent? If so, how much, and how added? Is there a coconut fat that has small coconut flavor?



We thank you for your attention, and hope we are not imposing in asking your advise. H. R. S.

Reply: I have analyzed your mix and you will find the figures given below in table one.

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
57.00 lbs. 36% cream	20.52	3.24	23.76
57.00 lbs. 3% milk	1.71	4.92	6.63
19.50 lbs. sugar			18.52
3.00 lbs. sweet cond.		.84	2.10
1.30 lbs. egg yolk			1.17
.50 lbs. gelatine			.47
138.30 lbs. mix.	22.23	9.00	52.65
Per cent	16.10	6.50	38.16
Per cent sugar	15.00	.....	.....
Per cent gelatine	0.35	.....	.....

You will notice that this mixture tests 16 per cent butterfat, but the total solids is 38 per cent or a little better. In figuring out the sugar I notice that your mixture contains 15 per cent sugar. I believe that if you will reduce the sugar content to 13½ per cent or 14 per cent and possibly use only one-half as much egg

Pierce-Arrow truck-Pfaudler tank, Nonpareil Corkboard Insulation—the combination that carried milk from Pittsburgh to Milwaukee with a 5-degree rise in temperature.

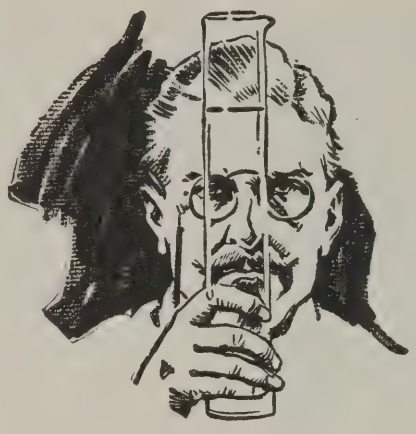
The Insulation Is Nonpareil

The whole dairy industry knows about the famous trip of the Harmony Creamery tank truck from Pittsburgh to the Dairy Show. From Saturday night to Tuesday morning—60 hours, 700 miles—the temperature of the milk rose but 5 degrees, from 36° to 41° Fahr.

The Harmony Creamery tank is insulated with 2 inches of Nonpareil Corkboard. That is the whole story of this 5-degree record. Nonpareil Corkboard held the temperature to a one-degree rise for every 12 hours.

One more triumph for Nonpareil Corkboard. One more demonstration of its dependable efficiency. Nonpareil is accustomed to records, whether spectacular records like this Dairy Show trip or the common, inconspicuous records of day-after-day efficiency in cold storage rooms. Nonpareil superiority is founded on dependability.

Have you tanks or rooms to insulate?



Full information, samples and estimates will be supplied on request.

Safeguarding Our Customers—and Yours!

To safeguard the reputation of your product you must be sure of the quality of your ingredients. Your position in regard to the public is exactly our position in regard to you. We can no more afford to supply you a gelatine of inferior quality than you can afford to put such an ingredient in the product you offer the public.

Atlantic Super-Clarified Gelatine is as good as modern science, up-to-date machinery and finest materials can make it. In our modern daylight factory, skilled workmen long experienced in gelatine making are constantly striving to make a better gelatine for you. Our intensive manufacturing processes keep costs down, save you money on gelatine and give you a product on which you may depend for clarity, purity, viscosity and absolute uniformity.

Thus we safeguard your reputation with your customers—and our own with you.

GELATINE

yolk as you are using you will not have the difficulty you mentioned in your letter. I rather doubt whether it would be advisable to use your regular plain ice cream mix and try to raise the fat content and the contents of other ingredients from this mix. I believe it will be much better to make up the mix separately and process it separately by pasteurizing and homogenizing. I suggest that you try using a little less sugar, a little less egg yolk and see if that will not remedy your apparent difficulty.

It is also possible that you have already solved your trouble by modifying your method of freezing, as it does not appear that the difficulty with your overrun and the weight of the ice cream should be due to the mix. You should, however, be able to get from thirty to thirty-one gallons of ice cream from the mix as indicated in table one.

You also asked whether it would be advisable to increase the fat content of the mix by using coconut oil. I do not believe that the additional coconut fat is permissible under your state laws and you certainly would not want to adulterate your special ice cream in that way.

MARKED IMPROVEMENT SHOWN AT CANADIAN COMPETITION.

(Continued from page 18)

duce people to eat ice cream for some other reason than because it is cold. It must have a natural clean taste, characteristic of fresh milk and cream.

"A very slight change in the amount of milk solids not fat will make a great difference. About 10 to 11 per cent is about right, more will smother the cream flavor, while up to this amount of serum solids intensifies the cream flavor when 10 to 12 per cent is used as well as supplying the necessary body. Too much sugar lowers the freezing point until it is hard to keep and if served soft the ice cream will be sticky." Mr. George then went through the various ingredients giving the proper proportions.

"The texture of the finished product must be fine and close in order to obtain smooth ice cream and to bring out the natural rich flavor of the butterfat, for if this butterfat flavor is overpowered by the use of too much of any other ingredient we are not doing justice to our product."

"I have found a regrettable suspicion in the minds of the public," said Mr. George in conclusion, "that ice cream is not what it should be and while we know that it is a pure and healthful product we should, as an industry, use the greatest care that we do not obtain flavor and texture of which the public will be suspicious and with the elimination of foreign substances and the proper use of dairy products we can attain this end."

BETTER ROADS IMPORTANT TO ICE CREAM MEN.

At different times The Ice Cream Review has pointed out to the industry the importance of encouraging better roads. Reviewing the proceedings of the 1924 convention of the Illinois Association of Ice Cream Manufacturers, it is noted that President Z. G. Gassmann brought cut some interesting points on this thought.

"Because of the fact that our product is highly perishable," Mr. Gassmann said, "prompt and economical delivery is essential. Motor delivery has come to play a large part in the business of the ice cream manufacturer, and can only be done economically and successfully where improved roads exist. I urge every one of you to give your support to the hard roads measure. It means not only improved transportation, it means a saving in real dollars to everyone who operates motor vehicles, whether for business or for pleasure."

ROCKY MOUNTAIN ORGANIZATION PROPOSED.

(Continued from page 28)

The subject of mechanically refrigerated cabinets, iceless shipping jackets and refrigerated soda fountains was discussed on the second morning of the convention. At that time papers on iceless cabinets were read by Lewis Chamberlin of the Nizer Corp., Detroit, and by N. B. Acers of the Denver branch of the Delco Light Co., C. A. Pearson of the Lipman Company, Beloit, Wis., spoke on refrigerated soda fountains, and G. Berg of the Montgomery-Washburn Company, New York, spoke of the iceless shipping jacket which his company makes. All the talks held interest and the speakers were kept on the floor answering questions on different problems.

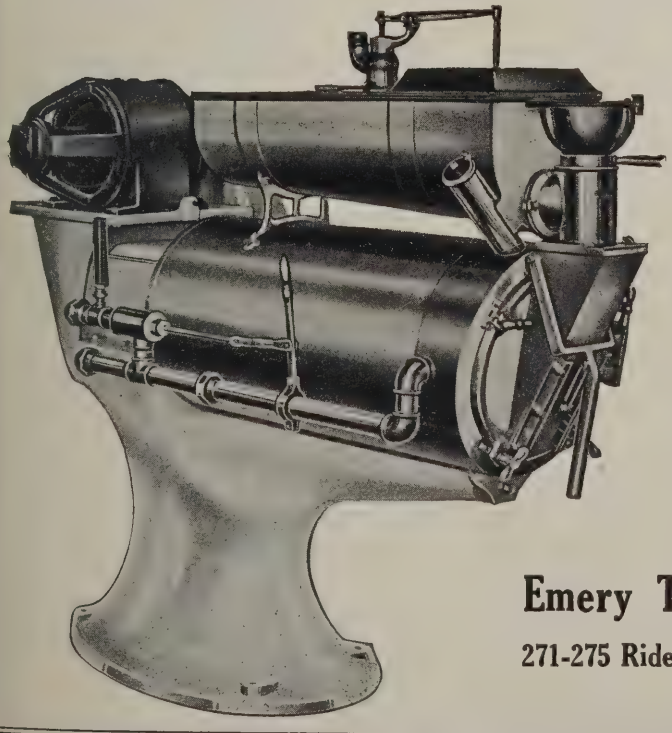
A DISCUSSION of cabinets, shipping jackets and refrigerated soda fountains was taken up in the afternoon. The majority of the manufacturers favored the use of all of these appliances, many of which are in use in Colorado. Most of the Colorado ice cream manmanufacturers buy the iceless cabinets to be used by their country dealers and then rent these cabinets to the dealers at 10, 11 and 12 dollars a month. In some cases the ice cream manufacturers provide the cabinets free in the cities, especially in Denver. Several manufacturers stated that they are using dry containers and iceless shipping jackets when shipping ice cream to country dealers and have found them very satisfactory.

One Denver manufacturer told of shipping a consignment of ice cream on a train that was wrecked and delayed 34 hours, but the ice cream reached the dealer in excellent condition.

THE Rocky Mountain Canaries, composed of the supplymen who operate among Colorado ice cream manufacturers, was organized during the convention, and will entertain the ice cream manufacturers during the convention each year. The officers of the new organization are C. L. Hurley, Denver, president; Lewis Chamberlin, Detroit, vice-president; John Bruce, Denver, secretary-treasurer, and C. H. Backer, St. Joseph, Mo., and G. Berg, New York, who, with the three officers, form the board of directors.

In the evening of the first day of the convention, a splendid banquet and dinner dance, a feature of the convention each year, was held. A number of Pueblo girls and women were invited to the dance by local ice cream manufacturers. The manufacturers and the supplymen attending the convention proved to be excellent entertainers and this banquet was one of the most successful ever held at the hotel.

On the final night, after the close of the convention, the ice cream manufacturers were entertained by the Rocky Mountain Canaries with a buffet luncheon, smoker and entertainment. Music was provided and several boxing matches were features. The convention ended with every manufacturer pleased that he had attended and promising to attend the next convention at Denver next year.



Among the ice cream manufacturers who attended the convention were E. B. Darrow, Pueblo; S. E. Miller, Denver; John Bruce, Denver; W. K. Zott, Denver; J. S. Bachelor, Canon City; Dan W. Morris, Sterling; L. H. Taylor, Sterling; C. B. Frank, Lamar; Harry Carlson, Denver; N. M. Due, Grand Junction; Edward Strain, Lamar; E. L. Carlson, Denver; A. R. Bleisner, Pueblo; H. F. Percy, Denver; C. F. Davis, Walsenburg; W. A. Randall, Boulder; C. T. Myers, Alamosa; George M. Flint, Denver; Frank Mauro, Walsenburg; W. F. Simpson, Denver; C. G. McLagan, Fort Morgan; D. B. Bier, Denver; H. J. Walsmith, Denver; L. W. Nelson, Pueblo, and Roy C. Newfarmer, Grand Junction.

An Ocean Voyage

The above picture of the Leviathan that appears on Page 20 of the new Emery Thompson catalog leads us to suggest —

Emery Thompson Ice Cream Freezers are enabling their owners to enjoy more of the good things of life — such as ocean voyages, long vacations in the the north woods, perhaps a finer new car, and other things that a man and his family desire.

Emery Thompson Ice Cream Freezers are in profitable use the world around—in this and practically every foreign country. They freeze ice cream on the Leviathan and many other great ocean liners.

In every respect, you will be delighted with the mechanical performance and sweet, smooth operation, and the long life of service given you by any Emery Thompson Freezer. Just how fully the Emery Thompson line meets every ice cream freezing requirement is shown in our new catalog. Shouldn't you have a copy for your files?

Emery Thompson Machine & Supply Co.,

McLAREN'S CONES

Every Cone in Every Row is Uniformly Baked

INSIDE and outside, from tip to top, McLaren's Cones are baked to an even brown color. This result can be obtained only through the scientific use of fully-automatic cone machines. Heat adjustments must be exactly right, and the finished cones must be ejected from the moulds at precisely the correct time.

McLaren's Cones have no soft spots to dry out and shrivel up. No turned points. No intermixture of light and dark colors. No steam cracks to weaken wall of cone.

You would find it a pleasure to sell these good cones,—profitable too.

Every Cone is Guaranteed

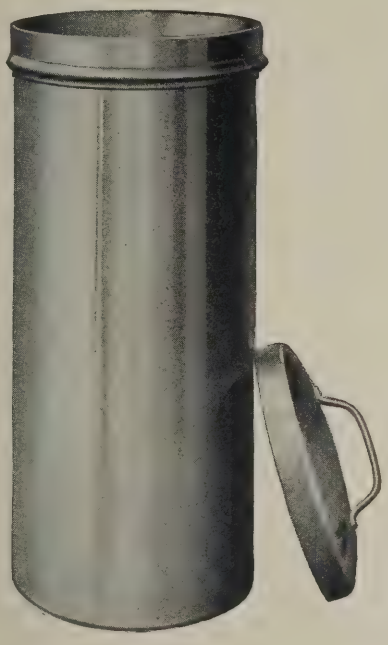
CREATING HUMAN INTEREST IN ICE CREAM THROUGH WOMEN.

(Continued from page 34)

opening for six evenings. We had photographs taken of every department in our factory. We prepared the proper data in the form of short stories which we ran in connection with the various photos, and compiled into a little booklet a story entitled "Around the Globe with Pen and Camera." We handed every visitor one of these booklets, and made the statement that the little booklet was prepared by the Globe Ice Cream Company for their convenience as an educational feature so as to enable them to know more about ice cream. As they were escorted through the factory we pointed out the fact that we wanted them to remember the various statements made, and to check them up from their personal observations and as outlined in the booklet. This fact alone thoroughly convinced our visitors that we were telling the truth, and we dwelt upon the fact that cleanliness was the watch-word of our factory.

In taking these visitors through our plant we showed them every piece of machinery, and explained why it was necessary to have such elaborate and scientific machinery in order to produce a pure and correct ice cream product. We showed them our raw materials, such as fruits, flavors, sugar, and gelatine; and by the way, women are not afraid of gelatine because they serve it on their dinner table very frequently. We pointed out the fact that the gelatine was pure, and that it was necessary to use it in ice cream; we covered every minute detail pertaining to the industry, and much to our surpris, the women were more keenly interested in our explanation than the men, yet we must admit that most men are mechanically inclined. The men paid more attention to the big motors in operation than they did to the other kinds of machinery installed in our plant. But you can readily see that from start to finish we really did interest the public in knowing how, where and under what scientific and sanitary methods ice cream—a pure food—is manufactured.



WE BELIEVE that the system employed by our company accomplished its purpose over and over again. For weeks we heard many people state that it was the first time they had ever seen the interior of an ice cream factory, and it was really interesting to see how, where and under what conditions ice cream is made, and they were very much surprised to learn the many details necessary in order to perfect and manufacture a good ice cream. Therefore, a human interest was created, and it still continues.

We might further state, that by using colored electrical effects for night advertising in which our system at night shows the inside of our plant in various appropriate colors, this item alone brings ice cream, whether it be Globe or some other brand, to the attention of the people on the street cars, the pedestrians, the people in automobiles, and constantly both day and night they are reminded of ice cream. We installed beautiful flower gardens in the front and on the side of our plant simply to attract the women, for we again realized that the women enjoy flowers and beautiful shrubbery.

Ice cream manufacturers in the United States today should immediately make plans to improve the inside and outside appearance of their factories, and this will have a tendency to increase ice cream sales. People will have confidence in that pure food product known as ice cream. Of course, manufacturers must realize the necessity of producing a good quality of ice cream, whether the butterfat be ten, twelve, fourteen, sixteen

Now Ready for Delivery-

The New *Ultra-Weld*

NO SOLDER-NO RIVETS-NO HOOPS

This newly developed ice cream can we are offering to those who prefer the solderless or welded type. The bottom is made an intregal part of the cylinder by a continuous electric weld; it cannot leak, become loose, or drop out. The side seam joint is a genuine electric arc-weld and is built up with steel to securely bind the cylinder edge together; also notice the triple folded, rounded, "crackless" Ultra top band and bead.

Our new Ultra-Weld is exactly the same as our regular Ultra, except it is welded throughout instead of soldered. By all means see the excellent Ultra cans before buying your requirements for next season.

CONTROL IN ICE CREAM SALESMANSHIP

THE developing of pride, loyalty and integrity among the men who do the selling work of the ice cream industry was urged in a speech before the New England convention in January on the subject of "Control in Selling." This subject, which has come in for little discussion at the ice cream conventions, was handled by the president of the Association of Ice Cream Supplymen, O. S. Jordan. Mr. Jordan introduced the question, "What is the training cost of a salesman?" One supply company selling to the ice cream industry, he said, spend between $15,000 to $20,000 at one time to bring its men in from the road and put them through classes in salesmanship. Other companies, he brought out, reckon the training cost of a worthwhile representative at $10,000—"in salary, time, blunders, etc."

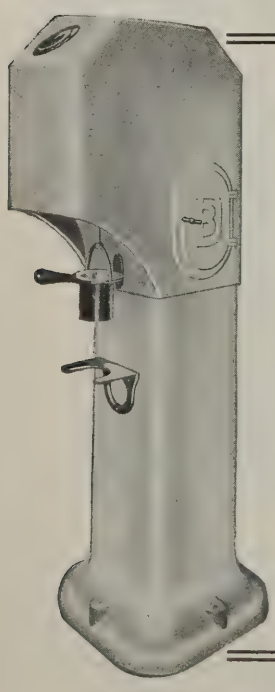
O. S. JORDAN.

After pointing out that the ice cream industry has parallel problems, the speaker launched forth upon a line of talk in which he brought out the value of character in merchandising. J. P. Morgan, for instance, believes that cash collateral in obtaining a loan is not so important as character.

Measures for relief from a slipshod merchandising practice involved in the ice cream industry today, as seen by the speaker are:

"Those of building up company and association esprit de corps and pride among sales representatives, of endeavoring to inculcate in them a never-sleeping sense of honor to the interests they represent, that will exercise itself in small as well as in larger things. A necessary part of this sort of effort lies in education. Not especially text-book education or the mechanical learning of facts, but education as to the broader bases of business, business practice and personal conduct in business.

"Many supply companies and ice cream companies do this intelligently and earnestly today. It will interest you that one of the points of investigation on which admission to The Association of Ice Cream Supply Men rests is the degree of effort and success that an applicant company exerts and enjoys in the control of its sales representatives. As a supplement to the individual work among their representatives of many of the companies in the association, the Salesmen's Club of the association works week-in and week-out every year to build up among all the sales representatives of member companies an understanding of business honor, of intelligent sales practices and dignity and decency in manner. Although the club's activities are under the general sponsorship of the association, it is actually directed by broad-minded, earnest salesmen themselves, who are proud of their vocation and seek to do it honor. And they do; and in passing I can do no better than to commend the efforts and the purposes of that club to the good wishes and the real support of every progressive man in the industry."



CREATING HUMAN INTEREST IN ICE CREAM THROUGH WOMEN.

(Continued from page 102)

or eighteen per cent butterfat, using good fruits and good flavors. It has been our experience that this grade of raw materials is cheaper in the long run.

Without throwing bouquets at ourselves, we would like to ask the question—"Why is it that the Globe Ice Cream Company of Los Angeles has created so much talk all over the United States?" Manufacturers come to visit us from all over the United States, and to our surprise, we have had many individuals who come to California as tourists go out of their way to come out and state that they have heard so much about Globe ice cream that they wanted to see the plant.

This article is in no way meant as a criticism. We have simply placed before you the true facts on which we have built up an elegant business, and which is increasing to our satisfaction day by day.

Sommers Ice Cream Over-run Tester

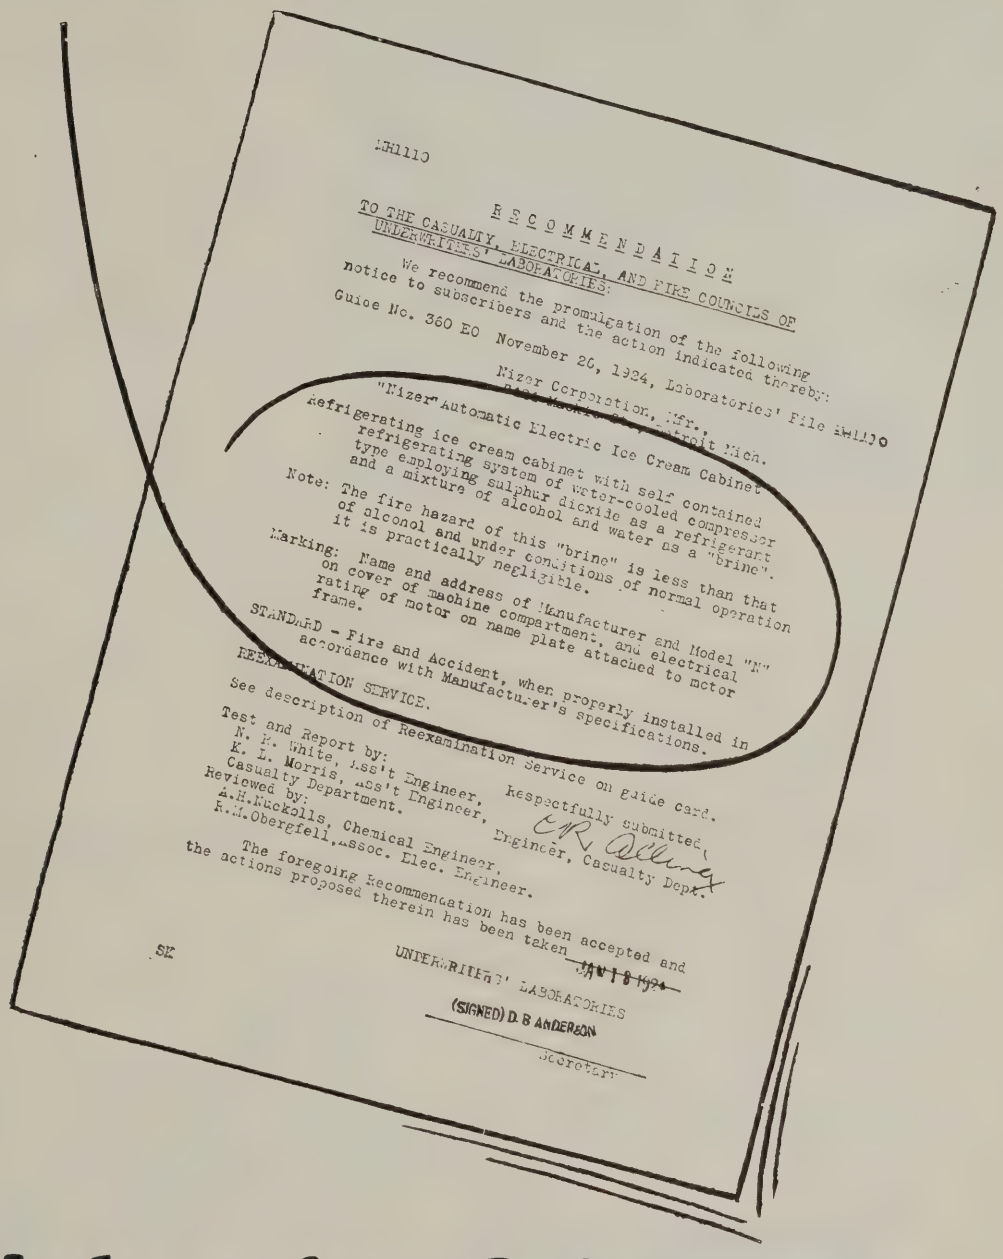
Simple in Construction—Quick Acting and Accurate

SMOOTH, SIMPLE CUP IS USED.

No loose weights or adjustment on Cup necessary.

Adjustments for variation in specific gravity of the mix are easily made on the Tester itself.

The Cup hanger is easily accessible.



The reading is always made at one place, right under your eye as you stand in front of the Tester and tilt your head slightly forward.

WHY DOESN'T THE ICE CREAM INDUSTRY CAPITALIZE ON POPULARITY OF DAIRY COW?

(Continued from page 13)

given much free publicity to milk. Since milk is the most important thing going into ice cream, this readily suggests that the industry can capitalize on the popularity milk already has won.

SO MUCH publicity has the milk industry achieved for itself, that we think it is worthwhile to publish in this connection, a letter from one of our correspondents who said that milk is mentioned in the Bible. This correspondent calls our attention to the following verses:

What Solomon Drank.

"I am come into my garden, my sister, my spouse: I have gathered my myrrh with my spice: I have eaten my honeycomb with my honey: **I have drunk my wine with my milk:** eat, O friends: drink, yea, drink abundantly, O beloved."

Verse I—Chapter 5—Book of Solomon's Songs.

* * *

What Isaiah Drank.

"Ho, everyone that thirsteth, come ye to the waters, and he that hath no money; come ye, buy, and eat: yea, come, **buy wine and milk without money** and without price."

Isaiah—Verse I—Chapter 55.

Another thought of the matter comes from C. H. Kimberly, dairy products laboratories, who said at the past New York State convention:

"With milk established as such a valuable food, it needs but little more to prove that ice cream, composed so largely as it is of milk products, is also a food."

ICE CREAM IN THE INVESTMENT MARKETS

The ice cream industry has broken into the investment markets. Trade observers recently were moved to get out some figures showing the remarkable expansion of its business.

The progress of the Chapin-Sacks Corporation, with a chain of 17 plants in the South was mentioned. It was shown that the average earnings of the Chapin-Sacks Corporation, available for depreciation, interest, taxes and dividends, for the past four years (1924 partly estimated) have been $588,982, or at the rate of $3.38 per share on the capital stock.

ICE CREAM MEN AID FARMERS.

Manufacture and sale of ice cream is not only profitable for those directly engaged in the business, but promotes permanent prosperity of the farmers by furnishing an outlet for farm products that take little fertility from the soil, Charles H. Allen of Defiance, president of the Farmers Sugar Company, told The Ohio Association of Ice Cream Manufacturers.

To cream, milk, eggs, sugar and corn starch, that compose ice cream, Mr. Alle nadded bacon, wool, and cotton as farm crops whose production should be stimulated because they do not rob the soil of its fertility. He contrasted these with wheat, which, he said, is always sold at a loss when the value of its mineral content is considered.

More Proven facts

Delivery costs on suburban routes cut with Dry-Zero 48 hour icing

Turn small profit suburban customers into regular profit ones by installing Dry-Zero cabinets. Instead of having your trucks make daily deliveries and daily icings, send them over suburban routes only once every other day. Changing from daily to every other day deliveries allows you to double the number of your drivers' routes, for there is no guesswork as to whether they can cover the ground when Dry-Zero cabinets are furnishing 48 hour icing. By doubling up you will need fewer drivers and trucks, less gas and oil, in fact less of everything which now makes it practically unprofitable for you to serve suburban customers.

Besides decreasing the number of your routes, your drivers can make more stops each route each day. Dry-Zero cabinets, while giving 48 hour icing, use 40 to 50% less ice and salt than any other cabinet on the market. Your drivers can serve more customers without increasing the amount of ice and salt carried by simply loading up with more cream.

Solve the problem of suburban deliveries by installing Dry-Zero cabinets. The decrease in cost will astound you. This is known to be absolutely true—it is not a mere matter of opinion. Big ice cream manufacturers, who tried out many different makes before standardizing upon Dry-Zero cabinets, have supplied us with information upon which we base proven facts. Before you even install Dry-Zero cabinets, you know definitely what they will do.

K-B ICE CREAM COMPANY

"THE PERFECT FOOD"

F. F. McClatchey Co.

QUALITY COUNTS

The Ashburn Creamery

Martin Ashburn, Proprietor

Denison, Texas

Sept. 22, 1924.

Mr. H.A. Benners,
New Orleans, La.

Dear Mr. Benners:

In reply to your communication of recent date we are pleased to state that the Dry-Zero ice cream cabinet which we purchased from you has given exceptional service at surprisingly low running costs.

We placed this seven compartment Dry-Zero cabinet in service about July 1st in our own plant. As you know we did. Install business as well as wholesale; and we have watched the performance of said cabinet very closely and we have watched the performance in doing all that you claimed for it. We are glad to admit that the cabinet has done everything that you claimed it would do.

We have sold as much as ninety gallons of ice cream in one day from ice alone mentioned cabinet in cases and pails and have had to re-ice only once each 48 hours. ice re-icing is done every other morning, and due to the construction of the cabinet it takes only seven gallon tubs of ice, about 180 pounds.

This cabinet keeps the cream in perfect condition and the saving on ice will pay for it in ONE season.

It is just as convenient as ice mechanically refrigerated cabinets and do not come in contact with the ice or brine and while we have never operated with the ice or brine the Dry-Zero is more economical to operate.

Wishing you unlimited success in selling these cabinets and assuring you that our next cabinets we buy will be Dry-Zero, we remain

Very truly yours,
F. F. McClatchey Co.

The Sugar Market

The Outlook for 1925

(From Facts About Sugar)

WITH current crops in almost all parts of the world showing a decided increase over last season, the world enters 1925 with the prospect that the available supply of sugar will be the largest in its history. An increase in production of 2,000,000 tons is more than international markets ever before have been called upon to absorb in a single year, but it represents no more than a normal increase in production as compared with the yearly rate of growth in effect before the war.

That the markets of the world are perfectly capable of absorbing this increase there is no reason to doubt. The only question as to which opinions may differ is the price at which demand can be expanded sufficiently to take up this increased supply. The process of absorption will be aided by the fact that invisible supplies all over the world are reduced to the smallest possible dimensions. The restoration of these stocks to normal proportion will use up a large part of the augmented supply.

Another factor that favors a record-breaking consumption during 1925 is the improvement in industrial conditions and the generally good outlook for business. In Europe the stimulus of better trade conditions is evidenced by the increasing rate of consumption since the beginning of the present crop year, distribution keeping pace fully with enlarged production. In the United States business authorities almost universally agree that the coming year will be marked by an expansion of business activity in virtually all lines. If this expectation is realized it will mean full employment of labor at high wages, a condition that is always reflected in a heavy demand for sugar. In far Eastern countries, where consumption is governed by price to a greater degree than elsewhere, the low values now established may be expected to lead to a marked expansion of demand in that quarter of the globe.

THE process of discounting the heavy production of the current year already has made noteworthy progress. At the close of 1924 raw sugar was selling in the New York market three-quarters of a cent a pound below the quotation prevailing a year earlier and about the same amount below the initial 1923 quotation, but it was still a full cent above the price at the beginning of 1922 when the carry-over of 1,200,000 tons of the previous Cuban crop acted as a powerful depressing influence in the early months of the season. While quotations on refined have not fully discounted the decline in raws, the adjustment of prices to the lower raw basis which is now under way should result in an active movement during the early months of the year in order to restore trade stocks to normal dimensions.

It is not to be expected that distributors or consumers will attempt to accumulate supplies in anticipation of future needs until an upturn of the price movement is clearly foreshadowed, but the satisfaction of current requirements and the replenishment of depleted stocks ought to result in a heavy movement on refined sugar during the early months of the year. With Cuban raw

sugar selling below three cents a pound other countries are showing an active interest in supplies from this source, and their purchases are likely to continue in good volume while values remain in their present latitudes.

AS a result of these conditions it is logical to expect that there will ensue a rapid shrinkage of the apparently large surplus now in sight, that may pave the way to an upturn in the market by May or June, particularly if conditions arise that cause the outturn of leading sugar producing countries to fall below early estimates, or which tend to limit the areas devoted to the following crop.

On the other hand, an interruption of the steady and even flow of sugar marketward, or a scramble for supplies such as occurred in the early months of 1923 and 1924, undoubtedly will put a sharp break on distribution, will cause dealers to adhere to the close buying policy they have followed for months past, and will bring on a recurrence of stagnation and declining values at the season when market activity normally should be at the maximum. For the welfare of all branches of the sugar trade it is especially important this season that nothing shall interfere with the smooth progress of production and movement of the crops.

With production large costs will be lower, and with low prices and an orderly marketing movement consumption will be heavy. Even though margins of profits may be somewhat narrower than heretofore, producers, refiners and distributors should find results at the end of the season fully as satisfactory as in the year just ended. Those who are pessimistic under present conditions fail to realize that the sugar industry is one in which rapid growth and a steady rise to a position of greater and more vividly recognized importance are normal expectations, and that recessions in the production or consumption are due to abnormal conditions of no more than temporary duration.

Writes Lamborn & Company, Inc., internationally known sugar brokers:

"The situation now facing us is briefly as follows: Production for 1925 is estimated at about 23,400,000 tons, an increase of around 3,000,000 tons, or roughly 13 per cent, over the previous campaign. Two million tons of this increase is in European production, and 400,650,000 tons represents the Cuban increase according to present forecasts.

"Closing prices for futures January 8th are: Jan., 2.77; March, 2.77; May, 2.90; July, 3.02; Sept., 3.14, Dec., 3.13. These prices to a certain extent have discounted the increased production, but as stocks of Cuban sugar mount prices will probably ease off to somewhat lower levels. Meanwhile the trade are buying as little sugar as possible, but when prices do reach a satisfactory basis, it is expected an enormous buying movement will result. It is readily believable that consumption during 1925 may absorb the entire increase in production, just as it absorbed the 1,200,000 ton carryover in Cuba in 1922, and the subsequent increase in world production in 1923 and 1924. According to records for a number of years back there is a normal annual increase in consumption caused not only by the increase in population but also by an increasing per capita consumption. The rate of this normal annual increase which was interrupted by the war, indicated that today, but for the war, the world might be consuming several million tons more than the present estimated production. Theoretically, therefore, the world's ability to consume sugars is still far ahead of production. Certainly under the influence of low prices, prosperous conditions in this country and improved conditions abroad, there will be a vastly greater demand for sugar this year. To cite one probability, there is Germany, where last year, due to the collapse of the monetary system, consumption dropped from 1,450,000 to 970,000 tons. This year consumption in that one country may be increased 500,000 tons.

"Then, too, low prices during the early part of the year will have a tendency to curtail sowings of sugar beets in Europe and America particularly, but to some extent cane also.

"We are of the opinion that some time during the forepart of 1925 sugar will be a most attractive purchase. Already speculative interest in subar is growing strong. It is expected that with wheat, corn, coffee and other foodstuffs which are marketed on exchanges, selling at such relatively high prices, traders will be switching operations from these markets to the sugar market. In fact we have already seen evidences of this.

"While present prices are the lowest since June, 1922, and in some cases below the cost of production, there is as yet no indication that the present decline has run its course. Nevertheless from now on the sugar market bears close watching."

Patented Jan. 21, 1923

What Do You Think The Ice Cream -:- -:- Business Is Going to do This Year?

Prosperity Gleams Ahead for our Business, Which is as Sound as the Packing Industry

*By R. C. MARINE**

YOU have all asked and been asked this question several times already. Yes, it is a stock question with many and although most trite remarks are dismissed with little consideration, I think this one deserves a little more than casual comment. So to conserve space and time, lets take for granted that the ifs and ands and qualifications hinging on the weather and general business conditions and the Republican party have all been disposed of and we are really considering what the outlook is for 1925.

R. C. MARINE.

From personal observation I have come to the unalterable conclusion that the ice cream business has reached a point of development and progressiveness that presages prosperity for those of its votaries who have withstood the gaff of the past few years and still remain steadfast to the principles of ethical competitive methods, and who display the faculty of good judgment in moving steadily ahead the tide of progress, instead of pausing to see what will happen next.

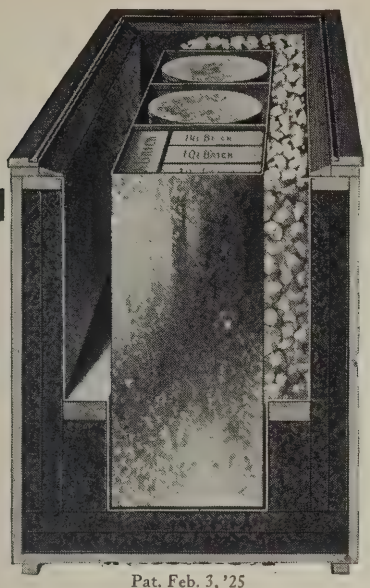
To succeed in the ice cream business of the future, requires vision. The day is past when a man can ride along on the rise and fall of everyday circumstances and rake in the kale. To be sure, there is still room in the front ranks for profitable service, but the fellow who figures he can keep the pace without working up perspiration is headed for a sad disillusionment.

Capital is being attracted to the ice cream business and to the allied industries, which serve it. Capital has always had its propensities for getting to the bottom of things and seeing that they are sound. To do that requires brains! Consequently, there has been an influx of scientific knowledge into this field, which has raised it to a higher plane than it ever would have attained without the contribution of the engineer's skill, the scientist's research and the economist's direction.

THE most obvious and gratifying indication of the effect these are having on the ice cream business is the increasing demand for the facts concerning everything that the ice cream manufacturer buys. Whether it be a product that goes into his product, or whether it be a machine which he uses in his manufacturing processes, or an article appropriated to the distribution of his product, invariably he must have the facts as to its worthiness. This is the primary consideration. The price is rapidly assuming only secondary importance.

More and more the ice cream manufacturer is reaching the viewpoint that unless the ingredients going into his product are pure and of the highest quality, he cannot afford to use them. He recognizes that unless the package he puts out is attractive, it will detract from the product within.

He is becoming convinced that the mere fact that his machinery is not worn out, is by no means reason to believe that it has not outlived its usefullness. For, unless it is efficiently performing the work it is intended for; unless it enables the ice cream maker to produce a better product; unless it lends itself to the maximum facility of plant operation; then it is indeed an expensive possession, for it frustrates the very purpose for which he is in business.



THERE are still a few who have rejected the most important inventions which have been introduced to the industry, as innovations unworthy of recog-

STOUT Brine Well

—the 48 Hour Service Cabinet

Test One

Alongside Any Other Cabinet
and You'll Adopt Them Regularly.

It Saves Money—Uses 30 to 50 percent less Ice and Salt —carry that much more "cream" on your trucks.

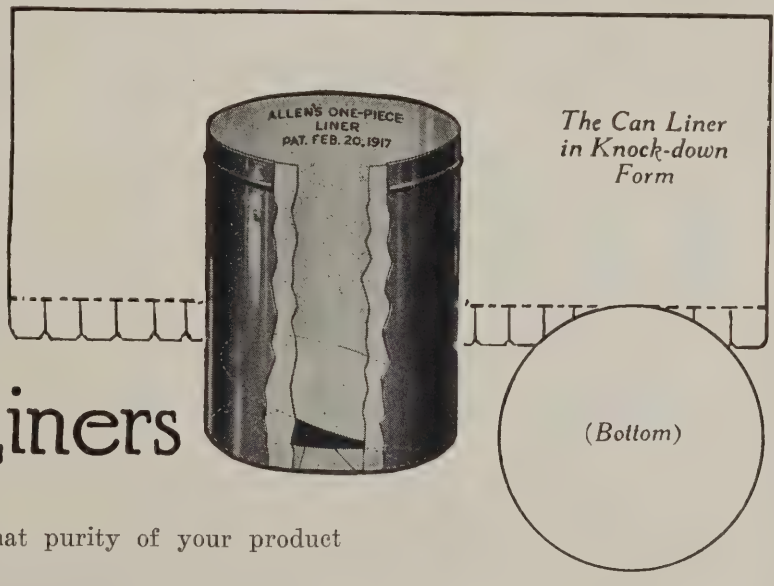
It holds the proper temperature, evenly

No brine comes in contact with the cans.

No sloppy dripping when removing them.

Holds either Bulk or Brick without changes.

Insulated with three to six inches cork board alternating with three layers of heavy asphaltum paper.



There is no question or guess-work about the 48 hours—numerous reports are coming in from users stating that this cabinet holds 72 hours.

Write for Fuller Details and Prices.

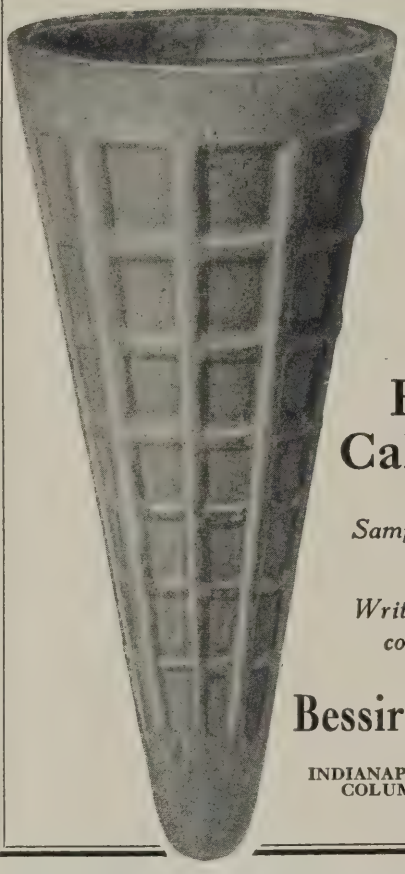
STOUT MFG. CO., 610 Sycamore St., MILWAUKEE, WIS.

Allen

One Piece Sanitary Can Liners

The Can Liner in Knock-down Form

The one means of preserving that purity of your product from freezer to consumer.



No matter what the condition of your can, the Allen Can Liner is 100% protection, and the use of Allen Can Liners is also practical. No trouble to insert in cans, and when removed your can is half cleaned. They save the hard scrubbing necessary to remove the "milk-stone."

MEMBER

nition. This disposition has been encouraged and in some instances fostered by selfish interests that would thwart the progress of the entire industry if they could, that they might continue reaping profits from the disposal of objects of antiquity. How ridiculous it seems to us today that there ever was such a thing as an execution for witchcraft, that bathing was once prohibited by law, that the steam boat was called "a work of the devil."

No doubt, some candle-makers said that the oil lamp would shorten human life. But some soon recognized that lamps were better than candles, so they got busy and went to manufacutring lamps. Not many years ago some thought that the increased consumption of natural gas was hastening the end of the world, for as they believed, the earth was filled inside with gas and as soon as it was exhausted it would fall ker-flop through space, like a punctured balloon.

Man's credulity is overcome by reason and experience. Yet some there be who fail to profit by it for the simple cause that they do not exercise the faculty of reason. The current of least resistance will always be filled with derelicts. Thanks to the very strenuousness of the ice cream business there are few of these sad objects to be encountered within the ranks. Its easier to sink than to swim, but not so pleasant. Get into the swim; it will do you good!

"WHAT do I think the ice cream business is going to do this year?" Why I know what it is going to do! It is going to reward those who use discretion and work hard. It is as fertile a field for human endeavor as any industry in the land. It is basically sound as the packing industry, agriculture, or the clothing industry. Ice cream is as essential to the happiness and health of us all as bread and butter, and is a great deal more pleasant to take.

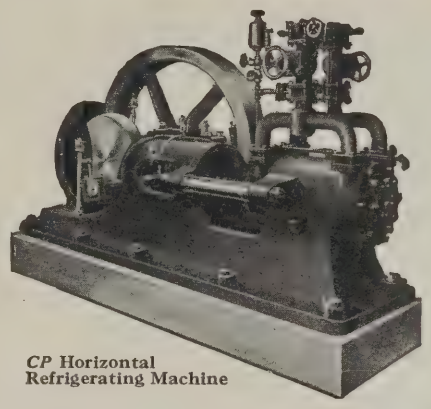
Why shouldn't the future be bright? Let each of us contribute the best that is in us to make it the foremost food of America and thus establish—"The Ice Creamic Empire in the Appetites of Our Fellowmen!"

NO ICE CREAM EATEN ON 300 DAYS.

I figured up the other day the amount of consumption of ice cream in this country within the past 12 months, taking the figures available so far as I have on the subject, and I found that during the past 12 months there was consumed in this country about 80 dishes of ice cream per person for the year. Thus, you see there were 285 days during the year in which ice cream was not tasted at all. That ought to be some inspiration to you! Nearly 300 days in the year when no ice cream was eaten by anybody and a little less than 80 days when each person had a dish of ice cream, or nearly one day out of five—about one day out of four and three-quarters.

We have plenty of evidence of the effect of intelligent co-operative advertising—From Illinois convention address by M. D. Munn.

THEATER NAMED FOR ICE CREAM MAN.



A California theater will be named for an ice cream manufacturer. This $600,000 structure is being erected at Fresno, Calif., which is the home of L. W. Wilson of the Benham Ice Cream Co., who with J. A. Benham, president of the company, are associated as the L. W. Wilson Co., Inc. The new theater will be named the Wilson Theater.

A *CP* Refrigerating Machine Which Has Been In Continuous Operation for 23 Years

For 23 years J. W. Beardsley's Sons of Newark, N. J., have been continuously operating a *CP* Horizontal Refrigerating Machine. Here is what they say about it:

"Certainly no machine could give better service and less trouble than this compressor has."

CP Refrigerating Machines are the heaviest machines on the market and every moving part is built over strong to withstand the severe work they are called upon year after year to perform. They can be supplied in all sizes in both horizontal and vertical types, either motor or belt drive.

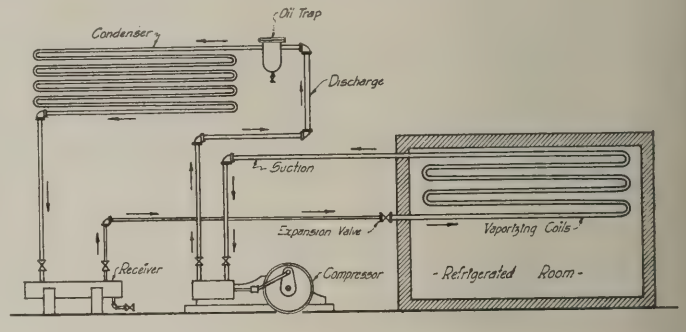
Dairy Refrigeration

The Compression System

By F. B. FULMER

MOST of the mechanical refrigeration is accomplished by what is known as the "compression system." In some special cases the "absorption system" may reach a higher degree of efficiency and this method will be considered later. In a general way, all of the refrigerating medias discussed have some points in common, hence the working cycle contains certain terms that apply to them all.

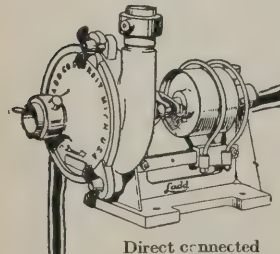


The first step in the cycle is starting with the media in a liquid form. The next stage is when the liquid passes from its first state into a vapor and it is during the second stage that heat is absorbed and carried away with the media when in this condition. As illustrated in the December issue of The Ice Cream Review, ammonia would perform its work when the vapor was permitted to escape into the atmosphere. This would apply to all medias used, but the cost of producing refrigeration would be prohibitive and it is to operate at the lowest possible cost that some form of a vapor pump is used to recover the vapor and changing it back into the liquid form to be used over again in innumerable successive cycles. The pump that is used for moving the vapor is usually called the compressor.

F. B. FULMER.

The compressor has two functions to perform, firstly the removing of the vapor from the coils where it is formed, so as to allow other media to be vaporized, and secondly, to compress the vapor to a dense state, under a high pressure, and force it to the part of the system where the heat is extracted, this being called the condenser, and when sufficient heat has been removed, the dense vapor is changed to a liquid. From this it will be observed that the compressor is the main power-consuming portion of the whole cycle and it is here that the principle operating cost is incurred.

The following schematic diagram will illustrate the essential parts of the refrigeration cycle:



Schematic Plan of a Compression System

AMMONIA has a great storage capacity for heat. This can be illustrated by a comparison with air. If air is used there would be a required change of temperature of 55 degrees F. per cubic foot, or 55 cubic feet raised one degree in temperature to acquire the heat equivalent of one B.T.U., while one cubic foot of ammonia has stored up in it as latent heat of vaporization approximately 20,000 B.T.U., which would be available without change of temperature during the evaporization process.

The returning vapor to the compressor has absorbed a considerable heat, which for practical purposes can be termed "low level" heat and the action of the compressor can be considered as lifting the heat to a "higher level," so it would be entirely proper to consider the compressor as a temperature pump. The compressor, then, should be designed, as nearly as practically possible, to draw into the cylinder at each stroke an amount of vapor equal to the piston displacement, and discharge all of this amount into the condenser with the least expenditure of power and at the pressure required for condensation.

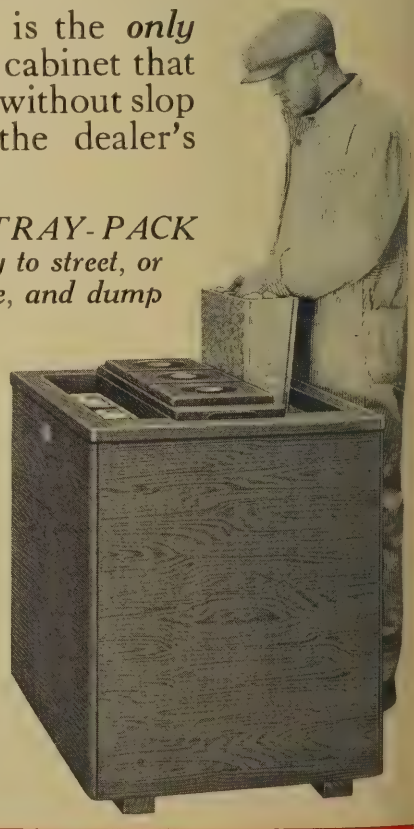
TRAY-PACK



The New, Safe, Reliable and Economical Method of Supplying Perfect Service to Your Customers

IN OUR entire experience, covering over a quarter of a century, we have never witnessed such enthusiasm for a new cabinet as is being shown on every hand for TRAY-PACK, *the 100% dry pack cabinet.*

To get an idea of the TRAY-PACK service method and its great potential value to your business you have to study the accompanying illustrations. Note:

TRAY-PACK is the *only* ice refrigerated cabinet that can be serviced without slop and muss in the dealer's store.

To SERVICE TRAY-PACK remove trays; carry to street, or other suitable place, and dump brine, repack at truck; replace trays — that's all.

The 100% Dry Pack Cabinet

(PATENT PENDING)

Consider what a big hit this feature alone will make with *your* trade. But remember that TRAY-PACK has a great number of other unequalled features that recommend it to your immediate consideration. A few of them follow:

1. **UNIFORMITY OF ICE CREAM TEMPERATURE** is maintained, varying less than 2° in 24 hours or less than 6° in 48 hours with **ONLY ONE ICING.**
2. **ICE CREAM TEMPERATURE** is practically uniform at both top and bottom of can. Thru our "**TRAY-PACK**" arrangement a closer degree of uniformity is maintained than in mechanically refrigerated cabinets.
3. **DRY COMPARTMENTS FOR ICE CREAM CANS**—more sanitary than old method—eliminate floating cans.
4. **ELIMINATION OF FAUCET** and its attendant troubles, including loss of refrigeration.
5. **INCREASED LIFE OF METAL LINING AND CANS**—ice and salt do not come in contact with them.
6. **NO LEAKAGE** thru lining in cabinet.
7. **INCREASED LIFE OF CABINET**—"**TRAY-PACK**" is the only iced cabinet not subject to the usual packing abuse.
8. **NO EXPOSURE OF ICE AND SALT** after trays are once placed in the cabinet.
9. **LESS SERVICE AND MAINTENANCE COST** as cabinet can be serviced in less time and with less wear and tear.
10. **SEDIMENT ACCUMULATION** in bottom of cabinet is done away with thru "**TRAY-PACK**" method.
11. "**TRAY-PACK**" **METHOD** keeps cabinets in a clean and sanitary condition at all times.

As orders are now being received from every section of the country it is important that you write at once for full particulars and prices.

Alert Officials Suppress Dangerous Ice Cream Bill

Effort to Raise Wisconsin Butterfat Standard to 15 Per Cent and to Eliminate Gelatine, is Thought to have been Repulsed in Wisconsin

STRIKING evidence of what can be done to protect the ice cream industry through concerted action was given by ice cream manufacturers of Wisconsin in February, when a committee of officers and directors of the Wisconsin Association of Ice Cream Manufacturers went before state officials and put forth sound arguments that very probably have put the "quietus" on a dangerous bill proposed for Wisconsin.

This bill, introduced by a Senator Schumann, proposed to eliminate gelatine from ice cream, and to raise the butterfat standard from 12 per cent to 15 per cent. Immediately after the introduction of this bill on February 6, President Kramer of the Wisconsin association wasted no time in rounding up his officers and directors to combat it.

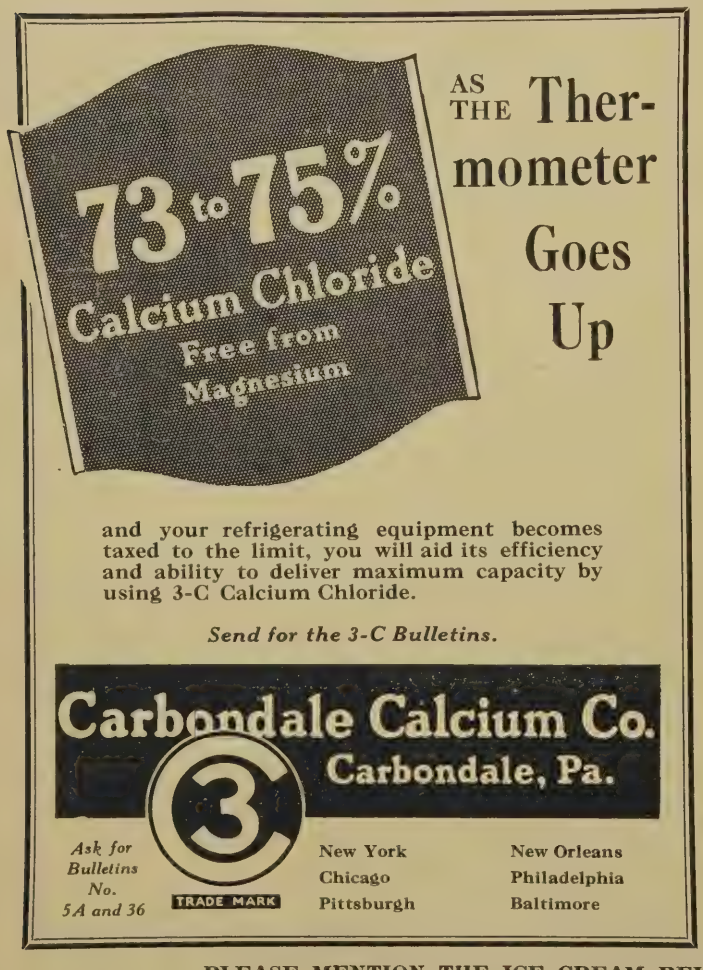
Ice cream men went before the legislative committee on February 18, and after presenting a mass of overwhelming arguments against the ridiculous provisions in this bill, it was the attitude of the committee that it was not necessary for the ice cream men to go any further into the matter. There is every reason to believe that the bill will die in the committee. The ice cream men rested their case on a brief drawn up by the editor of The Ice Cream Review, who formerly was dairy and food commissioner of Minnesota. The brief was presented by Secretary A. H. Graeszel.

In this brief the following reasons were set forth as to why the bill was wholly incapable of serving any useful purpose:

"First. The manufacture of ice cream containing fifteen per cent butterfat will unquestionably result in a decrease in the consumption of the product. We have only to refer to a report issued by the U. S. Department of Agriculture covering the year 1920. This report shows that more ice cream is produced and consumed in those states with a low fat standard (8 per cent fat) than in those states having a higher standard (10 to 12 per cent fat). Divided into two groups the report shows that for the year the average per capita consumption of ice cream was 2.35 pounds greater in the low fat standard group than in the other. No state in the Union has a fifteen per cent fat standard.

"Second. This bill, if enacted into law, would prohibit the use of gelatine in the manufacture of ice cream. Crippling the gelatine industry would react against the interests of the dairy farmer who now enjoys considerable revenue from the sale of veal calves. Gelatine used in the manufacture of ice cream is largely made from parts of the veal calf that would otherwise find no market. One of the largest gelatine factories in the world is located in Wisconsin.

"Third. The dairy farmer profits by an active market for his products. Cripple the great ice cream industry of Wisconsin and you not only deprive him of a market for his cream for ice cream making purposes, but you also reduce the demand for other dairy products by a decreased ability to purchase."



IT WAS further pointed out that the consumer of ice cream would suffer along with everybody else. It was shown that ice cream under such conditions as this bill proposed would make it possible for only the very wealthy to have ice cream, it being brought out that—

"If it were possible successfully to merchandise a commercial ice cream made according to the provisions of this bill, which it is not, ice cream would inevitably become the luxurious dish of the rich instead of the food of the masses. Besides denying the child of the poor man his ice cream cone, such a law would keep this delightful pure food product out of reach of the poor man for his Sunday dinner.

The paper then went on to show that forty-one states in the Union have set butterfat standards. Of these states, sixteen recognize an eight per cent standard. In regard to gelatine, this paper, which was filed with the legislative committee, said:

"To require such a high standard of butterfat for ice cream would be bad enough even if that were the only proposed amendment to the present law. The resulting product would be too rich in fat for the average person to eat. But this bill would also prohibit the use of gelatine, and ice cream made without it, containing such a high percentage of butterfat, could not be successfully merchandised."

"Gelatine has been used in the manufacture of ice cream for more than 40 years. Five million pounds of gelatine are consumed annually by the ice cream industry. Gelatine is a wholesome food. It is generally known that soup is most nourishing when made from bone stock. Gelatine is the pure protein-complex prepared from selecting white connective tissue in skin and bone of food animals by careful processes of liming, washing, extracting with water, filtering and drying."

The oldest electric truck in active service in Chicago is being operated by The International Dairy Co. It was bought in 1909—14 years ago—and has been in continuous service every day since.

Few persons are aware that the importance of gelatine was officially recognized by France as early as 1802, when a "Gelatine Commission" was created.

ALABAMA ASSOCIATION USES SLOGAN DESIGN.

The Alabama Association of Ice Cream Manufacturers is making use of the national ice cream slogan in a unique way. This slogan design, bearing the words in the circle, "Serve It—and You Please All," is used on

the letterhead, the inside of the circle bearing the name of the association.

J. P. Bethea of Mobile is president of the association, which recently held its third annual convention. J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers, also is secretary of the Alabama association.

SLIPPERY GROUND.

Any man who does not conduct his business at a profit ought not to be in the business, because he is not only a failure himself but he is a menace to other men in the same kind of business, as he not only prevents them from making a profit but actually puts their investment in jeopardy, and, wherever you find one line of industry in a crippled condition, it cannot be other than demoralizing for the entire community.

It is estimated that 90 per cent of those who engage in business ultimately fail, and it is further estimated that 75 per cent of these failures is caused by not knowing the manufacturing costs. If the ice cream industry is not included then it must be that the selling price is their salvation. If this is the case what will you do should the spread between cost and selling price be cut down, and as competition grows keener this very thing is bound to happen.

It is almost an admitted fact that the selling price of ice cream is not within the control of the manufacturer, and it goes without saying that the cost of material and labor is regulated by the law of supply and demand, hence the manufacturer has little to say as to what those two items of cost shall be. Now, if the manufacturer cannot control the selling price of his ice cream, nor the cost of his material and labor, then there is only one division of his costs that he can control, namely, the operating or overhead expenses, and he most certainly can control this group of expenses in a hundred different ways, but he can only do it when he knows what these costs are.

If, therefore, it is granted what has been stated above is true, there must be some kind of a cost system that will reveal these costs. The manufacturer who sells ice cream independent of cost is treading on slippery ground, and, if the selling price is less than cost, the day of reckoning lies before him.—From California and Pacific Convention address by Edward A. Burt.

The Ohio Association of Ice Cream Manufacturers will contribute $75,000 of its share of the $500,000 advertising campaign's fund for the national advertising committee.

Sanitary Ice Cream Truck

The Sanitary Ice Cream Truck facilitates handling cream from freezers to hardening room.

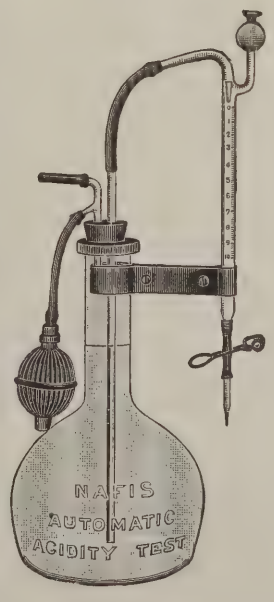
Will handle any size can in common usage. Avoids accidents in handling, as the operator does not touch the cans until he reaches the hardening rooms.

One man with truck will handle the cream from the freezers as fast as it will flow, no helper being necessary.

Substantially built to stand usage, nothing to get out of order. Can container revolves on a thrust roller bearing and is easily turned.

Style	Diameter	Capacity	Freezer Opening	F.O.B. Price
A	28½ in.	6 cans	30 in.	$50.00
B	23 in.	4 cans	24 in.	45.00
C	34 in.	8 cans	36 in.	62.50
D	40 in.	10 cans	42 in.	75.00

Two or three can containers, placed so that two or three freezers can discharge at one time, can be mounted on one truck, increasing capacity, making lesa trips to the hardening room necessary. Prices for these special trucks made on application, specifications required.



One regular size truck will be shipped, acceptance on approval.

Ask the Men Who Use It

DAIRY REFRIGERATION.

(Continued from page 116)

Ammonia compressors are, as a rule, divided into two types, the horizontal double acting and the vertical single acting. The choice of type depends upon the available space, the amount of work to perform, the class of work, and other local details. The single acting compressor is generally considered more efficient than a double acting one, and for installations requiring not over 50 tons of refrigeration effect the single acting machine is usually chosen. With the exception of very small machines, the verticle single acting compressors are manufactured with two cylinders and there is a similarity of design in practically all of the various machines made.

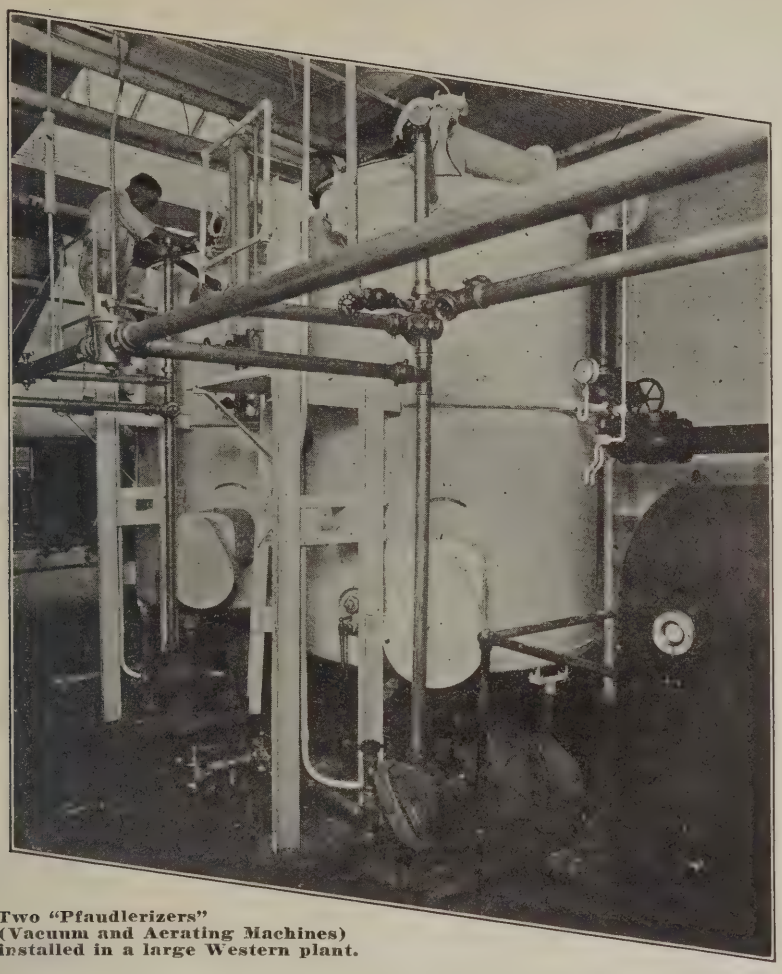
28. Compressor spring
29. Discharge valve
30. Discharge valve keeper.
31. Cover plates
32. Water jacket
33. Cover plate studs
34. High pressure relief valve

The following illustration shows a two-cylinder, single acting ammonia compressor in sectional detail and is fairly representative of all makes of this type.

As will be noted, with the enclosed crankcase, the crankshaft and connecting rod bearings run in an oil bath, and the action of the cranks as they dip into the oil when the compressor is in operation causes a "splashing" of the oil, so that all moving parts receive their lubrication from the "splash system." With some makes of compressors there is a forced feed oiling system, which is usually accomplished by a small pump driven by a belt from the crankshaft.

ANOTHER important matter is the "high pressure relief valve." This is connected so that a pressure above 250 pounds on the discharge side is by-passed back to the suction side and gives relief against undue pressure being built up on the compressor side. This matter is sanctioned by good engineering practice and is fast becoming a part of the "safety code" adopted by state and municipal governments.

Nearly all of the different makes of compressors of the verticle, single acting type have the suction valves in the pistons, the ammonia vapor flowing to the enclosed crankcase and the compressor cylinder is filled during the downward stroke. The horizontal, double acting compressors have a suction and a discharge valve at each end of the cylinder.



There are several factors which contribute to the efficiency of the ammonia compressor, and these will be considered in detail under the subject of "operation."

MICHIGAN SHORT COURSE.

The Michigan short course in ice cream will open March 3 to 14, it was announced by Prof. P. S. Lucas.

In the opinion of R. M. Washburn, formerly dairy and food commissioner of Missouri and dairy instructor in different leading universities, a standard of 8 per cent is sufficient for all useful purposes, and he brands a fat content as only a "national waste."

How Luick Made Suburban Trucking Pay

Profits Depend on Whether the Manufacturer Goes After Suburban Business That Pays or Just to Get Somebody Else's Business. There is a Difference As You Will See by Reading On

SUBURBAN trucking is a matter of great interest among ice cream manufacturers the country over. Those interested in this phase of the business were told by William F. Luick, one of the principal speakers at the past national convention, that the first step necessary is "to get paid for it." His success in carrying out that thought is the feature of his most interesting experiences with suburban trucking.

WILLIAM F. LUICK.

Mr. Luick told how he did not wish to go into this kind of business when his lieutenants urged it upon him. This speaker, whose Milwaukee plant is one of the most up-to-date in the country, explained his reason for first turning down the project of suburban trucking by stating that he figured the cost of putting a $6,000 truck in operation in the hands of an employee costing about $200.00, and estimated something for wear and tear. It seemed his lieutenants did not like the idea of this business on the outskirts of their territory falling into the hands of others when they felt they should be going out after it themselves.

The following interesting conversation along this line took place, using the words of Mr. Luick at the convention:

"When I finally did take up the subject of suburban trucking with my lieutenants, I told them that the first thing necessary was to get paid for it. Well, you know, that just threw everything into a conniption fit, because—PAID for it? They couldn't quite get that. I wanted to get paid for that trucking from Milwaukee to Racine and Kenosha and Oconomowoc. Why, one of them, the man at the head of the delivery department, said, 'You have got to deliver at the same price that you do in Milwaukee.' I said, 'All right, then, we will not do any suburban trucking; that settles that.'

"So they started again. They said, 'Well, what do you want to do?'

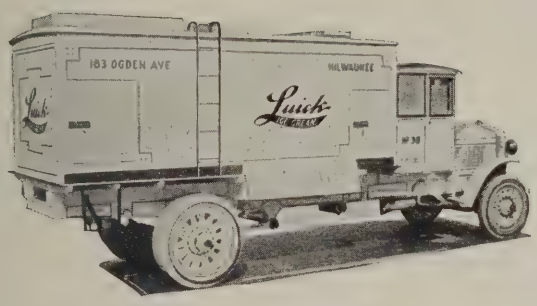
" 'Why, I want the difference between Milwaukee and Racine and Oconomowoc.' 'Now,' I said, 'Boys, I will tell you. You cannot expect me to look my Milwaukee dealers in the face, who have supported me and given us this volume of business, and helped me build this business, and tell them that I am going to charge the fellow that is six blocks from the plant the same price that I am going to charge the fellows that are sixty miles from the plant. That is not honest, and I am not going to do it. You can do suburban trucking with me only on one basis. If you can show me where we are going to get paid for that trucking.'

" 'Well,' one of my men said, 'You might as well drop the subject.' "

" 'Why,' I said, 'No. You go out and talk to these fellows and tell them that we have got to charge an advance of ten cents a gallon over the Milwaukee price for trucking to beyond our certain zone, which I placed at a little bit beyond our city limits.' Well, I would say I placed it at about in some cases about five miles beyond our city limits, and in some cases only a few miles.

" 'Well,' he said, 'Mr. Luick, I am afraid we cannot do anything if you are going to charge them more money, because they are used to getting it at the regular Milwaukee price, and there is no use doing anything about that.' "

"So I said, 'I will go out and talk to a few of these fellows myself.' The next day I went out and I went to the nearest town and took the biggest dealers there, the fellows who had been used to getting the ice cream and having it shipped, and I put the problem straight, flat before them here: 'We can truck to you, we can take care of your cabinets, we can deliver ice cream to you right to your door, and we can put it into your cabinet, but we have got to charge you more money than we do when we deliver it in Milwaukee, within a mile or two of the plants, as compared with trucking it out here, because it costs money for trucks, men, labor and shrinkage on ice, etc., and it must be paid for.'



"I had no trouble at all. I lined up everybody in that town that we had any dealings with in one afternoon, and

Increase Your Business in 1925

By Judicious Advertising

Resolve now to go after business aggressively during 1925. You can use the magical power of advertising to build your business just as successfully as Wrigley of chewing gum fame, Gillette of the safety razor or Ingersoll of the dollar watch. Let the public know early and often that you can serve them well and that you want their business and your reward is certain.

Send today for a copy of "The Sale and Advertising of Dairy Products." It will tell you how to plan an advertising campaign that is within your means and it will show you how to conduct it every step of the way.

This book contains hundreds of sales creating ideas that are carefully explained—any of which are worth several times the cost of the book. In addition it has scores of charts and illustrations which explain the subject matter with crystal clearness.

"The Sale and Advertising of Dairy Products" consists of over 100 pages, is abundantly illustrated with reproductions of actual ads and is well bound in blue cloth, lettered in gold.

It contains chapters on Milk, Ice Cream, Butter, Cheese and Dairy Farm advertising. It has become by far the best seller among dairy books. Send for your copy today.

W. W. CASSELL

VINCENNES INDIANA

I came back and made my report to the rest of the boys that day, and that settled it. They gained courage and went out and got straightened out in the matter, and today we are running seven trucks."

ALL of this has taken place in the last year or so, this being the Luick company's third year running suburban trucks. It will be readily understood that the company went into this business, first of all, to make suburban trucking pay, and did not go after the matter on a competitive basis.

"We were not trying to get the other fellow's business," Mr. Luick said, "but we are getting right back to the old principle, and that is the thing, the principle of what it costs you to make the product at a normal profit above your cost."

An idea of what the company calls suburban trucking that pays was given in the information that last summer Luicks operated seve ntrucks. These were genuine suburban trucks, operating outside of the city of Milwaukee. One of the trucks operated only two months. The record of the other six trucks per month's sales was given by Mr. Luick as follows:

Truck No. 3— 6,862 gallons.
Truck No. 4— 7,200 gallons.
Truck No. 5—10,100 gallons.
Truck No. 6— 8,600 gallons.
Truck No. 7—14,800 gallons.
Truck No. 8—14,945 gallons, "in other words 15,000 gallons. That was their average delivery per month."

In discussing this feature, Mr. Luick said:

"Now, when you compare that with some of the figures that I have seen quoted here of delivering 20 or 30 gallons a day, or 15 gallon, as I remember in one case, with a small truck, a Ford, that is quite a different story. You cannot make suburban trucking pay unless you can get volume enough for the truck so that your gallonage will subdivide the expense to such a point that your cost of delivery suburbanly will be not any greater than the additional money you can get, and in our case we found that we could get ten cents additional cost, or a ten cents additional price I meant to say, and we found that we could, by trucking under these conditions, make it pay.

"To show you how quickly your cost of suburban delivery changes with your gallonage, here is one. Truck No. 7 with an average, the mileage per day was 50, the average monthly —this goes over a year's time—the average monthly delivery was 1,810 gallons, and the cost of delivery of that truck was 28.8 cents; whereas, Truck No. 8 with a gallonage delivery of 3,403 gallons, immediately reduced the cost per gallon delivery to 16.8. So there was a difference of 8 cents a gallon between the same trucks."

At this juncture there developed an interesting discussion, which is quoted from the record of the convention as follows:

Mr. Cunningham: The same mileage?

"Mr. Luick: No. Truck No. 8 went farther than the one that had the higher cost. Truck No. 8 with a mileage of 72 miles per day, showed a lower delivery cost by eight cents a gallon against the other truck, although the increase in sales was only from 1,800 to 3,400 gallons, nearly double.

"Question: How much truck depreciation did you charge on that?

"Mr. Luick: This does not take depreciation into consideration. I had my accountant get this up on the basis of miles truck operated per day, and the cost of operation is based on driver's cost, gasoline and oil, maintenance,—yes, that takes in depreciation, excuse me,—maintenance in our case covers depreciation and insurance and all those items and also ice and salt. It covers, but I cannot give you the figures that we used on depreciation, because it is covered under a total item here of 7.1 cents per gallon, so I cannot give you the amount of depreciation figured.

"Question: What size trucks are those?

"Mr. Luick: All of these trucks are 3 and one-half ton trucks. Now, there is no sense—a man costs you about the same amount per month, whether you send him out with a little Ford or a one-ton truck—that carries only a few gallons, or whether you send him out—it will probably cost you a shade more, but not much—or whether you have a

Ice Cream Men

You Can Have Perfect Control of Your Mix

With the
Jensen Revolving Vertical Coil Batch Mixer

The Ice Cream Manufacturer wants a mix of **uniform flavor.** In order to maintain uniformity of flavor the mix must contain the smallest amount of air, particularly during pasteurization, homogenizing and aging.

Air, which causes **FOAM,** if not eliminated from the mix during the pasteurizing and aging period, results in the finished product having what is recognized as an oxidized, metallic or bitter flavor.

The Revolving Vertical Coil Batch Mixer furnishes the Ice Cream Manufacturer a process by which he is able to overcome these most objectionable evils.

The Revolving Vertical coil always revolving upwards, works the air and gas out of the mix. This coil being equipped with blades located at the extreme bottom furnishes the maximum agitating and mixing effect at the bottom of the vat where the sugar and heavy materials tend to settle.

Positive forced circulation of heating medium assures the greatest efficiency in heating, and eliminates any possibility of burning the mix and producing a cooked flavor.

Stuffing Boxes are entirely eliminated, therefore no grease or other contaminating verdigris can seep into the mix during the pasteurizing and aging periods.

Square construction requires one-half usual floor space.

Operating power reduced one-half.

man capable of handling a three-and-a-half-ton truck and taking care of business during the hot weather. These figures that I read off to you of Truck No. 7 that cost an average of 24.9 cents, truck No. 8, that costs an average of 16.8 cents, are based on all year 'round delivery, not on a three months basis, so it takes into consideration the winter months. And these trucks operated all last winter, the winter months when the sales were comparatively light, you can figure that, and we made these calls every day. So you must remember that in considering this gallonage I am reading here, it is for 12 months' delivery. So you see that I can't give you an answer on the subject of whether suburban delivery pays. I can only tell you this, that suburban delivery, operated as we operate it, with trucks of three and one-half ton size, with gallonage enough so that the smallest amount of delivery by one truck was 6,862 gallons in one month during the three summer months, and the largest amount was nearly 15,000 gallons. Under those circumstances our cost accounting system shows us that these trucks did pay, and, strange to say, in keeping an accurate record of the actual cost of maintenance, and, in fact, all costs, on these trucks, we found that at the end of the year our ten cent extra charge that we made for that delivery just exactly, within a very small fraction of a cent, covered our actual cost of making that delivery, averaged for all of these trucks.

"Now I am not going to keep you any longer, because I don't know as I can give you any further information on the subject, but if anybody wants to ask any questions, I will be glad to answer them.

"Question: Might I inquire on the gallonage figures, what term does that cover, how many months?

"Mr. Luick: I will give you that gallonage figure.. Here is the gallonage figure covering a three month's period. This is the three summer months' period of this year, and in this case the lowest amount that any one of these trucks sold was practically,—I will give you this in round figures,—practically 7,000 gallons in the month, and the highest amount that any of these trucks sold was 15,000 gallons in the month. That is the minimum and the maximum, covering a three months' summer period.

"Now, when we get down to this other scale that I have here, here is the scale covering the entire 12 months' period of 1923 and that shows a minimum sales covering 12 months of 1,810 gallons per month, with a maximum sales covering the 12 months of 2,403 gallons. That explains, I think.

"Mr. Cunningham: Do you mean to say that you have sold that in Kenosha and Racine?"

"Mr. Luick: Right in your neighborhood. I suppose we will have John Knobbe and Cunningham up there with trucks next spring. (Laughter.)

"Mr. Cunningham: I don't believe he is entitled to that dime, John.

"Mr. Knobbe: Racine and Kenosha are large cities, and they are suburbs of your city, are they not? We make city delivery out fifteen miles. (Laughter and Applause."

S. N. SUTTON, Pres.,
Southern Association.

THEY WILL WORK TOGETHER

for the success of the 1925 Southern convention at Lexington next December, toward which an early start has been made. Kentucky has pledged full support, and Mr. Sutton has promised that a record number of delegates will accept Blue Grass hospitality.

Although Mr. Cuscaden may give up the presidency of his association this month, he is sure to give full co-operation to Southern association officers.

HARRY A. CUSCADEN, Pres.,
Dairy Products Ass'n of Kentucky.

Full Support to 1925 Southern Convention Pledged -:- -:- by Kentucky Dairy Manufacturers

Meeting of Southern Association at Lexington Next December Discussed by Secretary Clopton at Annual Kentucky Convention

SOME advance thoughts on the 1925 annual convention of the Southern Association of Ice Cream Manufacturers to be held at Lexington next December, were dropped by J. W. Clopton, secretary of the Southern association, at the annual convention of the Dairy Products Association of Kentucky, held at Lexington a few weeks ago. The convention further revealed that the Dairy Products Association of Kentucky will take an important part in the Southern meeting next fall.

A resolution pledging its whole support to the 1925 Southern convention "to make it an important educational and long-talked-of social event," was adopted.

Near zero temperatures and the heaviest snow in four years did not quell the interest of fifty manufacturers and supplymen who attended the general meeting of the dairy products association, which was held at the Phoenix Hotel in Lexington, January 29. This meeting was held in conjunction with the "farm and home" convention of the college of agriculture.

The president of the association, Harry A. Cuscaden, widely known in Southern organization circles, started the program promptly at twelve-thirty, and proceeded with such business-like precision as to give a pronounced zest to the occasion.

AFTER the luncheon, H. C. Horneman, president of the American Association of Creamery Butter Manufacturers outlined the advantages to be expected from the national campaign to advertise butter, and pointed out the important factors of the present butter situation.

J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers, made a short address on the plans and great good to come from the convention of his association to convene in Lexington, December 1, 2, 3 and 4, 1925. His speech was followed by the adoption of a resolution pledging full support from Kentucky dairy interests.

Prof. J. J. Hooper commended the interest manifested by the dairy products manufacturers, in the "farm and home" convention of the college of agriculture and the rapid advance of dairy interests in Kentucky. He urged, as necessary to show the growth of the industry, the compilation of statistical information as to the amounts of dairy products manufactured from the raw material produced in Kentucky. A questionnaire is being arranged by Professor Hooper and his assistants to send to the members of this association who have agreed to so co-operate. H. W. Schearce, secretary of the Kentucky Live Stock Improvement Association, told of the work of his organization to develop dairying and stated it had placed during the past year, between 80 and 100 purebred dairy bull calves, the majority of them Jerseys, on farms where a purebred dairy sire had never been owned.

AT THE divisional meetings many questions of trade ethics, transportation problems and equipment topics peculiar to each branch of the industry were threshed out. Three hundred plates were spread for the "farm and home" convention banquet at 6:30 p. m. The menu was a tribute to the taste of the banquet committee, as well as the entertainment, a testimony to the ability of the students by whom the unique program was furnished.

The annual meeting and election of officers to the Dairy Products Association will be held Wednesday, March 11, at the Brown Hotel, Louisville, Ky.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

NEIL MORTENSEN,
Past President, Dixie Flyers.

RECORD CONVENTIONS AND BETTER BUSINESS for the ice cream industry is the way J: W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers, views the outlook at the opening of the 1925 "season." He is pleased with results of Southern conventions held the past winter and believes better understanding will result in advanced business conditions. Arrangements have been made for Mr. Clopton to act as clearing house for state associations selecting dates for 1925-26 conventions to avoid conflicts. He already has visited Kentucky and been given assurance of heartiest co-operation in connection with the 1925 Southern convention.

J. W. CLOPTON, Sec'y.,
Southern Association.

Lexington is Ideal City for Great Southern Convention

Hotels Are Chosen for Ice Cream Manufacturers and Supply Men As Advance Preparations Take Shape

*By CARLTON BALL**

A MORE attractive Southern city than Lexington could not have been chosen by the Southern Association of Ice Cream Manufacturers for its 13th annual convention December 1, 2, 3 and 4, 1925.

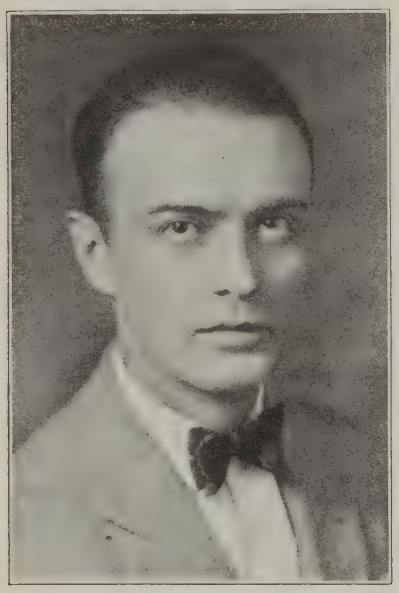
Lexington has a population of approximately 50,000, and is a pivot around which numerous historic events of national magniture have occurred. The scenic beauty of the adjacent country is unsurpassed. It is a Mecca of regional and nation-wide educational expansion. It is pre-eminent as a nucleus from which a systematic development of highways and transportation lines has evolved. All these advantages add toward making Lexington an ideal convention preference.

Lexington has had the singular privilege of acting as host to visitors from all parts of the world who have come to worship at the equestrian shrine, and to attend its growing register of conventions. This city has accordingly developed adequate accommodations for the comfort and cheer of its guests.

Phoenix Hotel, Lexington, which will be headquarters for Southern Association of Ice Cream Manufacturers next December.

THE Phoenix Hotel is a modern hostelry of 400 rooms with luxurious equipment, which will be used as convention headquarters for the ice cream manufacturers. The Lafayette Hotel is a recent structure of 300 rooms with sumptuous accommodations, where the Dixie Flyers will make their headquarters, and adjoining which is the space under option for the exhibits. These two hotels are separated by less than a block on which stands the Union Station.

At a recent general meeting of the Dairy Products Association of Kentucky, a resolution was passed authorizing that all possible assistance should be given to the local committee on arrangements, which in addition to the proffers of aid from the Blue Glass Dairy Club and the Lexington Chamber of Commerce, forecasts the greatest convention that the Southern Association of Ice Cream Manufacturers has ever held.



*General secretary, The Dairy Products Association of Kentucky.

TOMPKINS LEAVES THE CREAMERY PACKAGE.

Effective Feb. 1, Clyde Tompkins resigned as advertising manager of The Creamery Package Mfg. Company to join the Hertz-Hadley Direct Advertising Co. of Chicago, as vice-president.

Mr. Tompkins was also at one time with The Chicago Pneumatice Tool Co. and Montgomery-Ward & Co. He has been active in the affairs of The National Dairy Association, having been a member of the publicity committee for many years. He is the originator of the slogen, "Prosperity Follows the Dairy Cow." He is also known to many as the author of the first book ever written on the merchandising of dairy goods which bears the title, "The Sale and Advertising of Dairy Products."

Mr. Tompkins has a host of friends in the dairy industry who will join us in wishing him abundant success in his new work.

ICE CREAM INDUSTRY'S COMPOSER.

The ice cream industry has its own composer. This role is upheld by Fred E. Hollweg, vice-president of the Thos. W. Dunn Co., New York City. Several months ago, when the J. M. Horton Co. gave a ball in its ice cream plant, and wanted a special march for that ball, Mr. Hollweg was called upon to produce. He wrote a march particularly for that occa-occasion, this march being entitled, "The J. M. Horton Co. Ball."

FRED E. HOLLWEG.

A recent song producduction at the hands of Mr. Hollweg is entitled, "Marguerite, Stop Fooling Me." It is published by Edward Schubert & Company.

The Salesmen's Club of the Association of Ice Cream Supply Men has announced its plans to do its own entertaining at future ice cream conventions in which this body participates. It seems that there will be little difficulty in finding material for this sort of business as the membership of the supply body boasts of considerable talent of this kind.

H. P. JACOBSEN.

Announcement has been made that H. P. Jacobsen, formerly representing the Solar-Sturges Company on the Pacific Coast, has retired from his territory to be connected with the staff of the Lee - Greefkens Co., Inc., San Francisco. Mr. Jacobsen, who was president of the Supply Men of the Pacific Ice Cream Industry last year, becomes manager of the Lee - Greefkens Co., having assumed these duties on January 1. The Solar-Sturges Co. has closed its offices in San Francisco, according to announcement. Mr. Jacobsen for a long time has been popular among ice cream manufacturers of the Coast territory.

* * *

GODFREY AGAIN IN CHARGE OF CP ADVERTISING.

After several years in other departments, J. H. Godfrey is again in charge of advertising at the Creamery Package Mfg. Company main office at Chicago. Some twenty-one years ago Mr. Godfrey went down to Chicago from the University of Wisconsin to take on the advertising and catalogue work for the company. Prior to that time advertising copy for trade papers, of which there were less than a half dozen in all dairy lines, was written by the man who didn't have an alibi when press day came around.

Godfrey's work then was to handle and systematize the advertising. His advertising experience was zero, but, having been a practical buttermaker as well as student and instructor under Prof. Farrington, he knew the creamerymen's language and the product he was talking about.

Now, after seven years in sales work, he again takes the publicity reins, equipped, he says, to render better service to his company and the dairy industry in general. His work will not only have to do with the advertising of the company and its products, but he is in charge of the research work which is being developed along various lines by the company.

NEW JAMISON ICE CREAM CABINET.

A new ice cream cabinet which is claimed to be much different in construction from any other on the market has recently been announced by the Jamison Cold Storage Door Co., Hagerstown, Md., makers of cold storage and freezer doors bearing that name.

According to J. V. Jamison, Jr., president of the company, the decision to enter the ice cream cabinet field some months ago was entirely the result of an opportunity to secure patent rights upon a cabinet previously constructed and used for over two years by a large and well known ice cream manufacturer and designed by one of his engineers.

This cabinet, now manufactured and sold under the name of the Jamison ice cream cabinet, differs from other cabinets in that the ice and salt chamber which contains the cylinders extends to only one-half the depth of the cylinders them-

"They Keep a-Running"

BEARINGS of Highest Grade Cast Phosphor Bronze

The bearings in Century Repulsion Start Induction Motors are made from the highest grade cast phosphor bronze bearing metal that can be obtained. They are cast from metal heated in electric furnaces in the Century plant — the composition of each individual heat being exactly determined. They are then accurately machined on all dimensions and provided with machine cut figure-8 oil grooves, which insure a thorough distribution of oil throughout the entire length of the bearing. Lateral shifting is prevented by a heavy shoulder on one end of the bearing—built with liberal dimensions, they withstand the pounding of gear drive and pressures from unintentionally heavy belt tension.

These are just a few of the reasons why many Century Motor owners report continuous service for 20 years without a single bearing replacement.

Built in all standard sizes from ⅛ to 40 h. p. — temperature rise not more than 40 centigrade.

selves, the lower part of the cylinders being encased with solid cork insulation. Thus, it is stated, a saving of 30 or 40 per cent in the ice and salt required to maintain the proper degree of frigidity is effected.

Refrigeration for the lower portion of the ice cream can, we are told, is secured by means of holes in the upper half of the cylinder which permits the brine to circulate around the lower portion of the can; while extra-heavy, pure cork board insulation maintains the temperature which the circulation of brine makes possible.

WINNERS IN THE PFAUDLER NAME CONTEST.

The Pfaudler Company expresses itself as being highly honored by the great interest which the dairy industry has taken in the naming of its new 100-gallon pasteurizer. The primary purpose in running the contest was to obtain a suitable name and for this prizes of $50.00, $25.00 and $15.00, respectively, were offered for the three best names. Over 2,900 names were submitted in the contest, and they came from all divisions of the industry—college professors, managers, stenographers, etc.

"Pfaud-Elyria," "Pfaudler Midget," "Pfaudler 100 Special" and "The Pfaudler Peerless Pasteurizer" were duplicated more than any other names submitted. Then there was a vast array of exotic and unusual titles. Most of the suggestions were accompanied by definite inquiry as to the exact nature of the unit, according to The Pfaudler Co., and in the short 60-day period that they have been advertising the 100-gallon unit, over 150 have been purchased.

W. E. HITCHCOCK, Thomasville, Ga. First Prize Winner.

Here are the winners:

First prize: "C-Gal" (pronounced See-Gal)—submitted by W. E. Hitchcock, Flowers Ice Cream Co., Thomasville, Ga.

Born near Dallas, Paulding county, Ga., September 27, 1892. Graduate of University of Georgia, 1914. Took post graduate course in 1915. Entered First Officers Training Camp at Fort Oglethorpe, Ga., 1917. Appointed successively first lieutenant and captain, serving at Camp Travis, Tex. In 1923 returned to Georgia, going into the ice cream business with two brothers-in-law. Later joined Joseph Flowers, owner of the Flowers Ice Cream Co., as assistant manager. Has learned ice cream industry by practical experience (i. e., did not study at university). His company produces approximately 2,000 gallons of ice cream and 1,000 pounds of butter daily. The name "C-Gal," which the judges in the contest selected, was considered the most desirable of all sent in—

—because it is short and easy to say,
—because it means "100 gallons,"
—because its spelling intrigues one's interest,
—because it suggests, in pronunciation, the mystic, snow-white "sea-gull" famed for its speed,
—because it does not contain the word "Pfaudler," and therefore can be used appropriately in combination with this word.

Second prize: "The Aristocrat"—submitted by Albert Anderson, Erskine, Minn.

Born in the great dairy country of Denmark, 1878. Has been in the United States nearly 30 years and has nearly always been engaged in the dairy industry in one way or another. Has recently been operating the Farmers' Creameries in Minnesota, North and South Dakota. While in South Dakota organized and was for several years secretary and treasurer of the state dairy association. Was also superintendent of the dairy department at the state fair. Has also had the honor of being appointed to several offices in the dairy associations, such as secretary of the Red River Valley Dairymen's Association, president and director of Minnesota Creamery Operators' and Managers' Association. While

Battery of U. S. Heavy Duty Freezers in the Plant of Tauber Absopure Ice Cream Co., Chicago.

The U. S. Heavy Duty Brine Freezer

THE Tauber installation is typical of many that we have made in large plants throughout the Middle West—and hundreds of smaller plants are using one, two or three U. S. Freezers, with equal satisfaction and profit.

Here are some of the features that will give you a better product—and a better profit—with U. S. Freezers.

1—Automatic batch weigher that regulates mix and helps you to produce a uniform cream.

2—Patented removable bronze bearing for front end of dasher, which eliminates wear on cover and keeps whipping device in correct alignment.

3—Substantial brass hopper which simplifies the filling in of fruits and flavors.

4—Convenient hinged cylinder cover—always out of the way.

5—Rotary brine control valve which gives complete control of the rapidity of the freezing process.

6—Rapid vertical discharge for quick emptying.

There are seven sizes of U. S. Brine Freezers, ranging in capacity from 40 to 160 quarts. Ask for complete information and prices.

Plan Now for Bigger 1925 Production

1925 PROMISES more than ordinary business prosperity—for you, and all of us. That, coupled with the normal year-to-year increase in ice cream consumption, means larger sales and profits for you next season.

That will require larger production; and larger production calls for additional equipment—or speedier and more modern equipment to replace that you now have.

Now is the time to plan your plant improvements, while there is time to do so leisurely—without haste or waste. If you plan to build or remodel we shall be glad to give you, through our Engineering Department, the benefit of many years of experience in just that kind of work—without cost or obligation.

We shall be glad to advise you, also, in the matter of equipment, to help you select the items best suited to your needs. We may be able to offer suggestions that will reduce your equipment costs, or that will greatly improve your products or your service.

And don't overlook the economy of buying all of your equipment and supplies from a single source; we can give you everything from parchment to power plant equipment.

We can furnish these small size equipments in vaccuum pan size ranging from 8″ diameter to 36″ diameter, with suitable forewarmers and pump. These small compact outfits require but little space, are provided with suitable heating and condensing capacity and prove a valuable addition for experimental and study purposes as well as for the condensing of small batches.

Arthur Harris & Co.

210-218 N. Curtis St. Chicago, Ill., U.S.A.

located at Erskine has held several public offices, such as president of the Commercial Club and mayor of the city of Erskine. Since resigning from actual creamery work has been engaged in the business of making and selling butter culture and other products for the creameries. Winner of several prizes for making butter, among them a silver loving cup for the best butter at the Great Northern Minnesota contest in Red Lake Falls, 1922.

Third prize: "The Centurion" — submitted by S. J. Pearce, 318 Federal Building, Salt Lake City, Utah.

Born at Plattsmouth, Neb., March 8, 1892, not far from where the Platte River flows into the Missouri. Moved with parents to Council Bluffs, Ia., when about 14 years of age. One year later moved to Lincoln, Neb. In Lincoln received grammar and high school education, later entering the University of Nebraska, from which he received the degree B. Sc. in agriculture. Good share of time has been put at some sort of farm work; later this was confined mostly to dairy farms. Considerable time also spent in dairy manufacturing and in educational work. At present time holds position of assistant market milk specialist, bureau of dairying, U. S. D. A. Prior to this was connected with South Dakota State College and Iowa State College. At latter institution was instructor in the market milk department under Professor Mortensen.

BEACON MFG. & SALES CO. TO EXPAND.

Chas. H. Lush, president of the Beacon Mfg. & Sales Co., Freeport, N. Y., reports plans are under way to triple the floor space of the company's present plant. An addition will be built around the south side and east end of the present building for manufacturing purposes and office space will be provided on the second floor of the new addition. Concrete blocks and stucco will be used. Work on the new structure will begin about April 1. They expect to increase their production of 40,000 sidewalk and hanging signs of last year to 80,000 to 100,000 signs this year. Mr. Lush reports the business is prospering, and that business with ice cream manufacturers is increasing rapidly. They also make a large number of signs for gasoline companies. Chas. H. Lush is president and A. M. Lush secretary and treasurer.

* * *

WRIGHT-ZIEGLER EXPANDING.

P. R. Ziegler of Wright-Ziegler Co., Boston, reports the purchase of a plot of land 80 by 160 feet opposite Sullivan Square in Charlestown, Boston, Mass. On this the company will erect a building covering the entire site, three stories and basement. Their business of manufacturing and jobbing is now scattered around various parts of Boston and the new building will facilitate administration and enable them to increase production.

IMITATION ICE CREAM.

The Reproductions Co., 514 West 46th St., New York City, manufactures a complete line of imitation ice creams for window and counter display. Their product is different from anything else on the market, officials say. They control exclusive patents, it is added, and where the quantities ordered are sufficient they make up special designs such as large bricks bearing the name of the ice cream company and many other designs.

It is claimed that this product is such an exact imitation company can furnish cartons filled to the brim with any flavor ice cream one may wish to advertise—any size carton, we are told.

This, of course, is to serve the purpose of connecting up the name of the manufacturer with the product, and to make windows dressed with the cartons attract much attention.

NEW STERILIZER AND DRYER.

A new sterilizer and dryer for milk and ice cream cans has been developed by the Economy Products Co. of Auburn, N. Y. This machine has been thoroughly tried out in several plants in New York State, where, officers say, it has given entire satisfaction. The cans are first rinsed with cold water, then moved to a steam jet, where they remain for about seven seconds. Cans are thus steamed three times, then moved over to a suction dryer. A thoroughly dry and sterile can is delivered, steam is drawn from the building, protecting the interior paint, the building itself, and the health of the operators. Machines can be used for either milk or ice cream cans.

Officers of the company are W. H. VanDine and L. G. Ford. Mr. VanDine was for fourteen years in charge of a 3,000-acre certified milk farm at Tully, N. Y., where he recognized the need for a dryer and sterilizer, and with L. G. Ford, an experienced mechanic, perfected this machine. Further information regarding the machine will be sent upon request to the company.

Christopher's Fifth Plant Opened.

Glendale, Cal.—A strictly modern and complete plant has been erected by the L. J. Christopher Ice Cream Co. This makes the company's fifth plant in California, with headquarters located in Los Angeles.

The new plant is 50 by 175 feet, with a storage capacity of 6,000 gallons of ice cream. A fleet of eight large motor trucks will operate out of Glendale, delivering the ice cream to Pasadena, Eagle Rock, Burbank and all points in the San Fernando Valley.

The company opened its doors to the public the early part of February and many visitors took advantage of the opportunity to see in operation this modern ice cream plant. S. C. Hookstratten, general manager of the Glendale plant, estimates that the company will have a monthly payroll of $10,000 at the outset. C. G. Hitchcock will be in charge of plant operations.

One of the outstanding features of the new plant is the huge electric sign erected on the roof of the building, blazing forth "Christopher's" in 2,500 electric light globes. The sign is 34 feet in length and 10 feet high.

Ice Cream Man Arranges Regular Radio Program.

Los Angeles, Calif.—The Globe Ice Cream Co. of Los Angeles, Calif., presented one of the greatest radio programs ever broadcast on the Pacific Coast when A. A. Comey, vice-president and general manager of the company, arranged a 30-act all-star vaudeville show, which was broadcast over Radio Station KNX at Hollywood, Calif., on the evening of February 15. The program started promptly at 9 o'clock and continued until the wee hours of the morning. No expense was spared, according to Mr. Comey, to arrange the big vaudeville show. This means of advertising proved to be a sensation. Prior to the air appearance of the Globe vaudeville show, the Globe Ice Cream Co. carried numerous ads in the local publications, in addition to having large banners displayed on all of the globe ice cream trucks calling attention to the show, the place, the time and the date.

This feature was quite a unique novelty in the way of globe advertising. Mr. Comey made a contract with Radio Station KNX to appear on the air one night each week for the entire year of 1925, each show to be a feature program, and running for two hours each evening.

SOUTH.

Alabama Officials and Ice Cream Men Co-operate.

Montgomery, Ala.—Commissioner of Agriculture and Industries, J. W. Moore, has received from J. W. Clopton, secretary of the Alabama Association of Ice Cream Manufacturers, a copy of a resolution adopted at the organization's recent annual meeting in Birmingham, expressing the ice cream men's appreciation for the co-operation given them during the past year by Commissioner Moore's department.

This resolution voices especial appreciation to the commissioner himself, Dr. H. M. Robertson, director of the departmental division of pure foods, feeds and drugs, and W. R. Anderson, inspector. The ice cream manufacturers realized that Mr. Anderson cannot cover the entire state to advantage, and recommended that he be given one or more assistants, in order that the territory may be visited more often. Support is pledged in securing the necessary funds to take care of this additional expense, at the next session of the legislature. The resolution concludes:

"WHEREAS, We are intensely interrested in manufacturing and distributing to the public a safe and high grade ice cream, we appreciate the co-operation of the department of agriculture and industries and will be at all times ready to assist the officials in the carrying out of the regulations now in effect or any in the future that shall be put into effect for the mutual interest of ice cream manufacturer and consumer."

In reply to Mr. Clopton's letter, enclosing copy of the resolution, Commissioner Moore has forwarded the following extract from the department's report, through the state board of agriculture, to the governor:

"In the adoption of Article 6 of the agricultural code, the state has provided standards and other modern regulatory provisions under which the dairy, creamery and ice cream industries may steadily develop to the full extent of their possibilities in Alabama. Without such provisions, these industries have never developed on a large commercial scale in any state.

"With difficulty in providing funds for the work, inspection service under this article began on February 1, with one inspector who has since devoted his entire time to these duties. The work of this inspector has to a large extent been, to the present date, more of an educational nature. It has consisted of visits to creameries, ice cream plants, cream receiving stations and other dairy products plants, where explanations of the provisions of this article and how they may be complied with, were given.

"At these plants cream testers were met and given examination to determine their capability of becoming licensed as reliable and efficient testers. Forty of those visited and examined were issued a license. Since becoming licensed it has been the duty of the inspector to make return visits and check results of

that the delicate flavors and nutritious qualities of their ice cream commands a greatly increased winter trade.

Every possible source of uncleanliness or insanitation is quickly and easily removed from cans, freezers, separators, mixers, syrup containers, moulds and all equipment.

Moreover, Wyandotte Sanitary Cleaner and Cleanser is such a free rinser that the cleaner itself is entirely removed, leaving a pure, sweet, wholesome surface to protect the quality of your product.

Order from your supply house.

IT CLEANS CLEAN

The J. B. Ford Co. *Sole Manufacturers* Wyandotte, Michigan

their operations, the accuracy on which the dairymen depend for the full amount for butterfat due them.

"At the plants the machinery and equipment was thoroughly inspected and the managers interviewed with reference to the problems of the manufacturers. At the request of the manufacturers, in certain instances, the inspector took charge of the operation of the plants for two or three days, in aiding the manufacturers to solve their problems.

"The number of visits to creameries, ice cream factories, cream and milk receiving stations, cheese factories; the number of samples drawn and the results of their analyses, and the number of licenses issued to manufacturers and dealers of dairy products are carried in department bulletin No. 5, relating to foods and drugs. It may be stated here, that it is the policy of the inspection service to maintain close supervision of all plants wherever the products have been found to be under standard, or where butterfat tests were found to have been under read.

"Anothr matter which has consumed considerable time of the dairy products inspector has been the return of equipment to its owner. General complaints against express agents for failure to forward equipment delivered to them, resulted in our appeal to the district managers of the express companies, who have since rectified these conditions by causing the equipment to be forwarded immediately on receipt of its delivery to the express office."

EAST.

America's Favorite Dessert.

Pittsburgh, Pa.—Enrique Blanco, the Spanish writer, who, after a sojourn in the United States, has informed his countrymen that mashed potatoes and gravy come as close as anything else to being the American national dish, must have been singularly unobservant. How could he have overlooked ice cream, the importance of which is indicated by the news that students from as far apart as South Carolina and Illinois attended the Pennsylvania State College just to take advantage of a special course in the manufacture of our favorite dessert? Can you imagine a college giving a special course in the preparation of mashed potatoes, or of students coming a thousand miles to study the subject? Can you imagine mashed potatoes or any other food besides ice cream being served as a regular thing at pharmacies and candy shops as well as at restaurants? Apply these or a half dozen other tests that will suggest themselves and you will find that ice cream, not mashed potatoes, is the national dish.

The per capita consumption in the United States last year, according to the National Association of Ice Cream Manufacturers, was three gallons. No other nation can show anything approaching this.

261 BROADWAY NEW YORK CITY

Regarding this the Pittsburgh Post says: "Pennsylvania may well take pride in its position of leadership in the manufacture of this delicious, wholesome and national dish. We top the list of the states in the value of our ice cream production, which amounted to $35,322,300 in 1920, when the census was taken, and probably is even larger now, for the 1920 output was three and one-half times that of 1916. There is no reason to suppose that a movement which resulted in an increase of 350 per cent in four years suddenly halted.

"But we can take even greater pride in the quality of our ice cream than in the quantity produced. Pennsylvania has a comprehensive law governing the manufacture and sale of the delicacy—a law passed largely at the instance of the manufacturers themselves, who sought in this way to make cleanliness and wholesomeness mandatory. The law prohibits the use of cocoanut fat and other foreign fats and oils in the making of ice cream, thus assuring that cream and its products shall be the principal ingredients. It is forbidden to offer it for sale from any cabinet or container which contains any other article than ice cream, as for example, oysters and fish.

"With Pennsylvania taking the lead in almost everything that pertains to ice cream, it is not surprising that men should come to our state college from distant states to learn the business. It has great possibilities for expansion. During the years immediately following the occupation of Porto Rico by the United States, we exported ice cream to that tropical island—which suggests that an export business may be built up in other quarters, until these countries shall have become sufficiently fond of the dish to establish their own factories.

"The new forms which ice cream has taken in recent years—Eskimo pies, frozen tarts, sundaes, etc.—suggest also that there may be room for further developments along this line. At any rate it is obvious that study and a high degree of technical knowledge are necessary to get the best results. And no other institution is better qualified to give instruction in the subject than the Pennsylvania State College."

* * *

Northern Ice Cream Company Sold.

Gouverneur, N. Y.—The Northern Ice Cream Co. plant, and all equipment connected with it, has been sold by Clyde W. Bame of this village to Harry Steele of Wilkes-Barre, Pa. The sale was made by H. C. Roges, realtor, and it is reported involves approximately $35,000.

The new owner was for several years located here, being employed first by the International Milk Products Company, which sold out to the Nestles Food Co., in 1918. The former company manufactured cream on a large scale.

When the Nestles Food Co. bought out the International Mr. Steele remained with the Nestles Company until 1923, when he engaged in the milk business at Wilkes-Barre with a former associate, the Wilkes-Barre concern being known as the Glendale Farms. Mr. Steele will have associated with him his father-in-law, Erwin Liscum, and a brother-in-law, Ashton Liscum.

Mr. Bame has been operating the Northern Ice Cream Co. since the International Milk Products Co. ceased the manufacture of ice cream, and for several seasons has been making truck deliveries over a large section. The J. M. Horton Ice Cream Co. a year ago purchased of the Nestles Food Co. their local plant, and have since operated it, but the Horton Company does not manufacture ice cream here. The plant here is used to prepare the raw product for manufacture.

The name of the Northern Ice Cream Co. will probably be retained by Mr. Steele and his associates in the future conduct of the business.

Damage Suit Settled.

Wheeling, W. Va.—The $10,000 damage suit of Charles Strauss against the Imperial Ice Cream Company terminated February 9 when an agreement was reached between counsel for the principals. Judge J. Harold Brennan was informed that a settlement had been reached and at once discharged the jury. Terms of the settlement were not made public.

The end came after testimony had been heard by the jury during the greater part of the day. The suit was the outcome of the construction of a part of the ice cream company plant adjoining the Strauss property, the plaintiff alleging that his property was damaged to a great extent through its foundations being undermined.

Reading, Pa. Approximately 150 ice cream manufacturers attended the fourth anniversary banquet of the Central East Pennsylvania Ice Cream Manufacturers' Association, which was held January 23 at the Berkshire Hotel.

A program including a turkey dinner, novelty acts and dancing was given under the direction of C. M. Fries, chairman of the entertainment committee. More than 150 members of the association were present.

The program was: Opening march "Central East March," Boyer's orchestra; America; Hart and Dale in comedy song and dance number; Hi Leopold, vaudeville pianist; dance; Homer Sibley, "The Man From Dixie;" dance; Fonsia W. Kraemer, soloist; dance; Sunshine and Sunshine, "Can Such Things Be?"; dance; Elliott and West, "The Two Orphans." Dancing was enjoyed until midnight.

The officers of the association are: G. M. Bring, president; R. T. Smith, vice-president; C. A. Tharp, secretary; C. Leichtman, treasurer. The directors; T. Hall, J. W. Newman, H. N. Forey, G. B. Marrow, C. M. Fries, C. Leichtman, F. Murray, N. H. Meyer, C. C. Burdan. The banquet committee: C. M. Fries, chairman; N. W. Hill, F. S. Morrow and C. R. Fickes.

Employees Feted.

Columbus, O.—Employees of the Crane Ohio Ice Cream Co., with Moores & Ross branches at Lancaster, Zanesville and Sabina, attended a midsummer frolic at the Knights of Pythias Hall, 24 West Goodale St., which was given by the company recently.

Dancing and a program of vaudeville were arranged by the committee in chcarge of this feature of the evening's entertainment.

* * *

Frederick, Okla.—A. O. Lewis of the Lewis ice plant has announced that a 40x50 brick building will soon be started on property recently bought just east of the ice plant, which will be occupied by the ice cream factory which M. T. Cochran of Altus recently bought of Emil Steinbock. It will have concrete doors three feet above the grade line and will be as sanitary as it is possible to make a buildnig, enabling the highest quality of ice cream to be produced. Mr. Lewis did not state what the estimated cost will be or whether it will be built by contract or otherwise, but did say work will begin as soon as the blue prints arrive.

Weatherford, Tex.—A deal has recently been closed whereby the Taylor Ice Cream Co. of Weatherford and Mineral Wells has been sold to Messrs. Turner and Wagley of Mineral Wells and Mr. Vandervort of Fort Worth. The new company took charge of the business on February 1. Messrs. Turner and Wagley have been in the automobile business in Mineral Wells and Mr. Vandervort has been connected with the Goodyear Tire Company in Fort Worth. The local plant will be known as the Weatherford Ice Cream Company after the new owners assume the management.

The Taylors, J. A. of Mineral Wells and Miss Emma Taylor of this city, have purchased the ice cream factory and bottling works in Greenville, Tex. and they will assume the management of the business immediately after the first of February.

Paris, Tex.—Velvet Ice Cream Manufacturing Company changed name to Paris Ice Cream Company.

McMinnville, Tenn. — The McMinnville Co-operative Creamery has just completed the installation of ice cream manufacturing machinery and a complete refrigerating plant. Manufacture of ice cream has begun. The capacity is five hundred gallons a day.

Keokuk, Ia.—A combination of the Vaughan Ice Cream Company and a number of prominent milk dealers is proposed and plans are under way to erect an up-to-date plant in this city.

Charleston, W. Va.—Diamond Ice Cream Company's plant has been taken over by the Imperial Ice Cream Company.

ONE WEEK SHORT COURSE FOR ICE CREAM MAKERS.

The one-week short course for ice cream makers will be given at the University of New Hampshire, beginning Monday, March 30th.

The lecture and laboratory work is planned for men who took the course last year, and for new men.

Lectures will include the following topics: Ingredients of the Ice Cream Mix, Standardizing and Processing the Mix, Freezing and Hardening the Mix, and Factors Affecting the Quality.

Laboratory work will include: Freezing the ice cream, testing milk, cream and ice cream for butterfat and acidity, scoring ice cream.

A registration fee of $2.00 is charged for the course. Any additional information may be had by addressing the Dairy Husbandry Department, University of New Hampshire, Durham, N. H.

BOOSTERS ELECT.

The Michigan Dairy Boosters elected officers at the 1925 convention as follows:

C. J. Yuncker, president; D. W. Shiel, vice-president and C. J. W. Smith, secretary-treasurer. The directors are: S. A. Von Jasmund, Otto Grove, V. G. Harris, J. A. Wise and H. B. Coburn. The director-at-large to Allied Association is Jas. B. Hill.

(Continued from page 8)

old convention goer present and he voiced the general sentiment of all present.

At the afternoon session "Some Economic Policies" pertaining to over-head, ingredients of the ice cream mix, national advertising and insurance were thoroughly discussed by Chas. Weikert, St. Paul, Prof. H. A. Ruehe, University of Illinois, J. F. Kircher, representing Will Schwindeler, St. Louis, chairman of the advertising committee of the National Association of Ice Cream Manufacturers, and R. V. Mothersill of St. Paul. Prof. Ruehe's talk was along the same line as presented at other conventions recently and as reported in The Ice Cream Review, as was also the talk on national advertising by Mr. Kircher. The other subjects presented for discussion at the afternoon session will receive attention in a later issue.

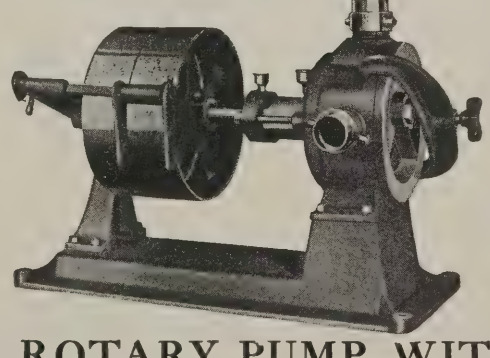
The big banquet on Thursday evening, (346 plates), was a most enjoyable affair and all problems of business —even the all-absorbing one of iceless cabinets—were left outside the banquet hall. Starting at 7 o'clock with a sumptuous feed, happy men and women made merry until the early morning hours, and at the wind-up voted the function the best ever put on by the Minnesota Gophers, the organization of supply men responsible for it. A vaudeville performance, with President C. A. Gould as master of ceremonies, created plenty of entertainment for everybody, except a few hapless ice cream manufacturers, who were the victims in a mock trial and who were sentenced to eat "five teaspoonfuls of their own ice cream." A dance followed the vaudeville entertainment and completed a splendid program. The Gophers should be, and are, happy in their success as entertainers.

We were up and around early on the morning of the second day, expecting to find a deserted lobby, but, on the contrary, we found everybody "on the job" eagerly awaiting the day's developments, because the big question of iceless cabinets was to come up that day. The busses were to leave at 9:30 a. m. for the plant of the Ives Ice Cream Company.

It wasn't an inspection visit either, although a few precious minutes were devoted to that pleasant pastime. At a special meeting of the Minnesota Association of Ice Cream Manufacturers, held in Minneapolis last December, a special committee was appointed to investigate the refrigerated cabinet question. Clifford Ives of the Ives Ice Cream Co., assumed that part of the committee's responsibilities of compiling data on efficiency of the different cabinets and fountains, from actual tests under typical conditions, and arrangements were made to conduct these tests in his plant.

Accordingly a test was run, covering a period of about six weeks, and close records kept. Mr. Ives read the report covering the test, which was exhaustive. It took him an hour to make his report, and at the close he was accorded a rising vote of thanks for the good work done. The report of this committee was made in a closed session, to which ice cream manufacturers only were invited. The report was considered so valuable by visiting manufacturers from other states that orders were left with the committee for over 300 copies, to be forwarded as quickly as they can be printed, at $2.00 a complete set, including photographic copies of charts.

Following the committee's report special busses carried the delegates back to the hotel for lunch and for the closing session of the convention. After passing a resolution deploring a political effort now being made to abolish the identity of the state dairy and food department, and voicing disapproval of that section of the state co-operative marketing law which prohibits dealings between members and outsiders, the delegates got right down to business on the cabinet question. This also was a closed session, but convention hall was filled with men with a serious problem to solve.



President Dunn briefly outlined the work of the association during the past year leading up to the special meeting in December, and the appointment of the special committee. He was generous with praise for the men that had worked with him, and for the members who have so loyally backed them up.

It was clearly the sense of the meeting that the officers and committee members had rendered exceptional service, and that whatever action they recommended would be speedily taken. Opportunity was afforded for a free and full discussion of the committee's report, and then followed the adoption of the following agreement:

RESOLVED, That we, the undersigned manufacturers of ice cream, in the state of Minnesota, in the interests of our industry generally, and protection of each and every manufacturer individually, do hereby agree to stand together firmly under the guidance of our state association in the matter of acceptance and disposition of mechanically refrigerated cabinets for preserving ice cream in retail stores.

We hereby agree not to install, rent or sell any refrigerated cabinets or fountain for the period ending Jan. 1, 1926, unless forced by competition, and in that case the following procedure shall be followed:

In case any competitor offers to rent, sell or install refrigerated cabinets or soda fountains we will immediately notify the president, in writing, who, with the state

A ROTARY PUMP WITH HIGHER EFFICIENCY

Operating at a low R. P. M., and with a minimum power requirement, the Viking Rotary Pump delivers an unusually high efficiency, even under extremely difficult conditions.

Built ruggedly of best materials and involving an improved pumping principle, the Viking has become the universal choice for every pumping purpose.

Could you ask for greater proof of what the Viking will do in your plant than that over 50,000 are now in successful use?

New, enlarged catalog, showing Vikings for every use, mailed upon request. Ask today.

association director from the affected district, will act as a committee of two to investigate the case and attempt to settle the dispute peaceably. If no satisfactory settlement between the interested parties is arrived at we agree to withhold action for 15 days from date of written notice before any competitive or retaliatory measures are taken.

This agreement was signed by the delegates present, representing, it was stated, over 90 per cent of the ice cream output of the state. It is understood that all manufacturers in the state will be invited to sign the agreement.

It is understood, also, that the problems peculiar to each district in the state will be worked out at a series of district meetings to be held soon. The special committee was authorized to continue its work so as to cover refrigerated fountains.

The delegates made short work of the election of officers. By unanimous vote the secretary was instructed to cast the association ballot for the retiring officers, and they were re-elected.

An unusual honor was conferred on J. J. Farrell, St. Paul, who has served the association in many ways. The office of "counselor and honorary member for life" was newly created and Mr. Farrell was unanimously elected, in recognition of the splendid work he has done for the association.

In adjourning the convention, sine die, President Dunn used these words, "boys, we have made history today," and he seemed to voice the sentiment of all the manufacturers present.

GOPHERS RE-ELECT OFFICERS.

The Minnesota Gophers participated in three conventions this year. The Gophers went out of their own territory to aid the manufacturers of South and North Dakota in their conventions.

At the annual convention of the association, which was held at the annual convention of the Minnesota State Association of Ice Cream Manufacturers, the Gophers re-elected its old officers, including C. A. Gould, president; R. N. Pal, vice-president; W. M. Booth, treasurer, and H. E. Stinchfield, secretary. The officials of the association constitute the executive committee.

The Gophers sent flowers to the family of the late H. Bridgeman, veteran Minnesota ice cream manufacturer, who recently died at Duluth.

BRITISH ICE CREAM CONSUMPTION GROWS.

About 96,000,000 quarts of ice cream were consumed in the United Kingdom last year, the British, as a nation, now eating more ice cream per annum than the most optimistic persons in the trade would have ever thought possible a few years ago. There is one plant in London which turns out an average of 100,000 quarts every day.

The American consul in London reports that the British are taking to ice cream, and that the consumption last year increased 1,000 per cent.

It is estimated by the ice cream federation of London thata consumption has increased 400 per cent during the past five years, due, principally, to a wider spread knowledge of the food value of ice cream, better advertising, more imposing and attractive establishments for its sale, and additional facilities for its consumption in homes. Each city in the United Kingdon that consumption has increased 400 per cent durwith a production of from 100 to 200 gallons per day.

WANT DEPARTMENT

IT PAYS TO ADVERTISE

Orders for this Department must reach our Office not later than the 25th of the month. Orders received after that date will be carried over to the following month's issue.

NOTE: Names and addresses of advertisers using blind addresses cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of "The Ice Cream Review."

NOTICE.

The Ice Cream Review disclaims any responsibility for the reliability of parties advertising in the Want and For Sale Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting any suspicious dealings.

NOTES OF THE TRADE.

(Continued from page 141)

of the "frozen suckers" is said to be extremely low. Actual figures supplied by ice cream manufacturers show the cost, including material, to range from 8 to 10 cents a dozen, it is further claimed.

* * *

BLANKE-MEYER COMPANIES MERGE.

Announcement has been made of the consolidation at St. Louis of the Meyer Dairy Equipment Co. and the Blanke Mfg. & Supply Co., with headquarters office at Vine and 3rd Sts., St. Louis, and with branch office and warehouse stocks at 1608 First Ave N., Birmingham, and 316 N. Preston St., Dallas.

Officials fix the combined gross business of the merged firms at four and a half million dollars annually, and they expect this merger to become a very important factor in the supply and equipment field in the dairy industry, with assets adequate to handle greater volume.

The active executives of the two merged firms are Ed. Meyer, Carl Meyer, Robert L. Blanke, H. E. Blanke and E. R. Owen. Sales development will be in the hands of Robert L. Blanke as president, with headquarters at St. Louis. The Dallas branch will be managed by E. R. Owen, and the Birmingham branch will be directed by H. E. Howland, as in the past. The financial and purchasing department will be conducted respectively by E. R. Meyer, as chairman of the board, and Carl Meyer. There is a combined sales force of 30 men.

* * *

Something new in dealer help advertising is being offered by the Bushong-Perry Company, Inc., "Purveyors of Paint and Painted Publicity," 32 East Georgia St., Indianapolis, Ind. It appears to be different from any other sign that has ever been offered to the trade. It is a modeled composition in strong relief against a background made of composition board. Material of which it is made is practically indestructible, officials say, and the whole sign is artistically treated in oil colors, done by hand and made "for keeps." It is easily washable. Inquiries directed to J. D. Riker, sales manager, will have prompt attention.

EMERY THOMPSON'S NEW CATALOGUE.

An elaborately designed and beautifully printed catalogue has recently been issued by the Emery Thompson Machine & Supply Co., New York City, in which their line of ice cream freezers are featured. It contains much valuable information for the ice cream manufacturer even though he may not at the present be in the market for a freezer. A postal card will bring you a copy.

* * *

A REPORT ON IMPROVERS.

Announcement has been made by S. Gumpert Co., Inc., Brooklyn, N. Y., that the company's chief chemist, Dr. A. R. Albright, has prepared a research laboratory report on Gumpert's ice cream improver, which, officials believe, will be of interest to ice cream manufacturers. Careful scientific research was conducted over a period of several months before this report was compiled, we are told. Officials add that this report shows, "Definitely, conclusively and scientifically why Gumpert's ice cream improver will produce richer tasting and better ice cream. It is further believed, that this report shows that one can make ice cream that is distinctly superior in flavor, in texture and in general appearance by the use of this product."

The importance of flavoring in determining the quality of ice cream and influencing the consumer is stressed in this report, which goes on to set forth how the creamery richness of ice cream is brought out to the fullest by the Gumpert improver. We are told that by the improvers' effect upon the proteins, of which casein is most important, the proteins are made ready for quick assimilation due to enzymic action, and that the protein films surrounding the particles of butterfat are developed to the maximum. It is further claimed, that the body of ice cream in this manner, is greatly improved and that the unfavorable reactions are thus avoided.

The Gumpert company has expressed willingness to send a copy of this report to anyone interested.

Can be supplied with entire wood construction [selected straight grain California redwood] or gray finished enamel, steel body or select cypress covered with vitreous enamel sheeting.

INSULATION

Every means of obtaining perfect insulation is used in the construction of these machines. Models C1 and C2, D1 and D2, E1 and E2 are lined with two inch corkboard —the best obtainable.

COIL CONSTRUCTION

Cherry coils insure absolute dissolving of all ingredients and a thorough agitation and mixing of the entire batch.

THERE is perhaps no trade as fickle as is the ice cream trade.

Retailers who pat themselves on the back and gloat over a wonderful business have been known to lose it all because their ice cream suddenly "went bad."

The shrewd ice cream manufacturer looks ahead and protects his trade by carefully watching every step of the manufacturing process.

A good freezer, yield, quality cream, etc., means nothing *if the batch is not properly mixed and aged.*

Cherry Coil Batch Mixers are universally recognized as highly efficient units. They provide for perfect mixing of the entire batch of ice cream mix.

APRIL 1925

ARE you preparing for Ice Cream Cone Week, beginning May 10? Are you going to get all the results that are possible from a special drive to further popularize this delightful ice cream package? Why not make 1925 the greatest ice cream cone year in the history of the business? And let it be understood that when we speak of the ice cream cone we have in mind also the ice cream sandwich which has gained such high favor.

The object of Ice Cream Cone Week is to sell more ice cream. That is what is interesting ice cream manufacturers in it, and rightly so. Ice cream sold in cones or sandwiches does not displace other sales of ice cream. It is added business, and that is exactly what business men want.

We sincerely believe that the possibilities for increasing the sale of ice cream cones is unlimited. In spite of the fact that millions upon millions of them are used each year the number might be easily doubled or trebled. The amount of ice cream thus sold runs into big figures.

A good ice cream cone or sandwich filled with good ice cream is good food. It rightfully belongs in the food class, not alone a delightful treat for the kiddies. There was a time when the grown-up had to "sneak" his ice cream cone. He didn't want to be caught with one on his person. He didn't like to admit his fondness for a kid's dish. But times have changed. The ice cream cone and his twin brother, the sandwich, are found in the best society circles. The only trouble is they are not found there often enough. The object of this special week's drive is to make them still more popular by calling attention to their merits.

The ice cream cone business is good business for the ice cream manufacturer. That is the reason we want to see it grow. We want to see ice cream manufacturers sell more ice cream. That is good for them, and it is good for us. That is why we emphasize Ice Cream Cone Week.

THE reader who is interested in the iceless cabinet question, and that takes in most people in the ice cream industry, will find this issue of The Ice Cream Review particularly valuable. Beginning on page 72 you will find a synopsis of what has transpired at the several conventions, which have been held during the past year, relative to the iceless cabinet question.

We have tried to bring facts together which might be helpful to our readers, so that in one issue anyone can find the answer to the question he may have in mind relative to iceless cabinets, that is, so far as the question was touched upon at the conventions. Arguments for and against are presented, along with statements from association officials, all with the object in view of bringing the situation in the different states before our readers, and which they can use for reference. The contracts used in different sections of the country are reproduced, along with any agreements that have been entered into between ice cream manufacturers.

We sincerely trust that our readers will find the same interest and profit in reading this presentation as we have found in compiling it for them.

FOR over four years past a certain druggist near our house has been catering to the whims and tastes of the members of our household. He is a good salesman. He has considerable of our hard earned money. He furnishes our home with a lot of things that depend on good salesmanship for their distribution.

We have asked him favors and they have been cheerfully granted. When we have had to get him out of bed in the middle of the night to fill an emergency prescription he has made us feel that nothing could give him greater pleasure. He can and does fill any sort of a prescription that we can prevail upon an accommodating and liberal family physician to give us.

This druggist salesman even cashes our personal checks and when our schoolboy hopeful calls in on an

errand, and has forgotten what he was sent for, this good salesman steps to the telephone and helps the boy out. He believes in "specials." He runs "specials" on most everything in his well stocked store, from cosmetics to gold fish. When a customer drops in for a box of tooth powder or a cigar he is reminded of some "special," and he is reminded by word of mouth as well as by the printed sign.

That man has sold us on so many "specials" that the word has become a household term. He has a lot of our money that he would not have if "specials" had never been invented. He has made us like it, too. He is a good salesman and we admire him. We suspect that many of his "specials" cost us as much or more than we would have paid somewhere else, but we admire him just the same.

During all these years that he has been successfully pursuing us with his good salesmanship he has never sold us a package of ice cream except when we went into his store with the fixed purpose of buying a package of ice cream. We have been waiting for him to suggest that we take along a package of ice cream and we are still waiting.

True, he has a couple of fancy signs hanging in his store, showing a pretty girl eating a dish of ice cream, but we suspect that he considered he was doing the ice cream manufacturer a great favor when he consented to have the signs placed there. We have always found him with a plentiful supply of good ice cream, but he has never seemed anxious to sell it, although he sells lots of it and at a good profit. He may not realize it, but he is not a good salesman of ice cream. He is doing business in a community where lots of ice cream is consumed and people just go to his store and take it away from him, he doesn't sell them. He seems to consider his ice cream sales in the same class with his prescription sales—something that the customer must have anyway.

This druggist is a fair sample, we believe, of his profession. There are exceptions, of course. There are ice cream dealers who really sell ice cream, but they are few and far between. Everything the average dealer does, in acting as the manufacturer's distributor, is done with the feeling that he is doing the manufacturer a favor. Ice cream manufacturers have only themselves to blame for this condition, but that is another story.

The dealer is a necessary link in our present plan of ice cream distribution. The question of whether that plan will ever be changed and ice cream sold direct to the consumer, as milk is sold, we shall leave to the prophets. We are not even the son of one. Our contention is, however, that the ice cream manufacturer who depends entirely on the salesmanship of the average dealer to increase the consumption of ice cream is working in the wrong direction. Nothing is to be gained by ignoring the true situation. If this average dealer cannot or will not part with his stock of ice cream except as his customers take it away from him, then it is up to the manufacturer to create the desire to buy in the minds of his customers. Many of these customers never go into the store. They do their business with the dealer over the telephone. They never see his signs showing the pretty girl eating a dish of ice cream. So long as the dealer persists in never suggesting ice cream, not even over the telephone, the ice cream manufacturer has no contact with the consumer.

The answer to this big problem is "consumer demand." When that demand is increased sales are increased, and not before. Many ice cream manufacturers realize this fact and are planning their advertising campaigns accordingly. They are not depending on the dealer to create consumer demand. They have tried him out and found him wanting—yes, "wanting" is a good word, he is always wanting — wanting and getting all that fierce competition will permit him to get. This is the fellow that ice cream manufacturers the country over have been spending their money on. This is the fellow that they fight over and try to take away from each other. Is he worth the cost?

A national advertising campaign that will reach the consumer in the home is a move in the right direction. Such a campaign, backed up by the manufacturer and reaching right into that same home, will unquestionably increase consumer demand. And that is what this industry needs more than anything else. Let's all resolve that from now on we will think of the consumer more than we have been in the habit of doing. Then we will be building on the right basis.

WE REMARKED to a friend the other day that we contemplated writing an editorial for these columns, in which we would recommend ice cream as a breakfast food. He replied, "Do that and your readers will think you were born in Winsted, Connecticut." It went over us at the time, but upon making inquiries we learned that the above mentioned town is famous as the birthplace of two-headed calves, four-legged roosters and other freaks of Nature. By the time we learned these facts our friend was in another city. We resolved then that we should make good on our threat to make such a suggestion.

First, we are going to admit that it will be difficult to provide a supply of ice cream for breakfast. The

GENTLEMEN OF ILLINOIS—THANK YOU.

The Ice Cream Review has been named official organ of the Illinois Association of Ice Cream Manufacturers, according to announcement last month by officials of that association. This is the thirty-second organization to confer this honor upon The Ice Cream Review.

The Illinois association is the oldest body of ice cream manufacturers in the industry. It was from this association that the National Association of Ice Cream Manufacturers was formed, leading members of the Illinois industry taking the lead in steps that put the national body to functioning.

The association celebrated its silver jubilee at its annual convention last year.

The Ice Cream Review deeply appreciates the honor that comes from an organization that has such a glowing record of constructive achievements for this industry.

druggist in our neighborhood who supplies us with ice cream is one of the last business men on the street to open up his store.

But even that is not going to prevent us making the suggestion. If we could create a real demand for ice cream for breakfast in our community we are sure some enterprising ice cream manufacturer would find a way of supplying that demand.

Why not eat good ice cream for breakfast? We have tried almost everything else on our breakfast tables. Almost anything that a good respectable dairy cow will eat is offered, in some form or another, to the consumers of this country. Most of these products, ranging from bran and cracked corn to baled wheat and shredded corn fodder, are nourishing and quite palatable if flavored, sweetened and liberally covered with cream.

Why not take these dairy products straight? Why not a dish of good ice cream, which contains the flavoring and sweetening along with the cream that is so necessary on all these patented palate teasers?

If you must have a dish of fresh fruit on your breakfast menu why not cover it with a liberal helping of good ice cream? A big dish of fresh strawberries a la mode, for instance. As Harry Lauder would say, "Yu canna beat it."

Really and truly now, how many of you men who believe in your product have tried a dish of good ice cream for breakfast? About every other food manufacturer in the country enjoys the demand created by three meals a day. If ice cream is more than a dinner dessert, and we all believe it is, how about getting it on to the dining tables in this country alongside of other dairy products?

We don't expect that this suggestion will result in immediately creating such a demand for ice cream for breakfast that any of you men will have to start early morning deliveries, but if it emphasizes the opportunities that lie before this industry to popularize ice cream as a pure food dairy product we shall be content.

⚜

SOME men persist in misunderstanding the proposal to fix an 8 per cent federal minimum butterfat standard for ice cream. They persist in believing that it is suggested in order to cheapen ice cream, thus making greater profits for the manufacturers.

The ice cream manufacturers who are sponsoring this proposal are not that foolish. They are sound business men and they know that they could not hope to win greater favor for their product by making it inferior. They want the consumers in this country to eat more ice cream and they believe that the tendency to increase the percentage of butterfat from year to year—a tendency that has prevailed for some time and which has been almost forced by competition—has gone too far for the good of the industry. They want to see this tendency halted. They want to see official recognition given to what they sincerely believe is the proper minimum fat standard.

Such a standard will in no way conflict with state standards. It is hoped, of course, that state standards will eventually conform to the federal standard, but that is a problem for the different states to wrestle with.

Where state laws require a higher percentage of butterfat the federal standard, of course, will mean nothing in actual practice. Ice cream will continue to contain whatever percentage the state law requires, or more.

So far as trade practices are concerned a federal standard will mean nothing except in the case of ice cream crossing a state line in transit. When it has entered any state it must contain the percentage of butterfat that is required in that state.

Some people apparently overlook the fact that the 8 per cent fat standard is proposed only as a minimum standard. Nothing will prevent the manufacture of richer ice cream if the trade demands it. And the good business man gives his trade what it wants.

The greatest benefit that can come from the fixing of an 8 per cent minimum standard, as we see it, is to crystallize sentiment and to work toward that butterfat content which experience teaches results in highest consumption. That, we understand, is the big object in the minds of the men who are giving liberally of their time and effort to get this standard question settled once and for all.

⚜

A COMMITTEE in the New Jersey legislature the other day voted disapproval of a bill which proposed to require the weight of ice cream to be labeled on the package. The bill did not seek to establish a weight standard, but was killed in committee just the same. It is to be hoped that weight bills pending in other state legislatures will meet the same fate.

OUR ICE CREAM CONE BOY.

The earnest lad that greets you from our front cover this month, with a death-grip on his ice cream cone, is not Jackie Coogan but is one of the army of American lads who never would eat so much ice cream as they consume were it not for the inexpensive cone. Ice cream at 15 cents and 20 cents a dish is entirely out of the question for the great bulk of boys.

The photograph from which our front cover was reproduced, by the way, was furnished by The Wide World Service, being copyrighted by that organization and released to The Ice Cream Review under a special agreement.

BULLETIN OF EVENTS.

National Association of Ice Cream Manufacturers—Twenty-fifth annual convention to be held at Detroit, Mich., the week of October 19, 1925. Convention headquarters, Hotel Statler. Secretary, Fred Rasmussen, Telegraph Bldg., Harrisburg, Pa.

Southern Association of Ice Cream Manufacturers—Annual convention at Lexington, Ky., December 1, 2, 3 and 4, 1925. Convention headquarters, Phoenix Hotel. Secretary, J. W. Clopton, Decatur, Ala.

Pacific Ice Cream Manufacturers' Association—Second joint convention with the California and Southwestern States Ice Cream Manufacturers' Association, Portland, Ore., January 12, 13, 14 and 15, 1926. Secretary, Bert H. Walker, Royal Ice Cream Co., Tacoma, Wash.

California and Southwestern States Ice Cream Manufacturers' Association—Annual convention to be held jointly with the Pacific Ice Cream Manufacturers' convention at Portland, Ore., January 12, 13, 14 and 15, 1926. Secretary, Jay H. Kugler, 57 Post St., San Francisco, Cal.

Safe or Out?

Soon on the sand lots and league ball parks, we'll be hearing the old familiar cry "Safe" or "Out." No matter which way the decision goes some good sport will yell "Kill The Ump."

You're the player and the umpire both in your business. When the hot weather comes along and "Old Sol" starts doing his stuff, will you have enough ice cream cans?

If you haven't you'll be "Out." If you order Electric Weld cans now, you'll be "Safe," not only this season, but for a couple of seasons.

PLAY "SAFE"

JOBBERS AND WAREHOUSE STOCKS IN ALL PARTS OF THE COUNTRY

Intensive Merchandising

OFFERS DAWN OF NEW DAY TO THE Ice Cream Industry

BETTER merchandising methods is the big matter before the ice cream industry. This has been approached from many different angles at recent conventions. As one prominent ice cream manufacturer has put it, the industry has passed through many different stages in the march to its present development, but "the present age belongs to merchandising."

A new day is dawning for ice cream; it is in the form of co-operative merchandising.

It is the same in all other industries. This is the day of the seller's market. The man who has something to sell is going out to put over his sale, leaving production details and other routine matters to capable men that the industry has been developing in recent years. We have made much progress in building up uniform quality in the ice cream industry, but as a large manufacturer of the East has said, "Now that we have something to sell, we don't know much about how to sell it."

Ice cream manufacturers are not satisfied with slip-shod selling methods in vogue in the retail stores at this time; that is, slip-shod as applied to the merchandising of ice cream. Our product has been regarded by the retailer much as a red-headed step-child, something that he just has to bother with but doesn't like to, for that reason taking little interest in developing the market for ice cream.

Ice cream manufacturers must do more personal visiting among the dealers. This is a point on which there seems to be much unanimity of opinion after a campaign in which The Ice Cream Review has worked together some of the selling ideas of the industry.

DISPLAYING ice cream in the dealers' windows is an all important matter. In the past we have seen very little of it, but more manufacturers are beginning to study window displays and co-operating with their dealers toward getting ice cream on the same selling plane with tooth paste, kodaks, stationery, writing fluids, and other sundries that druggists have been crowding to the front of their windows to the injury of ice cream.

"The trouble we find with the dealer is that he does not take care of his window trims for any considerable length of time," states H. S. Allen, one of the pioneer ice cream manufacturers of Illinois. "The dealer apparently thinks," says Mr. Allen, "that the manufacturer will supply as many trims as he can throw away. The ice cream industry has been greatly abused in years past, but the consumer is beginning to realize now that ice cream is a substantial food instead of a delicacy and that there is nothing better for light refreshments or for an after-dinner dessert than good ice cream," continued Mr. Allen. He believes that if some way of displaying ice cream in the dealer's window, other than show cards, could be developed, there would be greatly increased sales generally. He also believes that the manufacturers should visit the dealers and explain to them the necessity of his helping to advertise ice cream to his customers, and especially endeavor to get customers to take home packages of ice cream for home consumption.

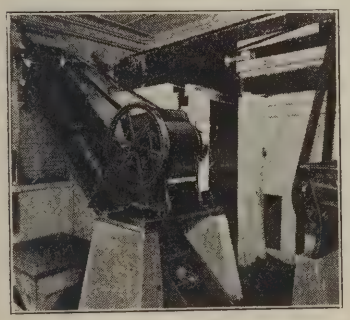
The Hydrox Co., Chicago, is making much progress with its soda fountain school, where sales people are educated to fix up ice cream dishes for the fountain, to trim windows with ice cream designs, and to give demonstration service.

"In spite of the great amount of educational work that has been done by ourselves as well as other ice cream companies," states a member of the Hydrox Company—

"We still find it hard to understand the attitude of a great many ice cream dealers toward ice cream. In spite of the fact that it is without question the most profitable item they handle, and that the turnover is several times that of any other class of merchandise in their store, they still merely meet a demand, instead of introducing and pushing the sale of ice cream."

THE manager of the Trinidad Creamery Co., Trinidad, Colo., believes that an attractive way of advertising ice cream is to show or write on the plate glass windows of a store what special ice cream the dealer may be handling, changing such ads every day for the sake of variety and neatness. Although many ice cream dealers could do that work themselves, with a little experience with a brush, this gentleman believes that much of this work should be taken care of by the salesmen of the ice cream plants. This company has a man painting up or decorating the dealers' windows in the summer time and the manager states that every time this has been done, he notices it has considerable effect in the sales, "and it makes a dealer take much more interest in pushing the sale of ice cream."

C. A. Hay, Newton Ice Cream Co., Newton, Kan., has gone after restaurant business to get more pie a la mode served to customers. The restaurants have been furnished with signs which suggest that the patrons order pie a la mode. Mr. Hay further has gone after the dealers in an effort to get them to talk up ice cream for customers who order other things, asking them to display cards reading "Take Home a Quart of Ice Cream."



Dealers' windows change on an average of once every ten days caused by different wholesale firms trying to push favorite items, it has been observed by Nat

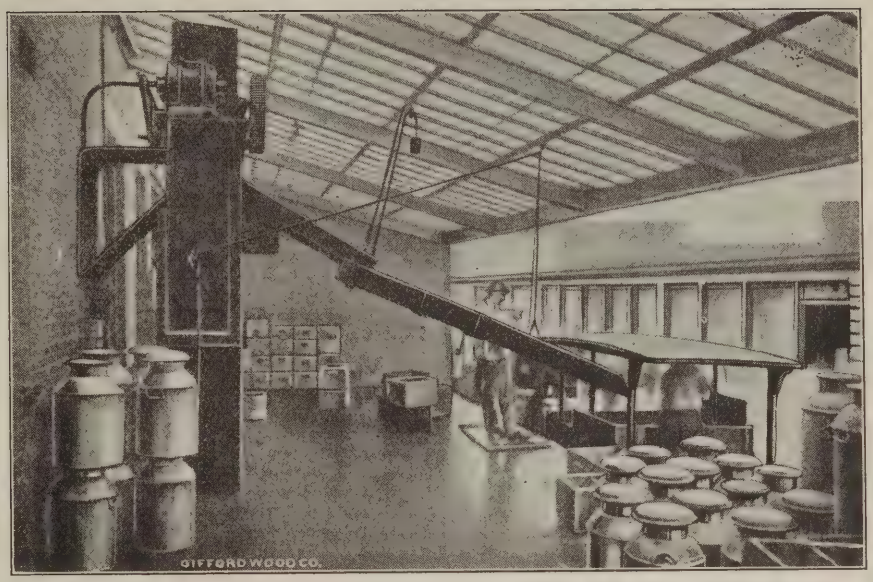
Crushed Ice and Salt Elevators



G-W Crushed Ice Conveyor for handling ice from under crusher direct to trucks.

Ice Crusher and double chain G-W Crushed Ice Elevator discharging to wagon chutes.

Standard G-W Centrifugal Discharge Elevator for salt. Feed point and take-ups are shown in this view.

For Reducing Handling Costs

Each piece of G-W Equipment shown here is a means of reducing the cost of handling ice and salt. All have been tested by experience and have justified the confidence of owners by the dependable results which follow their use. These few types are but a small portion of the complete line of G-W Equipment.

If you contemplate the installation of crushed ice or salt handling equipment in your plant, take advantage of our many years of experience in designing and building equipment of this character. You will find a talk with one of our practical engineers worth while.

At each of the offices below you will find engineers who are always glad to tell you about the many economies of G-W Equipment—Ice Crushing, Ice Handling, Salt and Sugar Handling—and how these economies can be brought to your plant. Just address the nearest one.

Decrease of 9,000,000 Gallons was Ground Lost by Ice Cream Industry in 1924

Cool Weather Caused Total Consumption to Fall to 285,550,000 Gallons, While Per Capita Consumption Fell from 2.68 in 1923 to 2.56 in 1924 U. S. Survey Shows

THE ice cream industry embarks upon the 1925 campaign with much lost ground to recover. Jack Frost bit deeply into our market last year, cutting down consumption by nine million gallons. This is revealed in figures recently announced by the U. S. Department of Agriculture showing 1924 consumption to have been only 285,550,000 gallons, while the figure for the preceding year was more than 294 million gallons.

Per capita consumption fell from 2.68 gallons in 1923 to 2.56 gallons in 1924.

For a long time it has been understood that figures for consumption in 1924 would be far from satisfying, though many of us held out hope that the final computation would find these figures approximately as high as for 1923.

There seems to be every indication that the industry will win back its lost ground and go into new high levels in 1925. The weather outlook at this time is extremely favorable, following a comparatively mild winter and excellent prospects for early warm weather, to say nothing of important lines of action organized forces in the industry are trying to set in motion.

THE agricultural, commercial and industrial conditions of the country are largely healthy, it is pointed out by the president of The Association of Ice Cream Supply Men, Oliver S. Jordan, New York, who in a statement to The Ice Cream Review, said:

"It is a rare man in or related to the ice cream industry today who is not putting to himself the annual question, 'Is this a good ice cream year?' Many a prophet already has destroyed a reputation fortunately gained in this field by endeavoring publicly in April to answer such a question for a year not yet half run.

Your old-time ice cream man will permit no ifs and buts and ands as to prospective ice cream conditions other than those that attend what he regards as the first and last word, the weather. Some newer ice cream men, and optimists whether old or new throughout this field, believe, or hope at least, that the time will come when the weather will not rule so completely the volume of ice cream.

"It is to that end, partly at least, that national advertising is receiving much notable consideration.

"The expectation of conditions this year, at least, as in past years, will have to rest still on the weather to a great extent. A long, warm summer will surely substantially boost the industry's volume. A normal summer will undoubtedly show an increase in 1924's production.

"The agricultural, commercial and industrial conditions of the country are largely healthy. To my eyes, at least, there is nothing visible that is apt to tinge them with depression. It will remain with the weather to write the total number of millions of gallons that 1925, favored with these generally sound, basic conditions of business, will have been found next January to have produced."

ICE cream production for the first nine months of 1924 shows a slight decrease under the production in the corresponding period in 1923, according to figures recently issued by the United States Department of Agriculture.

The total amount of ice cream manufactured at the end of the month of September was 147,277,000 gallons. In 1923 the ice cream production at the end of September amounted to 156,305,000 gallons.

The ice cream industry started off 1924 by making a quarter of a million gallons less ice cream than was made in January, 1923. In February, 1924, however, production showed an increase of more than two million gallons over February, 1923. March likewise showed an increase of little more than a half million gallons over March, 1923, and in April there was an increase of almost a million gallons over April, 1923.

But the pendulum took the other swing when the cold weather continued to prevail last May, June and July, and beginning with May, ice cream production during the summer of 1924 began falling off. The industry rallied slightly in the month of August and showed an increase, but only to fall off again in September.

Ice Cream Production Through September, 1924.

Month	1924 Gallons	1923 Gallons
January	5,750,000	6,052,000
February	7,754,000	5,625,000
March	9,152,000	8,570,000
April	13,400,000	12,433,000
May	18,609,000	19,667,000
June	26,782,000	29,034,000
July	29,661,000	31,137,000
August	26,468,000	25,957,000
September	14,701,000	17,830,000
	147,277,000	156,305,000

WALKER-NIZER PATENTS

Bilt-Rite

3 temperatures without icing

One corner of charging room and compressor assembly department in plant of Russ Mfg. Co. Inset shows interiors on test rack.

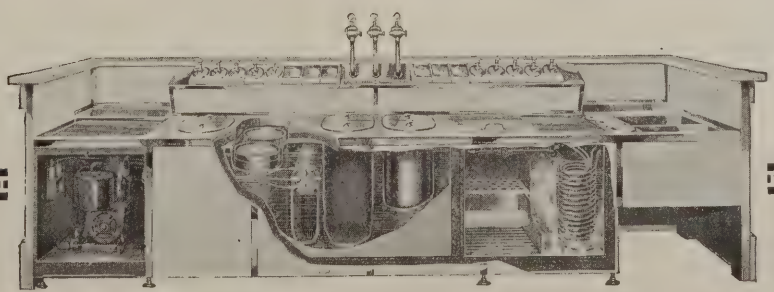
You don't have to experiment with mechanical refrigeration!

The BILT-RITE fountain is a *proved* success

UNINTERRUPTED service through the entire summer of 1924—that's the record of about 100 Walker-Niser type fountains sold last spring.

It's the 100% Mechanically Refrigerated Fountain—the BILT-RITE—the first of its kind on the market—the only one with a background of a season of commercial usage.

Simple, efficient, economical, dependable—that's what all owners testify. NO HAND ICING and yet perfectly conditioned ice cream; wonderful dry cold storage and ICE COLD fountain drinks. It is the fountain that produces maximum results with the smallest amount of mechanical complexity.



THE BILT-RITE is shipped to the purchaser as a complete outfit, with the refrigerating mechanism built-in. Every fountain is placed in operation at our factory and given an intensive three-day working test before shipment.

The three correct fountain temperatures are thus established, and all necessary adjustments made before the outfit leaves the testing rack.

Once set up in the purchaser's store, the fountain is ready for use without the uncertainties and delays that must follow where a refrigerating machine and fountain are delivered to the purchaser as separate units and assembled after delivery.

National Ad Campaign Taken Over By Executive Board

W. A. Schwindeler and his Committee Relieved With Praise for Meritorious Service, after Leading for Two Years a Winning Fight for Co-operative Advertising

W. A. SCHWINDELER.

The Industry's Honor Roll Has to Make Place for this Man who Has Given Much of His Own Time to Serve His Fellows-in-trade

AN AGGRESSIVE movement to put over the national advertising campaign with a vengeance has been begun by the executive committee of the National Association of Ice Cream Manufacturers, through the office of the secretary, Fred Rasmussen, Harrisburg, Pa. This developed at a meeting of the officers and the executive and advertising committees of the association at the Cleveland Hotel, Cleveland, a few weeks ago, when it was decided that the advertising committee already had made a very real contribution to the welfare of the industry, and that the rest of the matter was up to the executive committee.

The committee already has obtained approximately one-half of the required gallonage, and the executive committee has voted to take steps to obtain the balance of the 40 per cent of the gallonage of the country, this being required before the advertising campaign can be started, according to the vote of the membership at the 1924 convention.

WILL A. SCHWINDELER, chairman of the advertising committee, was given warm praise for extraordinary services he has rendered the industry in fighting for the success of the co-operative advertising movement. A bulletin from the secretary's office concerning the work of the advertising committee and Mr. Schwindeler, reported on at this recent executive meeting, reads, in part, as follows:

A complete report of the activities of the advertising committee since its inception in October, 1923, was given, the status of the work at this time was shown and the many questions that have arisen were discussed in complete detail. This report also included a list of state association meetings which some member of the advertising committee or Mr. Gentleman has addressed since the national association meeting in New Orleans, with copies of the resolutions passed by the various state associations, as well as a list of group and individual pledges made by various manufacturers the country over.

It was apparent to those attending the meeting that this activity had reached such proportions that it was no longer right or possible for the association to expect Mr. Schwindeler and the other members of his committee to be burdened with the responsibility of caring for details of this all-important association activity.

It was pointed out that Mr. Schwindeler and his associates had made a very real contribution to the welfare of the industry in devoting months of time and energy in an effort to bring this co-operative development program about; for that reason a resolution was passed thanking the members of the advertising committee for the splendid work they have done and putting the association office back of this work so that their work might go on with increasing impetus without so greatly taxing the energy of the chairman of the advertising committee and his associates.

The decision also was reached that when sufficient pledges are received, the funds will be expended under the direction of the executive committee.

"Inasmuch as it is highly important that we have these pledges in before the next joint meeting, which is to take place in the near future, the executive committee earnestly requests those who have not sent in their pledges for the advertising campaign to do so as quickly as possible," Secretary Fred Rasmussen has announced.

The meeting was attended by President Hovey, Vice-President Campbell, Treasurer Lewis, Secretary Rasmussen, Messrs. Lewis, Morris, Sutton, Dessert and Randolph of the executive committee; Messrs. Schwindeler, Cunningham, Kennison of the advertising committee; and F. W. Gentleman, who has been working with Mr. Schwindeler's committee.

THE national advertising committee of the National Association of Ice Cream Manufacturers early in March made known facts which showed the following results:

The membership of the states of Texas and Oklahoma has endorsed the plan with 75 per cent of the entire gallonage of these states. The state associations of Kansas, Iowa, Mississippi, Ohio, Kentucky, Louisiana, Alabama, Tennessee and the New England association have endorsed the plan Over 5,000,000 gallons are pledged on the Pacific Coast, and approximately 7,000,000 gallons in New England. Many of the best minds in the industry are lending their influence toward this constructive undertaking.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Commenting upon this report, Carlton Bell, general secretary of The Dairy Products Association of Kentucky, in a letter to his membership, said:

"We believe that you, too, are convinced that the future of the ice cream industry is not in the barbaric custom of taking another's business, but rather in stimulating and creating increased consumption by intelligent advertising: and that you will embrace this opportunity of endorsing the plan and pledging your support on the basis of one-half cent a gallon on your 1923 gallonage.

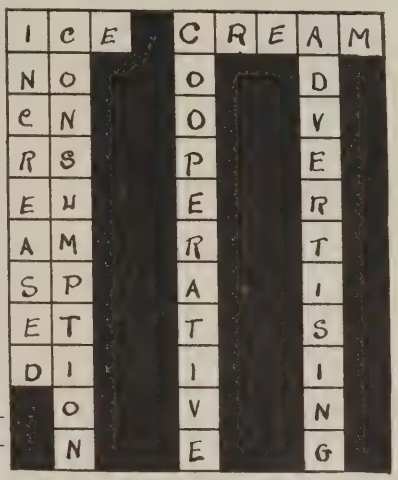
"Enclosed you will find a pledge sheet which is made out in duplicate. We would like to have your signature on this pledge sheet, keep the duplicate for your files and return the original to us at once so that the national advertising committee may know exactly the definite support it is to receive from Kentucky.

"National advertising and its benefits are well known and there is no reason why national advertising of ice cream should not bring about the increase in gallonage which would equal, if not surpass, the percentage increases that have been brought about by the nation-wide advertising of other food commodities. The fact is, that if our national advertising campaign accomplishes only one-third of what has been done with other food commodities, its consumption will be increased one hundred and seventy-nine million gallons per year, a part of which you are sure to recognize in your own plant.

"We know that you will be glad to participate in a movement which has for its purpose the building of a bigger, better and finer ice cream industry."

OHIO FURNISHED MOST SLOGANS.

Ohio furnished the largest number of slogans suggested for the national ice cream slogan, 12,562 slogans having been received by the slogan committee from the Buckeye state. Next came the state of New York, with 12,190 suggestions, followed by Massachusetts with 10,712 replies to the committee's advertisement for slogan contributions.



The nation's leading ice cream state, Pennsylvania, furnished 8,041 replies. Among the other states from which a large number of suggestions were received are California, with 7,401; Wisconsin, with 6,879; Michigan, with 2,747; Idaho, 4,683; Connecticut, 3,875; Missouri, 2,403, and Texas, 2,146.

Eight Canadian provinces furnished two or three thousand slogan suggestions, with Ontario, the home province of the girl who suggested the winning slogan, furnishing 1,235 contributions.

From Porto Rico there were received 38 contributions, and from Hawaii, 538. A total of 110,000 slogans

Our Eternal Cross Word Puzzle--

"Increased Consumption"

THE ice cream industry's eternal cross-word puzzle looms large before manufacturers as they prepare for the grind of another season. Our missing link consists of two words—one beginning with "I" and ending with "D," and the other beginning with "C" and ending with "N." These words are "increased consumption." They have been used so frequently in late years that they almost have become one word in the language of this industry, just as some folks say "damrepublicans," and other "damn-ocrats."

When we get these words adjusted in their proper place in our cross-word puzzle board, it seems sure, we shall have solved some troublesome problems. Do they fit as outlined above?

There are those who believe the answer lies in national co-operative advertising. They point out that discussions at conventions this past winter gave ample evidence that the ice cream industry, by profiting to an extent much less than other industries that have successfully advertised on a co-operative national scale, can increase consumption to a point far greater than otherwise could be expected.

It is one of the really big matters facing the industry.

Others believe that iceless cabinets will do much toward winning new customers for the industry, through better sanitary conditions, keeping ice cream in better condition, renewing the dealer's interest in ice cream, etc.

Standardization is regarded as a development which would make ice cream over the nation a definite article of commerce, which not only would better suit national advertising purposes, but in itself would do more to win and hold public confidence.

More attention is being given to window displays and co-operation with the dealer looking to more aggressive salesmanship in handling ice cream. To increase consumption we must induce people to eat more ice cream.

How about national advertising?

Don't forget National Ice Cream Cone Week—beginning May 10. Everybody set? Let's go!

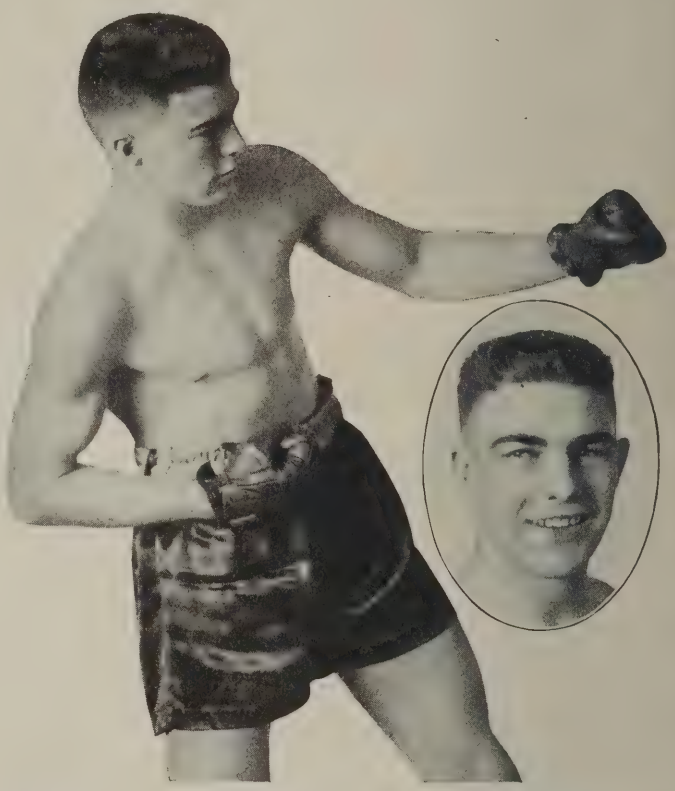
Ice Cream for the Invincibles

Young Stribling, "Uncrowned Light Heavyweight Champion of the World," Who Eats Quart of Ice Cream After Every Fight, is Proof that Ice Cream Can be Made a Most Popular Health Food, Since it Can be Eaten by People Who Don't Like Milk. "Gentleman Jim" Corbett, Babe Ruth, Ty Cobb and Nurmi also like Ice Cream

IN THE March issue of The Ice Cream Review there appeared an interesting discussion concerning reasons why the ice cream industry should capitalize upon the popular sentiment built up around the dairy cow. A. C. White, Flint, Mich., was quoted as wanting to know why ice cream never gets as much publicity as milk.



Welfare workers are continually making lectures on the health importance of milk, and many times prominent men voluntarily take time to make speeches of this kind, but when do you ever see anyone rise up in meeting to expound all the food qualities of America's greatest food dessert—ice cream? When?

The National Dairy Council has succeeded in driving home some valuable educational work for ice cream. But outside of that little has been done.

Mr. White, in the article in the March issue, was quoted as having observed that many people who should be drinking milk don't get it because they don't like it. But did you ever hear of anyone who doesn't like ice cream? If so, see Mr. White; he has offered a reward for anyone who can produce a child that doesn't like ice cream.

ICE cream for health? Why not? If we just stick a little closer to the dairy industry, keep letting folks identify ours as a dairy product, we shall hear more about the dairy food value of ice cream than has been said in public heretofore.

W. L. Stribling, "uncrowned light heavyweight of the world," is passionately fond of ice cream. There could be no better argument for the food value of the product than the phenomenal success of this great ice cream fan, who, in an extremely short space of time, has defeated virtually every pugilist of importance in his division.

Ring views of Young Stribling, "Uncrowned light heavyweight champion of the world," who likes a quart of ice cream at end of every fight.

He eats ice cream every day of his life except during the period of three days immediately preceding each fight.

And after each fight he eats one quart of ice cream before going to bed!

He likes our product pretty well, doesn't he?

Young Stribling getting his fill of ice cream at the Kinnett-Odom plant, Macon, Ga.

YOUNG STRIBLING was in Milwaukee in February to fill a boxing engagement. A representative of The Ice Cream Review sat at the side of his cot and talked to him after he had finished a run of about five miles. He was hardly breathing fast at all. His young body—he is not yet 21 years old—stretched as lean and muscular as that of a panther, power showing in every line.

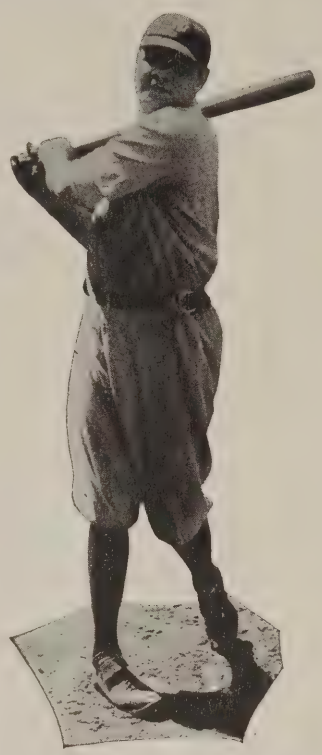
His famous father-manager, "Pa" Stribling, was engaged in massaging each and every little muscle of importance. During this operation Young Stribling talked. And listening to him one could not help but be impressed with the great change in boxers of today—a decided improvement upon the plug-ugly type of mit

swingers we used to call pugilists. He frankly discussed his eating, living and fighting habits. All were clean.

JUST a few years ago a pugilist would snarl a nasty insult out of one corner of his mouth if anyone should suggest that he have a dish of ice cream. Not so with Young Stribling or any of the other high grade young fighters.

"Gentleman Jim" Corbett, who defeated the mighty John L. Sullivan for the world's heavyweight championship, always has liked ice cream.
This photo, taken when Corbett was champion, is used here by courtesy of John Morgenroth, Milwaukee.

People who have read the memoirs of James J. Corbett, the great pugilist who brought about a veritable reform in boxing technique, understand how ice cream was regarded in what some folks call "the good old days." Ice cream was "lady-like stuff." No he-man would think of eating it. Naw, gimme raw meat and hash brown potatoes.



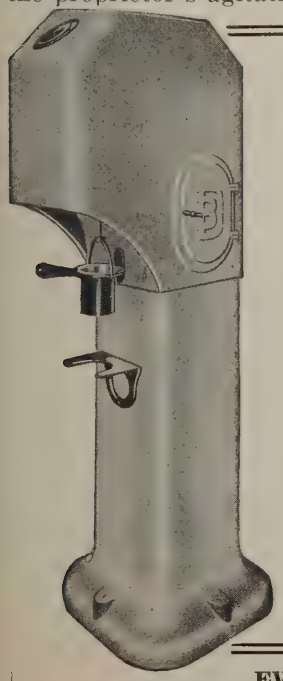
The story is told of how Corbett had an altercation with a young man once, a personal quarrel about a girl. They were at a party. The young man did something that made it very unpleasant for the young lady Corbett was escorting. "Gentleman Jim" immediately made up his mind that the next day he would call upon this young man, who ran a soda parlor in an obscure part of the city. On his way to this place, Corbett was joined by a friend, who also was Irish. This lad went along just to see a good fight.

They reached the soda parlor. The proprietor, the man who had committed the affront, was approached by Corbett, and the former immediately turned deathly pale upon recognizing the great boxer, for even then Corbett had much of a reputation. In fact, so great was the proprietor's agitation, and so profuse was he in his apologies, Corbett had no wish to fight him. So when the proprietor invited him to have a dish of ice cream on him, Corbett accepted the invitation, for he was—and still is—fond of ice cream. The fighter's friend, seeing the pugilist "lapping" up ice cream and no prospect of a fight materializing, said, "Aw, hell," and turned on his feet and walked away.

A FEW years later the same man was among those who stood on soap boxes and cheered till they were hoarse when "Gentleman Jim" Corbett, the lad who liked ice cream, knocked out the mighty John L. Sullivan and became heavyweight champion of the world.

Corbett's fondness for ice cream probably had much to do with the popularity this product soon began to claim among most all pugilists. To this day the great exponent of the modern school of boxing likes his ice cream.

Paavo Nurmi, "the Flying Finn," who at this writing is engaged in smashing running records all over this land, has learned to like America's great food dessert after becoming fully acquainted with it on his visit to America.



Babe Ruth, the mighty bambino, is a thoroughbred ice cream fan.

Ty Cobb, the world's greatest baseball player, holder of more records than any other man that ever played the game, is fond of ice cream.

"Babe" Ruth, the mighty slugger, can "kill off" a huge dish of ice cream any time he stops to pass the time of day with a friend.

Ice cream has won a place on most of the training tables for college athletes, wrestlers, professional baseball teams, swimmers and virtually every other kind of endeavor that calls for expending great energy.

Sommers Ice Cream Over-run Tester

Simple in Construction—Quick Acting and Accurate

SMOOTH, SIMPLE CUP IS USED.

No loose weights or adjustment on Cup necessary.

Adjustments for variation in specific gravity of the mix are easily made on the Tester itself.

The Cup hanger is easily accessible.

The reading is always made at one place, right under your eye as you stand in front of the Tester and tilt your head slightly forward.

CO-OPERATION AND ARBITRATION IN THE ICE CREAM INDUSTRY.

New York, Feb. 27, 1925.

Editor The Ice Cream Review:

As I read your first editorial in the current number I said to myself, "Well, someone is waking up to the whole trouble in the ice cream business." You have hit the nail on the head, so far as the basic trouble is concerned. I felt the same about it years ago, but then I did not know how to remedy it. Now I do.

Secretary Hoover said the other day: "Industries must do their own house cleaning, or the government will step in."

The Commissioners of the Federal Trade told me the same thing. The U. S. Chamber of Commerce head said the same. I was then studying the great problem of every industry—how to make their members co-operate and deal fairly with each other. I have found it; it is an arbitration system that is at once a police power, an enforcer of fair dealing and a stabilizer of business conditions.

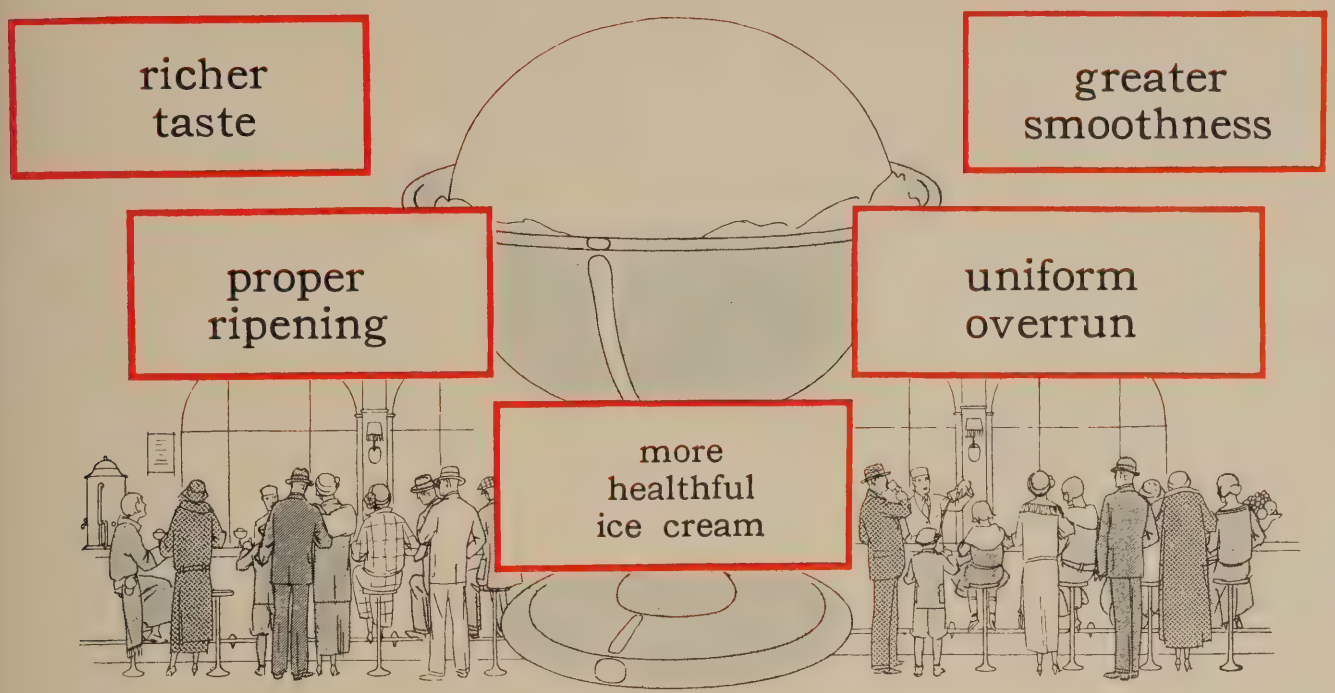
There are now 132 industries and businesses that are using arbitration to cure their ills, and it is succeeding even more wonderfully than was hoped. I have got up several plans and they are being put to good use. It can be done in the ice cream industry, and the plan can be more simple than you would think.

In two states there is a similar law on arbitration. When an arbitration clause is printed on contracts or bills all disputes must be settled by arbitration. The arbitrators have all the power of courts, can issue subpoenas for witnesses, documents or books, and the decisions can be filed with a supreme court judge, having all the effect of that judge's mandate. The decision cannot be set aside unless for bribery.

There is a national arbitration law ready to be passed by Congress which will allow the settlement of any dispute involving amounts less than $5,000 by arbitrators. We are working for a standard law in all the states, which will relieve the courts, save time, money and insure more fair decisions.

Any industry that is sold on this idea can set its own trade policy, tell what cannot be done and offenders can be hauled up before its own courts and adjudged. Publicity can make the judgments enforcible.

Why not try it out? Sincerely, L. O. THAYER.



HOW ARE WE GOING TO GET THIS CO-OPERATION?

We manufacturers can equip our plants in the most modern manner, perfect quality until it is practically perfect, spend thousands of dollars yearly in advertising, until it would seem there could not be a man, woman or child in the community who would resist walking up and purchasing ice cream every day. But, alas, when they do, it is only to strike against the impregnable entrenchments built around our product by the indifferent and careless dispensers and all the money and effort put into advertising is scattered to the four winds of the earth.

The dealer is directly responsible for this condition of affairs—not all of them, of course, but the percentage of dealers that seem to have the right viewpoint toward our product is so small until at times it would seem they are almost unanimous in their attitude of absolute indifference, apparent lack of interest and entire lack of co-operation in promoting the sale of ice cream.

Just what is the cause of this, I am unable to say. It seems inconceivable, but it is true, that a druggist or confectioner will spend thousands of dollars on fountain and fixtures and then turn over the entire management and responsibility of making them profitable to a usually listless, careless, indifferent dispenser, who promptly fails to make good and as an alibi blames it on the ice cream.

What is the remedy for this? The advertising man will say: "Advertising;" the iceless cabinet man, "Better service;" the food official, "Higher standards;" the salesman, "Better salesmanship." True, all of these are unquestionably essential and beneficial and over all of them you have absolute control and the responsibility as to how efficiently they are administered rests entirely with you. But you have no control and cannot assume any responsibility for the dealer. We have gained the interest and appetite of the public and a little co-operation from our dealers would sell two gallons of ice cream where one is sold today.—From Southern convention address by Convention President W. J. Barritt.

[FOR A RICH, APPETIZING ICE CREAM *Hansen's June Cream Color*]

Mammoth Show Planned for Detroit

Ice Cream Men Will See Exposition One-Third Larger Than Last Cleveland Show When National Association Celebrates Silver Anniversary This Year, According to Supplymen's Officials

WHAT promises to be the largest and most complete exposition of ice cream supplies, equipment, etc., will be held in connection with the National Association of Ice Cream Manufacturers' silver anniversary at Detroit, October 19-24, it is indicated in an announcement just released by Roberts Everett, secretary-manager of The Association of Ice Cream Supply Men.

This exposition, according to announcement, will be larger by one-third than was the second national exposition in Cleveland's public hall in 1923. There was no exposition in 1924.

Convention Hall is the name of the building which will be the scene of the exposition. This is described as one of the largest industrial exposition halls in the world. The display will all be on the ground floor, which is of cement. We are told that the building is unusually well lighted, is within favorable distance of the leading hotels and business section, and is directly accessible from the street for the delivery of goods.

The supply association's announcement follows in part:

The exposition will be the largest and most comprehensive, in all probability, that the industry will ever have witnessed. This is indicated by statements of association officers, based on an informal survey that has been made of what may be termed the exhibiting field's requirements and on the leasing of an exposition area larger by one-third than that occupied by the second national exposition, held in Cleveland's Public Hall, in 1923.

Arrangements for the housing and convenience of delegates to the national convention, and visitors at the national exposition, will be adequate. Hotels, the association announces, within a ten minute radius of chosen hotel center—itself ten minute distance only from the exposition building—aggregating 7,000 rooms will receive, beginning immediately, reservations from the ice cream industry. No other industrial convention will be held in Detroit during the week of the national exposition and convention.

Pending the issuance of a general hotel guide for the week, The Association of Ice Cream Supply Men announces that its general headquarters will be established at the Hotel Tuller, and that the National Association of Ice Cream Manufacturers, according to information received by the supply association, will establish its headquarters at the Hotel Statler. These hotels stand on adjoining corners fronting Grand Circus Park.

DETROIT was put in Class "A" in the grading of American cities as to fitness for ice cream expositions when the Association of Ice Cream Supply Men completed its survey of the country some months ago, which was published in the December issue of The Ice Cream Review.

Group "A" includes the cities that can be expected to offer the least physical inconvenience with respect to

Fred Rasmussen, New Secretary, Assumes Duties

Loewenstein's Successor Takes Office in Time to Prepare for Association's Silver Jubilee

FRED RASMUSSEN is in harness. He assumed the duties of secretary of the National Association of Ice Cream Manufacturers March 1. It would be better to say, he is in harness again, for Mr. Rasmussen is no stranger to the dairy industry. His splendid career was reviewed in a past issue of The Ice Cream Review, when it was first announced that he would become identified with the ice cream manufacturers.

FRED RASMUSSEN.

He has wasted no time in setting things in motion at Harrisburg, Pa., where national headquarters have been established, after being located for many years in Chicago, where the association was organized.

Mr. Rasmussen takes hold in time to begin energetic preparations for the silver anniversary celebration of the national association at the Detroit convention next fall.

"There is every reason to believe this will be a most important convention," he says. "Detroit has admirable convention facilities. The totels are nicely bunched. The convention will follow the dairy exposition, so that delegates can go from Indianapolis straight to Detroit."

The secretary has some interesting ideas of his own about popularizing ice cream, for which product he believes there is a remarkable future. The suggestion of serving ice cream at breakfast with strawberries has been spoken of jokingly. Not so with the new secretary, who very solemnly believes there is no limit to the extent to which ice cream consumption can be increased.

National headquarters will remain at Harrisburg, at least for the time being, though officials give no intimation as to whether or not another location will be sought in the future. Washington, D. C., which was recommended by many manufacturers for ice cream headquarters, has been eliminated from consideration, however.

The bulletin in which President Hovey announced that Mr. Rasmussen was to take over the duties of secretary, stated that the national association had weighed the advantages that some believed Washington would offer as national headquarters and it had been decided that, for many reasons, Washington would not be made headquarters, among those reasons being, according to the president's bulletin:

> We consider that the work of dealing with state and national legislation is only a very small part of the work of the national association, and we do not believe it is desirable to subject the association to the criticism of being primarily a lobbying organization by moving the offices to Washington, at this time. Neither do we desire to leave the impression with our members that the legislative problems is the principal work of the association. For the above reasons, and also for the convenience of the secretary and president, and also because we do not wish to increase our expenses or make any great splurge until warranted by the work we are doing, we shall for the present defer consideration of Washington for our headquarters.
>
> The association now has a full-time secretary, who is ready to promote the industry in every way possible. To render the greatest service, he must have the co-operation of the members of the association. The offices of the association should be the clearing house for all the problems of the industry; therefore, whenever you have suggestions to make for the good of the industry, or problems which need study, or immediate attention, write the National Association of Ice Cream Manufacturers, Telegraph Building, Harrisburg, Pa.

Mr. Rasmussen recently visited Chicago and completed the details of taking the association's business to Harrisburg, where he will be found again in the service of the industry he loves so well, this time in the ranks of the ice cream men—in harness!

MAMMOTH SHOW PLANNED FOR DETROIT.

FOR MAKING THE MOST DELICIOUS

Water Ices and Sherbets, Use

BOWEY'S

JELINE

FOR WATER ICES, SHERBETS, ETC.

Increased business, larger profits and satisfied customers await the ice cream manufacturer who can supply the growing demand for smooth, delicious and stable Water Ices, Sherbets and Frappes.

Insures Uniformity and Stability of Color, Flavor and Texture

The day of the icy, harsh, tasteless Water Ices and Sherbets, etc., is over. Jeline insures body and velvety smoothness, uniformity of flavor and color and a stability that will permit repacking without loss of these most necessary qualities.

Sample Sufficient for 10 Gallon Pot Free on Request

Jeline does for Ices, Sherbets, etc., just what gelatine does for ice cream, and is far superior to gelatine in its particular field. Jeline is a pure vegetable product, easily soluble, requiring no boiling, soaking or heating, and invariably gives a velvety smoothness to the body of Water Ices, etc., while maintaining a uniformity of flavor and color.

Baird Bodies for

175 GALLONS OF ICE CREAM PER TRIP can be delivered in the Baird Refrigerator Body pictured above.

It is a regular 100 gallon Baird Refrigerator Body carrying 1500 pounds of ice and ample salt.

The ice cream compartment holds a full 100 gallons. In addition this body is equipped with an insulated and refrigerated can compartment, as described in our catalogue.

This insulated and refrigerated can compartment holds an extra 75 gallons, giving a total capacity of 175 gallons of ice cream.

175 gallons of ice cream, with 1500 pounds of ice and ample salt, in a Baird Refrigerator Body on a 1-ton truck means economical delivery.

Economical Delivery

THE WIDE AND GOOD REPUTE of Baird Refrigerator Bodies is based upon the lasting satisfaction which they give in service. This is demonstrated by the large number of Baird users who re-order Baird Refrigerator Bodies year after year.

A FEW INSTANCES:—

The Hershey Creamery Company, Harrisburg, Pa., bought 6 in 1923, 1 in 1924, and 3 in 1925.

The National Ice Cream Company, San Francisco, Calif., bought 3 in 1923, and 7 in 1925.

H. P. Hood & Sons of Boston, Mass., bought 4 in 1923, 1 in 1924, and 12 in 1925.

The City Creamery Company, Danbury, Conn., bought 2 in 1923, 2 in 1924, and 1 in 1925.

T. G. Hancock Company, Chelsea, Mass., has bought Baird Refrigerator Bodies in 1922, 1923, 1924, and 1925.

The Puritan Ice Cream Company, Boston, Mass., bought 1 in 1922, 1 in 1923, 2 in 1924, and 1 in 1925.

Mr. E. L. Garber of Lancaster, Pa., after observing Baird Refrigerator Bodies used by associated companies in 1924, bought 11 Baird Refrigerator Bodies in 1925.

William F. Baird Company

Honeymoon Ice Cream

our Special today

THE new Honeymoon window strip pictured above, will soon be teasing the eyes and appetites of people in 42 states where Honeymoon Ice cream is now being made.

If you do not know about "Honeymoon Special," here is the story in a nut-shell. It is a fruit blend made exclusively by The Cleveland Fruit Juice Company. Two quarts are sufficient for a 5-gallon mix. No color is needed.

Honeymoon Ice Cream outsells other Specials because it has all three points that make a winning cream.

—a color that coaxes a trial. Pink with bright fruit pieces flashing throughout.

—a flavor that teases the taste. One of those rare blends that appeal to all classes of trade.

—a catchy name.

Let us send you quotations on Honeymoon Special. We'll also tell you about the success of other ice cream manufacturers in your own state with this great Special.

Breyer Again Will Teach Ice Cream Salesmanship

THE sales promotional scheme inaugurated by the Breyer Ice Cream Co., Philadelphia, in 1924, when the company held a convention of its dealers from several states, will be repeated this year, it is announced in a statement by E. J. Mather, sales manager of the Breyer Company.

The second annual convention and exposition for ice cream dealers will be held by the company at the West Philadelphia plant, April 13, 14, 15 and 16.

The company has put under way plans to entertain 20,000 or more dealers and their families this year. The company expects to make this year's convention eclipse the 1924 affair in every respect. The company has made the following statement with regard to business sessions:

"This year there will be but one business session on each of the four days—from 3:00 o'clock to 4:30 o'clock. The dealers will be addressed by men who are familiar with every phase of ice cream manufacture and merchandising, and opportunity will be given for informal discussions of problems affecting the industry. Practical talks will be given on store lighting, management, location, and other topics of interest to dealers in bringing about a closer co-operation between the maker and the seller of ice cream."

The exhibit will occupy two entire floors of the Breyer plant. Leading manufacturers of modern store equipment, soda fountains, fixtures, lighting devices, etc., of interest to ice cream dealers, will exhibit their wares. There will, of course, be inspection tours through the large Breyer ice cream plant, which claims the distinction of being the largest plant of its kind in the world.

⚜

A BACKGROUND FOR ICE CREAM.

It is absolutely necessary that you build a standard. You must have a background for presenting your product and a foundation on which you can present it with safety, assurance, confidence and success. What is your product? It is everything there is in milk. Your president said the consumption of milk has increased during the past three years over thirty per cent. That is true. The milk production of this country has increased from 1920 to the beginning of 1924 from 89,000,000,000 pounds to 109,000,000,000 pounds, and it has all been consumed in this country. Why? Because people are coming to learn the food value of milk and what is in milk. About 46 per cent of that 109,000,000,000 pounds of milk are consumed in the form of milk. Between 36 and 37 per cent is consumed or used for butter. The balance is used in ice cream, evaporated, condensed, powdered milk, cheese and incidentals, feeding calves, etc.—From national convention address by M. D. Munn.

⚜

There were 187 ice cream slogans submitted by American citizens temporarily residing in England, Spain, Germany, Japan and other parts of the world, showing how wide-spread and far-reaching was the publicity.

⚜

You see some wonderful things looking up; you see nothing but mud looking down.

RICUT

The **orange** flavored pulp absolutely uniform—no seeds, etc. Makes the finest Ice Cream, Sherbet and Ices.

Something new and better than ever before—improve your product. Send for sample. Packed 100 lb. kegs and bbls., also in gallon bottles.

ICOLETTE

The ideal flavor and color combined. Made in all flavors including orange, use 5 oz. to 5 gal. mix.

Motorized Delivery in the Ice Cream Trade

Experiences of Two Leading Manufacturers With Gas and Electric Trucks

THE experience of the Hendler Creamery Co. of Baltimore is interesting. This company has motorized its delivery, using both gas and electric trucks. Electric trucks are used within a radius of 10 miles from the plant, with an average daily mileage of 15. Gas trucks are used for the longer distances and for inter-urban transportation. The electrics are of 5-ton and 3½-ton capacities, the 3½-ton averaging 170 gallons of ice cream a day and the 5-ton as high as 500 gallons.

A driver and helper are used on each truck, and a superintendent and six men take care of the repair work in the garage on 31 trucks and 6 passenger cars.

Up to about six years ago horses were used but were abandoned for sanitary and other reasons. It was found that in the hot weather at the height of the season horses were knocked out just when their services are most needed. This seriously crippled their service and customers were lost as a result.

Trucks in use by different ice cream manufacturers of the country.

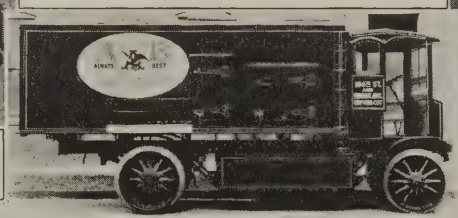
Some of the mighty carriers of the Supplee-Wills-Jones Co., Philadelphia.

Views of electrics of manufacturers of New England will appear in the May Review.

Part of a Chicago manufacturer's fleet of electrics.

Pittsburgh hills are no obstacle to these motors of The Tech Food Products Company.

The Carroll Company, Chicago, have used economical, dependable trucks for years.



Trucks operated by the Hoefler Ice Cream Company, Buffalo.

Recent installation of trucks by the New Haven Dairy Company, New Haven, Conn.

Part of fleet of 10 trucks of the National Ice Cream Company, San Francisco.

Part of The Lawrence Ice Cream Co.'s fleet of 20 trucks.

Each truck carries also 500 pounds of salt and about 2½ tons of ice.

On account of the corrosion, due to the brine, the chassis are always galvanized and special refrigerator bodies used, which keeps the salt water away from the machinery of the trucks.

Two hundred and twenty-five dollars is allowed for body repairs and painting, because it is believed that well-kept trucks are a valuable advertising asset to the business. The same amount is allowed for repairs on the chassis and the cost of galvanizing is about $125.00.

The experience of this company shows that their electric trucks last at least twice as long as the gas trucks, and the tire mileage is about 33⅓ per cent greater.

The Chapin-Sacks Corporation, the large ice cream manufacturing firm, operating throughout the South, has recently motorized its delivery equipment in Washington, D. C., and Greensboro, N. C., changing over from horses to electric trucks. After testing and experimenting with various types of trucks, officials decided to sell their horses and stable equipment at auction and place

Better Morale for Employees

Working Seven Days a Week in the Ice Cream Industry May Be Eliminated by Iceless Cabinets, Expert Believes

A GOOD influence upon the morale of employees in the ice cream industry is seen in the iceless cabinet by F. B. Fulmer, chairman of the board of directors of the National Association of Practical Refrigerating Engineers, and connected with the Miller Bros. Creamery Co., Oakland, Cal.

It has long been a general complaint that the ice cream industry is pretty much a seven-days-a-week proposition, with little time off for anybody. The iceless cabinet promises to do away with these long working weeks, it was pointed out by Mr. Fulmer, in an address before the National Association of Ice Cream Manufacturers at the 1924 convention. The speaker told of the lengthy investigation of iceless refrigeration.

F. B. FULMER.

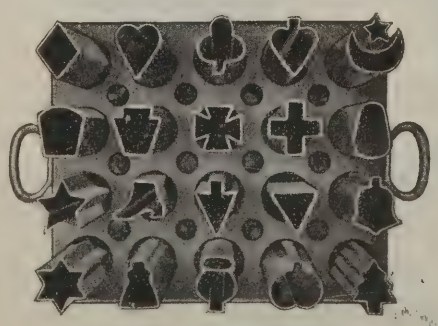
Speaking on the increased efficiency that may be expected of ice cream employees as a result of the iceless cabinet, Mr. Fulmer said:

"Brushing other considerations to the side, the lowest point that we considered was the ethical standpoint. Now, the theory of the mechanically refrigerated cabinet is this, that it keeps the ice cream, whether the can is nearly full or nearly empty, in a good serving condition throughout the whole period of the time it is in the machine. That being true, in the slack season of the year it is no trick whatever to fill up the cabinet to its full capacity on Saturday and allow the drivers and other operators their Sundays off.

It has been bound that people look forward to a day of rest on Sundays perhaps more than any other day of the week. I say that from experience, having tried it out. And, such being the case, we expect a reasonable increase in morale in the employees, and when that reacts we have the same condition that prevailed at Gary, Ind., when the steel mills there—I was going to say the steel trust—I will not use the words—the steel mills there reduced their working period from 12 hours to 8 hours per day and turned out practically the same amount of work."

Sanitation is an important point that should be considered with regard to iceless refrigeration, the speaker pointed out. His investigation shows that sanitation is one of the arguments on the side of iceless cabinets.

AS FOR durability, a point that has been debated much at recent conventions, Mr. Fulmer believed "it is reasonable to conclude the mechanical refrigerated cabinet as it stands today is reasonably durable." He said he had seen iceless cabinets that were in operation for three years and others that had been in operation one year. He has studied the mechanical construction of the various devices made, watched them in operation and gathered other's experiences.



Regarding temperature, he said:

"As I understood the first speaker this morning to say that there was a range of temperature in the ice cream in the mechanically refrigerated cabinet of approximately eight degrees. Now, if I understood that right, I question it. I do not know what cabinet he is referring to, and it doesn't make any difference what cabinet he is referring to. I don't think there is a mechanically refrigerated cabinet out today that has a variation of eight degrees in the temperature of the ice cream. Probably the temperature of the media surrounding the cream was meant. If that was the case, I have no issue with him."

HE ISSUED a warning against forcing mechanically refrigerated cabinets upon dealers, pointing out the danger of reaction. The attitude of the manufacturer, he insisted, should be to consider the convenience as applied to the customer, the ultimate consumer, for—

"Any innovation or new appliances forced on the customer against his will, is not based on a solid foundation, and will, in time, react, and the reaction many times will be rather sharp. Such being the case, we should investigate the merits and demerits of everything that is put up to us as a new proposition."

Mr. Fulmer is one of the leading experts of the country on refrigeration. He contributes regularly to The Ice Cream Review.

TELLING'S LATEST

(THE NATIONAL SLOGAN)

Serve It and You Please All

In addition to the long tubes used extensively by the large Manufacturers throughout the country for making Fancy Center Brick Cream, the smaller dealer may now secure all these designs in 1 qt. lengths with covers, neatly packed one dozen in a box, assorted if desired, at $15.00 per dozen.

Those using the Sealright container may secure these in one quart, three pint or two quart lengths, one end being closed to allow the removing by pouring a little water in the tube so it will lift out easily by a conveniently arranged handle, after which the space is filled with any color cream, sherbet, water ice or whipped cream, to carry out the design and color scheme, making a very beautiful portion when served. These sell at $17.00 per dozen.

Why the Canvas Iceless Shipping Bag?

The Shipping Bag is Claimed to Have An Established Place in the Ice Cream Industry

*By P. C. GOODRICK**

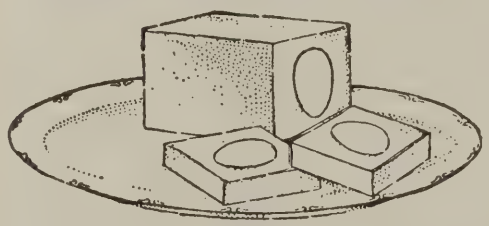
ICE cream shipping containers made from canvas and other insulated materials which do not require ice or salt to preserve the cream have been holding the attention of the manufacturer the past six or eight months.

The containers made by the various companies are proving so successful in operation, and the ice cream manufacturers everywhere using them, appearing so enthusiastic over them, a brief outline of their general outline may prove interesting.

Canvas and hair felt, and other insulating material of this nature, have been used by milk shippers for years, being used to keep the cream in the cans from getting too warm, and to hold the cream to as low a temperature as possible during transit.

While canvas and felts had long ago proved their value as insulation, they had not come into use by the ice cream manufacturers until the introduction of the iceless cabinet. The use of the cabinet has given the iceless shipper a tremendous boost. Naturally the dealer operating a cabinet does not require ice that ordinarily comes packed around the cream. Further, he does not want the ice, much preferring to receive his shipment dry as the ice is objectionable in handling in his store and care should be taken that the can of cream is put into the cabinet dry; owing to the entire absence of any ice or salt in the shipper and to the fact that the canvas bag is so light, compared with the old tub and ice method, making such a decided drop in express cost to the dealer, it has rapidly in the past few months ascended to a place of interest to the ice cream manufacturer; second, only to the cabinet itself in importance and general interest.

* Manager of the Canvas Products Corporation.



QUESTIONS are often asked the writer, as to how long will the cream hold in these bags. As a general rule the bag will hold ordinary cream, well hardened, from six to ten hours. A little depends on weather conditions; considerable depends on how hard and firm the cream was when put into the bag; and not a little depends on the cream itself. Naturally, a cream that is light and full of air will not hold as well as the heavier makes. It is advisable for the manufacturer contemplating to use bags to test out his own cream under conditions in his own territory to get an accurate average amount of hours the cream can be expected to hold. The different manufacturers of these bags will gladly send one for such a test. Cream has been known to hold fourteen to eighteen hours, and has been reported as high as twenty. Last month's "Review" carried the story of one manufacturer who claimed his cream was carried through in good shape after shipment had been delayed on account of a wreck thirty-four hours. On the other hand, a few manufacturers report they cannot use them at all, but many of these afterward purchase them and use them successfully. There is some advantage in keeping the bags in the hardening room or anti-room. If the bags are placed open in the hardening, or anti-room, for about fifteen minutes prior to packing, the warm air which is within the bag will become chilled or escape and in buckling the can of cream into the bag cold air is thus held within the bag. In filling the bags outside of the anti-room there is, naturally, a certain amount of warm air contained within the bag which must be absorbed before refrigeration takes place. Most manufacturers fill their bags outside of the anti-room, finding that the bags hold sufficient time to make the average deliveries and only on long shipments, or in severe weather, are the bags packed inside of the anti-room or hardening room. It is estimated that packing the bags within the anti-room as suggested will make an hour or two hours difference in the holding time.

WE ARE sometimes asked how long will the canvas bag wear? Ice cream manufacturers who contemplate using bags are sometimes worried, believing that this canvas will soon wear out. As a matter of fact, their fears are unfounded. The peculiar resilient quality of the canvas fabric will tend toward a longer life of usefulness than is ordinarily accredited by persons unfamiliar with these products. In a general way it can be said that there are certain advantages in favor of the bag in that it naturally cannot break. It cannot crack, and if wear comes about it will be a long process, with the insulation intact until the wall of the bag is completely worn through.

You can readily understand that these bags can be hurled from an express car without doing the bags any particular damage. They can be stacked one on the other, either lying down, upright, or even upside down.

THE NEW ERA
Ice Cream Brick Cutter

Is now equipped with two scale boards that have adjustable scale racks. Each board, with a simple adjustment, will make ten different cuts to the quart, besides cutting quarts and pints.

The feed plate is now equipped with a screw adjustment, making it possible to adjust machine so same will space with unfailing accuracy.

This machine is simple in operation, speedy, accurate, and very durable. It is easy to keep clean and takes up very little space.

The NEW ERA has revolutionized the Brick Ice Cream Industry.

Write for our leaflet showing the operation and construction of the NEW ERA.

Our representatives are the leading Ice Cream Supply Houses:

John W. Ladd Co	Detroit, Mich. Columbus, O. Cleveland, O. Cincinnati, O.
Cherry-Bassett Co.	Philadelphia, Pa. Baltimore, Md. Pittsburgh, Pa. New York City Syracuse, N. Y.
J. G. Cherry Co	Cedar Rapids, Ia. St. Paul, Minn.
Wright-Ziegler Co.	Boston, Mass.
A. H. Barber-Goodhue Co.	Chicago, Ill. St. Paul, Minn.

The New Era Company
146 Merritt St. Oshkosh, Wis.

The canvas bag is easily repaired and kept in repair. They can be painted, and it is believed by those that have used them any length of time that the average life of the shipping bag will nearly equal that of the tub; in fact if it does not actually surpass it.

As far as adaptability is concerned, it is a wonder. A boy can deliver twenty quarts on a bicycle. You can pile five twenty-quart bags in the back of your sedan and seat your family there beside and have no fear that the canvas will mar the finest upholstery. It takes up much less room than the tub and ice; it is much cleaner; and does not weigh more than half as much. An ordinary truck with a double platform, 8x12, can be arranged at very small expense to transport as high as 1,000 gallons of cream. There is not an ounce of salt or ice used, and the express, a very important item in distribution, is cut all the way from fifty to seventy-five per cent, depending upon locality and amount of shipment. The above are facts which can be verified. Most manufacturers have been successful in shipping cream in bags at actual weight (about forty-five pounds.)

There is no question but what the bag is among us to stay. The cabinet was the introductory medium, but now with the iceless shipper firmly intrenched and the dealer educated to its advantages, many are demanding them whether they have cabinets installed or not, preferring to save on the express or service charges and purchase their own ice; and the manufacturer likes them because they eliminate a great amount of his cost of packing and delivery and takes up so much less storage space in his plant during the winter months.

NO METALLIC FLAVOR POSSIBLE FROM TINNED COPPER SURFACES.

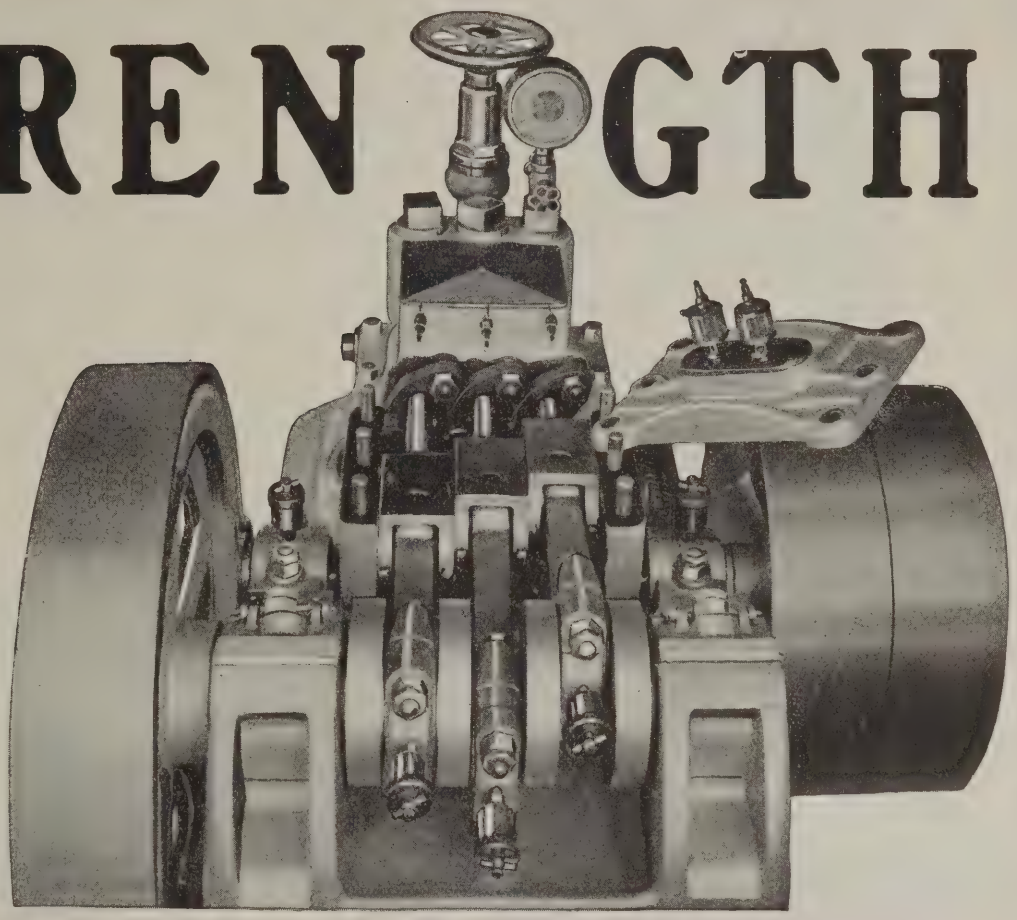
There has been so much propaganda in the trade papers of a misleading nature regarding "metallic flavors" it does not seem amiss to point out some facts that are invariably omitted from these articles.

It has been definitely established that it is no more possible for milk or cream to absorb "metallic flavors" from tinned copper curfaces than from glass. A careful reading of Prof. Hunziker's articles will reveal that fact.

You are never reminded in any of this propaganda that condensed milk is invariably heated in an **untinned** copper vacuum pan without imparting any "metallic flavor" to the product!

Your attention is never called to the fact that milk is first received at the farm in metal pails, put through a metal strainer at "animal heat" temperatures, transferred to your plant in metal cans and forced through metal tubes with a metal pump!

But most important of all, the flavor called "metallic" is now admitted by all authorities to be an acid or bacterial development in no way directly connected with metal or caused by contact with metal.—Cherry Circle.



ICE CREAM IN THE NEWSPAPERS.

The ice cream industry is getting more publicity today than ever before. There was a time when newspaper editorial writers held away from such things as baseball, ice cream and golf, but in this day and time, when these things mean so much in the affairs of people, one reads a newspaper editorial on ice cream every once in awhile. An interesting editorial on ice cream recently appeared in the Pittsburgh Post.

STRENGTH

Every successful Ice Cream Dealer knows the value of the **Viscolizer.**

A machine of this type which produces results must be of powerful construction.

A view showing the mechanism of a No. 450 Belt Drive Viscolizer. Cross Head cover is removed and this affords a good view of the crankshaft, piston rods and bearings. The Viscolizer is built for heavy duty service.

With STRENGTH as an objective the VISCOLIZER is built with

MACHINED STEEL CRANKSHAFT
EXTRA LARGE CYLINDERS
HEAVY CONNECTING RODS
BRONZE CYLINDERS
CAST EN BLOC CYLINDER HEADS
NON-CORROSIVE STEEL PISTON RODS

"There Are **MORE** *Viscolizers* in Use Than all Other Similar Machines Combined"

What Advantages Does The Electric Truck Offer for Ice Cream Delivery?

Pertinent Points for Manufacturers' Consideration*

1—Do electric truck manufacturers advocate the use of electric trucks for all ice cream routes?
No. Only for city routes where they are clearly economical

2—Why is the Electric truck more economical on city routes when the manufacturers do not recommend it for long routes?

Read On:

TIME studies show that the electric truck with its limited speed actually makes as good and sometimes better time on frequent-stop routes than the gas truck can, due to the fact that it gets away to a quicker start and comes to a quicker stop—has no gear shifting. The average ice cream truck is standing still nearly three-quarters of the time on a city route. It makes anywhere from 100 stops up to 200 or 300 stops a day, including both delivery and traffic stops. The quick get-away of the electric truck is evident from 100 to 300 at home, or a toaster, a percolater or an iron. Just throw the switch. Electric trucks may be equipped with automatic cut-offs. When the battery is charged the current supply is cut off.

How often does an electric truck battery have to be charged? It depends largely on the size of the battery and the mileage per day. Some electric truck users make it a practice to plug in the battery each night at the conclusion of the day's work. Others charge it two or three times a week.

These trucks of a leading Philadelphia ice cream manufacturer make a good impression on consumers in the streets.

times a day. Experience shows that the gas truck driver does not stop the engine at each delivery stop because that would involve a delay in getting away, particularly if he uses a crank to start. It would be practically impossible to use a self-starter on an ice cream gas truck and stop the motor at every delivery stop. The frequent stopping and starting would soon wear out the self-starting mechanism and exhaust the battery. Wherever there is an open highway—wherever the route is the outlying cities and towns, the gas truck is the logical vehicle to use because it can make better time. But where stops are frequent, as in the city, the electrical is logical not only because it frequently saves time, but because it saves expense. When the electric stops, fuel consumption stops and so does wear and tear on the mechanism. This is economy of time, days in service, and money.

Has the electric truck an engine? No. The power plant of the electric truck is a storage battery—simple, rugged and lasting. It is the big brother of the storage battery used in millions of passenger cars, and requires practically no care except occasional flushing with water and charging.

Is charging complicated? No. You simply plug in the truck the same as you plug in for an electric light

Where is the battery charged? In your own garage, or at your own loading platform. With the electric truck it is frequently right at the loading platform. No odor, no dirt, no fire risk.

How long does a battery last? It varies with the type of battery. The Edison battery has a schedule of replacement allowances covering a period of ten years. If the battery wears out in five years, there is a considerable allowance made on the purchase of a new one. If it wears out in seven or eight years, there is a somewhat smaller but liberal allowance made. If it wears out at the end of ten years, even then there is an allowance. Lead batteries, such as Exide, Philadelphia, K-W, also have liberal schedules of replacement allowances.

But what is the average service life of a battery from experience? The average Edison is between six and eight years. The average on Exide batteries is between three and four years.

HOW is the current from the battery turned into traction to the rear wheels? Through an electric motor; this electric motor is built to last as long as the electric truck. It is a powerful, sturdy, simple mechanism that requires little or no attention. You have a motor in

* Contributed to The Ice Cream Review.

The PROFITABLE LIFE of a truck is terminated when it no longer does its work at a lower cost than any other type of vehicle.

The experience of hundreds of Walker USERS, who have operated a wide variety of trucks, as well as horses, has fixed the profitable life of Walker Electric Trucks at from ten to twenty years.

"Old Faithful," one of the first Walkers built and the oldest truck in Chicago, is fifteen years old, but keeps on delivering from 300 to 350 bottles daily for the International Dairy Company. Investigate the Walker—leading Electric. Ask the users in your own field.

your passenger car and probably don't know it is there. That suggests to you the simplicity and freedom from trouble of the electric truck motor.

Is there anything about the electric truck, mechanically, that is at all complicated? No. The electric truck is acknowledged to be the simplest motor vehicle in existence. Outside of the battery and motor there is the chassis frame, the two axles, four wheels and a shaft, or gears, to convey the power. Taking one prominent make of electric trucks as an illustration, this driving train consists of a shaft with a Spicer universal joint and a worm drive axle—a type of construction that is thoroughly familiar to truck operators and truck service men. The wheels on this truck are artillery wheels similar to gas truck wheels. The brakes are the same as the gas truck brakes. Outside of this there is nothing except the controller which determines the speed of the truck. The electric truck has four speeds forward and two reverse. The higher the number of speeds the greater the number of contacts there are in the controller—the more power there is applied to the rear wheels. The controllers on electric trucks have been developed to a high point of efficiency and give little trouble.

How long does an electric truck last? The life of the electric truck is not really known yet. If an electric truck does not last ten years, with reasonable care, its maker is ashamed of it.

There are numerous electric trucks running around that are 15 years old, and, in fact, in New York City there are electrics running that are between 20 and 25 years old. Their owners refuse to trade them in for new vehicles because they are still running efficiently. This, in spite of the fact that the electric of today has many improvements over those of years ago. Ten years' life is a safe figure, and, in many cases, it is safe to depreciate electric trucks over a 15 year period.

What is the easiest way to determine the routes for the electric and the routes for the gas truck? By route analysis, or what is known as logging each route. It simply consists of determining the mileage on each route, the number of stops, the grades, paving conditions, and the loads to be carried. With this information it is possible to tell exactly where the electric truck can save money.

What saving does the electric truck effect? Users report savings of from 20 to 35 per cent, and some times as high as 50 per cent. Naturally it depends upon the character of the equipment that was used before the installation of electric trucks. The electric will operate more efficiently and more economically than the horse, and more economically than the gas truck on the short-haul or frequent-stop route. The degree of the efficiency against the gas truck on such routes depends upon the type of gas truck. It is obvious that a quality gas truck costs less to operate in the long run than the cheap gas truck. It is also obvious that an overloaded truck costs more to operate than a truck that is loaded to its normal capacity. If a man is using a cheap light gas truck and overloading it, he is not only rendering himself a disservice, but he is not fair to the truck manufacturers because he is subjecting that gas truck to a load and strain it was never recommended for. So the saving the electric truck will effect will depend upon the character of the present equipment.

You say that electrics are cheaper than horses. What evidence have you of this? Savings are a matter of dollars and cents. There are two ways to determine them. One is to set up a complete statement of horse costs in one column and set opposite them electric truck costs. The other way of determining which is more economical is through those who have used horses and replaced them with gas trucks. The Hydrox Ice Cream Company, Chicago, for instance, used horses on frequent-stop short-haul routes. They say that compared with the shortest horse route—down in the Loop District—the cost of the two vehicles was just about a stand-off. From there on up, the electric showed economy over each horse route and the economy grew greater as the routes grew longer. Rather than continue the few routes where it was practically an even break, Hydrox applied the electric truck to all horse routes and saved considerable money.

Partial view of plant and electrics of Goldenrod Ice Cream Co., Chicago.

The horse costs much less in first cost than the electric truck. Do you take into consideration depreciation and interest on the investment when you say that electrics are cheaper? Yes. We consider everything. You must bear in mind in considering everything that there are two sides to that story. The electric has a higher first cost and, therefore, higher depreciation and interest on the investment. Some users also insure their electrics against different forms of loss, although they did not insure their horse units against loss due to runaways, property destroyed, etc. On the other hand, the horse requires from two to five times the stable space when you consider not only the room taken up by the vehicle and one horse, but also the space for the harness room, the feed room, each horse's share of the hay loft, etc. As stated before some electric truck operators have greatly decreased their stable or garage space by storing their electrics right at the loading platform. But even if a separate garage is maintained for electric trucks, they take up very much less space than horses and wagons, making it possible to use the space saved for storage purposes. We know of one place where the proprietor now has a rest

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

This Adjustable Spring Hinge is another special feature that saves you money

A DOOR without hinges is just about as useful as an auto without an engine. In fact, the hinges have just about the same relation to the efficiency of the door that the engine does to the performance of your car.

And, obviously, a big, husky door on a weak, wobbly pair of hinges is as sensible as a 12-cylinder body on a set of Ford tires. You must match strength with strength. Otherwise—you soon find your doors leaning up against the back of the building, instead of directly between the cold air of your storage rooms and the warm air outside.

The hinge we have on exhibition here has two big advantages well worth noting. First — it has the weight and strength to match the lasting qualities of our doors—and remember, please, there are quite a few Jamison Doors on the job right now, that are already considerably older than the last generation to try on long trousers.

Second—it has more than STRENGTH! A special, patented, adjustable spring holds the door tight against the seals of contact **all the time.** Losses due to heat transmission have ceased to be a worry in nearly nine out of every ten big plants, both in this country and abroad, where Jamisons are an established fact.

You see, even though a door may be a small item in a large plant, it's a mighty big item with us. And if we were building dirigibles, I don't believe we could use any more care in each operation or give our customers any greater assurance of built-in worth.

DOBBIN GOES OVER THE HILL.

A traffic ordinance, recently passed by the city council of Los Angeles, prohibits animal drawn vehicles from the central business district of the city between the hours of 4:30 and 6 p. m.

"The horse, once man's speediest means of locomotion, has become too slow for the modern American city," says the Los Angeles Times.

Los Angeles is not the only city that finds the slow-going horse a problem. Already there is under consideration in Chicago the question of keeping horses out of the Loop section, at least during certain hours of the day. In all large American cities traffic has become a great problem. One way streets have helped somewhat. The regulation of traffic by towers, such as on Fifth Avenue, New York, opening all north and south traffic at one time, and opening all east and west at one time, has done considerable, but no regulation made by man can speed the horse up to keep the pace of motor traffic.

The electric truck is peculiarly adapted for traffic and frequent stops.

With an electric, the motor stops when the truck stops. A policeman may hold up traffic, and when the electric stops, the car is silent—no vibration, no waste of power, no wear and tear on the car. And the same is true when an electric stops at a customer's door.

HOW IS SUCCESS ATTAINED.

One of the questions uppermost in the lives of all ambitious people is the question of how success can be attained. Young people especially are interested because life is before them with all its allurements, prospects and adventures but also with its failures. They know that success has been attained by many and they are eager to carve out a successful future for themselves, but how can it be attained and what are the necessary essentials that bring it about?

H. C. Larson, secretary of the Wisconsin Buttermaker's Association, has given some good advice on this subject to the junior buttermakers of Wisconsin which is not only applicable to those learning the art and science of buttermaking but to all young people who wish to attain success. Mr. Larson says: "The essentials of success are to work hard, to be up-to-date, to be efficient in work, and to be prepared to meet scepticism and ridicule." He then quotes the following:

"The father of success is—Work.

"The mother of success is—Ambition.

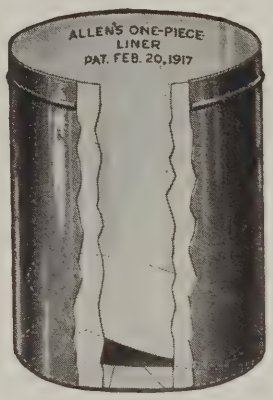
"The oldest son is—Common Sense.

"Some of the other boys are, Perseverance, Honesty, Thoroughness, Foresight, Enthusiasm and Co-operation.

"The oldest daughter is—Character.

"Some of the sisters are—Cheerfulness, Loyalty, Courtesy, Care, Economy and Sincerity.

"The baby is—Opportunity.



"Get acquainted with the 'Old Man' and you will be able to get along with the rest of the family."—Fountain City Republican.

The only ice cream customer really worth-while is the one who comes back for more. The Philadelphia Retail Public Ledger gives a hint at why some people don't go back for ice cream when it listed this paragraph under the headline, "That's Why I Didn't Go Back:"

"A tank of milky-white, lukewarm, oily water in which a soda fountain clerk washes the glasses, dishes and spoons and then dries them on what looks like a dustcloth."

Ice Cream Campaign to Cut Candy Business, Confectioners Believe

Warning to Candy Men Voiced by Leading Candy Publications in Regard to National Ad Campaign for Ice Cream Industry

VERY great possibilities for the ice cream industry's national advertising campaign are suggested by an article in a recent issue of one of the prominent confectionery journals, it being stated in this article that ice cream is going to replace "thousands of tons of candy sales in the latter's best season — the cool months." The ice cream men's ad campaign is presented to the confectioners as a warning that they must be up and doing themselves. The candy men are told that the important feature of the proposition, from their viewpoint, is that the ice cream manufacturers are endeavoring to work up their advertising and lay plans to increase the sale of ice cream in the seven cool months. It is at this time of the year that candy is sold in greater quantities.

This matter is discussed under the headline, "Ice Cream Aims to Get Trade Away from Candy," in the February issue of the International Confectioner, which is ably edited by George U. Harvey. Mr. Harvey is one of the outstanding men in the candy industry, his fearless fight against gambling machines in the industry, which was brought to a successful conclusion, having stamped him as one of the candy industry's real defenders. The sub-title of the article says, "Back of the $500,000 National Advertising Plan is the Idea to Sell Ice Cream in the Cool Candy Months. A wonderful Example of Co-operation and Business Brains in this Well-Planned Action."

The article points out that there are three lessons in the ice cream men's undertaking for the candy men to study. These are:

"The industry must get together and do it now. The way has been pointed out. Candy must be advertised much better than before."

This publication quotes "one big candy man" as saying:

Candy men will be forced to do a lot more reading, and very much more deep thinking if they expect to retain present sales volume, to say nothing of increasing it.

"Leaders are called for and they should have positive minds and views and get into action with a determination to have things done.

"The trouble is that every man has surrounded himself with a high wall of suspicion within which he is slowly poisoning himself to death. If a man goes out to do anything right he is misjudged, so what's the use?

"I wonder if this is the real trouble with candy. It seems too drastic to be true. Yet the condition is here to be faced. Brave men face danger while the other kind run from it.

"If the big men of the trade will only get together and hang together they can accomplish much that ought to be done. They can get up a national advertising campaign as well as the ice cream men. A workable plan is easy to provide if the trade will support it. Co-operation is the one essential necessity, as viewed by the leaders, to put the candy industry on a sound basis.

The peak of the candy industry's sales came in December, 1924. If the ice cream men could get to work and try to sell more ice cream in December, January, February and the rest of the cool weather months, the candy industry feels that it should get together and sell more candy in June, July, August and September, the months during which the ice cream industry is going at its liveliest clip.

FOUR KINDS OF ICE CREAM.

There are four kinds of ice cream:

1. Plain ice cream—called Philadelphia or New York ice cream, which is uncooked and is the kind usually made by the trade.
2. French or Neopolitan ice cream which is cooked and includes the custard, parfait and pudding.
3. Fancy ice cream—which includes mousse, bisque and glace.
4. Sherbets and ices.

Our Ladies Who Have Helped the Dairy

"THE ROSE OF LITTLE ROCK"

(at left)

is the title given Miss Helen Carmichael of the Watson & Aven Co., Little Rock, who covered herself with trade glory in connection with the Southern convention held in that city in 1923.

Miss Carmichael was placed in charge of local arrangements for that convention and her reward in a handsome bouquet of flowers from the Dixie Flyers.

She is a member of the Ladies Auxiliary and takes a keen interest in ice cream activities generally as well as in her company's own affairs. Her father is with the same company. No, boys, not married—not yet. But stand back, now—no crowding.

Alice in Freezerland

Might Well be the Title of this Sketch

SHE HELPS HUBBY

(above)

run the Sutton Ice Cream Factory, Vicksburg, Miss., and no one can bring up any phase of the industry with which Mrs. S. N. Sutton is not familiar. Her husband is prominent in association circles and is the active head of the company that bears his name, but Mrs. Sutton is right in touch with everything. And does her business activity make her a matter-of-fact business woman? There is a chorus of emphatic "No's" from ladies and gentlemen who have shared hospitality in the Sutton household and have seen this gracious hostess presiding over the dining room, the dance floor—and in the kitchen!

THEY CALL HER DIXIE'S SWEETHEART

(below)

but Mrs. E. B. Geisel's popularity is not confined to the ladies and gentlemen of the South. She is the wife of E. B. Geisel, manager of the Anheuser-Busch Ice Cream Co., New Orleans, and while she leaves business matters entirely to Mr. Geisel, she always is an active figure at all conventions held in the Crescent city. Ladies and gentlemen of the ice cream industry in all parts of the country last November left New Orleans saying nice things about this lovely hostess, who is a native of New England, which few people know when they speak of her in connection with Southern hospitality. Mrs. Geisel was the first secretary of the Southern Ladies Auxiliary. She is shown here with her little girl, Patsy, also a popular lady.

MIS' MARY KATE

(above)

is a familiar convention figure. She takes an active part in the management of Carr's Creamery at Montgomery, and is among the best posted people of her section on dairy manufacturing thoughts.

In her shop, so they say, she puts forth the same amount of serious effort that she shows in having a good time at conventions. She goes on the job early in the morning and stays late, keeping up with everything that goes on and all the ice cream that goes out.

She never misses a Southern convention.

Make Ice Cream the Rose of Industry

THERE IS A LADY

who signs her name as B. Edith Moore and says she has not as yet gone "far enough to deserve publicity," but those in the know say she is doing good work for the Flynn Dairy Co., Des Moines. One of her partners in industry, Laura Norvell Elliott, with the Union Ice Cream Co., Nashville, likewise shrinks from the spotlight. Lucy White, head of an ice cream manufacturing company at Covington, Ga., has given her only photo to some one she likes. Mrs. Nafis is found to be a very active member of the fraternity when anyone visits the offices of Louis F. Nafis.

And these are just a few of the ladies who are proving that making ice cream is not altogether a man's game. Indeed, No—o—o!

THEY CALL HER SALLY
(at right)

and she is at home wherever ice cream freezers "do their stuff." Miss Sally Mahoney, Hudson Manufacturing Co., Chicago, is one of the industry's most popular ladies. She finds time to handle a large part of her company's business, participates in many conventions. Members of the firm will tell you she never fails to find time to go to church.

"She is a good girl—a mighty good girl" they'll tell you at the Hudson office and you'll be surprised to find out how much of that company's business passes through her hands. The company claims it "adopted" Sally when she was a chit of a girl about 15 years old.

Visit the plant and you will be surprised at the large amount of the company's business that passes through her hands. She was the first president of the Southern Ladies' Auxiliary.

NATIONALLY PROMINENT
(above)

Mrs. A. H. Vander Bie-Babcock of the J. C. Vander Bie Co., Inc., St. Paul, owns one of the largest ice cream factories of the West and takes an actual interest in the affairs of this business, although the actual operation of the plant is under the direct control of W. W. Dunn, Jr. Mrs. Babcock has a typically feminine office in her plant, and she spends much of her time looking on and advancing helping suggestions.

Her interest does not stop with her own business; she is interested in the upbuilding of the industry. She is one of the directors of the National Association, being a familiar figure at national conventions.

THE OTHER MASSEY
(below)

of the firm of Massey & Massey is none other than Mrs. R. J. Massey. She is a member of probably as many ice cream supply organizations as her husband, though he directs the business that is carried on at their place of business in Chicago. Mrs. Massey was elected president of the Ladies Auxiliary to the Southern Association and the Dixie Flyers at the New Orleans convention last year. She formerly was vice-president of that organization, and is identified with other organizations of ladies-in-arms in Texas and Oklahoma.

No one is better posted on conditions in the ice cream industry, or upon association affairs in different parts of the country.

A PRACTICAL ICE CREAM WOMAN
(above)

is Mrs. Ruth O'Neil Dawson, production manager of the Peerless Creamery, Chattanooga, Tenn., who began in the ice cream industry 25 years ago, and has seen it advance from humble beginning to its present place of importance. She began her career in Chattanooga with the Sprague Dairy Co.

Mrs. Dawson is keenly interested in the development of the ice cream industry of the South, and is a good friend of the Dixie Flyers, the supply organization affiliated with the Southern association. She is seen at most every convention of the Southern association. She is secretary of the Ladies Auxiliary to the Southern Association.

YOUR CO-OPERATION WITH OUR ADVERTISERS BRINGS DESIRED RESULTS.

National Ice Cream Cone Week May 10-16

Second Annual Occasion

ICE cream cone week has come around again. It is to be hoped that it will find ice cream manufacturers of the entire country "up on their toes" with high resolve to make the most of this occasion, inaugurated last spring and expected to prove a popular annual custom. Results last year spoke for themselves; manufacturers who got behind this scheme made it count toward new customers at the soda fountain — ice cream customers.

The cone has won its place in the industry. It is our hope that out of this custom of National Ice Cream Cone Week will develop interest among manufacturers that will lead to bringing about uniform quality standards among ice cream cone men. The majority of the cone manufacturers are making a high-grade product, though once in a while a manufacturer acts against better judgment and accepts cones from obscure dealers who have little regard for quality. This is something which can do our industry no good. The cone is one of the links in our industrial chain; we cannot afford a weak link.

PUTTING over National Ice Cream Cone Week in any given city or group of cities merely means getting together in advance. It will be worth-while for the manufacturers of each city to call a little conference and talk over things, figure out a little money for newspaper advertisements, window cards, and take steps to see that dealers actually have ice cream cone window displays for at least a portion of the time during cone week.

Windows are all important.

There has been much complaint and protest upon the part of the public with regard to "special weeks," "drives," and such commercial occasions. But the fact of the matter is the public not only will stand for these occasions but actually likes to do so. That is one of the odd inconsistencies of human nature; we grumble at the things in which we really are interested; we crack jokes at the things which strike our fancy, though the real truth of the matter is we do not dislike the things at which we joke. Take baseball, fishing stories, jokes on wives, etc.; nobody can say we don't like these things, and yet they furnish a large share of our popular jokes and complaints.

National Ice Cream Cone Week will enable us to sell more ice cream. That is its purpose. It will bring the people back to the realization that a nickel still is useful for a purpose other than putting it with other nickels to make a purchase.

The ice cream cone is one of the very few things that can be bought for a nickel; and there are few dime purchases that can even compare with the nickel cone with regard to value for the money.

DURING most of the year we talk to the public about ice cream in terms of dimes, fifteen cents—even a quarter and 35 cents. For ice cream in the dish often runs up to pretty high figures.

This is our splendid opportunity to talk to the public in the term of a popular price —the lowly nickel. Not everybody can afford to pay fifteen and twenty cents for an ice cream dish, and still fewer can afford 25-cent sundaes and banana splits. The nickel cone enables us to attract to the ice cream counter many people who in the past have been spending their nickels with our friends the enemy, the soft drink and candy people.

With the ice cream cone we can meet these gentlemen on even ground, getting a fair field and asking no favors.

new points *in making* ice-cream

Send for a copy of the new folder on Skimilflakes

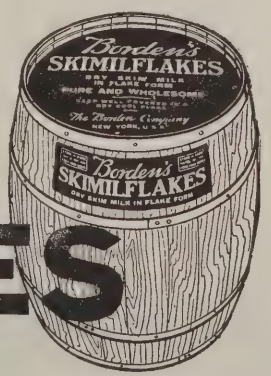
IF you're not already using Skimilflakes for your ice-cream, it's high time you learned about it and tried it.

The little folder just published by the Borden Company tells you exactly why this wonderful new dry milk in flake form is better than any other milk for ice-cream.

Skimilflakes is better

First, because it improves your product. A perfect body-builder, Skimilflakes makes smooth, rich ice-cream that never becomes grainy or sandy when cut. It's absolutely uniform, too.

Second, because it prevents waste and delay. Immediately and entirely soluble in cold water. For this reason *it does not clog the homogenizer with lumps.* Once in solution it will not separate or precipitate. Can be prepared at your convenience and used when you're ready.



Third, because it's more economical. Reduces manufacturing costs to the lowest possible figure. Eliminates all waste—cuts freight charges—saves time.

The folder contains a complete set of ice-cream formulas using Skimilflakes—made with or without a homogenizer. Some made with sweet butter, others with cream—of varying richness to suit your needs.

You'll find it well worth your while to read this information and try Skimilflakes for yourself. Send for a free copy of the folder today—or for advice, samples and prices. The Borden Company, 768 Borden Building, 350 Madison Avenue, New York, N. Y.

Ice Cream Cones

Why

your Ice Cream Dealers should get their Cone Supplies thru you!

Only a quality cone can truly represent the quality of your ice cream

Moral: Know the quality of cone your dealer sells

Ice Cream Cone Week

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Build Business!

Because:

The quality of ice cream is dependent as much upon the quality of the cone in which it is served as upon any other factor entering into the manufacturing and distributing of ice cream.

The best ice cream ever made will not live up to expectations when served in poor cones.

Good cones build gallonage. See to it that your retailers use good cones.

Many leading ice cream manufacturers of the country would not think of letting their retailers use cones that they did not know to be of high quality.

The ice cream manufacturer is in direct daily contact with his retailers. By pushing the high quality cones he will be helping to build up his gallonage.

The ice cream manufacturer is in position to do the jobbing for the retailers on his list, and could handle the cone business to much better purpose than others.

The Cone Makes the Ice Cream
a Balanced Ration

This advertisement published in the interests of National Ice Cream Cone Week by several leading ice cream cone manufacturers.

May 10th to 16th

There's No Argument About It

Practical use has proved that DREW'S Egg Yolk makes better ice cream and increases demand. Your gallonage will prove it—Your profits convince you of its continued use.

Let the good judgment of the largest ice cream manufacturers guide you. Write for particulars today.

Egg Yolk sold in original Cases

JAMES F. DREW & CO.

320 Broadway New York City

The cone enables us to reach the child, whose penny long ago became valueless, and whose nickel even now buys little except candy—and not a high-grade product at that. A nickel ice cream cone enables the child to get a real nourishing product at a price the child can afford.

In the cone one can buy the best ice cream made for a nickel.

You can't say the same of any other kind of merchandise.

For just one week in the year—the week of May 10—can't we afford to put a little snap and ginger behind a campaign to let the public know something about what a nickel will buy of our product?

Gentlemen of the ice cream industry—let's go!

ENDORSES CONE WEEK.

Editor The Ice Cream Review:

We certainly indorse your action to have an ice cream cone week in 1925. I think all of these special sales assist in the output of ice cream.

I think if we had a national day for strawberry ice cream, about the time when strawberries are ripe throughout the country that it would help also.

I would not be surprised if a national pineapple ice cream week would not help sell pineapple ice cream, at about the season of the year when pineapple is arriving on our market.

Yours truly,
THE YELLOWSTONE CREAMERY.
By V. E. Sampsel.

WILL DOCTORS ORDER ICE CREAM?

Medical condemnation of our civilized foods is so frequent nowadays that it is refreshing to hear something on the other side from an equally scientific source.

Edinburgh's medical officer of health has made a report on ice cream. Ninety per cent of it as sold in Edinburgh, he says, is good food material, being extremely rich in butterfat. This seems to confirm the recent accounts of how a prominent professional boxer did his training chiefly on ice cream.

Smith, minor, may now proceed to the tuckshop with a sense of virtue and fortified by medical approval—provided he restricts himself to ice cream. We can hear him murmur as he licks the luscious "slider," "The very thing the doctor ordered!"—Confectioners' Union (London).

NO ICE CREAM LEGISLATION IN NORTHWEST.

The ice cream industry of the Pacific Northwest is not affected by any legislation passed by the state legislatures of that territory, which recently completed their work. This information is conveyed in a bulletin from E. A. Burt, president of the Pacific Ice Cream Manufacturers' Association.

OUR INDUSTRY AND HUMANITY.

When you manufacture and distribute your product, remember that you are manufacturing and distributing vitality, health, efficiency, and, above all, national security. And don't ever forget this: the better you serve your own industry, the better you serve humanity; and the better you serve humanity, the better you serve your own industry.—From national convention address by M. D. Munn.

Sooner or Later

Every ice cream manufacturer in the country can be assured that the quality of his product is of the best when using *American-made Edible Gelatine.*

The health value of American-made Edible Gelatine is now being proclaimed throughout the land, and it is important that every user of gelatine give thought to that fact, also that the gelatine he uses is made where Government standards are so rigid as in the United States.

Sooner or later every user of gelatine will take pride in saying he uses *American-made Edible Gelatine.*

Ice Cream Cone Week—May 10

Second National Observance Promises to Create More Interest in Ice Cream Than Ever Before Has Been Possible Through Cones

ALL set? Let's go. The ice cream cone comes into its own again. The week of May 10 has been designated National Ice Cream Cone Week. Manufacturers throughout the country will seize this occasion to promote the sale of ice cream in cones. This is not to say that the regular channels of sales will be neglected, but by pushing the sale of ice cream cones during a certain period of the year manufacturers have the opportunity to win many new friends for their product.

National Ice Cream Cone Week was inaugurated by The Ice Cream Review, the first event of this kind being held last year, in co-operation with cone manufacturers and leading members of the industry.

THE idea is not merely to enable cone manufacturers to sell more cones, though they have a perfect right to want to see their market increased; the real purpose is to get over more sales of ice cream. It is in this spirit that The Ice Cream Review has fostered ice cream cone week, and it is in this spirit that manufacturers of the nation have rallied around the plan and taken steps to give the movement their greatest support.

It is advisable for members of the industry to begin making preparations well in advance. National Ice Cream Cone Week should be well advertised in different cities. We often have urged manufacturers to do more co-operative advertising, joining together to advertise the ice cream made in their city or state, rather than spending money merely on their particular brand of ice cream.

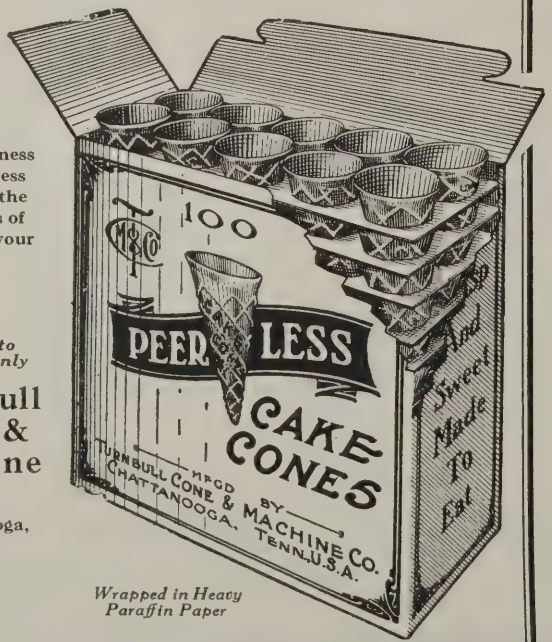
Individual advertising has great merit from the viewpoint of attracting customers for the time being, but the industry's greatest advancement is coming through that advertising which sells ice cream as a safe, wholesome, palatable food product.

BOOSTING cone sales has proved to help ice cream sales. The dealer likes this business; he has no dish to bother with after the sale. By boosting for more ice cream in cones the manufacturer is helping get the dealer more interested in ice cream, and the interest of the dealer in our product is an all-important matter; in fact, it is one of the things most necessary to the industry's growth.

This float commanded much attention during an ice cream pageant. The Wheat Ice Cream Co.'s big ice cream cone was drawn through the streets of Buffalo.

Coming at this particular time, National Ice Cream Cone Week gives members of the industry the opportunity formally to open the ice cream season with a bang.

The Ice Cream Review will be glad to give what advice readers may ask regarding advertising copy in connection with ice cream cone week.



The week opens on Sunday. Float parades Saturday afternoon, in trucks particularly decorated to carry out the idea of ice cream cones, would be an excellent way to attract attention. Placards for dealers' window also will keep the thought before the minds of buyers.

DOES the public know much about ice cream and cones, food affinities that have traveled together for several years? Very probably the public doesn't. The cone is a food product in its own right. It is manufactured for the special purpose of being eaten with a splendid food product, such as ice cream, and no kind of cake or pie fills the particular purpose the cone serves.

The manufacturer will do well to satisfy himself that dealers are using only the best of cones. The best ice

cream in the world would mean little if served in a cone not up to the proper food standard.

If for nothing else than that it gives ice cream manufacturers the occasion to think more about their cones and their quality, the idea of National Ice Cream Cone Week has proved to be of value.

Last year's cone week brought out many pleasing developments, particularly when it is considered that it was the first time this matter was put before the public. Manufacturers learned some interesting facts about public habits. For instance, one manufacturer viewed results of the special week in 1924 and decided that the ice cream cone is our best weapon for meeting the competition of the nickel soft drink. It is one of the few things that a youngster can buy in this day of time when penny commodities are almost entirely gone.

CHILDREN have more nickels now than they ever had before in their lives, and actual proof can be offered that the child can get for a nickel nothing that contains so much as an ice cream cone.

Mothers are being drawn away from prejudices that some of them built up against the cone.

The ice cream cone has proved one of the most important innovations of ice cream history. After twenty years it not only has retained all of its original popularity but steadily has grown in public favor, certainly not proving to be a "flash in the pan."

IN a speech before the World's Dairy Congress in 1923, Martin Mortensen, head of the department of dairying, Iowa State College, Ames, Ia., who has studied dairy manufacturing in Great Britain and Denmark, summarized the development of the ice cream industry in the United States as follows:

1. The progressive and aggressive attitude of the ice cream manufacturers.
2. The rapid development and improvement of machinery and equipment.
3. Trade papers and books.
4. State agricultural colleges.
5. State agricultural experiment stations.

"The ice cream cone, in 1904, aided in increasing the sale of ice cream," he said, and he might have added that it has been one of the factors in the industry's growth since that time.

Sunday, May 10, should find all dealers with their windows well filled with displays calling attention to ice cream cones and ice cream cone week. Many manufacturers already have laid their plans; all will do well to take steps in this direction.

SERVICE AND SELLING.

Let the quality be right, let the quantity be right, let the manner be right and your service will be right. And service must always be written with a dollar mark through the "S," because that is what service means to the individual and to the institution.

After all, you are not selling ice cream and the things that go with ice cream. You have only one thing for sale, and that is service, that is integrity, that is character, and the value of your ice cream doesn't lie so much in the ice cream itself as it lies in the integrity and the character and the honor of the men and women back of your ice cream. You can take two ice cream dealers only three blocks apart, selling the same ice cream, one succeeds and the other fails. Why? Because of the service, integrity and character.—From national convention address by Harry L. Fogelman.

When ice cream manufacturers have to depend so largely upon the flavor of their product for sales, it is not surprising that so many select Hudson's Ice Cream Flavor No. 52 Concentrated, or Hudson's Ice Cream Flavor No. 52 Special. One can not afford to speculate with ice cream flavor!

Use Hudson's and Be Sure

Ice Cream Flavors - Concentrates
Compounds - Blends, etc.
All Grades for All Purposes

Let us ship you a sample gallon of Hudson's Concentrated No. 52, or a sample keg of Hudson's Ice Cream Flavor No. 52 Special—express or freight prepaid to your City. You may return same to us if not entirely satisfactory.

Good Cones Uphold Ice Cream Quality

Manufacturers Should Pick Their Own Cones for Their Dealers, Jobbing Only the Best to Protect Their Quality

THE quality of ice cream is dependent as much upon the quality of the cone in which it is served as upon any other factor entering into the manufacture and distribution of ice cream.

The quality idea is being—and has been—thoroughly studied out in this industry for a long time, and members of the industry have come to realize that quality does not stop the work and care that actually enter into the production of ice cream.

It is for this reason that the ice cream manufacturer should be at least as much interested as anyone else in seeing that only the very best cones are sold. Poor cones can do as much to hurt the ice cream industry as anything else, and in the course of time, no doubt have done much to this industry's detriment.

The best ice cream ever made will not live up to expectations when served in a poor cone.

You would not expect anyone to enjoy the best butter made in the world if butter was spread between two pieces of stale bread. The same thing applies to ice cream in a cone—that is the same analysis.

One of the great evils of the situation has come about through the activities of jobbers of cones not identified with the ice cream industry. These men, who are in no way interested in the welfare of the ice cream industry, or for that matter, not interested in anything else except making sales, often sell to retailers cones that are not of the best quality.

The ice cream manufacturer is in position to do the jobbing for the retailers on his list in matters concerning ice cream, and could handle this business to much better purpose than the other kind of jobbers.

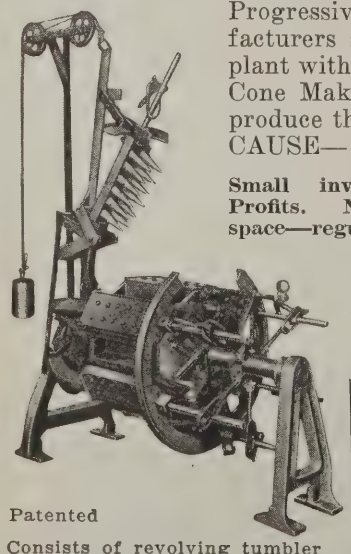
It is through the ice cream manufacturers that these cones should be sold. Some of the best cone manufacturers of the country are of this opinion. Many of the leading ice cream manufacturers of the country would not think of letting their dealers use cones that they did not know to be of the best quality.

The ice cream manufacturer is in direct contact with his retailers. By pushing the right kind of cones, he will be helping to build up his gallonage.

Most of us like to believe the industry as a whole is well established on the idea of all around quality. But the fact remains that there are some manufacturers who would not think of letting one thing enter ice cream that could possibly do any harm, but at the same time are indifferent about how their ice cream is relayed to the public through the dealer.

The advertised product is almost inevitably a guarantee of merit. Cones are not different from any other kind of merchandise when it comes to this standard.

It is not meant by this to insinuate that all manufacturers who do not advertise in reputable trade publications are making poor cones, but there are a number of cones made in what may be called the "underbrush" of the cone industry, that will not stand up to this standard.



The best plan is for the ice cream manufacturer to secure a cone that is of high quality. Sell this cone to his trade, and he will not only make a profit on the cone, but will be absolutely assured that his ice cream is being done full justice by being served in the right kind of a product. The matter of price should not necessarily be a consideration.

A chain is no stronger than its weakest link. The cone is one of the links in the chain of distributing the ice cream from the manufacturers' freezers to the ultimate consumer.

This is the situation that we might get under full control.

An advertisement placed in "The Review" Want Department will put you in touch with just the kind of help you are looking for. Give "The Review" a trial—it's the best way to get results.

NEW FIELD Opens for Ice Cream Manufacturers

Progressive ice cream manufacturers should equip their plant with the "Philadelphia Cone Making Machine" and produce their own cones BECAUSE—

Small investments net big Profits. No extra labor or space—regular salesmen solicit orders — helpers bake cones. Fresh, Crisp, Delicious Cones increase ice cream consumption.

This machine saves time, space and positively produces a better cone at less cost than any other machine on the market — Write for details today.

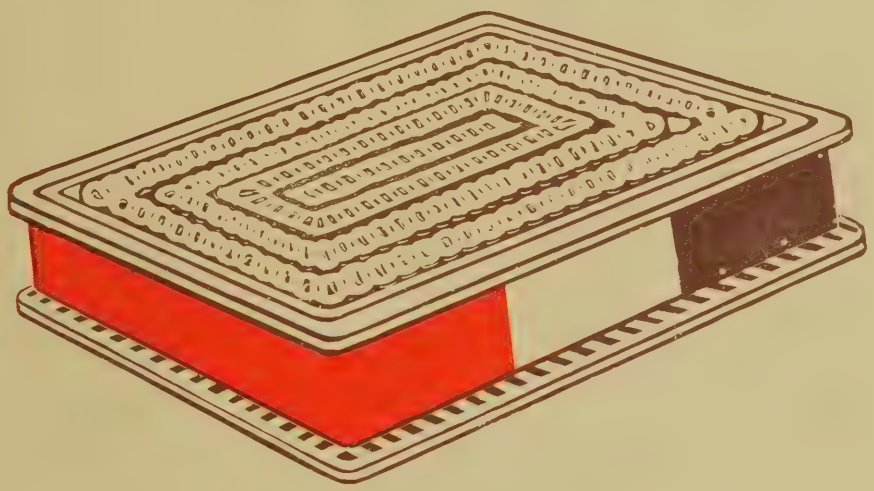
Patented

Consists of revolving tumbler containing six sets of moulds of 12 cones each baking 72 cones each revolution.

THE PHILADELPHIA ICE CREAM CONE MACHINERY AND ART METAL WORKS.

68 N. Fourth St. Philadelphia, Pa.

THE UNBROKEN CHAIN.



Conditions today will not permit a line to be drawn between the manufacturer and the retail dealer, nor between the retail dealer and the consumer. No manufacturer can long prosper or continue to increase his business, if after making the sale to the dealer, the latter is unable to dispose of the manufacturer's product with reasonable success. Therefore, in modern merchandising, the manufacturer whose goods reach the consumer through dealer outlets, should be as much interested in retailing as is the retail dealer himself, and as much interested in satisfying the consumer in the matters of quality and price, as is the retail dealer himself, and vice versa. The co-operative interest must be complete all the way down the line and up the line.—From California and Pacific convention address by K. L. Carver.

Glowing Picture Depicted for Ice Cream Industry

Manufacturers Given to Look on the "Dark Side" Have Little Reason for Such Pessimism, Trade Educators Declare

INTERESTING statistics favorable to the future of the ice cream industry were given in an address before the Oklahoma convention by Prof. A. D. Burke of Oklahoma A. & M. College. Pointing out that the ice cream industry involves an outlay of billions of dollars, the production of some 466 million gallons of milk for the manufacture of 300,000,000 gallons of ice cream, "a product unexcelled in palatability," the speaker declared that there is little ground for the pessimism of ice cream manufacturers who occasionally look on the dark side of their business and feel "hopelessly lost in his undertaking."

The speaker then shot forth a ray of sunshine by saying that he wished to banish all misgivings and to—

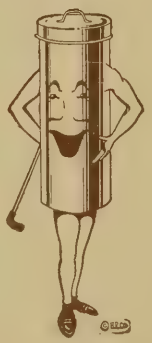
"Bring before you the realization that your servants are scattered all over the entire world. According to True in the proceedings of the World's Dairy Congress, the U. S. department of agriculture has about two thousand scientists engaged in its research work. Under governmental direction these scientists are striving to solve the problems of the soil, which, although frequently not directly related to the ice cream industry, do serve in some way to affect it indirectly. Our government is likewise keeping in touch with leading dairy countries of the world, publishing regularly in the Experiment Station Record a complete review of all dairy experiments and discoveries. Forty-nine experiment stations serve you. About one hundred and ten dairy scientists are attempting to fathom as many or more problems relating to dairy products while many industries establishing private research laboratories are aiding in solving your difficulties. In many an endowed college, unattached to the government and state experimental departments, many an individual has answered a puzzling question of the ice cream trade and the information is spread through the medium of trade papers, extension workers, dairy students, short course students and those sent out by the government to establish new discoveries and processes in the various plants. I believe I am safe in saying that the ice cream industry may gain all assistance desired if it but seeks the opportunity, yet sometimes I feel there is lack of co-operation between the trade and its servants."

Future opportunities for the ice cream industry are indicated by what has been accomplished in the last fourteen years. Prof. Burke went back to 1910, when the bureau of animal industry reported that "the enormous increase in the consumption of ice cream, together with the fact that it is now generally on sale in the small towns as well as the large ones, etc., and it was figured that the expenditure for equipment need not exceed $300.00, and that "such an outlay could often be paid for in one season with a substantial surplus remaining."

PROF. BURKE then went on to show how much had been learned in the years since about such matters as the acidity problem, the bacterial problem, the problem of defects and lead himself up to the present day, the problem of food value, in stating that many ice cream manufacturers themselves accept the argument of food value as hearsay, the speaker pointed out some interesting facts:

"Probabilities are, someone figured that since it contains fat, carbohydrates, protein, minerals and water, it must have food value. Therefore, it does and that's all there is to it. Where is the concrete proof? Recently, Smith, writing in the Journal of the American Medical Association and working with ice cream containing 10 per cent fat, cites the fact that although the product is frozen we still have our vitamines A and B, so necessary for growth and well being, but that vitamine C may be somewhat deficient, due chiefly to pasteurization. A little later, this year, if you please, Dr. Howell, a specialist of Columbus, O., has written for us in the trade journals an account of his findings in feeding infants ice cream, and makes mention of the fact that "in homogenized ice cream we can find a safe substitute for the butterfat of mothers' milk," and Hammond, trying the feeding of ice cream in the schools of Cumberland, Md., reports in The Ice Cream Review, gains in weight of the principals varying from 1 to 9 pounds in 9 weeks. So we have at our beck and call definite proof that ice cream is really a food. Who knows but that it may prove to be the most desirable food in the world? Perhaps additional research will answer the question! That's a future possibility."

INTERESTING thoughts along the same line were brought out at the 1924 Pacific joint convention by another able educator, one of the greatest in the industry, Prof. M. Mortensen of the Iowa State College, Ames.



It is well known to ice cream manufacturers, as the speaker pointed out, that our industry is of recent origin; that "twenty-five years ago it was hardly considered as an industry, but it has since that time advanced at a most tremendous rate which is evident when we realize that only 80,000,000 gallons were manufactured in 1909 as against 263,520,000 for the year 1922, or it represents a consumption of over two gallons per capita per year."

As a result of this rapid development the research worker has not been able to solve many of the numerous problems which have arisen, and although it was "embarrassing to admit," the speaker felt that the scientific

Low Starting Current Advantages

Because the starting current of all sizes of Century Automatic-start Induction Polyphase Motors does not exceed 245% of full load current, any approved single throw switch may be used for starting. Skilled attendants, special manual controls, compensators, or any other current-limiting devices are unnecessary—features which make this type of motor particularly desirable for automatic and remote control.

Another advantage in low starting current lies in the fact that the regular operating fuses are in most cases large enough to effect a start. In the few isolated cases where slightly heavier fuses are necessary, they are always small enough to give the motor ample overload protection.

Century Automatic-start Induction Polyphase Motors are especially desirable wherever a motor is called upon to develop a heavy starting torque with a definitely limited current. They are widely used for operating refrigerating machines, plunger pumps, compressors, conveyors, extractors, crushers, mixers, high-speed machinery and similar apparatus.

Built in all standard sizes from ½ to 60 h.p.—temperature rise not more than 40 deg. Centigrade.

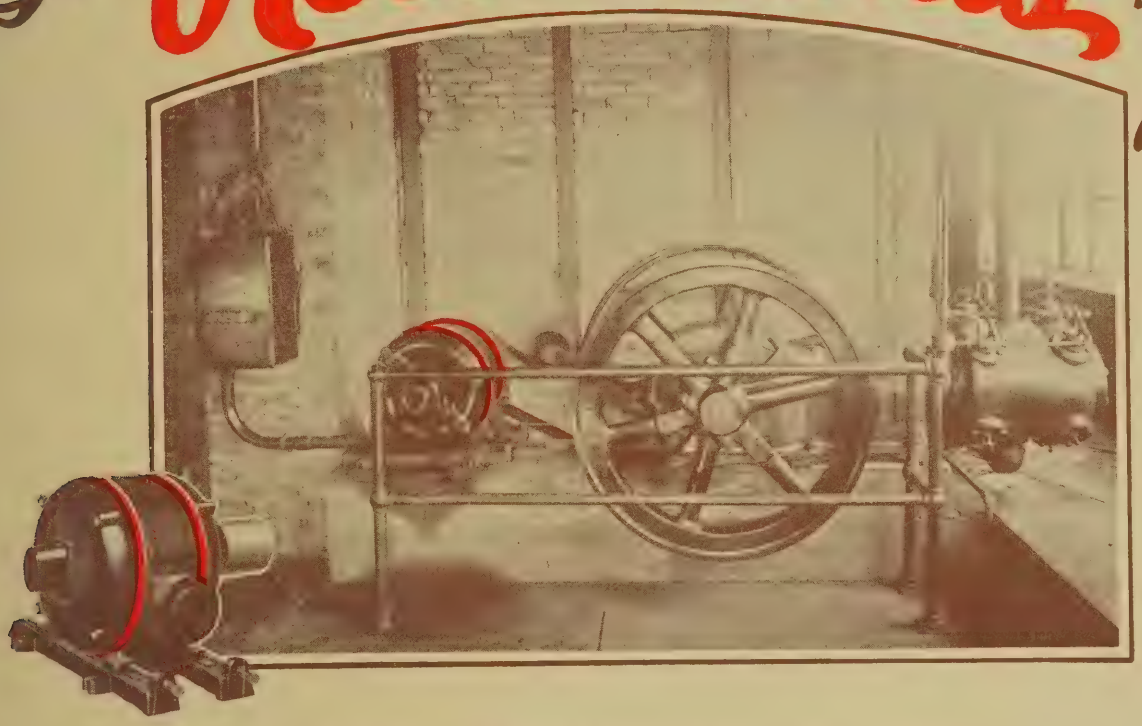
knowledge available on the ice cream industry is "comparatively limited." The manufacturers may be able to render a service by assisting their experiment stations in securing equipment and facilities by which the research workers may be enabled to solve some of the problems which are of immediate importance to the industry. Then he turned his vocal guns to the defense of quality:

"In the manufacture of ice cream the quality problem is of great importance, for, although we consider ice cream to be one of our staple food products, yet, unless quality of a high standard is manufactured people will use their money for something else, as the young people who are our best consumers of ice cream give more attention to what pleases their taste than to the food value of the product. A certain retail dealer in Iowa has greatly increased his business by installing an iceless cabinet; he is now able to carry fancy as well as plain ice cream and the consumers are willing to buy and pay a good price for any food product which is of high quality. In judging ice cream the consumer considers mainly flavor and texture, except for special functions when the color may play a most important part. The flavor requirement is easily met by the manufacturer if he will only use high grade material. The texture, on the other hand, presents a number of difficulties and it appears from what is known today about the science of ice cream making that the experimentalist will be able to render the greatest service in that field of research.

"In studying the texture of ice cream it should be understood, that in general, the mechanical structure is made up from air cells, fat globules, serum solids, ice crystals and solids foreign to milk, such as sugar, eggs, stabilizers, etc. The secret of securing a desirable texture is first solved after the operator has made a thorough study of the proper combination of solids to meet the demand of his customers.

"The successful manufacturer is watching his overrun very closely for his profit is to come from the overrun. We are often inclined to consider overrun as a source of revenue when the real significance thereof is something entirely different. If an attempt were made to manufacture an ice cream without any appreciable swell, the resulting product would be unpalatable, as the texture would be extremely coarse."

600 MILLION GALLONS OF ICE CREAM.



If there is any product in the world that would seem to lend itself less readily than other products to increased consumption, we might think it would be sauerkraut. The secretary of this association at Clyde, O., gave me these figures.

In 1918, 1919, 1920 and 1921 their sales were 100 per cent. In 1922 they began the campaign which you are all familiar with, and you probably laughed about it. I know I did. They are laughing now, incidentally. That campaign told us about Mrs. Brown calling up the doctor, you know, and she thanked him for telling Jim to eat sauerkraut three times a week, because since Jim had been eating the kraut and had gotten the lactic acid or the acetic acid in his system he was a better man. And their sales have gone up 275 per cent over those two years.

If we had done as well as an industry, with our product, we would have sold in that period an additional—get the force of it, gentlemen—an additional 595,000,000 gallons of ice cream.—From national convention address by Frank W. Gentleman.

Give Red Bands your hard jobs

"As Reliable as the Corner-Stone of our Plant"

Says N. H. Motsinger, Works Manager of The Cushman Company, Inc., Champaign, Ill., "We have in operation several Howell red band motors ranging from 25 H. P. to 5 H. P. in size. Most of these have been in service five years and during this period there was seven months when they were running twenty-two hours per day. We do not know what motor troubles are as, aside from an occasional cleaning of the rotors these motors have been as reliable as the corner-stone of our plant."

Howell Red Band Motors are made in all types and sizes from ½ H. P. to 100 H. P. Sales and Service blankets the nation. Catalog on request.

Make Good On The Hard Jobs

Cone Attracts People on the Fly

It is Through the Aid of the Ice Cream Cone that We Can Step Up to the Speed of Our Prospective Customers in this Age of Speed

THIS is a faster age; the customer wants to get his on the fly—in again, out again and gone again, so to speak. That's the kind of service he wants to get when he buys ice cream at times, though most of us like to linger once in a while over the old-fashioned way of nibbling it out of the dish.

But we've got to step up to the public's speed. The soft drink and candy people are far ahead of us; it doesn't take long to put out a nickel drink of pop or a bar of candy and let the customer drop his change on the counter and be off again. It makes no difference where he is going; we're always going somewhere now-a-days and are in a hurry to get there, though it may not mean so powerful much whether we get there so soon or not.

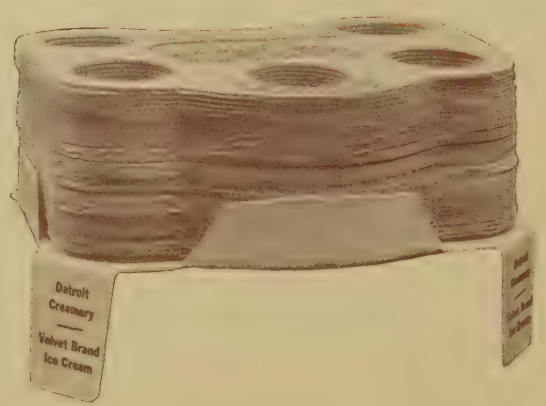
Probably the auto is responsible, and probably various other things contribute to this mania for speed, but regardless of the cause, the fact remains that we must deal with men, women and children today on the same plane that they live—with action.

It is not difficult to interest the dealers in the ice cream cone; the dealer is in a hurry himself. One of the reasons why he doesn't push ice cream sales more is it takes so much time and trouble to scoop it up, dish it out, serve it—and then bother with the washing up after the customer is gone.

THE man in the auto will stop oftener for ice cream when he is given to understand how quickly and simply he can be served with the cone. What he likes about it is, he doesn't have to wait until the ladies in the back seat have finished theirs so they can return the dishes; they can just take their cones from the service boy, pay off, step on the gas and be right off again to wherever they are going—eating ice cream as they travel.

* * *

The big thing in the ice cream industry is to make ice cream easy to buy. That's the simple synopsis of the situation we face. Of course, we must have a quality product to make the customer want to eat ice cream in the first place, but given the quality product he will eat much more of it if it is made more convenient for him to get it when he wants it.



The ice cream cone serves an extremely useful purpose toward making our product easier to buy.

* * *

The ice cream cone is a natural ice cream affinity; it "teams up" with our product. Some of us think of it as a pastry, a piece of cake or a certain kind of confection. The truth of the matter is, it is a dairy product, made from wholesome milk, and being extremely

DIXIE MAIL BAG

ARKANSAN BOOSTS THE REVIEW.

Little Rock, Ark., March 9, 1925.

The Olsen Publishing Co.,
5th & Cherry Sts.,
Milwaukee, Wis.

Gentlemen:

I am just in receipt of your favor of March 3rd, and appreciate very much your promptness in sending me another copy of the February Ice Cream Review. We feel sure that we will get The Ice Cream Review regularly now. We probably were in a hurry on account of some nice reports we had from some of the traveling salesmen of the contents of this issue.

The writer was in El Paso, Tex., a few days ago and in conference with Mr. Miller of the Velvet Ice Cream Company and told him what a wonderful ice cream publication you were getting out and suggested that he subscribe for it. If you have not heard from him by now you probably could enter his subscription if you would only write him.

I believe all the ice cream manufacturers in Little Rock are subscribers to The Ice Cream Review, but I will investigate and if I find some that are not will be glad to get them to subscribe.

Thanking you again for your promptness in getting The Review to us, we remain

Yours truly,
TERRY DAIRY COMPANY,
By Will Terry, Pres.

CUMBERLAND MANUFACTURERS MEET.

The Cumberland Ice Cream Manufacturers' Association, which embraces the ice cream manufacturers interested in southeastern Kentucky and is a subsidiary organization of the Dairy Products Association of Kentucky, met at London, Ky., Friday afternoon and evening, February 27, with W. N. Scoville of the London Ice and Ice Cream Company acting as chairman and host.

There was a full representative attendance from the ice cream plants at Middlesboro, Pineville, Barbourville, Corbin, Jellico, Harlan and London. The meeting convened in the London Hotel where a special dinner was served at 7 p. m.

Prior to the business session, J. O. Barkman, dairy manufacturers' specialist of the College of Agriculture, talked on the subject of furnishing the college with a monthly report on the gallonage of ice cream made or sold in Kentucky. Dr. A. W. Homberger, head of the chemistry department of the University of Louisville and a fellow of the Royal Society of Arts of England, was to have addressed the members on the nutritive advantages of ice cream but previous engagements prevented his being present, at the last minute.

The next meeting will be held in Harlan, about the middle of April, the exact date to be determined later.

As I grow older I come more and more to realize that we are losing a lot of the joy that we could have in living, when we do not express ourselves when we are pleased with the same readiness, that too often times we hasten to show when we are displeased.—Jacob B. Jones, Bridgeton, N. J.

Good NEWS for Users of Natural VANILLA

IF PURE vanilla has played a part in building a reputation for your ice cream, the inflated condition of the vanilla bean market presents a trying problem. To continue to use pure vanilla means an unwarranted increase in production cost. To switch to something altogether different is a move any foresighted manufacturer wisely hesitates to make. For these reasons we have designed and now offer a flavor that duplicates to a remarkable degree the delicate and fragrance of natural vanilla.

VAN VOGUE

makes no pretense of being a natural vanilla. It is, however, strikingly like vanilla and can be used to excellent effect to tide over the present condition.

Use it alone or blend to taste with pure vanilla. Trial gallon $6.00. Try it; you'll like it.

Iceless Cabinets—What and Why?

Virtually Every Angle—Advantages and Disadvantages—Brought Out in Sweeping Survey—Contracts used in Many States Presented for Study—Refrigerated Soda Fountains are Liked

Pro and Con

PROPER conditions are necessary for iceless cabinets to be of full benefit to the industry, it is made plain by a sweeping survey of the situation covering every state in the Union and Canada, conducted through the secretaries of the different ice cream associations and now announced in The Ice Cream Review for the first time.

While the organized industry is much opposed to the purchasing of the iceless cabinet by manufacturers, particularly to buying it outright, it seems to be the general consensus of opinion that the most important thing in connection with these cabinets is that a perfect understanding be developed in each territory into which they are introduced, regardless of the general plan of handling the purchases. Some manufacturers believe in holding off for the perfection of refrigerated fountains.

Searching inquiry into this matter has been made in virtually all parts of the country by committees appointed at past conventions of ice cream manufacturers. In many Northwestern states the plan of the Minnesota ice cream manufacturers has met with much favor. This is pretty much the same policy laid down in New England. It provides for the ice cream manufacturers, in consideration of rents, and other points, to install cabinets and lease them to customers for a period of three years, to maintain the cabinet in repair and working order for a period of one year, except where repairs are made necessary by negligence on the part of the customer, and the customer agreeing to pay all plumbing, electric wiring, freight, cartage, labor and other charges necessary to installation, giving the manufacturer access to the store to inspect the cabinet at all times.

THE Ice Cream Review's almost complete investigation into this matter is made possible by the cooperation of T. C. Reed, chairman of the committee on refrigerated cabinets appointed by the North Carolina Ice Cream Manufacturers' Association, which body went very thoroughly into this subject at its convention in January. Mr. Reed reported at this convention results of a canvass he had conducted on iceless cabinets among the different ice cream associations.

New England ice cream manufacturers have gone very slowly into this matter, this association's committee recommending that not more than ten cents be allowed to dealers in ice cream for cabinets. Although some New England manufacturers have their own contracts, the association has adopted one of its own, from which the one recommended by the Minnesota committee seems to have been adopted.

Two meetings have been held to study iceless cabinets. Discussions at one of these meetings are reviewed by Prof. H. F. Judkins as follows in picking out the advantages and disadvantages of iceless cabinets:

Advantages of cabinets.

1. Does away with disagreeable handling of ice and salt.

2. Much neater in store than ice and salt cabinet.

3. Ice cream kept in much better shape.

4. Manufacturer can do same business with less trucks and do it somewhat more cheaply.

5. More servings per five gallon can.

Methods of introducing cabinets.

Dealers buy their own cabinets. Majority of ice cream manufacturers think this is the best method.

Ice cream manufacturers buy the cabinets and put them out as they do the ice and salt cabinets.

Disadvantages were listed as follows:

1. First cost (about $500 per cabinet) is tremendous.

2. Dealer will not be as careful of cabinet as if he owned it himsef.

3. Hard to move them from place to place.

4. Rapid depreciation.

5. Difficult to place used cabinets if customer leaves you. Competitor may offer prospective customers new cabinet as inducement.

6. Something new. In short time prices are sure to be less and many improvements are probable.

7. May result in bad trade practices. Some ice cream manufacturers have offered a cabinet as an inducement to get a competitor's customer before first offering cabinets to their own customers.

One proposition was for the ice cream manufacturers to buy cabinets

NO CUSTOMER WANTS TO BUY CABINET.

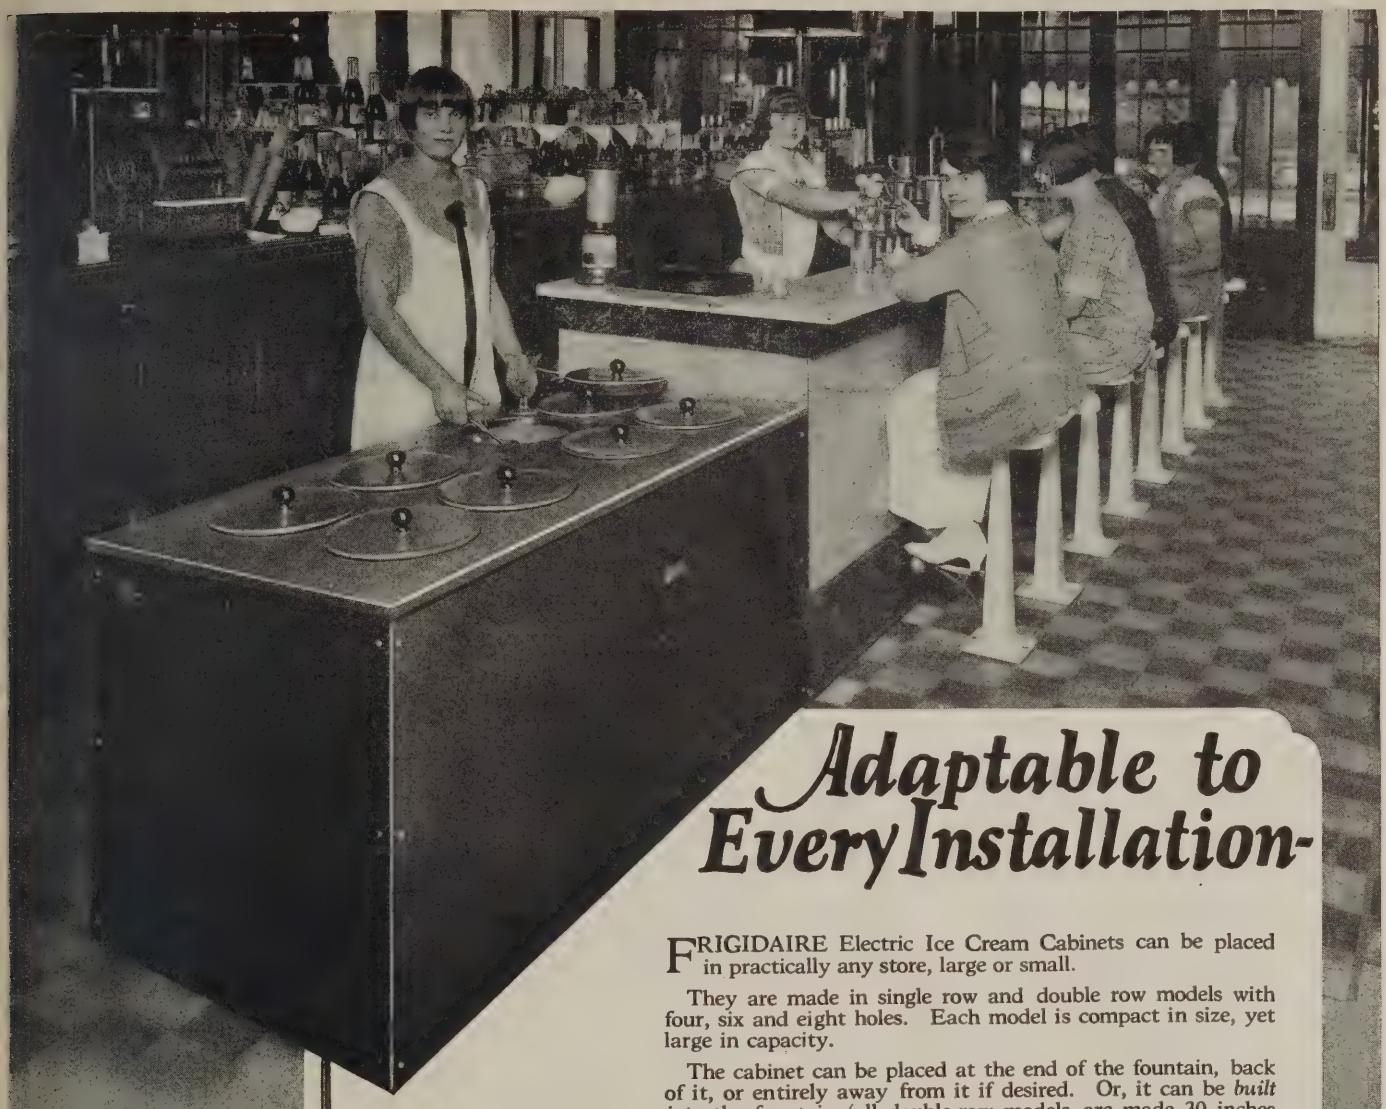
(From National convention address by W. E. Hoffman.)

We have in operation 227 cabinets in our several plants. Our business covers five plants and they are all in small towns and a good deal of it is country trade. Our first intention, when we put in iceless cabinets, was to use them only in the country, but, like so many more of us, our competitors commenced to put them in the city and we did so, too. Now, we find the saving to be considerable. We are not prepared to give you exact figures, as some can do, because we haven't been operating them a year yet. Our first installation was on the 23rd of February, 1924, and we have kept on putting them in as fast as we could get our customers to allow us to do so. In some cases we have to coax them to let us put them in. They fear that there may be some advantage to us, and they don't care about letting us have that advantage if they can help it.

We put them in without any charge to our customers on the regular delivery route. We don't make any alterations to their building or anything like that; they have to prepare the space for the cabinet. But then we hitch it up at our expense. That applies to all customers on our delivery routes that are selling 1,000 gallons or more per calendar year. If we think he is not going to sell that much, or if he hasn't been, we put him on a contract and he pays two dollars per week rental. If he should exceed 1,000 gallons in a year, we agree to refund that to him.

Shipping customers that we pay the express on their ice cream, they pay the two dollars per week—and I say per week because we have it each week, so they don't carry it through the season, two dollars each week. And they get no refund, because in our case it costs us approximately twenty cents a gallon to ship that fellow ice cream, and he had to furnish his ice anyhow. But without any exceptions they are glad to pay it.

We had one case where the customer objected to paying it and she said, "Well, I will pay my own express if you will put the cabinet in." It was a little out of our line, but in order to please an old customer we put it in for her, and we instructed our bookkeeper not to charge her over $104.00 per year. At the end of four weeks she asked to have another contract. "Or else," she said, "I will have to quit selling ice cream." She said, "I paid between seven and eight dollars last week in express." So we were not long in convincing her that she would better pay the rent and let us pay the express. But the other fellows, our other dealers, we have some selling as much as 4,000 gallons that we ship to, but they pay the two dollars.



I don't believe in giving your customers a different price, that is, say ten cents a gallon less if they buy a machine. We own all the machines. We have in no case found a customer who wanted to buy a machine. If there is any saving, we prefer to make it ourselves. We are like Mr. Wilson in that respect.

If there are any questions, I will be glad to answer them if I can.

QUESTION: What is your price?

MR. HOFFMAN: One dollar thirty cents a gallon.

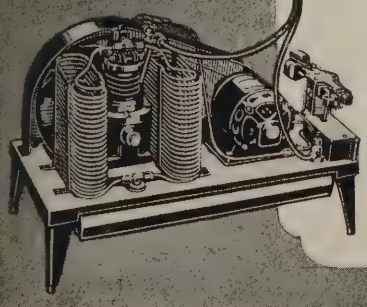
QUESTION: You deliver?

Adaptable to Every Installation-

FRIGIDAIRE Electric Ice Cream Cabinets can be placed in practically any store, large or small.

They are made in single row and double row models with four, six and eight holes. Each model is compact in size, yet large in capacity.

The cabinet can be placed at the end of the fountain, back of it, or entirely away from it if desired. Or, it can be *built into* the fountain (all double-row models are made 30 inches wide for this purpose).



Frigidaire cabinets are equipped with either *water-cooled* or *air-cooled* compressors, to meet any service conditions. The water-cooled compressor may be installed with the cabinet in an added enclosed section. Both water-cooled and air-cooled compressors may be installed in another room on the same floor or in the basement.

The Frigidaire cabinet is quiet in operation and highly efficient. It saves salt and ice expense, saves time, trouble and annoyance, prevents shrinkage and waste—makes money for both the manufacturer and retailer of ice cream. It is a product of General Motors Corporation—backed by a nation-wide sales and service organization of over 2,500 representatives.

Write today for the complete Frigidaire story.

DELCO-LIGHT COMPANY
Subsidiary of General Motors Corporation
Dept. J-12 Dayton, Ohio

Makers of Delco-Light Farm Electric Plants, Electric Pumps, Electric Washing Machines and Frigidaire Electric Refrigeration

PRODUCT OF GENERAL MOTORS

Frigidaire

ELECTRIC ICE CREAM CABINETS

and sell them to dealers. The advantages of this plan were set forth as follows:

1. Dealers get cabinets more cheaply as ice cream manufacturers can buy them cheaper in quantities. The cabinet manufacturers greatly prefer ice cream manufacturers buying cabinets themselves and installing them on old plan or to sell them to dealers, as it means more cabinets sold with a low selling expense. Chances of losses due to bad credit less than if selling to a number of small dealers.

As for the disadvantages—

1. Manufacturer may buy more cabinets than he can sell.
2. Results in bad trade practices such as giving a variety of discounts and prices, especially to get competitor's customer.
3. Operation, costs, etc.

Service costs first year or two are small. So new, not much known what may happen after this.

Cabinet manufacturers usually furnish service first year.

Probably best plan for ice cream manufacturers to furnish service to cabinets no matter who owns them.

Dealers pay their own water and power costs. They are then less wasteful.

Detroit Creamery Co. found delivery cost of ice cream using cabinet varied from 3.6c for a 4,000 gallon per year customer to 36c for a 400 gallon customer. They figured

Cost of cabinet.....	$426.00
Interest	25.50
Depreciation (20%)..	85.00
Service	35.00
Total.....	$145.50

Most cabinets run to hold ice cream at about 10 F. Thought to be best temperature.

Compressor runs on average of 8 hours in 24.

The professor summed up his conclusion and forecast probable future practices as follows:

1. The refrigerator cabinet is here to stay.
2. Rapid improvement and lessening costs are likely.
3. Soda fountains are likely to install refrigerating outfits that will both cool the fountain and keep ice cream hard.
4. It is doubtful if any group of manufacturers in a given territory will all stick together and adopt a certain uniform system of introducing the cabinets. It would be easier for ice cream manufacturers if dealers would buy own cabinets.
5. Because of (4) most ice cream manufacturers are taking the attitude that they will not buy cabinets either to sell or to loan to dealers unless forced to do so by a competitor. That there will be much of this "forcing" seems evident.

The New England association contract follows:

CONTRACT.

(When manufacturer owns cabinet.)

This agreement made this..... day of.....by and between ..... of ....., in the county of.....and state of....., hereinafter called owner, and ....., ..., in the county of.....and the state of....., hereinafter called customer.

Said owner hereby agrees to install one .....ice cream cabinet hereinafter called cabinet in the store or place of business of said customer.

The customer agrees to provide the electricity and water connections to the point of installation of the equipment, at his own expense and to provide a space..... by.....by.....for a.....hole cabinet. The owner agrees to keep the said equipment in repair and in good operating condition except where repairs are made necessary by the negligence of the customer or his employees, when the repairs shall be made by the customer.

Said customer hereby agrees to hold said owner harmless from any loss, cost or damages, by reason of leakage or alterations made necessary to install said cabinet, or for any other cause or reason due to the installation and use of said cabinet.

It is hereby mutually agreed and understood that said cabinet shall be used for the express storage of the ice cream sold by said owner, and shall not be used for any other purposes whatsoever.

It is hereby mutually understood and agreed that this agreement can be terminated by a written notice of two weeks from said owner to said customer, or by a written notice of two weeks from said customer to said owner. Said owner shall have the right to enter the premises of said customer for the purpose of examination of said cabinet, to repair said cabinet, and to remove said cabinet, without being liable for damages for so doing.

It is hereby expressly understood and agreed that said cabinet shall be the sole property of said owner, and shall remain the property of said owner and shall not become the property of said customer, or his heirs, assigns, or any other person.

Witness our hands and seals this..... day of....., 19....

Owner .....

Customer .....

CONTRACT.

(When customer owns cabinet.)

Where the customer has purchased and installed a mechanically refrigerated ice cream cabinet at his own expense, it is recommended by the committee that a rebate not to exceed 10 cents a gallon be granted such customer, provided no ice or salt whatsoever is furnished.

Where shipping customer, who had not previously been serviced by the manufacturer, desires to have a mechanically refrigerated cabinet installed, it is recommended that the conditions regarding installation set forth in uniform contract be adhered to and that a minimum charge of 10 cents a gallon in addition to the manufacturer's established price be assessed.

UNFAIR PRACTICE.

The committee feels that it should be considered an unfair practice for an ice cream manufacturer to solicit business from other manufacturers' customers, using as an inducement the installation of a mechanically refrigerated cabinet where his own customers have not previously been offered this type cabinet.

A REPORT submitted to the Association of Ice Cream Manufacturers of Pennsylvania and New Jersey sets forth the views of that association's committee as believing that there is no reason why cabinets should not be owned by either dealer or manufacturer. This report follows:

Your committee can see no reason why cabinets should not be owned by either dealer or manufacturer.

When the dealer purchases such mechanically refrigerated or iceless cabinets your committee feels that an allowance in price of ice cream not exceeding 10 cents a gallon in lieu of ice and salt service would be fair and reasonable.

Where a refrigerated cabinet is placed

MR. HOFFMAN: Yes.

MR. ROSZELL: I don't want to take up much time, but we couldn't hear back here very well. I understood Mr. Hoffman to say they had an installation of about 227 cabinets. Is that correct?

MR. HOFFMAN: Yes.

MR. ROSZELL: Did you also say your average sales would run 1,000 gallons?

MR. HOFFMAN: We don't put them in for a customer selling less than that, without we charge them a rental. I don't think we have half a dozen who sell less than 1,000 gallons.

MR. ROSZELL: You charge the rental for the customers under 1,000 gallons?

MR. HOFFMAN: Yes.

SHOULD BE HANDLED WITHOUT COERCION.

(From convention address by a representative of an iceless cabinet firm.)

The substitution of the iceless cabinet for the old style method of salt and ice should be accomplished without coercion of the slightest kind. The cabinet manufacturer should meet the ice cream manufacturer on a common sense ground and handle the cabinet situation as the ice cream manufacturer desires it to be handled in his particular territory. In other words, the cabinet manufacturer should be willing to play ball with the ice cream manufacturers. Any other method of handling this situation will be detrimental to both. Without the ice cream manufacturer's good will the cabinet manufacturer is bound to suffer. Without the willingness of the cabinet manufacturer to meet the ice cream manufacturer on a common sense ground and treat the subject of cabinets in a businesslike and conservative manner, a great deal of confusion, and sometimes hard feeling, may result.

DEALERS SHOULD PAY FOR CABINETS.

(From Illinois convention remarks by Ed. Klinenberg.)

As I see it, many cabinets are being put out today and these gentlemen will say, "I sold the cabinet," but after we get the correct information, we find out that the cabinet has been given to him in some way or another. I have not found one case where the ice cream buyer has put down his cash money for the cabinet.

I think it is time for us gentlemen to keep some money in our pockets, to go on a business basis and try and clean up the situation and see if we cannot find a solution to this problem.

Some fellows tell the dealers they will save from ten cents up to fifty cents a gallon on their ice cream by using these cabinets. I talked to one gentleman who bought a couple of these cabinets and he told me frankly that he'd be glad to get rid of these cabinets if he could and he'd rather serve the ice again just like he used to. I don't think one of you can show me a profit today that you saved on these cabinets if you serve them; if so, I'd like to get the information because I am as much interested as anyone.

I said before that I was in favor of these cabinets if we could put one in every stop that we have if the customer would be willing to buy the cabinet the same as he buys his other machines. We would get customers through the machine.

If he bought the machine himself, he wouldn't be calling us up at 11 o'clock at night to tell us that the machine is not working and if we don't give him service right away, or if we go there the next morning with some excuse why we can't fix it, tell us to take it out and he'll take somebody else's ice cream.

Business Jumps from 500 Quarts to 5,000

Here's how a New York dairy increased its ice cream sales 900%:

"By using Sealright Containers we reduced the price of ice cream to the consumer 20 cents per quart, and where we used to sell 300 to 500 quarts we are now selling 5,000 quarts in Sealright Containers at the reduced price to the consumer and we are making about the same amount of profit. We are in hopes of getting away from cans entirely. We believe it will not be long until all ice cream will be sold in sanitary paper containers, like Sealrights."
(Name furnished on request.)

Many other ice cream manufacturers have written us that Sealrights are big money-makers for them. Why not get in the same money-making class with these other alert manufacturers by using Sealrights—100% leak-proof and crush-proof.

The illustrations at the right show how Sealrights are used and why there are no other containers like them. Sealrights are nationally advertised in the Saturday Evening Post. Send coupon today for samples and full particulars.

Automatic Electric Ice Cream Cabinets

Made in 4, 6, 8, 10 and 12-hole sizes—water or air-cooled—single or double row—self-contained or remote.

Nizer Corp.: Detroit, New York, Atlanta, Chicago, St. Louis, San Francisco
A. P. McLendon, Waco, Texas. Linde Canadian Refrigeration Co., Montreal

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

with a dealer who does not own the property we recommend that a landlord's release be taken.

That there be no reduction in price of ice cream if manufacturer install refrigerated cabinets without charge to dealer and maintain service on cabinet.

That manufacturers do not pay for water or current, but shall pay for fire insurance on this cabinet and also liability insurance in case of injury to person or property, caused by such cabinet, if property of manufacturer.

We recommend that where the dealer purchases his own cabinet that manufacturers do not endorse nor give financial assistance in securing such cabinet for purpose of getting his business.

Where the installation of mechanically refrigerated or iceless cabinets are being considered by a manufacturer, we recommend that he first take it up with his competitor in that particular section and endeavor to secure a mutual understanding to the best advantage of manufacturer and dealer concerned.

We consider the use of iceless cabinets as an inducement for a competitor's customer to change over a distinctly unfair trade practice and cannot too strongly recommend co-operation between competitors in connection with the distribution and installation of these cabinets.

We advise that no iceless cabinets be installed where competitor's iceless cabinet is already in service.

Respectfully submitted,

J. W. NEUMAN, Chairman,
H. N. FORRY,
THOMAS HALL,
W. E. MYERS.

Section No. 1 was amended to read:—Your committee does not encourage the installation of ice cream cabinets by the dealers, but feel that the cabinets should be owned and installed by the manufacturers.

THE uniform contract recommended by the North Carolina Ice Cream Manufacturers' Association committee, of which T. C. Reed is chairman, for country and city use, has been submitted to the association as follows:

AGREEMENT.

The following agreement is entered into by and between the..... chartered and doing business under the laws of the ....., hereinafter called the Manufacturer, and ..... of ....., hereinafter called the Dealer.

The Manufacturer has been, and is, engaged in the business of manufacturing ice creams, sherbets, and other frozen ices and edibles, for which business it has advertised extensively, and has built up trade marks, trade names, and a certain defined good will, all of which is dependent upon the distribution and merchandising to the general public of this city and adjacent counties and communities, thereto, of its products by and through the medium of merchants and other vendors, who retail said ice cream, sherbets, etc.

And the said Manufacturer has the right to sell, distribute or use, in the territory in which the Dealer is operating, certain equipment for the purpose of temporarily storing and distributing therefrom for sale, and for preserving them in a proper condition during said storage prior to distribution from said cabinets, the particular wares manufactured by it, and which particular equipment is distinctively and peculiarly adapted for this purpose, and which particular equipment if further identified as.....Mechanically Refrigerated Cabinets, and which cabinets, the Dealer desires to use and the Manufacturer would only consent to being used by merchants and other vendors for the sole purpose of storing and handling the products of the Manufacturer; and the Dealer, who is engaged in buying and retail selling of ice cream in..... desiring to procure and secure the use of .....Mechanically Refrigerated Cabinets, adaptable for and suitable for its usage, contracts with the Manufacturer that the said manufacturer shall lend to the said Dealer one..... Mechanically Refrigerated Cabinet ..... size, which the Manufacturer is to install and maintain at its expense, and which the Dealer is to supply the electric current and water used, together with proper and reasonable upkeep at its expense; and the said loan is to extend for a minimum of three years subject to the following conditions, terms and agreements:

(a) The Dealer shall pay to the Manufacturer the sum of $100.00 which is the agreed cost of installation.

(b) That during the period of said three or more years, the Dealer will buy from the Manufacturer and distribute solely its wares from said cabinet, except in the event that the Manufacturer is unable to supply the Dealer at any time or times, then the Dealer shall be permitted to store in and sell from said cabinets the wares of such other party or parties as the Dealer might purchase from, but with the understanding that this license is only granted during the time that the Manufacturer is unable to so supply the Dealer either in whole or in part.

(c) It is agreed between the parties, hereto, that a basis on which this entire agreement is made is that the Dealer shall purchase from the Manufacturer during the life of this agreement not less than .....gallons per year of ice cream and should the Dealer fail to purchase that amount or more, he shall pay to the Manufacturer the sum of 10c per gallon of the above required amount not sold, as a rental.

(d) The Manufacturer is to sell to the Dealer during the term of this contract for the purpose of temporarily storing and distributing from said cabinet sufficient merchandise to supply the trade demands of the Dealer, subject to the conditions imposed in paragraph (b), with the understanding that the Manufacturer will not be responsible in damages for any failure to so supply the Dealer, either in part or times in whole, by reason of any causes whatsoever. The said Dealer is to pay the Manufacturer at his regular price and the payments to be made in the following manner: Terms:.....

.....

.....

(e) The Manufacturer, in accordance with this agreement, herewith lends and permits the Dealer to use one Mechanically Refrigerated Cabinet, ...size, which by no implication is to be construed to be the property of the Dealer, but remains the property of the Manufacturer, and the Dealer agrees that in the event it breaches any terms of this contract, including the payment of indebtedness, or any other terms or conditions hereinafter set forth, said Manufacturer may enter upon the premises of said Dealer and immediately remove said cabinet without legal process of any kind. The Dealer waives any damages liquidated or otherwise, that may be suffered in said removal as a part of the consideration of this contract.

(f) The Dealer is to properly keep up this said cabinet; shall keep same clean and in sanitary condition; shall keep the top polished and shall not unduly mistreat or expose said equipment so as to cause it to deteriorate, other than the usual wear, tear and usage. In the event of the failure to so do any or all of the conditions, the Dealer obligates itself to do in this paragraph, said failure shall be construed to be a breach, and the right of re-possession shall immediately vest in the Manufacturer, who shall likewise be vested with the right of re-possession in the event the Dealer should use said equipment at any place other than....., without the written consent of the Manufacturer.

(g) Failure to take advantage of one breach shall not be construed as the waiver of rights, the right herein given being a continuing one.

(h) In arriving at the price, which merchandise is to be furnished as set forth in paragraph (d), it is contemplated that shipments or deliveries will be made in containers which the Dealer agrees to return within two days of their receipt.

(i) In the event of the bankruptcy, either voluntary or involuntary, assign-

These things have been done, you know.

I could point out a good many other things that have come under my observation during the last 12 months. I only beg of you gentlemen that you consider this gravely before any of you put these cabinets in; see if we cannot get together with these manufacturers of ice machines to have them put out by the right method. We will be glad to help them in any way we can.

CABINETS SHOULD BE SOLD THROUGH ICE CREAM MANUFACTURER.

(From Illinois convention remarks by Lee Wilson.)

With 15c cost or rebate to the customer and assuming that 7c which seems to be the concensus of opinion and I am going to grant that that's right—although it isn't right and it's a long way from right—but I'm going to grant that it's right for the purpose of this illustration: There is 25 cents a gallon taken off of that customer's ice cream with the cabinet. With a thousand gallons, that means $250 per year.

I don't believe there's any business man who wouldn't invest $400, which is the cost of an eight-hole cabinet. Our average installation cost is approximately $25 to $30, which covers the bringing of the water line to the cabinet and the bringing of the electric line directly from the meter. The cost runs approximately $20 to $30. That would be the average. That makes an investment of $420 to $430 installation cost and a saving each year of $250.

Now we have some deductions. I am aware that there will be something to take off in the way of service charges. Our company has, I believe, 36 or 38 cabinets installed. I am not here to discuss the merits or demerits of the different makes of cabinets. That would't be policy for me to do. I have gone over the subject very thoroughly since the early days of the refrigerated cabinet, when it first bubbled forth a little over a year ago.

I had the misfortune, if you want to call it such, of representing the Michigan association at Dayton with Mr. Fisher and going over the subject there of the sale of the cabinet to the dealer. Mr. Grant also had a conference with several other ice cream manufacturers of Michigan and myself in an endeavor to conform their sales policy with ours. I will be frank in saying we were able to convince Mr. Grant that the logical solution of the sale of the cabinet was through the ice cream manufacturer, if he could be induced to see the light. I say "see the light" and I mean it in exactly that manner!

Just quoting from memory some few little figures in connection with our business, the figures of which I am now getting out, for a little analysis, I remember taking some stops where they had the old style soda fountain in. The old style soda fountain was almost impossible to keep the ice cream in a perfect condition or in a salable condition with one pack in 24 hours. That was our experience. I may be wrong. Maybe we did not know how to pack, maybe a weakness in our organization. But at any rate we found cabinets that were using seven and eight pails of ice twice a day. We were sending a truck to these stores twice a day to take care of them.

On account of the close proximity of our plant to the majority of our stores, it was cheaper for us to do that than it was to maintain large storage cabinets, and it was easier for the dealer because our drivers did all the work.

We made the analysis and figured our cost of ice at $5 a ton to our ice cream department. I realize that's high, and we make our own ice in a small plant suitable for the manufacture of the ice to take care of our individual needs under our

SAFE AT HOME!

THE reliable Emery Thompson line of ice cream freezers has been use in the most prosperous wholesale ice cream factories for so long a time that their value is proven without a doubt.

The Emery Thompson—whether you consider the Horizontal, the Vertical, or the Direct Expansion—is a **safe** machine to purchase and operate. It safeguards profits. It protects you against excessive labor cost. It assures you of satisfactory production and is your guarantee of a quality product. We believe that our catalog contains **reasons** that will interest you.

Emery Thompson Ice Cream freezers are ***safe*** —not alone when they are tested in our factory —but safe ***at home in your factory!*** That's what proves their value.

THE WALRUS CABINET

(Mechanically Refrigerated)

(Patented)

THE above illustration shows a "tilted" view of the No. 3, four compartment, Walrus Cabinet.

Each compartment in all three sizes of Walrus Cabinets is oval in shape and will accommodate two five-gallon packers of ice cream —one packer in front of the other.

There are two Sliding Lids over each oval compartment. The Sliding Lids are light in weight, but very sturdily constructed, and are easily and quickly shifted, as compared with the ordinary round, bulky, weighty and cumbersome type of lift-off lids.

Dispensing from the front or rear row of packers in the Walrus Cabinet is easy and most convenient. Compare the ease and labor saving of these Sliding Lids with that of lifting off a five or six pound bulky round lid several hundred times a day.

The Walrus Cabinet has a sturdy, strong body construction. The linings are of unusually heavy copper. The top and lids are made of heavy, pure, solid nickel silver. The Sliding Lids slide on nickel silver bars. The heavy copper lining is mounted on a flooring of artificial stone, which affords a substantial foundation and prevents punctures and breaks in the copper lining, which often occur in the ordinary type of cabinet when heavy packers of ice cream are carelessly dropped into the cabinet.

The facings on the Walrus Cabinet are not of heavy marble, that would "sweat," stain and break—or white glass, that would break easily—or enameled iron, that would chip and rust and can not be refinished. They are of aluminized Redwood, specially treated, and can be refinished, and thus renewed, easily, quickly, and at small expense.

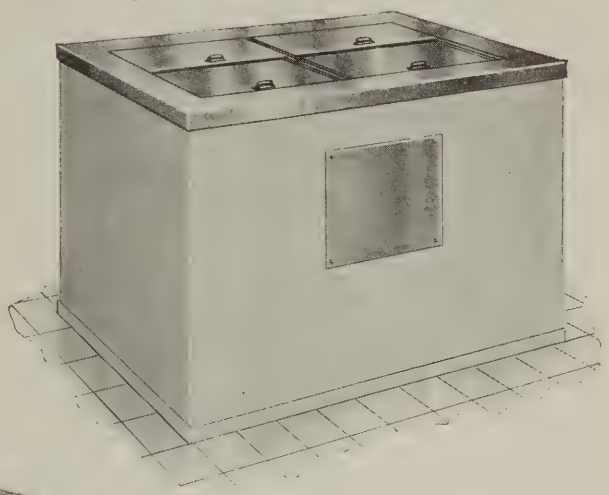
The Walrus Cabinet conforms in height and width to the height and width of the standard Soda Fountain workboard.

Any one temperature desired may be generated and automatically maintained throughout one cabinet.

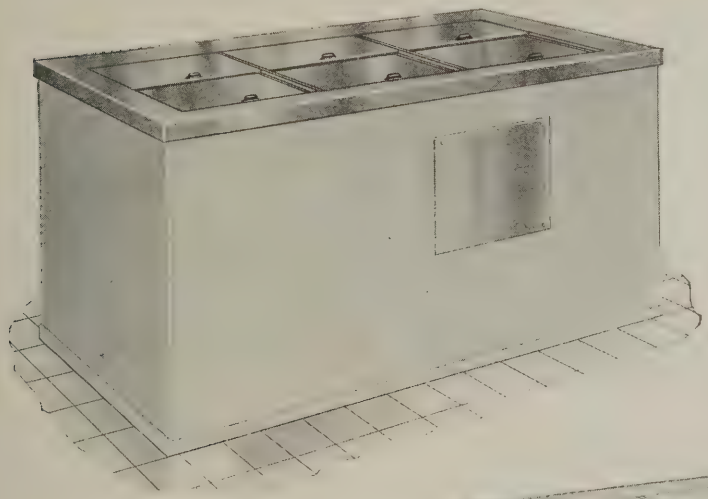
The Walrus Cabinet pays its cost with what it saves in labor, reducing to a minimum the loss in bulk of ice cream and preventing spoilage of perishable goods.

PRICES AND TERMS QUOTED UPON APPLICATION

THE WALRUS CABINET



(Made in three sizes only)



NO. 1 WALRUS CABINET

(Two Compartments)

39″ Long, 30¾″ Wide, 30″ High

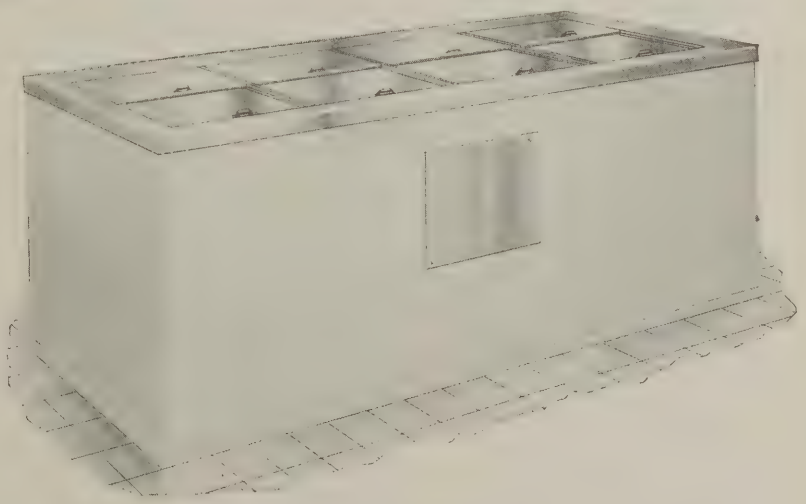
Each Walrus Cabinet is equipped with a complete Frigidaire Mechanical Cold Storage or Refrigerating Plant. The Frigidaire equipment is put into operation and adjusted without additional charge, if the purchaser resides within a fifty mile radius of a Frigidaire Service Station. Also, six months' free service is included in the price of a Walrus Cabinet, under the same conditions. Frigidaire is guaranteed against all mechanical defects. Many thousands of Frigidaires are in use.

NO. 2 WALRUS CABINET

(Three Compartments)

52″ Long, 30¾″ Wide, 30″ High

Walrus Cabinets have many advantages in construction, convenience, durableness, appearance and efficiency. They eliminate entirely the use of ice and the labor and muss incident thereto. They function automatically and perfectly. They save perishable foods, prevent most of the shrinkage or loss of bulk in ice cream, are a protection to health and are not any more expensive to operate than the iced Cabinets.



NO. 3 WALRUS CABINET

(Four Compartments)

65″ Long

30¾″ Wide

30″ High

Manufactured Only By

WHILE the Pacific Ice Cream Manufacturers' Association took no concerted action on this matter, Bert H. Walker, secretary of the association, has outlined some interesting views, as follows:

"As associations, there was no action taken, but it was the universal opinion (at the joint Pacific convention) that the iceless cabinet was not the answer to the problem in hand, but rather the refrigerated fountain. There were several kinds of both fountains and cabinets exhibited at the show, what business they did I don't know, but there were none of the men who favored furnishing dealers with cabinets for the purpose of inducing or holding trade.

"We had men who advocated putting in ammonia units for any customer who wanted them. We had one man who said any manufacturer who allowed his dealer to own either a refrigerated fountain or cabinet was digging his own grave. Others were willing to finance the dealer for a cabinet on a gallonage basis, or monthly payments. Others again who would not have anything to do with it and thought the dealer should own his own equipment."

IN ILLINOIS the ice cream manufacturers feel that inasmuch as the cabinets are part of the dealers' equipment, the dealer should properly make the purchase and pay for the power and water used in the operation of the cabinets, securing an allowance from the manufacturers for the ice and salt saved, according to N. Loewenstein, secretary of the Illinois association. A policy regarding the cabinet situation in that state was adopted by the Illinois association and was published in past issues of The Ice Cream Review.

Since that time there has been no material change in the attitude of the Illinois manufacturers, according to L. W. Roszell, who added:

"Manufacturers still feel that this equipment should be bought by the retailer and that manufacturers should not, under any consideration, make investments in this equipment, and least of all should they ever consider buying and placing this equipment as competitive advantage over other manufacturers.

"Manufacturers in this state are cooperating with the manufacturers of these cabinets in the sale of them to the retail trade. There is only one instance that I know of and that of a very small and inconsequent manufacturer purchasing any of these cabinets and placing them with dealers.

"We feel, out in this section of the country, that this equipment belongs in the classification of retail equipment and should be bought, paid for and owned by the retailer."

old system of packing and icing. Our reason for putting the price of the ice at $5 to our ice cream department is that we have an arrangement with the local ice company there that they take our surplus ice off our hands at $5.25 a ton on the platform, so we don't cheat the ice cream department any when we charge the ice at that figure.

We found, by taking the number of stops that we had and dividing them into two-hole cabinets, that our cost of taking care of the average two-hole cabinet was somewhere around (I'm quoting from memory) $4, I believe. Taking 52 weeks for a two-hole cabinet, it cost us over $200 to take care of it with ice and salt.

That caused us to think just a little before leaping. We took the larger installations first — fellows using 1,200, 1,500, 1,800 to 2,000 gallons and made our installation of refrigerated cabinets only in spots where it would be of such a great advantage to us that we couldn't help but see that we were going to get our cabinet investment back in a short time.

Our service calls and inspections on those 36 or 38 cabinets installed from January 3 or 4, 1924, up until I believe we made our last installation in that number along about the middle of May or the first of June— and by inspections I mean where the service man went to the store and opened the cabinet and looked in to see if there was anything wrong, to try the oil, look at the brushes, etc. —those together with the service calls from the customer numbered 22 calls, I believe, up until the first day of October.

Of those 22 calls, 5 of them were service calls, telephone calls to the office that there was something wrong with the cabinet. I don't just remember the nature of them, but there has been no case where we have had to pull the cabinet out of the store for the purpose of making the repair.

We have reduced our ice consumption to our ice cream department on our gallonage an average of 12 pounds for every gallon of ice cream that we sold during the months of June, July and August. I think that's the figure. Our gallonage in June and July was slightly less than what it was a year ago so that the 12 pounds would possibly be higher, the saving would possibly be higher had our gallonage gone to last year's rate. In the month of August our gallonage was almost identical and the saving went up just a fraction.

You must understand that we are not 100 per cent equipped, that some of those 36 or 38 cabinets are in country districts where we still ship in the old-fashioned method of ice and salt. We are not getting as much of a saving on those as we might, although we charge the customer our city delivered price, which is 20 cents a gallon over our shipping price. Our shipping price generally throughout Michigan is $1.10 a gallon f. o. b. shipping point. Our price to the shipping trade, where we make an installation of refrigerated cabinets (and we only do that in cases where it would show us a benefit) the price is $1.30 a gallon. That is for bulk vanilla cream. Flavors take a correspondingly higher rate of 10 cents and 15 cents.

The saving in ice has been approximately 12 pounds, which at $5 a ton means 3 cents a gallon on every gallon of ice cream that we sold regardless of whether it went in a refrigerated cabinet or not, and we are not 40 per cent equipped with refrigerated cabinets.

Possibly there are gentlemen who would like to ask me some questions. I simply want to tell you that I am quoting these figures from memory, but anyone can write me and they will get a frank expression from me on any question of any nature in connection with it, with an unbiased opinion.

I believe I stated here to Mr. Cun-

(Continued on page 84)

THE Wisconsin Association of Ice Cream Manufacturers took up this matter at its meeting in January and appointed a committee to confer with the Minnesota association's committee.

J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers, advises that only about a half dozen members of his organization use iceless cabinets, and most of them are restricting distribution to their local cities.

Although the past Kansas convention was almost entirely taken up with discussions of iceless cabinets, Secretary B. T. Perkins reports that it was impossible to get a majority to agree sufficiently to take action, except for one resolution, which disapproved lending or placing of cabinets free. He said:

"Almost the entire membership agreed that the ice cream manufacturer really should have no part in the purchasing of cabinets, but the retail dealer should buy the cabinets or fountains himself. Several expressed their opinion that they will not do so, but if competitors take up the placing of cabinets they will make reduction in price to counteract this competition.

"There have been a few of the larger ice cream manufacturers who have purchased and placed several cabinets, some on rental plan, one company has loaned them free of any and all charge, but we understand that at this time this company is about at the end of its rope on finances and now they see their mistake. Several large manufacturers who have not yet gone into the cabinet plan see that those who have been placing cabinets have done so because they wanted to beat somebody else to it, or was afraid the other fellow would get one or two accounts."

IN CALIFORNIA the situation is being handled entirely different in almost every locality covered by this association, according to Jay H. Kugler, secretary of the California and Southwestern States Ice Cream Manufacturers' Association, who adds:

"Where one manufacturer has attempted to install cabinets in certain localities, he has forced his competitors to do likewise and this has caused a very bad condition. A great many of our members favor the idea of promoting the installation of iceless soda fountains."

C. F. Jamison, secretary of the Ice Cream Manufacturers' Association of West Virginia, has announced the

The MANNING PRICE LIST

following report adopted by his association:

"We, your refrigerated cabinet committee, beg to submit the following report:

"That the ice cream manufacturers of West Virginia do not encourage the installation of iceless cabinets at their cost.

"That if untoward or competitive conditions arise involving the installation of such cabinets, the question to be handled by the regional associations.

"That if any action on the question by the regional associations is not satisfactory to a manufacturer, he may appeal to the board of directors.

"That where the dealer supplies his own cabinet, an allowance not to exceed 10 cents per gallon be made where icing service is now being given.

"That the dealer pay for the current and water.

Signed by the committee,
J. J. SCHMIDT,
G. W. SHETLER,
G. W. STRONG."

THE committee on cabinets of the Canadian Association of Ice Cream Manufacturers had taken no action on this matter when the survey was made, it was stated by M. E. H. Morrison, secretary.

E. L. Carlson, secretary of the Colorado Association of Ice Cream Manufacturers, states:

"Many of the principal members of the association are installing cabinets, and we have ironed out a few evil practices at their inception.

"We are installing on packing routes free of charge, the dealer paying costs of water and electricity. Our installations to the shipping trade are made on a rental basis of $10.00 per month for a four-hole cabinet, $11.00 for six-hole, and $12.00 for an eight-hole. The dealer pays costs of plumbing, wiring and remodeling of fixtures if necessary. He also pays costs of water and electricity.

"Most of us out here feel that the iceless cabinet is a big step forward and an instrument to be used for a great deal of benefit to individuals and the industry alike. It can be made likewise a source of contention and possibly an item of expense to the manufacturer unless they are installed under proper conditions."

The attitude of the Michigan ice cream manufacturers has been outlined by R. F. Frary, past secretary of the Michigan Allied Dairy Association, as follows:

"Large and small manufacturers alike generally conceded they (the iceless cabinets) were—at least when properly perfected—a decided improvement both in convenience, service, efficiency and probably (eventually) in economy, and in view of this prospect, after numerous meetings, decided to direct effort to a sane, businesslike distribution and keep away, if possible, from their free and unrestricted distribution. However, the effort in this respect, while it has been generally effective, in some few cases of course has failed. There is no question, though, but that it is important and well worth the effort to concentrate on the importance of making every cabinet self-financing, for neither large nor small manufacturers can afford to do otherwise, and especially so in view of the almost yet untried stage of their perfection.

"I presume that there are some 2,000 or more iceless cabinets now installed in our state."

ningham a year ago that I wasn't interested either directly or indirectly in the sale or manufacture of any iceless cabinet, and I'd like to say it again here.

"WE ARE WELL SATISFIED."

(From Southern convention address by George L. Boedeker.)

One of my good friends who cannot see iceless cabinets yet, this past year has increased the size of his garage, put in another ice tank and bought five or six new trucks. He probably spent fifty to sixty thousand dollars and that, if put into cabinets, would have started immediately to saving him money and he would not have needed the ice tank, trucks or added garage space.

We have purchased a total of 141 cabinets, of which all are in the city of Dallas. Thirty are in the smaller surrounding towns on a rental basis. Our investment on these out-of-town cabinets is $15,405.08, and we get a rental back from them totaling $5,865.00 per year, or a return of almost 38 per cent. It also holds the dealer for us, increasing his ice cream sales from 50 to 150 per cent, and increases the dealer's profit on ice cream.

We are very well satisfied with our refrigerator cabinet investment and experience.

ADVANTAGES OF MANUFACTURER OWNING CABINETS.

(From Illinois convention remarks by Mr. Hey of Sterling.)

We bought 50 cabinets. I think there is no one here who will say that we have used these cabinets as a club. We have tried to keep away from that and give the other fellows a chance to think it over for a year. We have had immense numbers of retail customers learn of the cabinets that we put in for our customers and there has been a great cry from other territories for cabinets. We undoubtedly could have put in a large number of cabinets and taken customers from our competitors, but we don't believe that we should go at it that way.

We are very much pleased with the cabinets. One reason for putting them in, one thing that decided us in putting them in, was that we do not intend to make as many deliveries as we used to make with ice and salt. We deliver twice a week now in and out-of-town places and we hope to close our doors entirely on Sunday. That, to us, is a thing to be desired and we haven't had much service trouble. I figured up the other day the average number of service calls, and it was somewhere between six weeks and eight weeks to a cabinet. No serious trouble. Several of the water valves didn't work right and the water ran a little longer than it should. The only serious trouble we had was the other day a machine went wrong inside and probably it was a broken crank. At the time we left, we were just taking the machine to our repair station to open it up and repair it. I do not know whether that's it or not, but I believe that's what the trouble was. That's the only trouble that has bothered us to any extent where we had to take the cabinet out and repair it.

That is the advantage, I think, in the manufacturer owning the cabinets—the ice cream manufacturer. If that dealer had that trouble, it might be quite a burden to the individual dealer, but by the manufacturer owning a number of cabinets, he can average his costs on the whole proposition.

We figured when we bought the cabinets that we ought to be safe on an average life of four years, and we intend to charge off 25 per cent depreciation. We don't know whether that's going to be right or not. We hope and expect that it's going to be a longer life than four years. We believe it should be more.

W. A. Wentworth, secretary of the Ohio Association of Ice Cream Manufacturers, has outlined his views on the subject as follows:

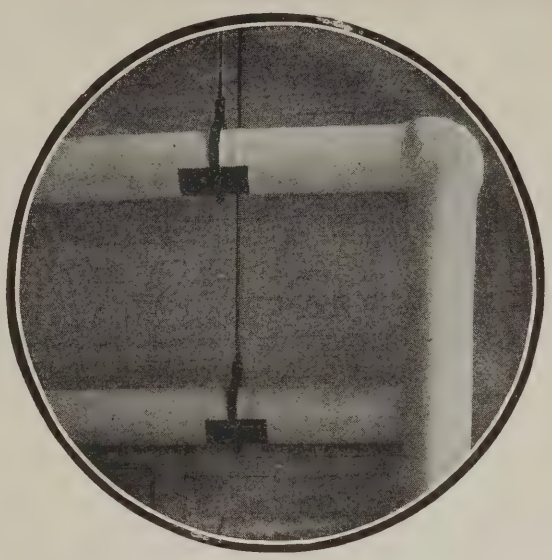
"An ideal situation would be that cabinets be installed by manufacturers, thereby eliminating their use in the solicitation of stops. This has been impossible in this state, but I think that it would be possible if everybody would get together at the outset. Our people in most sections of the state are working together pretty well on the thousand gallon minimum, although once in a while one breaks over. In the matter of ownership, we are finding that the majority of the people put them out in the same manner that they formerly placed the ice and salt cabinets, namely, that ownership rests with the ice cream manufacturers. Out of some three thousand installations in Ohio, I do not suppose there are five per cent of them owned by the retailer."

The following report was made by the Ohio association's committee on mechanically refrigerated cabinets on October 9, 1924:

"The uppermost thought in any change of policy in the ice cream industry should be for the improvement of service and quality of the product with no resultant increase in cost to the consumer thereof.

"Upon the best information gathered from dealers in, and manufacturers of, ice cream, in certain districts, this committee feels that the operation of the mechanically refrigerated cabinet contributes to the improvement of such service and quality; based upon this conclusion of the service provided by such cabinets, the committee desires to recommend certain policies and practices with regard to the extended use of these cabinets in Ohio. These recommendations are offered upon the conclusion that those policies adopted on February 1, 1924, at the annual convention have, to a certain extent, outlived their usefulness to the industry, in view of the fact that there are now in operation in Ohio approximately 2,700 mechanically refrigerated cabinets.

"Your committee does not feel justified in recommending or advising any policy which would arbitrarily affect all manufacturers in Ohio. We believe that local and district conditions should govern. We, however, propose the following basic policies for the installation of mechanically refrigerated cabinets in this state:



I. To promote the greatest economy in providing service for the ice cream dealer, it is the suggestion of the committee that dual service, i. e., the maintenance of both icing service and mechanical service on individual trucks where mechanical cabinets have been installed, be discouraged and discontinued as rapidly as possible.

II. That where the ice cream manufacturer installs the mechanical cabinet at his own expense and of his own investment, that profiting by experiences already gathered, such cabinets be installed only in retail stops which sell in excess of 1,000 gallons annually, whether these be so-called city or country stops.

III. That in view of experiences with

Trapeze hanger for large pipes and double lines. May be made with angle iron or pipe. St. Mary's Hospital, St. Louis, Mo.

Strap hanger for single lines. Note shield around covering. These lines are canvassed. Buffalo State Hospital, Buffalo, N. Y.

How to Hang Insulated Cold Lines

Cold pipe insulation must be as nearly as possible continuous, unbroken and sealed absolutely tight against the entrance of air and moisture. Every hanger that runs through to the pipe is a refrigeration leak, and carries moisture and frost right down under the insulation.

Here are two types of hangers that show how lines insulated with Nonpareil Cork Covering should be supported.

On the left is a trapeze hanger, generally used for large pipes or for two or more lines close together on the same level.

On the right is a strap hanger for small lines. Both have a metal shield between the hanger and the covering.

The point to note is that both hangers are entirely ***outside the covering*** There is no break in the insulation and no chance for moisture and frost to follow down the hanger rod under the covering. Outside hangers like these eliminate entirely the commonest source of trouble with cold line insulation.

With Nonpareil Cork Covering and Fitting Covers and ***outside hangers,*** you can insulate your lines from end to end without a break, without a crack or crevice where air or moisture can get in.

Hangers and other details of cold pipe insulation are fully explained in a 32-page book, "Permanent Covering for Refrigerated Lines and Tanks," sent free on request. Write for it.

ARMSTRONG CORK & INSULATION COMPANY 164 Twenty-fourth Street, Pittsburgh, Pa.

REFRIGERATED FOUNTAIN IS ANSWER

(From National Convention Address by William F. Luick)

The cabinet as we know it momentarily, is not the final answer, and at least three-quarters of your business within three years is going to be done with the refrigerated fountain. Therefore, why worry so much about the cabinet? The cabinet is going to be the place of storage for ice cream, because the up-to-date dealer will want and is going to have the refrigerated fountain. So you won't need to worry much about the cabinet inside of a year or two.

I am not worrying about it now; I am a big booster for the refrigerated cabinet, and the refrigerated fountain particularly, the equipment, for instance, that several of our manufacturers are making today is so reasonable in price that the dealer can buy a refrigerated cabinet and refrigerated fountain for less money than he paid for just an ordinary non-refrigerated ice cream fountain a year ago.

Therefore, the installation of the refrigerated fountain, which relieves you of all ice troubles, * * * and leaves you then clear to sell ice cream to that dealer back on the same old basis * * * cost of economical production of as good ice cream as you know how to make, with the normal profit that Mr. Knobbe is asking for.

Mr. Knobbe is trying to put across this thought, that what he wants to know is how he best can handle this to treat each one of his customers squarely and get the normal profit that he is entitled to, and that is all I am looking for. And the one principal reason why I don't favor the manufacturer owning the cabinet is because I am firmly convinced that the cabinet, even though you depreciate it 20 per cent, and you estimate it will last five years, the demand for that cabinet in that place is not five years of time.

In other words, the dealer, the druggist, we will say, that you furnish a cabinet to today, by next year he will say, "Well, I don't want this cabinet any more, I have contracted for a fountain and I want to take your credit. * * *. Therefore, you are going to get right back to that same proposition, that the final word is the fountain, and this cabinet question won't last more than another year or two.

Another reason why I don't feel like owning the iceless cabinet is because I have always worked on the basis of giving each one of my dealers * * * a square deal, and I don't think I can do it by installing the ice cream refrigerated cabinet, because I know that if we install a cabinet for the 700-gallon man, we are doing more for him than we are by installing the cabinet for a 2,000-gallon man. In other words, it costs us the same money to install the cabinet for the 500-gallon a year man as it would for the 3,000-gallon a year man, and we are not giving him a square deal. That 500-gallon a year man, if he can't do more business than 500 gallons a year, should stand the expense of the installation of equipment to handle that 500 gallons, and the 3,000-gallon man is entitled to have the benefit of the saving that is made on his greater sales.

MR. LIFTER: Mr. Luick, do you finance your dealer for that cabinet or fountain or does he finance it himself?

MR. LUICK: He has financed it himself entirely.

MR. LIFTER: You never finance it?

MR. LUICK: We have never financed it to the extent of one single dollar.

QUESTION: What do you allow per gallon?

MR. LUICK: Seven cents a gallon for the past summer, but we increased that to ten cents a gallon, because we want to encourage the installation of refrigeration. This step in refrigeration means the biggest evolution that has taken place in the ice cream industry in ten years, and we want our dealers to install it as soon as possible, and although we believe that the fountain is naturally the final answer, still there are a great many dealers who are willing to invest $400 to get that immediate return, and they get the immediate return, and the benefits of having a refrigerated cabinet.

mechanical cabinets located in so-called country stops, ice cream manufacturers who have placed such cabinets provide refrigeration and transportation or freight on the same basis as to so-called city stops. However, should a manufacturer prefer to continue on an f. o. b. basis to shipping customers, it is found that the cost of such service is at least 10c per gallon of ice cream, on account of the average life of the cabinet being three to four years.

IV. That wherever a cabinet may be installed by the ice cream manufacturer, the retailer, whether city or country, shall bear the cost of water and electric current used in the operation of such cabinet.

V. That in view of the available data on the cost of ice and salt service, viz., 5c to 10c per gallon, such actual cost of service be used for determination of any allowance in case the dealer or retailer, who previously was provided with ice and salt service, may furnish or own his own mechanically refrigerated cabinet.

VI. In case manufacturers of ice cream do not desire to install refrigerated cabinets as a part of their own investment in equipment, it shall be considered entirely proper as a contribution to the progress in the industry, to sell such cabinets to dealers or retailers at cost price, based upon the purchase price in lots of five, sale to be made for cash.

VII. That under circumstances of the ice cream manufacturers furnishing as a part of his own investment mechanical cabinets to the dealers, a contract providing proper terms and conditions under which such cabinets will be furnished and maintained, be used for the protection of the investment made.

VIII. Recognizing the many complexities of such a transition in the ice cream industry, and in view of possible developments and improvements in the designs and effectiveness of mechanically refrigerated cabinets and fountains, your committee suggests that the installation of such cabinets be made only where conditions may warrant or demand.

The action of the North Dakota association at its 1925 convention is covered farther back in this discussion. On April 1, 1924, the cabinet committee made the following report:

"Your directors acting as a committee beg to report to you on the mechanically refrigerated cabinets, as follows, which is timely and may save you money and lots of trouble:

"After thorough and deliberate consideration of all points involved on the subject of the mechanically refrigerated cabinets and equipment, it is the finding of your committee that no installation of such equipment should be made or paid for in any instance by ice cream manufacturers nor should manufacturers endorse any notes for dealers in the purchase of such equipment.

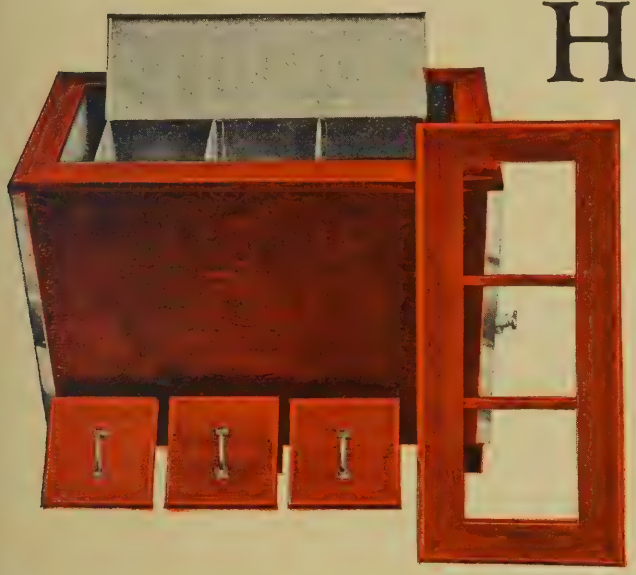
"Your committee is further of the opinion that no service charges, nor installation costs or costs of any kind should be borne by ice cream manufacturers on mechanically refrigerated cabinets installed by retailers.

"From all available statistics your committee feels that in the matter of allowances on the price of ice cream to dealers who have installed such equipment or contemplate installing same, that the actual saving of ice and salt for the packing of the equipment is the only saving that can be effected and that this ranges from 5 to 7 cents per gallon. In view of the desirability of encouraging the installation of refrigerated cabinets by retailers, it is the opinion of your committee that an allowance of not to exceed in any case ten cents a gallon is a fair and reasonable allowance. You will notice this paragraph applies to manufacturers who have regular routes carrying ice and salt and icing free to dealers. (We hope we have none of these in North

TWO SIDES OF THE PICTURE.

(From National convention address by N. J. Dessert.)

I find that 47 per cent of our city trade was served by mechanically refrigerated cabinets during the months of July, August and September, 1924, and that these customers handled 68 per cent of our total city gallonage. Just digest this for a moment—47 per cent using refrigerated cabinets handled 68 per cent of our gallonage.



You will note from the figures given above for the decrease in ice and salt used during this period that with 53 per cent of our customers handling only 32 per cent of our gallonage, we used 63 per cent as much ice as for all of our customers combined during 1923. With complete mechanical equipment in all of our stops we could, of course, save practically all of our ice and salt, or roughly, seven and one-half cents more, and the additional saving in the cost of drivers and helpers and maintenance expense of transportation equipment would surely increase this saving by a variable figure, which I am not prepared to state. You can perhaps draw your own conclusions from some of the figures given above.

From the foregoing you may feel that I have worked out a rosy endorsement for mechanical refrigeration. However, there is another side to the picture, and we will now take a look at that side.

Our figures show an average cost for refrigerated cabinets installed in our customers' stores of $430 each, and this sum includes cabinets of all sizes, cost of labor for installing, running electrical wiring, water lines, drayage, handling, etc.

Now, to get an accurate line on the cost of ownership in cents per gallon, we have allowed six per cent interest on our investment in cabinets, a maintenance expense per cabinet of $38.40 each per year, electrical operating cost $33.36 each per

Twice-a-Week Icing Keeps His Cream Firm and Hard

Mr. R. C. Woods tells of astonishing performance of A-B Ice Cream Cabinet in store of Cobb-Woods Drug Company at Union City, Tenn.

Who is better qualified to judge the merits of an ice cream cabinet than the man who actually uses it in his store every day—who knows exactly how much ice and salt is necessary to maintain perfect refrigeration—who knows how often re-packing is necessary?

Here is a letter from just such a man—R. C. Woods, manager, Cobb-Woods Drug Company, of Union City, Tenn.

"We recently installed one of your A-B Ice Cream Cabinets in our drug store," writes Mr. Woods, "and wish to say that, from the standpoint of efficiency and economy, it is 100% perfect.

"We need ice the cabinet only two to three times a week, and it keeps the cream in perfect condition. Ice furnished in ice cream tubs is sufficient to take care of the needs of the cabinet."

A-B Ice Cream Cabinets will save more ice and more salt for you than any other pack cabinets you can buy.

Why? Because an unusually effective insulating material surrounding the ice and salt chamber on all four sides keeps cold air inside the cabinet and warm air out. Even the lids are fully insulated, and fit tight.

Cream compartments are square and perfectly dry. All sizes of bulk ice cream can be inserted with greatest ease—square pockets permit carrying all package cream in compact facility.

Full details and prices gladly furnished on request. Write for them—NOW!

Dakota), as it has been a bitter experience to most all who have tried it.

"Your committee is of the opinion that a complete refrigerated unit, composed of storage cabinet and fountain, is desirable equipment and will have a tendency to increase the per gallon allowance to the retailer by reason of the greater saving on the part of the manufacturer—by the manufacturer not being required to maintain what is known as dual service. Such dual service is now necessary in many instances by reason of the fact that a refrigerated cabinet alone in a dealer's store does not eliminate the necessity of icing the fountain by the manufacturer, thereby reducing or eliminating any saving in service to the manufacturer.

"Your committee has not exhaustively gone into the merits or demerits of the equipment on the market and is of the opinion that ice cream manufacturers are not called upon to recommend any particular equipment to their dealers—selection of equipment being a matter that should be left entirely to the discretion of the purchaser.

"Your committee desires it to be understood that it feels that the mechanically refrigerated cabinet is a propressive step in the distribution of ice cream and the further development of this innovation in the ice cream business should be encouraged, but it feels plainly obligated to set forth facts as they exist at this time, with reference to the general subject of refrigerated cabinets.

"There is a wide difference of opinion as to the most desirable refrigerant used in the various machines on the market. There is a question as to the practicability of these machines operated by a novice as would be the case in installation in retail stores—the point of liability in case of an accidental discharge of gasses or refrigerant in the event of loss of life or loss of business. There presents itself the question of the small retailer making the investment in the mechanical equipment and its subsequent influence upon the manner of paying his bills.

"While desirable and deserving of the fullest co-operation, it must be borne in mind that the development of mechanically refrigerated cabinets must be along lines consistent with continued sound and economical distribution of ice cream.

"Your committee emphatically DENOUNCES AS AN UNFAIR TRADE PRACTICE any attempt by an ice cream manufacturer to use the installation of mechanically refrigerated cabinets as an inducement to secure customers from a competitor or for the purpose of attempting to tie a retailer up with a long time contract, which has in practically all cases proven unenforcible and has no other significance than that of a sharp trade practice carrying a distinctly unpleasant reaction.

"Respectfully submitted by the directors of the North Dakota Ice Cream Manufacturers' Association,

S. J. LADUE,
H. K. GEIST,
F. O. KNERR,
R. C. SCHULTE,
H. C. CHRISTIAN."

year—you may know that all of the Detroit manufacturers are paying the electrical cost of operating these cabinets, and while this is not an unbearable item, it is one that should not be borne by the ice cream manufacturer and it is a practice that should be stamped out before it starts—figuring a depreciation of 20 per cent per year on this equipment installed in the customer's store.

By dividing our total gallonage for the year into the total cost of ownership, we find that the machines have cost us 7.28 cents per gallon. Now we show a net saving, due to decreased service costs of 6.98 cents per gallon, therefore, the installation of machines this year has cost us three-tenths (.3) of one per cent per gallon more than our service would have cost if we used no machines at all. This is the other side of the picture and it is not a gloomy one by any means.

While we have undoubtedly placed refrigerated cabinets in some places where the dealer, by reason of gallonage, was not entitled to machine service, we find from our records that the average gallonage per dealer serviced by mechanical refrigeration has been approximately 1,750 gallons. I believe that we should look into this matter of gallonage per customer very carefully and not make the mistake of scattering them around regardless of present or possible gallonage in the future. As we drop down in total gallonage per cabinet, the cost of ownership per gallon goes up very rapidly.

CABINETS AND COUNTRY RETAILERS.

(From Illinois convention remarks by John Knobbe.)

I go into the country occasionally, and I go into a store and I'll say again that it's a ragged looking proposition. Here's an old soda fountain in a nice drug store in a country town. The druggist wanted mechanical refrigeration and the

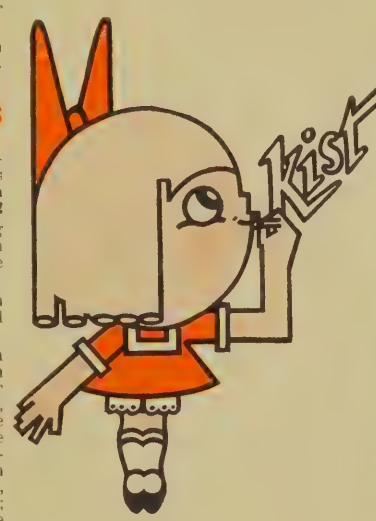
"INSIST ON KIST"

the Frozen Sucker

A New Source of Added Revenue for the Ice Cream Manufacturer

During the past few months you have heard a lot about The Frozen Sucker. Hundreds of manufacturers throughout the country are already exploiting this salable product and are building profits far beyond their greatest expectations.



We have made The Frozen Sucker a National item.

Manufacturers who have gone into this proposition are reaping from $50.00 to $500.00 a day in added profits, **without tying up any of their Freezer Equipment,** and are finding that besides giving them additional profits, it is also helping increase the sale of their Ice Cream, Ices and Sherbets by adding new dealers.

The Frozen Suckers are easily and quickly frozen in inexpensive mold units. Each mold consists of 72 tubes, allowing the production of 6 dozen suckers in one simple operation. Freezing can be done in hardening room or easily constructed brine tanks.

The Frozen Sucker is easily and cheaply manufactured. It is purely and simply a flavored ice, frozen on a stick. The cost of making the Frozen Suckers, including all materials, sticks and wrappers, is less than 7 cents per dozen. The selling price to the dealer is 40c per dozen. The retail price is 5c.

With practically no initial investment, you can add this new source of income to your 1925 business.

Success with Kist Flavors

During the past 18 months, a number of prominent ice cream firms have made a marked success with the Frozen Sucker. In **every notable success in this country to date, Kist Flavors have been used!**

Just as Kist Flavors have been the outstanding flavors used in week-end bricks and bulks, ice cream cups and other specialties, so they have become the accepted flavors for making Frozen Suckers.

Here are just a few of the larger Ice Cream Manufacturers who are putting out the Kist Flavored Frozen Sucker.

Rieck-McJunkin Dairy Company of Pittsburgh and allied Pennsylvania plants; Imperial Ice Cream Company of Parkersburg, West Virginia and their various plants; M. B. Ise Kream Company of Dallas, Texas; Telling Belle Vernon Company and Tabor Ice Cream Company of Cleveland, Ohio; Houston Ice Cream Company of Houston, Texas; Terry Dairy Company of Little Rock, Arkansas; Horn Ice Cream Company of Baltimore, Md., Norfolk and Richmond, Virginia; Pangburn Company of Fort Worth, Texas; Peters and Jacoby of Allentown, Pa.; Williams Ice Cream Company of Scranton, Pa.; Hill Ice Cream Company of Benton Harbor, Mich.; Peerless Ice Cream Company of Kansas City, Mo.; Weber Ice Cream Company of Jefferson City, Sedalia and Moberly, Mo.; White Ice Cream Company of Minot, N. D.; Model Creamery of Redlands, California. (We have made this list scattered to show the already national acceptance of the Frozen Sucker Proposition. (Space precludes listing of scores of others.)

Frozen Sucker Equipment

We have gone into the Frozen Sucker proposition thoroughly and coordinated all the details, enabling the Ice Cream Manufacturer to start production quickly, with practically no initial expense.

After careful investigation, we have made arrangements with the Valentine Machinery and Supply Company of Chicago, to supply our customers with their Frozen Sucker mold units at $29.50 each. We have found the Valentine Method to be by far the most satisfactory and sanitary way of making Frozen Suckers.

We have secured a source of supply for the necessary sticks and vegetable parchment wrappers at exceedingly low prices for our customers' benefit.

To help the manufacturer put the Frozen Sucker proposition over quickly and effectively in his town we have prepared a forceful advertising campaign, consisting of a series of powerful colored dealer window posterettes and newspaper advertisements.

This is only one of the many ways in which Kist Flavors help Ice Cream manufacturers increase their profits.

All advertising material and other aids are only a part of our large and comprehensive advertising and merchandising service which we furnish FREE to one Ice Cream Manufacturer in a town under a Friendly Agreement plan by which he enjoys the exclusive rights on "Kist" Flavors and "Kist" Flavored Frozen Suckers.

ufacturers' Association, as outlined by the president, D. V. Vandiver.

TEXAS ice cream manufacturers have not acted in the matter, but the secretary, A. J. White, believes the situation will resolve itself to the point "where cabinets are going to be owned by the retailers so that manufacturers will not be required to carry the heavy investment." He states that cabinets at this time are being "leased, given away and used in about any other form that individual operators see fit in order to increase their business."

In Texas cities the ice cream manufacturers own most of the cabinets, pay all power and water charges on these, and make no change in the selling price of ice cream, it was reported by George L. Boedeker, Boedeker Manufacturing Co., Dallas, Tex. He continued:

"Some ten or twelve dealers own their own cabinets and to them the selling price is reduced. At present this reduction is twenty-five cents a gallon, but this is a mistake and will eventually be remedied. The difference should be not less than ten cents a gallon, and not more than fifteen cents a gallon. Lack of co-operation when the first cabinets were installed is to blame for this mistake in the differential made in the price.

"Of the five manufacturers here, four are in favor of owning the cabinets and keeping the price the same. One is absolutely against the manufacturer owning the cabinets, wants the dealer to own them and is willing to advance the dealer money in order to buy the cabinet or fountain. Some cabinets have been installed here that the dealers are paying for at the rate of twenty-five cents per gallon on the price of ice cream.

"In the shipping trade, it has been the custom to rent the cabinet on a basis of $172.00 per year for a 4-hole, $202.00 a year for a 6-hole, and $232.00 a year for an 8-hole.

"One firm has about 300 cabinets out on this arrangement. Now, another big ice cream manufacturer who refuses to buy or rent cabinets has lost a lot of trade to those manufacturers who are renting cabinets. This firm, in an effort to stop the renting, has cut the price of ice cream 25 cents a gallon. This is simply demoralizing conditions in the ice cream industry here. So far, this fight has not entered our city and the one against whom the fight is being made is a Dallas manufacturer, but he has refused to meet the cut. It now appears that it will enter Dallas soon, and even further cuts made."

Mr. Boedecker enclosed copies of his contracts, which follow:

AGREEMENT.

Memorandum of agreement under which the Boedeker Mfg. Co. has installed a..... refrigerator cabinet No.....Dome No. .....in the store of..... at....., Dallas, Tex.

It is agreed and understood that this cabinet is the property of the Boedeker Mfg. Co. and has been installed for the purpose of keeping the ice cream and ices sold to the.....by the Boedeker Mfg. Co. in a firm and serviceable condition.

The Boedeker Mfg. Co. has paid all installation charges and agreed to pay for the power required to operate cabinet.

The Boedeker Mfg. Co. agrees to pay for the water used by cabinet at the rate of one and one-third cents for each KWH consumed.

The..... agrees to keep cabinet in clean and sanitary condition and not to permit same to be marred or defaced other than from usual wear and tear of general usage.

The..... agrees to allow the Boedeker Mfg. Co. to remove the cabinet at any time after a five day written or verbal notice.

The Boedeker Mfg. Co. agrees to remove cabinet within five days upon request of the..... Should this removal request be made within six months of installation of cabinet, the .....agrees to pay to the Boedeker Mfg. Co. $25.00 as a part of the installation expense.

Cabinet installed on.....

Signed.....

.....

manufacturer said, "I'll put in the box for you." He removed the showcase and here sets the box out here and the soda fountain is here and he's putting ice in there yet. He walks over to the cabinet and there are all the boys in the store and everybody else lying around, with the covers open—I don't think that's the thing. I don't know why we would want cabinets.

We have some candy stores and confectioners that do not have fountains. There would be a nice place for a cabinet. They're all right, and I want you cabinet men to understand that I am in favor of your cabinet every minute and I'm very much pleased with one man standing up here and saying, "We want to sell them to the retailer." I want to back him all the way—back him all the way! Because then Cunningham, Chappel and the gang will all have a chance to take a bid with me at that place. I will sell them if my quality and price are right.

CABINET CUTS COSTS.

(From California and Pacific convention address by a representative of an iceless cabinet company.)

From the manufacturers' viewpoint the electric ice cream cabinet cuts costs and, in some cases, entirely eliminates some of them; first, by the elimination of salting and icing cream where cabinets are in use; second, the installation of electric ice cream cabinets greatly decreases the labor at each stop because no time is taken for mixing ice and salt, carrying it into the store, packing the cream, and cleaning up the muss, to say nothing of the general inconvenience and confusion caused by such a process in a retailer's store.

The installation of electric cabinets means a great deal in the reduction of cost in connection with delivery and delivery equipment. Where the entire route is iceless, the truck equipment can be cut down to light economical trucks with a low first cost and small depreciation cost. Fewer deliveries need be made with the trucking equipment on account of the greater and longer storage capacity in the cabinets.

Delivery time is reduced due to the speed of delivery and the elimination of labor so that more stops can be made in the same time.

There is less depreciation on trucks, less investment per truck, and fewer trucks. If present trucks are used more cream can be carried. Consequently, longer routes can be established, quicker and better service given to the dealers, and a general saving effected on each route.

Experiences of many manufacturers show that the installation of iceless cabinets on country and suburban routes brings the country stop to the city and makes it practically a city stop. Installation of the cabinets on stops of this character often enables the manufacturer to eliminate the dairy delivery because the cream does not have to be packed. It is kept in perfect condition and a large amount of it can be stored. Delivery is often accomplished by light, high speed trucks, whose operating over a radius of a great many miles is exceedingly low.

In cities the parking problem is becoming greater every day. The delivery time, due to the fact that salting and icing is done away with entirely, has so cut down the time at each stop that the driver can leave the truck at almost any place, drop the cream, and be off on his way to the next stop in a very short space of time.

Manufacturers find that upon the installation of a cabinet in a store that the public quickly appreciates the better quality of the cream—the fact that it is kept in an absolutely clean, sanitary condition—that there is no danger of salt, ice, water or other foreign substances getting into the cream—that it is always kept

Following is the company's contract governing a six-hole cabinet:

AGREEMENT.

Memorandum of agreement whereby the Boedeker Mfg. Co. of Dallas, Texas, installs a six-hole Delco Frigidaire Cabinet in the premises of the Blank Drug Store, Jonesville, Texas.

Said cabinet to be installed by the Boedeker Mfg. Co. without cost to the Blank Drug Store except for the bringing of the water and power connections to the location of the cabinet.

Cabinet is to remain the sole property of the Boedeker Mfg. Co. and the Blank Drug Store agrees to pay rental on said cabinet as follows:

Six dollars ($6.00) per week for the period bewteen March 15 and October 10, and $1.00 a week for the period between October 10 and March 15 of the following year. Said rentals to be paid promptly each week and to run from Sunday night to Sunday night.

Blank Drug Store is to pay for all the power and water necessary for the operation of said cabinet. The Boedeker Mfg. Co. is to install and adjust the cabinet so that it will give satisfaction and properly take care of ice cream.

Any service call made necessary by any defect in the cabinet or of improper adjustment to be made without cost to the Blank Drug Store.

Any service call due to any other cause will be charged for on a basis of time and material.

This contract is for one year from date but is subject to cancellation by either party concerned upon five days written notice with the following conditions:

If cancelled by the Blank Drug Store within one year from date of this contract, the Blank Drug Store agrees to pay $50.00 installation charges in addition to all rentals when due.

If cancelled by the Boedeker Mfg. Co., the Boedeker Mfg. Co. agrees to give the Blank Drug Store a reasonable length of time to install another cabinet. Such time not to be more than two weeks and rental upon cabinet to be paid for the entire time that the cabinet is in use by the Blank Drug Store.

It is further agreed that if the Blank Drug Store purchases this cabinet within three months of date that all rentals then paid on this cabinet will be applied on the purchase price of this cabinet.

Signed.....

.....

Gentlemen:

We are pleased to advise that the Lathrop-Paulson Ice Cream Can Washing machine is installed in our plant, and has been in operation for the past week, and we find same is giving very satisfactory results. In fact, it is the first ice cream can washing machine that we have seen in all of our experience that delivers perfectly clean and dry cans.

Kindly consider this letter as our acceptance of the machine.

Any references you may wish from us, will be gladly given.

Wishing you success, we are

Yours very truly,

L. J. CHRISTOPHER COMPANY,

TEC:N By Thos E Chapman

L.-P.

ICE CREAM CAN WASHER & DRIER

Only two men are required to operate the machine at maximum speed, and one man can handle the work efficiently at the 300 speed. Cans are washed on outside as well, freeing the cans, lids, pans and covers from brine. This machine eliminates the necessity of washing cans and covers separately. Cans which have been stored and coated with oil do not have to be brush washed. They come out ready for service, or may be piled in storage racks without danger of rust. Machine will also handle brick tanks up to 12 qt. size. All cans are placed in machine upright, and are delivered **absolutely clean, sterile and dry.**

The machine is sturdily constructed and heavily galvanized. Temperatures are thermostatically controlled. Soda solution is automatically controlled by L.-P. Patent Soda Regulator.

Machine is sold on a results-guaranteed basis. Names of users will be gladly submitted upon request. It will not obligate you to obtain full information and price. Send the coupon today.

$144 for 8-hole cabinets. This is more nearly a return to the manufacturer of the cost of keeping these cabinets than by the two dollar a week proposition which is used in northeast Iowa. While the northeast Iowa manufacturers realize that they should have more rental, the competitive situation is such that this rental basis cannot be changed at the present time."

The Mississippi association did not see fit to place the iceless cabinet in program for discussion at our next meeting. "Those in charge of the program observed results obtained in New Orleans and thought it wise to not let it get too good a start as we might not have time for other matters," reported Secretary N. D. Brookshire. "No doubt we will have some of the cabinet men with us and they will be extended the courtesy of the floor. There are some ten or twelve cabinets in use in the state, these being purchased by the owners, and it is the general opinion of the manufacturers that I have talked with that the only way they will handle the situation is to let the dealer buy. The cities of Mississippi are all small, consequently the manufacturers are in the same class, and the cabinet matter is one that we are going to feel our way before we take any aggressive steps."

W. H. List, secretary of the Metropolitan Ice Cream Manufacturers' Association, whose association has taken no official action in this matter, states that the general feeling is that the iceless cabinet proposition requires considerable investigation. He believes it will take years for the iceless cabinet to gain foothold, and his assertion is based on the history of refrigeration in the industry.

A. L. Manning, past secretary of the Louisiana association, states that "it is the opinion of most of the members of the ice cream manufacturers that the manufacturers should stay off the iceless cabinet proposition and let the cabinet and fountain people sell direct to the dealers."

Howard Geist, secretary of the North Dakota association, outlines his body's policy as follows:

"Reports with copy of opinion of directors, dated April 1, 1924. This opinion is unchanged to date.

"Directors of this association recommend to the members that no installation of iceless cabinets should be made or paid for in any instance by the ice cream manufacturer—nor should manufacturers indorse any notes for dealers in the purchase of such equipment.

"Service charges and installation costs should not be borne by the ice cream manufacturer when installed by the retailers.

at the proper temperature, it is never too hard, nor too soft—and that the cabinet itself attracts a great deal of attention in the store. Soon the entire neighborhood learns of the cabinet.

The cabinet improves or maintains the quality of the ice cream by keeping it at an even temperature; it is always at the proper consistency; the temperature of the machine can be regulated to suit your own needs or the needs of the particular dealer in whose establishment it is installed; the flavor is always maintained, and the customer is quick to recognize the superiority of the product and the service.

There is no re-icing, and the sometimes consequent attendant damage to the cream through crystallization; no returns of soft cream, a cost which some one always has to bear, and no petty annoyances such as delivery damages, etc., in the dealer's store.

The electric ice cream cabinet makes better customers for the manufacturer because the installation of a cabinet offers the dealer a convenience and fills a long felt need. It is something they have been wanting and hoping for, for years. Ice cream dealers will be much pleased when they learn that they can be provided or can provide themselves with a cabinet that needs no ice or salt, makes no dirt, no muss, does away with sloppy floors and insanitary conditions, eliminates the often insanitary cabinet behind their counter.

Electric cabinets enable the merchant to serve a more superior, a more sanitary, and a more palatable product.

Electric cabinets relieve the employees in the store of much work of a disagreeable nature, makes them more satisfied, and turns them into boosters for the cabinet and your ice cream.

WHAT ABOUT THE ICE PLANTS?
(From national convention address by N. J. Dessert.)

It is manifestly unfair to make a customer who gives you a business of 1,750 gallons a year stand the burden, or part of it, of a customer who handles four or five hundred gallons. Some plan should be worked out for a service charge per hole or per cabinet for these customers who use less than, say, 1,000 gallons per year. It is not a difficult plan to work out and it may have the effect of cutting down the number of small customers, as many small stores who handle 400 gallons or less per year would probably not care to handle ice cream if it entailed any responsibility or expense on their part. This would not cut down our total gallonage, but would give us fewer customers and better ones.

The figures which I have given you covering our various costs do not reflect the picture of a manufacturer who might be equipped 100 per cent mechanically; we can only conjecture what savings might be made in that case. Surely our large ice plants will be a thing of the past, although we will need considerable refrigerating capacity for freezing and hardening the cream. We, who already have large ice-making plants, will necessarily have to find an outlet for our capacity or take a loss on them.

We should not maintain a dual service indefinitely. You can see what it has meant to our company to do so. Fifty-three per cent of our customers were iced up this year and they used only 32 per cent of our gallonage, while requiring 63 per cent as much ice as we used on all of our customers a year ago. Part of this ice must be charged up to the fact that our drivers have continued to ice up the fountains, even though we have a refrigerated cabinet installed. This much is a pure loss, but we are only continuing a practice that has been customary with all of us since the industry was started.

"The only saving to the manufacturer is in ice and salt, such actual saving ranges from 5 to 7 cents a gallon. However, in view of the desirability to encourage iceless cabinets, the committee agreed that an allowance should not exceed ten cents a gallon as a fair and reasonable allowance. (Very few manufacturers in North Dakota carry ice and salt and icing free to dealers.)

"This board of directors feel that iceless cabinets are a progressive step to the manufacturers of ice cream and further development should be encouraged.

"Committee emphatically denounces as an unfair trade practice any attempt on the part of the ice cream manufacturer to use iceless cabinets as an inducement to secure customers from a competitor and to tie a retailer up with a long-time contract."

Kentucky ice cream manufacturers feel that only those dealers selling from 1,800 to 2,000 gallons of ice cream a year can make iceless cabinets justifiable.

The majority of the manufacturers in that state, according to Carlton Ball, secretary of the Dairy Products Association of Kentucky, favor dealer ownership, but "if trade desires, they are prepared to loan cabinets." He said:

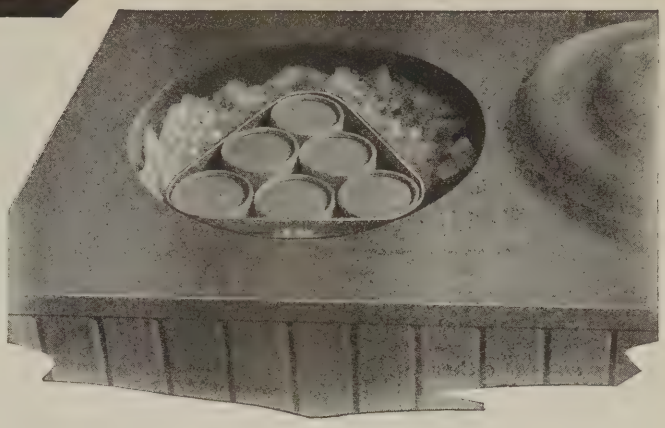
"The majority of our members favor dealer ownership and iceless fountains, the manufacturer selling the cabinet to the dealer on either cash or time payments basis. However, should the trade desire, they are prepared to loan the cabinets.

"The National Ice Cream Co. of this city is the only manufacturer planning to install the cabinets entirely on a loan basis. It is felt that 10c per gallon would be a satisfactory differential in making allowances for ice and salt.

"The consensus of opinion is that refrigerated cabinets should not be urged upon the dealer, mainly because of the inevitable swing toward iceless fountains, and secondly, because of the large stock of ice and salt cabinets now on hand.

"It is believed that only dealers of 1,800 to 2,000 gallons per annum would make iceless cabinets justifiable."

The iceless cabinets are going very slow in Kentucky, reports William Heuser, manager of the National Ice Cream Co., Louisville, who adds:

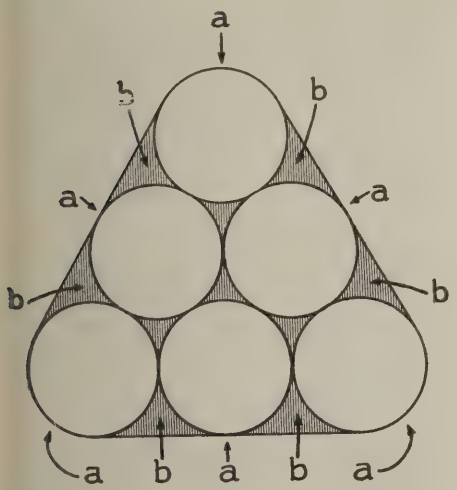


"The general opinion is that each customer should buy his own cabinet. This, however, seems to be a very slow process. Another reason for this opinion among the ice cream manufacturers is because it requires a large outlay of money to finance the iceless cabinet business. Several of them have one or two out through the state.

"We have none up to the present time, but are now making water and electric connections and have some thirty-five ready for installation.

"We are trying out one 6-hole ——— cabinet and one 6-hole ——— in our office, having them connected on a separate meter so that we may be able to

The O. & B. Triangular Packer serves as a container both in the shipping tub and in the cabinet. This saves much can-washing, re-icing and retinning of the containers.



In the diagram below, "A" indicates the direct contact of each Sealright container with the sides of the packer. "B" shows the cold air spaces between the containers.

This arrangement gives perfect refrigeration. It insures the cream reaching the user's hands in perfect condition.

The tub and cabinet illustrations show clearly the ample icing space surrounding the packer.

Each Triangular Packer holds 18 quarts, or combinations of quarts, pints, and half pints.

Increase Your Sales

With the O. & B. Triangular Packer

THERE is no question that *bulk ice cream* packed by the factory in air-tight packages that are also thoroughly cold will solve your problem of selling *the home trade.*

Successful factories everywhere are educating their trade to the use of fibre containers.

Users are *instantly served* and need not wait for cream to be packed by the dealer.

There is *no loss of cream* to dealer.

User *prefers* bulk ice cream, and that is what the dealer may now sell him *in the fibre package.*

When packed in *O. & B.* Triangular Containers, cream in fibre packages keeps *perfectly hard* even after user has them in his home.

The net result of the above is *more home sales;* and that, Mr. Ice Cream Manufacturer, is *important to you.*

Better order a sample dozen Triangular Containers *today.*

compare the electricity consumed by each one. Our own opinion at this time is that the ——— is the most economical and best cabinet so far as we can see on account of having twice as much installation as the ———. They also have a service station which of course will be of great benefit to us in case we need service. We, however, will have our own service men to look after our cabinets. We will own the cabinets and furnish them to our dealers who will use 1,000 gallons and upward per season. We are sold on the iceless cabinet proposition and believe it is a step forward in the ice cream business.

NATIONAL ASSOCIATION AND CABINETS.

The National Association of Ice Cream Manufacturers, at its annual convention last November, took no action, either official or unofficial, in connection with the iceless cabinets, leaving this matter entirely up to the membership.

At that time the association appointed a committee to test ice and salt cabinets and make reports that would be of benefit to the industry. W. H. List, Puritan Ice Cream Co., Newark, was made chairman of that committee. Mr. List reports that a meeting of this committee was held recently and that ten cabinets from ten different cabinet manufacturers will be tested—one icing every 48 hours. The test has begun and lasted for three weeks. The test ended just before this issue of The Ice Cream Review went to press. Different proportions of ice and salt were used for six day periods, said Mr. List. A report of the test will appear in the next issue of The Ice Cream Review.

"We have talked to one small dealer here who makes his own ice cream, who has one of these cabinets in his store and he says if he had to go back to the old salt and ice method of packing ice cream he would go out of the business. We have heard this on several occasions and we believe it to be so."

The New England contract in popular use is as follows:

CONTRACT.

(When manufacturer owns cabinet.)

This agreement made this ..... day of .....
by and between..... of .....
in the County of.....and State of.....
hereinafter called owner and....., ...
in the County of..... and State of.....
hereinafter called customer.

Said owner hereby agrees to install one.....ice cream cabinet hereinafter called cabinet in the store or place of business of said customer.

The customer agrees to provide the electricity and water connections to the point of installation of the equipment, at his own expense, and to provide a space.....by.....by....for a..... hole cabinet. The owner agrees to keep the said equipment in repair and in good operating condition except where repairs are made necessary by the negligence of the customer or his employees, when the repairs shall be made by the customer.

Said customer hereby agrees to hold said owner harmless from any loss, cost or damages, by reason of leakage or alterations made necessary to install said cabinet, or for any other cause or reason due to the installation and use of said cabinet.

It is hereby mutually agreed and understood that said cabinet shall be used for the express storage of the ice cream sold by said owner, and shall not be used for any other purposes whatsoever.

It is hereby mutually understood and agreed that this agreement can be terminated by a written notice of two weeks from said owner to said customer, or by a written notice of two weeks from said customer to said owner. Said owner shall have the right to enter the premises of said customer for the purpose of examination of said cabinet, to repair said cabinet, and to remove said cabinet, without being liable for damages for so doing.

It is hereby expressly understood and agreed that said cabinet shall be the sole property of said owner, and shall remain the property of said owner and shall not become the property of said customer, or his heirs, assigns, or any other person.

Witness our hands and seals this.....day of.....19..

.....
Owner.

.....
Customer.

CONTRACT.

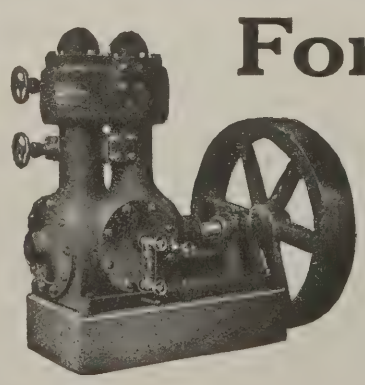
(When customer owns cabinet.)

Where the customer has purchased and installed a mechanically refrigerated ice cream cabinet at his own expense, it is recommended by the committee that a rebate not to exceed 10c per gallon be granted such customer, provided no ice or salt whatsoever is furnished.

Where shipping customer, who had not previously been serviced by a manufacturer, desires to have a mechanically refrigerated cabinet installed, it is recommended that the conditions regarding installation set forth in uniform contract be adhered to and that a minimum charge of 10c per gallon in addition to the manufacturer's established price be assessed.

UNFAIR PRACTICE.

The committee feels that it should be considered an unfair practice for an ice cream manufacturer to solicit business from other manufacturers' customers, using as an inducement the installation of a mechanically refrigerated cabinet where his own customers have not previously been offered this type cabinet.



THE New York state association does not attempt to decide what action its several members shall take in matters that might be called service operation, according to Secretary A. M. Lemessurier.

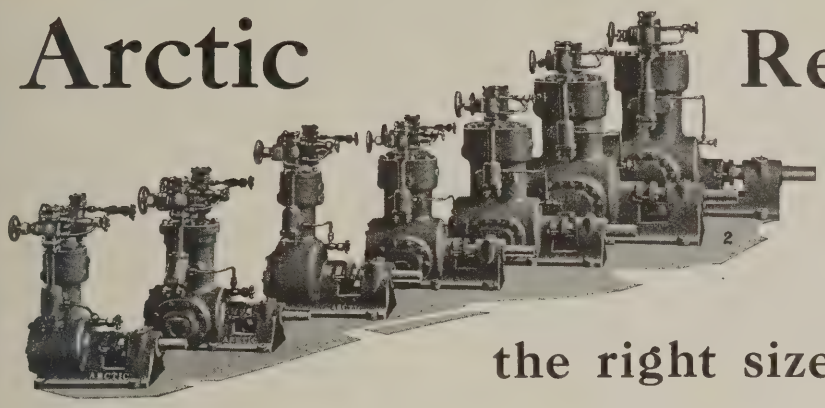
"It was the consensus of opinion," he added, "that it was advisable to proceed cautiously and a majority of the members felt that more would be gained for the industry and the public at large by waiting developments than by hurried acceptance of the installation of refrigerating units in the stores of our dealers."

"The iceless cabinet question was discussed at our last annual convention and addresses were made by representatives of several companies manufacturing them," reports Secretary C. F. Jamison of West Virginia. "A few iceless cabinets have been installed in West Virginia, but the general tendency is to hold further installations of them until business conditions warrant the investment." He continued:

"A few cabinets have been installed in West Virginia and we are doing our best to thwart the indiscriminate installation of these cabinets and have succeeded in a measure, but only by heroic efforts.

"It appears that some of the manufacturers are nervous and afraid of the other fellow beating him to it and occasionally a cabinet is installed where a good customer is the goal.

For Lasting Satisfaction



York
Refrigerating Equipment

One reason why there are so many installations of York Refrigerating Equipment is that its satisfactory working condition does not pass with the seasons. York Equipment does not mean satisfaction until the first signs of wear show up, but a year in year out dependable service that stands the strain of rush seasons without injury to its long life.

Let us show you just why York Equipment lasts longer.

"Personally, I am of the opinion that the installation of iceless cabinets promiscuously is going to be a very expensive operation and I do not think the time is quite ripe for their use for out-of-town customers."

UNFAIR TO USE CABINETS AS INDUCEMENT.

Your committee emphatically denounces as an unfair trade practice any attempt by any ice cream manufacturer to use the installation of mechanically refrigerated cabinets as an inducement to secure customers from a competitor, or for the purpose of attempting to tie a retailer up with a long time contract, which has in practcally all cases proven unenforceable and has no other significance than that of a sharp trade practice carrying a distinctly unpleasant reaction.—From report of Illinois association committee on refrigerated cabinets.

Secretary C. C. Totman, in a recent letter, describes the South Dakota situation in this way:

"We arrived at no real definite decisions at our annual convention on February 3 and 4. We did decide to get copies of rental and sales contracts which the Minnesota association has undoubtedly adopted at their convention which is just over, with the idea of using the same in South Dakota. I believe that uniformity on this point is very desirable, not only within state borders but everywhere possible. It is too bad to make poor use of a good thing, such as is being done with cabinets by many men.

"We have but one manufacturer in Sioux Falls who is putting out cabinets and while others no doubt will soon, I believe they will use uniform contracts."

Secretary P. A. Crowley of the Iowa association has announced the following contract is being used in northeast Iowa, and also, to some extent, in Nebraska:

LEASE.

This agreement made and entered into on this..... day of....., 192.., by and between....., a corporation of....., Iowa, and..... of....., hereinafter called the Customer.

1. The Company, for and in consideration of the covenants and agreements hereinafter set forth on the part of the Customer, does hereby agree to furnish to the Customer and fully install one.....hole.....mechanically refrigerated cabinet No..... for preserving ice cream and sherbets exclusively.

2. The Customer, in consideration thereof, hereby agrees to buy ice cream exclusively, and to the full extent of his needs, from the Company at its regular established wholesale price, for a period of three years from and after the date of this contract, and to pay for the same to the Company at....., Iowa, on the Company's regular weekly terms.

3. In addition the Customer agrees to bring water and electric connections close to the cabinet and to supply sufficient water and current to operate the same properly, and to pay the Company for the use of the equipment a yearly rental of $104.00, payable weekly on Monday, dating from the time of the installation of the cabinet, as follows:

.....

.....

.....

4. The Customer further agrees to pay all indebtedness due under this contract each week, and agrees that upon the failure to so make such payment, that the Company may enter in and upon the premises of the Customer and immediately remove said cabinet without legal process of any kind, the Customer hereby waiving his rights as to notice and legal process of such removal, and agreeing that no damage will be claimed because of such removal.

5. The title and ownership of said equipment is hereby expressly retained by the Company, which shall have the right to remove its said equipment upon the termination of this contract, as provided for herein, or in the event of breach of this contract by the customer.

6. The Customer agrees to bear the risk of loss or damage to said equipment by fire or freezing up to Two Hundred and Fifty Dollars ($250.00), and to indemnify the Company against any such loss or damage up to said amount.

7. This contract shall be continued from year to year after the expiration of said three year term unless either party shall give the other at least thirty days written notice of its or his intention to terminate the contract at the expiration of said yearly period. Upon the termination of this contract at any other time or upon the termination by the Company because of breach of contract by the Customer, the Customer agrees to pay the Company the sum of One Hundred Dollars ($100.00) as

Final Judgment

The verdict of the public is final when it comes to the judging of food products and from their decision there is no appeal.

Quality and flavor are the dominant factors in their judgment of ice cream products and these factors are due to careful selection of good ingredients, scientific manufacture and the maintenance of strict sanitary cleanliness throughout the making process.

These factors of quality and delicious taste are greatly assisted in hundreds of ice cream plants where the use of

Wyandotte Sanitary Cleaner and Cleanser

Indian in Circle

CONTRACT FOR SHIPPING ICE CREAM IN INSULATED BAGS.

This agreement made and entered into this..... of 192..., by and between.....(hereinafter referred to as the Company) and....., doing business under the trade style of..... of.....(hereinafter referred to as the Customer), WITNESSETH:

WHEREAS, it is proposed that Ice Cream be shipped in insulated bags instead of iced wooden tubs, resulting in a reduction of transportation costs to the considerable advantage of the Customer, and

WHEREAS, those bags are expensive and susceptible of rapid depreciation and are easily lost, and

WHEREAS, said Customer requests the Company to ship Ice Cream to said Customer in these insulated shipping bags,

It is agreed by and between the parties named herein that in consideration of shipments of Ice Cream being made by the Company to the Customer in said canvas bags, the Customer agrees to pay 15c per bag per shipment as "bag charge" for the use of each bag and to be responsible for the prompt return of these bags and the enclosed cans and covers.

The Customer will thoroughly clean the can, cover and bag before returning them.

When making a shipment of Ice Cream in insulated bags to the Customer, the Company will bill the Customer for the bags at the rate of $3.00 each, indicating on the invoice the serial numbers of the bags.

The Customer agrees to return all shipping bags within three days from date of the receipt thereof, and upon the failure to do so, will pay the Company promptly for each bag not so returned at the aforesaid rate of $3.00 each.

The Customer agrees that since the above charge of $3.00 for each bag is less than one-half of the cost thereof, he will not sell the Company's bags to others and will not hold them for his private use.

The Customer agrees that upon the return of each of the bags, he will note upon the Transportation Company's receipt the number of each bag in order that the returned bag may be identified and the proper credit given.

The Company agrees that the Customer, in making weekly remittances for Ice Cream purchased from the Company, may include as cash at the rate of $3.00 each, the Transportation Company's signed receipts for the return of each empty Ice Cream bag; each bag containing a clean can and cover.

Ice-and-Salt Cabinets Not in the Discard

Regardless of our conclusions regarding refrigerated cabinets, there is no doubt that many of us are going to use ice-and-salt cabinets for a long time.

—From National Convention Remarks by President Vernon F. Hovey

Getting the Most From Ice-and-Salt Cabinets

From National Convention Report by W. H. List, Chairman of Ice-and-Salt Cabinet Committee

WE TOOK eight cabinets, from eight different manufacturers. We put them all in the same room. We put recording thermometers in one hole of a two-hole five, and in the first test we put ice in the other hole. The cabinets were each one loaded with 50 pounds of ice and salt as a preliminary test, to find out the transmission and tie-up with tests that were afterwards made. In three days the ice was taken out and weighed. During the time the ice was in the boxes the temperatures were recorded. So as to give you an idea, I don't want to use these charts other than just to mention a few instances. In a short preliminary test of ten days like this we don't want to bank on all these figures; we would rather corroborate them by further tests. I don't want to have you gather the impression that all of these are final figures. In some instances we have tied up in two or three ways, so that we have figures that we feel pretty well satisfied with, but you would be surprised to find a very, very simple test like the meltage in pounds, I won't refer to the temperatures, they vary from 10 pounds to 28½ pounds in three days. They run 10, 13, 18½, 22, 25, 25, 25, 28½.

Now I can talk about that 28½ cabinet, because it was made by the manufacturer who makes our cabinets. It was made with three inches of sheet cork all around, the cork was coated on both sides with an emulsified asphalt, that is, a pure lake asphalt which is broken up in particles and suspended in water by emulsification, and you can paint that on and when the water evaporates the particles of asphalt adhere. It is tasteless, odorless and neutral, and it will stand a very low temperature without cracking or breaking. It will stand shocks and torsion strain, as has been proved by using that stuff in our refrigerated truck bodies, very successfully.

That gives you an idea of the preliminary tests with ice and salt, or rather, I mean, with ice.

After we had finished with the ice we put in ice and

These Figures tell their own story,

they are typical records of the operation of the Jamison Ice Cream Cabinet

Note that the ice and salt compartment surrounding the cylinders, which contain the ice cream cans, extends only half the depth of the cylinders. Solid cork board insulation replaces one-third to one-half the ice and salt used by all other cabinets. For detailed explanation of the cabinet's construction, send for the folder shown below.

IN ACTUAL operation the new Jamison Ice Cream Cabinet has repeatedly justified our strongest claims. Numerous tests on the part of big manufacturers have demonstrated the success of its new principle of construction beyond question. Wherever these cabinets have been in use or put to test, a saving of 30% to 50% in ice and salt has resulted. The two records below are taken from Washington, D. C. They are not at all exceptional.

Dealer No. 1 Cabinets: Two, 3 hole 5 and two, 2 hole 5 Time: March 5-20

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

salt. We wanted to have these cabinets tested uniformly, as near as possible, so the tests would be comparative. So we used the same proportions of ice and salt in every cabinet. They were iced up without any ice cream having been put in. The second day the ice cream was put in and the temperature of the ice cream was recorded. Well, of course, it was in our factory; we were right close to our hardening rooms, and every can that came out was a five-gallon can of vanilla, and every can registered with the themometer 1½ degrees below zero. That insured uniformity as regards any refrigeration that was exercised by the ice cream being colder than the cabinet.

OUR charts show seven days' icing with the ice cream in the cabinet. Before the ice cream went in our temperatures varied from 16 degrees to 27½ degrees in the eight cabinets. When I say 16 degrees, we took the minimum and the maximum that the charts showed. There were 24-hour charts used. Now, for instance, in the case of the 16, when I said 16, the minimum temperature was 14 and the maximum was 18 degrees; so we marked the minimum and the maximum on the chart and took the mean, showing a great variation in the cabinets before the ice cream was put in. The ice and salt temperatures were taken, you see, on the two-hole five cabinet, the ice cream in one end, the bulb of a recording thermometer, the bulb of which was 18 inches long, was carried down into that compartment. Four of these cabinets had square cans in, and the can of ice cream in that instance was put in the air instead of up against the ice and salt. The same way with the thermometer on the other end. The thermometer was suspended in the air in a square can that was part of the cabinet.

In the ones that did not have the square cans in, where the can was ordinarily submerged in ice and salt, we put in a five-gallon empty can and put the thermometer down in the center of the five gallon empty can. Now, that is as close to uniformity as you can get from recording tests with the different conditions of the different cabinets. Understand, these cabinets varied in length, width and height. They vary in insulation. They are not special cabinets, they are cabinets as manufactured by the various makers of ice cream cabinets.

On the ninth day we have 15 degrees, running up to 27½ degrees. That is the minimum and the maximum temperatures in the eight different cabinets, showing with the same proportion of ice and salt, showing the great variation in the temperature obtainable with a thermometer suspended in the air in a round or a square can in one compartment of a two-hole five cabinet.

I was talking to one of our ex-presidents of the national association and he told me that a survey of New York state showed about 30 pounds of ice per cabinet hole per day. Now, we have three cabinets that run as low as 30, and then they run up to, oh, 40,—say they run from 30 to 40 pounds of ice per day in a two-hole five cabinet, not per hole,—this is per two holes. In other words, gentlemen, on thirty pounds of ice per day per hole in the New York state survey, we have three cabinets in this test that will figure 15 pounds of ice per hole per day. There are only seven days,—I am not trying to take the average of seven days, where the cabinet had to be cooled down and take the first icing to give you an average. I am telling you that they ran for several days at 30 pounds for two holes.

I am not going to say that we ran down exactly to 15, because at the start that would run higher, but, covering a long period, you will say you would approach very closely to 15 pounds average.

Now, then, I want to give you some idea of the variation in these cabinets, so as to impress you with the fact that there is a great difference in cabinets, there is a great difference in what these cabinets will do in the way of keeping the heat out, there is a great deal of difference in what these cabinets will do as regards getting the advantage of the temperatures secured by the ice and salt to a greater or less extent, in accordance with the arrangement of the cabinet inside; you may not think that means much, but before we get through we will prove that it does, whether your can of ice cream is in the air or whether it is in the ice and salt; whether your can runs up to the lid, your square can. We had cabinets, four of them, with square cans in and four cabinets that had no cans in; that is, you put the

Salt Merchants

NORFOLK, VA. WILMINGTON, N. C.

Two years ago

1. Panels, three-ply, rotary cut fir.
2. Insulation, patented.
3. Blackrock insulating lumber.
4. Ice compartment.
5. Cream compartment.
6. Hard wood corner strips.
7. One-piece spigot
8. Solid oak lids and covers.
9. Brass screws permitting easy removal of ice compartment.

Two years ago the Dry-Zero Cabinet made its first appearance East of the Rockies introducing the dry pack principles. At that time we were told again and again that correct refrigeration could not be obtained by putting round cans inside of square compartments. Nevertheless, the Dry-Zero Universal Cabinet, *right from the start*, has supplied a consistently low temperature for 48 hours on one icing and at the same time effected a saving of 40% to 50% on ice and salt.

THAT was two years ago.

Now the Dry-Zero Cabinet is still giving the same satisfactory service that it gave then. Today, however, judging from the number of "*new*" cabinets being placed upon the market which have copied our design and imitated Dry-Zero as closely as possible, the superiority of the principles originated by the Dry-Zero Insulation Company are *openly* admitted. The "*new*" cabinets can imitate the original but they can never duplicate its results for the Dry-Zero Cabinet is *fully patented*, both the construction and also the insulation.

Each and every Dry-Zero Cabinet is backed by PROVEN FACTS supplied by reliable ice cream manufacturers. Why bother with imitations and infringements? Use the original and know beforehand what your cabinets will actually do. Write TODAY for further information and prices.

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

ice cream in the ice and salt. We found the greatest difference in the world where the square can containing a can of ice cream with air around it was carried up to the under side of the lid of the cabinet.

Up to the present time we sort of feel that we can account for the difference in the temperature on the top of the ice cream due to the fact that in carrying that square can up to the under side of the lid we prevent the heat that leaks in the four walls from going through and over the can of ice cream. We stop it off right there and let it go down and melt the ice and exert its powers in the help of refrigeration, and the only heat that gets in there is the heat that is displaced. Well, you displace the cold, putting your arm down in, and that runs off just like water, that heavy, cold air; you put your arm down in to dip, the cold air is displaced and runs out; then when you take your arm out you let the hot air in.

ANOTHER very interesting fact that we have concluded is that in an ice and salt cabinet you have all found that on the inside of your ice cream can, where the can is surrounded by ice and salt, and comes immediately in contact with it, when the moist air from the outside comes into that can it precipitates frost on the inside of the ice cream can. Under certain conditions that frost will get into your ice cream in particles, under severe conditions it will get down into the bottom of your can, and then you have your dealer sending you back a can of ice cream that has a quarter of an inch or half or three-quarters of an inch of ice in the bottom of the can.

There is a reason. I think you can prove it to your own satisfaction by testing a can of ice cream right immediately in the ice and salt and put another can of ice cream in a cabinet with a rectangular metal container for that can, and in that case the coldest place being the metal rectangular container surrounding the ice cream can, which is the coldest because of the fact that it is up against the ice and salt brine which surrounds it, is the first place that you get the condensation of the moisture in the air.

On the inside of the square can, instead of on the inside of your ice cream can, is the place.

The pounds of ice and salt used totaled during that period. We didn't think we were very much efficient, we thought we were just about as good as the next fellow, and we are pretty nearly as good as the average when it comes to using ice and salt. We didn't think it was possible to take our two-hole five cabinet and in that period of time use 490 pounds of ice as compared to three other cabinets right adjacent to ours that went down to 395, 385 and as low as 337. In other words, we are using almost 50 per cent more ice than the cabinet that is immediately adjacent to ours, and he is getting a darn sight better temperature in his cabinet and a darn sight better temperature of his ice cream, taking a bulb thermometer and putting it in the ice cream at the top, the mercury bulb being about an inch and one-half and the thermometer being put in there for two inches, for a uniform test all the way through; and then another test, if you take a can of ice cream and take a piece of metal and run it down the center of the can and fill one-half of the can with ice cream and make two just like that and put them in your hardeners, harden up the ice cream, put one of those cans immediately up against the ice and salt brine anl put the other can in a compartment where it is surrounded by air. If the cabinet is well and efficiently insulated you can get low enough temperatures in the air to hold that one-half a can of ice cream with temperatures top and bottom remarkably close together, because those temperatures equalize between the round can and the square can with sufficient room to cause air circulation, you have the cold air dropping and the warm air, due to the differences in temperature between the two sides of that air body, and you get an equalization of temperatures for your ice cream, which is the best thing in the world.

We have had cases in my personal knowledge where we wanted to see what condition the ice cream was in in the cabinet, where we laid it there after the best part of the 24 hours had elapsed from the time that that cabinet was iced. For instance, the dealer wants to serve vanilla and chocolate. He has used up one can of vanilla, he has another can of vanilla in the cabinet that has been in there all the time. He has to take the lid off the latter and he tries to serve it. Because the ice has melted the cream has fallen away and is soft, almost too soft to serve.

But in the chocolate can he digs way down in the bottom and that is surrounded by brine, it is at a very cold temperature, and he has a great deal of trouble digging out the chocolate, and he chops it off and puts it on the plate alongside of the vanilla and he has one that is too hard and the other is too soft.

That is proved by the other half of the can of ice cream that you put in your ice and salt brine, with the brine directly up against the outside of the can. Your one-half can of ice cream for the latter part of the 24-hour icing, the ice cream will start and it will get so soft it will bend down and bend over, and you would be surprised to know that under those conditions it is possible to register as much as 27 degrees difference in the ice cream at the bottom and the ice cream at the top of the can.

We also manufacture Jackets for Square Ice Cream Cans. Prices and samples submitted upon request

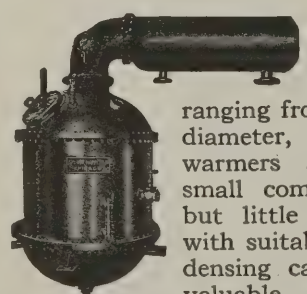
YOU have less fluctuating temperatures where your ice cream can is surrounded by air, you have less differences by far, very, very much less difference between the temperature of your ice cream at the top and the bottom in those two instances. You can get a short thermometer and reach down in the can and stick the thermometer in the ice cream in that half can of ice cream at the bottom and stick your thermometer in the top and note the difference yourself, and you will be very much surprised.

Not only that, we are convinced that that is the coming way to hold ice cream, instead of the way we have been doing it. We have never done anything else but hold it with the brine up against the can. We are convinced that the thing to do is to have efficient insulation so as to enable you to get your ice cream at a proper temperature in spite of the fact that it is surrounded by air instead of brine, because it can be done, gentlemen, as has been demonstrated here with four cabinets.

* * I asked somebody about refrigerated cabinets, what the maximum and the minimum were, as regards temperature fluctuation, and he told me that the way they set their cabinets they got 8 degrees difference between where she would shut off and the point at which she would start.

Now, I have heard that they can be regulated down to give you three to four degrees, but that is as low as I have heard. That is to say, maybe the refrigeration would start, and when she got down to four, say, she would shut off. But if you had told me that we could have an ice and salt cabinet that would give you one degree fluctuation, up or down, or, in other words a maximum of two degrees from the high to the low, and run it for seven days and prove that that can be done, I would probably want to call you as big a liar as you would probably call me when I get through; but, nevertheless, gentlemen, it is a fact.

ONE of these cabinets kept the temperature of the ice cream between 9 and 11 degrees as follows, for seven days: The first day was 10, the next 10, then 10, 10½, 9, 11, 9½. We want to get the ice cream to the consumer in as good condition as possible. We want to keep the ice cream in the cabinet under as favorable conditions as possible. It doesn't make any difference what you store in a storehouse, if it is apples or eggs or what it is, you want to keep that temperature fluctuation as low as possible. If you are in the egg business you know what you require your cold storage man to guarantee you before you will put your eggs in his cold storage. He wouldn't guarantee you what you have obtained here; I wouldn't guarantee to keep that up indefinitely, but, gentlemen, it shows that you can at least do as well as the egg cold storage man, with a cabinet that is as efficient as this one, because we have demonstrated with this test that we are 100 per cent better than he is, and that is going to mean that you will hold the texture of your ice cream for a much longer period, because it is not subjected to the rise and fall of temperature, it is kept within a reasonable radius. You are going to get away from trouble that you all know about, and you are going to hold the texture of that cream and make it much more desirable, and you are not going to have a temperature making soft ice cream at the top of one can and hard ice cream at the bottom of another can, as we have today.



"THAT WHICH IS LIFE-GIVING."

A great scientists could hold the most intelligent audience of his day spellbound for four hours. Talking on what, do you suppose? The wing of a grasshopper. Why? Because he was enthusiastic about grasshoppers.

You are selling that which is life-giving, that which has life-giving properties. It is not only palatable, but the doctors even come to your assistance and tell you what a wonderful life-giving property a plate of ice cream has. You are selling something worth more to this country, it seems to me, than the wing of a grasshopper. But how many of you can get up here and talk intelligently, logically, forcibly, persuasively, conclusively on your own institution, on your own product? I hope that you all can. If not, you would better go home tonight and cast yourself upon your knees, if you can still bend them, and ask God to help you—ask God to help you.—From national convention address by Harry L. Fogelman.

STOUT Brine Well

The happy medium in solving the Ice Problem

The 48 Hour Service Cabinet

It solves the serious problem between the costly ice and salt system of old type cabinets and the tremendous investment required to do away with them completely.

There Is No Guess-work About It—A Full Year of Satisfactory Service Is Behind this Cabinet

It Saves Money—HOW? Uses 30 to 50 percent less ice and salt and Doubles the Route Capacity.

Carry that much more cream on your trucks.

It holds the proper temperature, evenly.

No brine comes in contact with the cans.

No sloppy dripping when removing them.

Holds either Bulk or Brick without changes.

Insulated with three to six inches Cork Board alternating with three layers of heavy Asphaltum paper.

Test One Alongside Any Other—and You'll Adopt Them

Numerous reports the past season state that the Stout Brine Well holds in fine shape up to 72 hours.

Iceless Cabinets Left Up To Members By Canadian Association

Advertising Program Followed in U. S. Being Considered Individually by Manufacturers of the Dominion

THE matter of iceless cabinets was left up to the membership of the Canadian Association of Ice Cream Manufacturers, following the annual meeting of that organization at King Edward Hotel, Toronto, February 19.

The subject of express rates arose out of the minutes of the previous meeting and it was stated that the high rates had curtailed business for both the ice cream manufacturers and the carriers. It might be that the carrier companies are looking at this matter in a little different light now and that possibly a further representation might be made to them.

There was presented to the meeting a very full report from the advertising committee of The National Association of Ice Cream Manufacturers of the United States, on a national advertising campaign. Owing to the fact that the members had not had sufficient time since the reception of this report by the secretary to give it careful perusal, it was decided to send each member the information for his serious consideration.

THE attention of the members was directed to the great increase in the Provincial license charge for trucks. A suitable resolution will be drafted on behalf of this association protesting this increase and will be presented to the government, according to Secretary M. E. H. Morrison of Toronto.

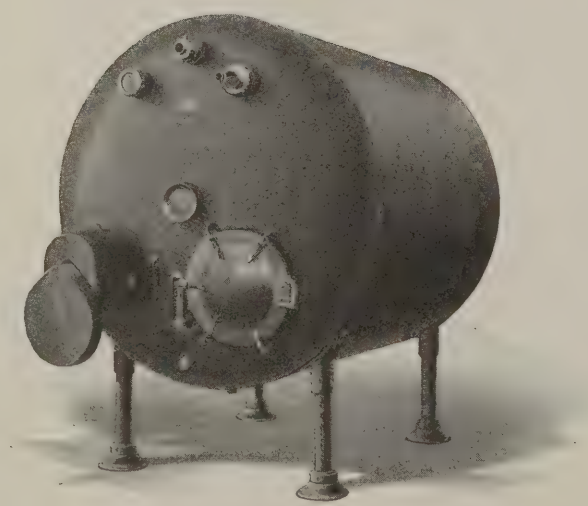
The officers for the ensuing year were re-elected, as follows:

President—Morden Neilson, president, Morden Neilson Limited, Toronto, Ontario.

Vice-president—B. Henry, Producers Dairy Co. Ltd., Ottawa, Ontario.

Secretary-treasurer—M. E. H. Morrison, William Neilson Limited, Toronto, Ontario.

Executive Committee—H. M. Gully, City Dairy Co. Ltd., Toronto, Ontario; R. T. Stillman, Brant Creameries Ltd., Brantford, Ontario; Chas. Yeates, Chas. Yeates & Co. Ltd., Guelph, Ontario, and G. A. Gillespie, Peterboro Milk Products Ltd., Peterboro, Ontario.



REID CO. TAKES OVER POLAR PRODUCTS.

What is reported as one of the largest business deals ever transacted in the ice cream industry recently took place in New York. The Polar Products Co. of New York City was sold to the Reid Ice Cream Co. of the same city. The Polar Products Co. was formed about five years ago and has enjoyed a marvelous growth. Its headquarters was located at 611 West 48th St., with branch plants at Mineola, Long Island.

The Reid Co. has eight plants in New York and New Jersey. The amalgamation will result in the Reid Co. having an output of 10 million gallons of ice cream yearly.

The Ideal Coating for all equipment in which Milk Products are handled, is

STANDARD BLUE GLASCOTE

GLASCOTE INSULATED
HORIZONTAL JACKETTED TANK

Its New Blue color is attractive and due to its richness and depth gives a strong contrast to the white milk, thus unclean, unsanitary conditions are readily detected.

Its extreme density and its very high glaze avoids any rough, porous condition which is hard to clean and forms harboring places for bacteria.

GLASCOTE is fused onto and into the steel and having the same co-efficient of expansion as the metal contracts and expands with it, even when subjected to sudden high thermal shocks.

Being practically part of the steel itself there is no danger of damage due to any of the many dairy operations, but being glass will not stand physical abuse.

The Life of GLASCOTE is indefinite.

CALIFORNIA CRUSHED FRUIT CORPORATION—LOS ANGELES

NATE LOEWENSTEIN CLOSES SUCCESSFUL TERM OF OFFICE.

Nate Loewenstein has stepped down from the stage of activities on which he performed signal services for the ice cream industry during the years he was secretary of the National Association of Ice Cream Manufacturers. Mr. Loewenstein turned over the association's affairs to Fred Rasmussen on March 1. He now will confine his activities to promoting his business and to continuing the good work he has been doing as secretary of the Illinois Association of Ice Cream Manufacturers.

N. LOEWENSTEIN.

Mr. Loewenstein's career was reviewed in a recent issue of The Ice Cream Review. He has been identified with the leading activities of organization forces in the ice cream industry almost since the very first organized undertaking was launched. He stood by and saw the Illinois Association of Ice Cream Manufacturers build up into a very successful organization, and it was not surprising that his ability should have early attracted the attention of officers of the national association, to which his services were soon drafted.

Mr. Loewenstein rendered particularly noteworthy services in the matter of express rates, ever being on the alert to guard the industry's interests in that direction. It would be difficult to estimate how much he saved for ice cream men through his constant vigil in express matters.

The national association, during his term of office, climbed phenomenally both in membership and in revenues.

He leaves the association's affairs in excellent shape for his successor, and in giving up these duties it is a certainty that he carries the good wishes and kindest sentiments of the members of the industry he has served so well and of the officers of the association with whom he so conscientiously labored to make this a bigger and better industry in which to do business. His friends will continue to watch his career with great interest.

⚜

Our friends in Canada also are talking about co-operative advertising. Probably they feel that if a Canadian girl can select the national slogan for American manufacturers, they can accomplish some good work along this line in Canada. The outcome of the movement, which was suggested at convention at Nova Scotia a few weeks ago, and later discussed at the convention of the Canadian Association, will be watched with interest.

CONE ATTRACTS PEOPLE ON THE FLY.

(Continued from page 68)

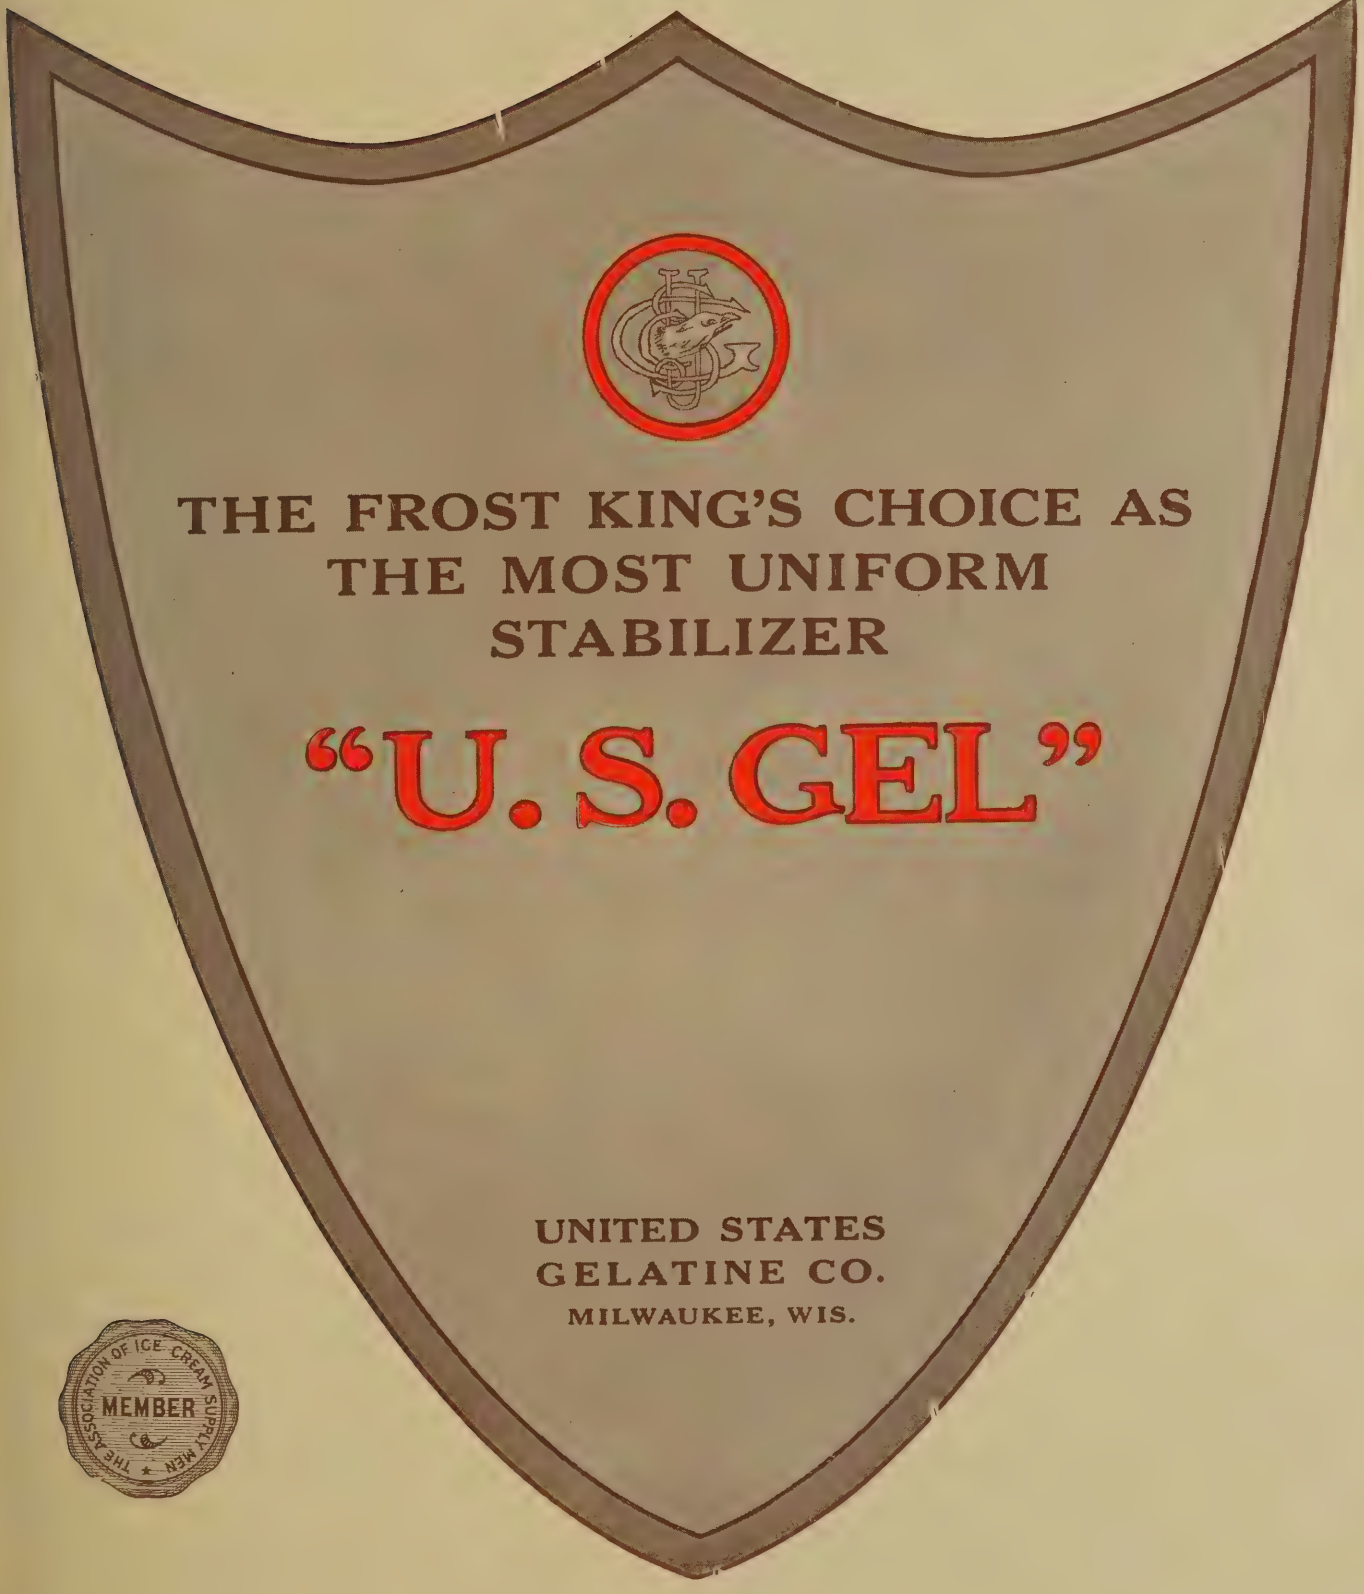
nutritious. We have no reason to regard the cone as a red-headed step-son, as one of the odd members of the family; it belongs with us, having earned its position through twenty years of meritorious service.

* * *

Few people know how satisfying one ice cream cone can be. It makes a perfect lunch. That has been proved. This writer often has made one ice cream cone suffice for lunch and was much the better for it. Most of us eat too much. Let the public understand that an ice cream cone can be so satisfying at lunch time, and then many of those nickels that have been going in other directions at the soda parlor lunch counter will turn to our direction.

* * *

More than two billion ice cream cones were eaten in America in 1923, and despite the unfavorable year for ice cream, it is reported that 1924 showed a large increase in cone consumption.



There is no reason why the cone should be regarded as likely to eat into our regular business; people who eat ice cream as it is generally served are going to continue to eat it. But through the cone we can go out and bid for the business of that fellow who won't stand still long enough to eat a dish of ice cream, spending his money on the popular drinks that are so quickly served and so easily downed. We must go out and bid for some of the money the kiddies are spending for other things. We must tell the story of the cone. It will bring additional customers and make ours a greater industry.

SUPERLATIVE CLAIMS PROVE NOTHING.

Advertisers are awakening to the fact that the use of superlatives, such as "best," is both unwarranted and unwise, as well as unnecessary. A recent writer said, "To say that our article is best because 'it is made of the choicest materials by the most experienced workmen' proves nothing, for the alleged reason is itself only an assertion, colored by biased opinion. To be acceptable as evidence, the choice materials must be named specifically, and the length of experience of the workmen must be given in definite figures. The copy writer must have enough legal sense to distinguish between a fact and an assertion. Too often he assumes that copy is 'reason-why' copy if it contains the word or inference 'because,' and his argument makes no more real progress than if he said 'it is good because it is good,' or 'it is best because it is best'."—From California and Pacific convention address by K. L. Carver.

IS OUR INDUSTRY OUTRUNNING US.

The ice cream industry is one of the fastest growing branches of the dairy industry—we are told—and with that, of course, there is a lot in enthusiasm which goes along with it by men connected with that industry. That may account for the enthusiasm and the interest to which I have already referred. But you have in that rapidly growing industry the problem of keeping up with your business, and that is quite a serious problem. If we can only grow ourselves individually as fast as our business grows—that applies to educational work as well as commercial work—if we can only grow as fast as our business grows we are fortunate, and that means progress.—California and Pacific convention address by Dr. C. R. Roadhouse.

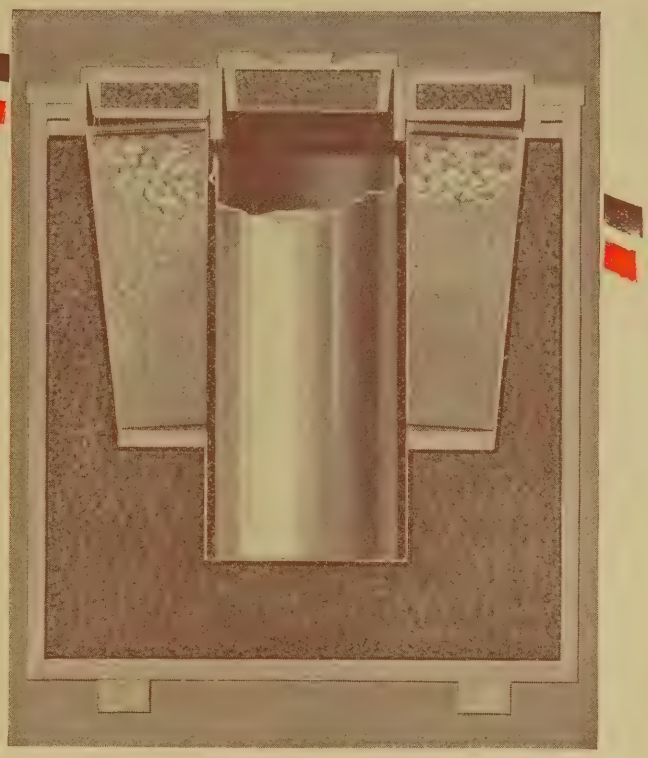
TRAY-PACK

The New, Safe, Reliable and Economical Method of Supplying Perfect Service to Your Customers

IN OUR entire experience, covering over a quarter of a century, we have never witnessed such enthusiasm for a new cabinet as is being shown on every hand for TRAY-PACK, *the 100% dry pack cabinet.*

To get an idea of the TRAY-PACK service method and its great potential value to your business you have to study the accompanying illustrations. Note:



TRAY-PACK is the *only* ice refrigerated cabinet that can be serviced without slop and muss in the dealer's store.

To SERVICE TRAY-PACK remove trays; carry to street, or other suitable place, and dump brine, repack at truck; replace trays — that's all.

The 100% Dry Pack Cabinet

(PATENT PENDING)

Consider what a big hit this feature alone will make with *your* trade. But remember that TRAY-PACK has a great number of other unequalled features that recommend it to your immediate consideration. A few of them follow:

1. **UNIFORMITY OF ICE CREAM TEMPERATURE** is maintained, varying less than 2° in 24 hours or less than 6° in 48 hours with **ONLY ONE ICING.**
2. **ICE CREAM TEMPERATURE** is practically uniform at both top and bottom of can. Thru our "**TRAY-PACK**" arrangement a closer degree of uniformity is maintained than in mechanically refrigerated cabinets.
3. **DRY COMPARTMENTS FOR ICE CREAM CANS**—more sanitary than old method—eliminate floating cans.
4. **ELIMINATION OF FAUCET** and its attendant troubles, including loss of refrigeration.
5. **INCREASED LIFE OF METAL LINING AND CANS**—ice and salt do not come in contact with them.
6. **NO LEAKAGE** thru lining in cabinet.
7. **INCREASED LIFE OF CABINET**—"**TRAY-PACK**" is the only iced cabinet not subject to the usual packing abuse.
8. **NO EXPOSURE OF ICE AND SALT** after trays are once placed in the cabinet.
9. **LESS SERVICE AND MAINTENANCE COST** as cabinet can be serviced in less time and with less wear and tear.
10. **SEDIMENT ACCUMULATION** in bottom of cabinet is done away with thru "**TRAY-PACK**" method.
11. "**TRAY-PACK**" **METHOD** keeps cabinets in a clean and sanitary condition at all times.

As orders are now being received from every section of the country it is important that you write at once for full particulars and prices.

MARYLAND CREAMERY CO. CELEBRATES TENTH ANNIVERSARY.

The 10th anniversary of the Maryland Creamery Co., 1700 Block East Pratt St., Baltimore, was celebrated at a banquet in January. Stock certificates were presented to the oldest employees and all department heads by M. J. Abrams, president of the organization. Those receiving certificates included N. Bliss, superintendent; C. Boyd, L. Levy, F. Joiner, H. Vobbe and S. Friedenberg. Each member of the organization present was presented with a gold piece by W. Abrams, treasurer of the firm.

An interesting outline of the history of the company, from the first day of incorporation up to the present date, was given by President Abrams. N. Bliss was toastmaster.

⚜

ICE CREAM AND BREAD.

In 1917, 71.75 dishes of ice cream, per capita, were consumed; in 1918, 72; in 1919, 75; in 1920, 76; in 1921, when our national gallonage slumped to 210,000,000 gallons, 64 dishes per person were consumed.

On bread, one of the oldest foods, you would naturally think it would be difficult to get an additional consumption. They did this in a period of five years, under conditions somewhat similar to ours. If we had done as well as the bread industry in that particular period, we would have sold to the American public an additional 321,000,000 gallons of ice cream, and we would have done it by inducing the American public to eat an additional dish of ice cream every 19 days. It would be very simple if we would only get around to it.—From Wisconsin convention address by W. A. Schwindeler.

⚜

ICE CREAM IN TRAINS?

Why not? The new Pullman trains from London to Dover, Brighton, etc., are not only the smartest in the world (until America claims the record) but have many innovations concerning foods, such as cold stores under the floor and near the wheels. The foods, drinks (champagnes, etc.), are kept very cold by utilizing the cold draught from the wheels, hitherto wasted.

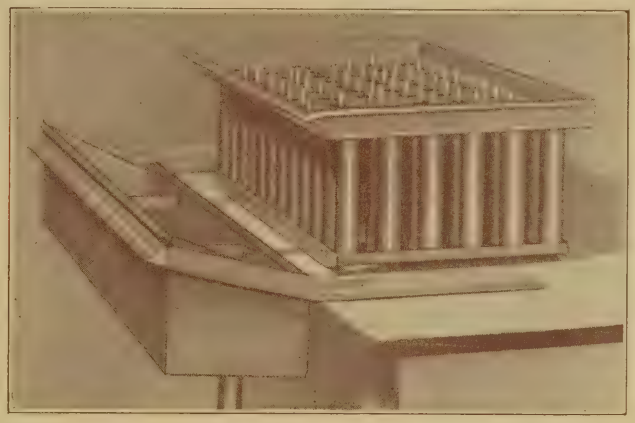
A load of ice cream bricks, for instance can be kept cold in this way without the cost of ice and salt. In future, trains versus barrows and carts!—Confectioners' Union (London).

⚜

Dates selected for the 1925 convention of the National Association of Ice Cream Manufacturers are sure to meet with widespread approval. There has been a real urge for the ice cream men and the dairy exposition people to get together in working out plans for these two great trade events.

Home of Cloverland Dairy, Memphis, one of South's greatest ice cream and milk distributing plants.

Make Your Frozen Suckers by the Valentine Method with the



Valentine FROZEN SUCKER Mold

(PATENTS PENDING)

$29.50

Only additional equipment required is one Valentine Spill-drain, price $8.50.

One Spill-drain will suffice for 25 to 30 molds.

Immediate Delivery.

Valentine Frozen Sucker Mold Unit and Spill-drain.
Note top pan with special Valentine pouring edge.
This view shows filled mold with sticks in place ready for freezing.

Requires no extra filling pan or unsanitary drip pan.—Tubes made without overflow holes, thus doing away with dripping syrup and mess.—No possibility of syrup spoiling brine or brine spoiling syrup.—Each tube can be completely submerged in brine, insuring uniform freezing entire length of sucker.—Made of highest grade acid and rust proof, imported dairy tin and Monel metal.—The only easy, rapid and sanitary method for making "Frozen Suckers."

The Valentine Frozen Sucker Mold Unit comprises 72 slightly tapered tubes opening down from a securely affixed top pan with a specially constructed pouring edge. This complete Unit is sturdily made of the best materials throughout. The pan at the top is made of the finest grade imported 4X Dairy Tin. The walls of the tubes are made of heavy 3X 2A charcoal tin, examined and tested against pin holes. The bottoms of the tubes are capped with genuine 26 gauge Monel metal, which is absolutely rust and acid proof and eliminates rusting and corrosion from dampness. The Mold Unit is protected around the bottom by a heavy, tin plated angle iron frame to which heavily tinned brass runners are attached. The Valentine Mold Unit is a high grade quality throughout, with materials and workmanship up to the standard of the finest dairy and ice cream machinery. It is neat, compact, well built and will wear for years.

The Valentine Method of making Frozen Suckers is simplicity itself. The flavored syrup is poured into the top pan and instantly flows directly into the 72 tubes, which are slightly countersunk. No funnel or bothersome extra filling pan device is necessary.

When the tubes are filled, the Mold Unit is tilted until it automatically comes to rest at a fixed, invariable position, which allows just enough excess liquid to pour out of each tube to insure the uniform length of 5½ inches for each Frozen Sucker. This excess liquid runs over the ingenious, dripless, pouring edge of the top pan into the specially constructed Valentine Spill-drain (which is rigidly fastened to the table) and is carried to a receptacle for later use without contamination or waste. The Mold Unit is then tilted back to a horizontal position, the sticks are inserted, and the Mold Unit placed in brine tank or hardening room for freezing.

Under the Valentine Method, there is no mess, unsanitation or waste of any kind. There are no overflow holes in the walls of the tubes, hence no opportunity for the syrup to run over the outside of the tubes and the Mold Unit, a difficulty encountered under the old methods. No part of the outside of the Mold Unit or tubes can come in contact with the syrup, thus insuring absolute cleanliness and sanitation. If freezing is done in a brine tank, there is no chance of polluting the brine with syrup or of the brine getting into the syrup. Because of the absence of overflow holes in the walls of the tubes, the Mold Unit can be immersed deep enough in the brine so that the entire contents of each tube are below the level of the brine, thus assuring quick, uniform freezing the entire length of the Frozen Sucker. The Valentine operation is not only simple and absolutely fool proof, but also much easier and more rapid than any methods used heretofore.

The price for each Valentine Mold Unit is only $29.50 F. O. B. Chicago; terms, 2% ten days, net 30 days. The Valentine Spill-drain comes extra at a cost of $8.50 each, **but only one Spill-drain is needed for the average size plant, and only two for the very largest plants.** One Spill-drain will suffice for 25 to 30 molds. All Valentine equipment is sold under money-back guarantee as to quality and performance.

ABC Bodies keep ice cream firm and hard during entire delivery day

Anxious to bring delivery costs down to the lowest possible level—and keep them there—the National Creamery and Produce Company, of Los Angeles, purchased three ABC Refrigerator Truck Bodies in the spring of 1923. Later, F. S. Calkins, general manager, penned this letter:

"We have operated three of these bodies for over a year and find them satisfactory in every way. They are not only exceptionally well constructed, but furnish the temperature necessary to keep ice cream in proper shape during the entire delivery day."

National's experience tallies with that of ice cream manufacturers everywhere—that ABC Bodies provide perfect refrigeration regardless of outside temperature or weather conditions; that they eliminate the added weight of a water-soaked body and keep the cream firm and hard on less ice and salt than any other.

Burdan Bros., of Pottstown, Pa., who operate a fleet of 50 ABC Bodies, put it this way: "During the warmest weather, ABC Refrigerator Bodies enable us to deliver ice cream to our customers in first-class condition at minimum expense and with the least possible handling difficulty. The bodies are very economical in ice and salt consumption, and their construction is far superior to any others of which we know."

ABC Bodies are adaptable to any type or size of truck chassis from 1-ton to 7-ton capacity.

WHAT ADVANTAGES DOES THE ELECTRIC TRUCK OFFER FOR ICE CREAM DELIVERY?

(Continued from page 40)

room and a cafeteria in the building formerly occupied by horses, hay loft, etc. When all costs are taken into consideration over a sufficiently long period to cover the life of the two kinds of delivery equipment, the electric truck easily wins out against the horse. It takes fewer people to care for electric trucks. They do not have to be fed Sundays and holidays. They are out of service less than any other equipment. They require very few repairs. They cost only in proportion to their use.

Aside from economy, what is claimed for the electric truck? Cleanliness—the electric truck is in keeping with the character of the ice cream business. Horses and a stable are not in keeping with the appetite appeal. The growing place of the electric truck in the baking industry is a very good indication of the appeal of clean bread delivered clean.

Are there any other advantages? Yes. The electric truck is hardly ever stolen. A recent survey showed that the few electrics that had been stolen were recovered, because when the battery is exhausted it has to be charged again and the thief is too wise to attempt that. It is interesting to note that in Mexico, where revolutions have been a frequent occurrence, the electric has won a place, because it was found that while a revolutionary army passing through a city or town might confiscate all of the gas trucks and all of the horses, that it wouldn't steal the electrics since they are intended for short haul and frequent-stop operation.

ISN'T it an objection to an electric that it cannot be placed on a 100 mile-gas truck route? No. You use a boy for errands because he is cheaper. You use a man for heavier work because he is cheaper than the boy. You use a skilled mechanic for some work because he is cheaper than an unskilled man. You use an accountant for accounting work because he is cheaper than someone who knows nothing about accounting. In other words, you use different types of people where they are best suited. **The electric truck is economical on certain routes. Use it there. The gas truck is more efficient on other routes. Use the gas truck where it is efficient and the electric where it is economical and efficient.**

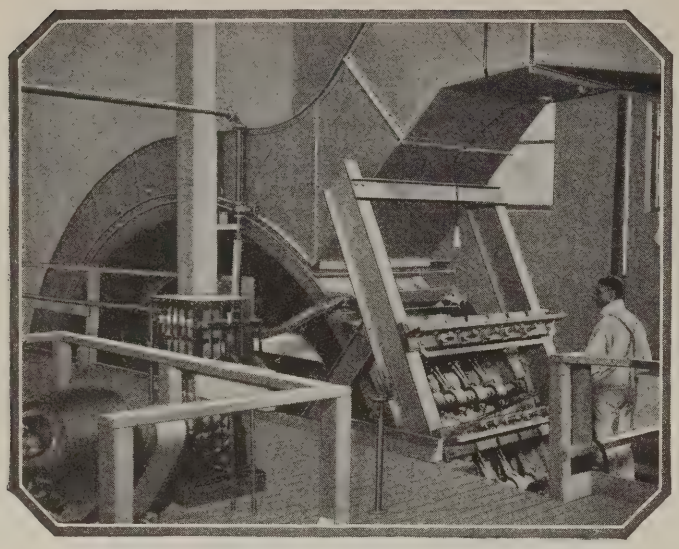
Is the electric truck industry a staple one? The four leading concerns in the electric truck business average approximately 20 years in that business. Incidentally, 75 per cent of their business is repeat orders—a pretty good indication of what the electric truck has done for those who bought them.

How should we go about finding out whether the electric truck will save money for us? Address a letter to one or several of the leading electric truck manufacturers asking them to supply you with a cost analysis form, and a route analysis form. They will do this without obligation. You can then ascertain your present conditions and costs. The electric truck manufacturer will then tell you what routes electric trucks can operate on most efficiently, and he will set opposite your costs for those routes electric truck costs and you can see for yourself what the saving would be. In some cases the saving has been great enough to amount to a sum equivalent to 2 and 3 per cent of a concern's gross business. This usually means 20 or 30 per cent increase in net profits.

HOW can I find out more about electric trucks without calling in an electric truck manufacturer? The Ice Cream Review has secured a number of copies of a book that tells about electric trucks. We will furnish

Where Quick Service Means Money Use SANISCOS!

Nothing takes the place of Sanisco Ice Cream Sandwich Machines for Speedy Service to the Public.



Wherever crowds gather big sales of ice cream are possible, but the public won't wait—they want **quick** service and that's why the men with Saniscos are reaping such big profits. They are satisfying the wants of the public for speedy service and a practical method of eating ice cream that appeals to young and old alike.

Order Machines now. Special Discount to all Ice Cream Manufacturers. Write for sales plan.

We recommend "UNEEDA BAKERS" Ideal Wafers. National Biscuit Branches thruout the U. S. can supply Ideal Wafers for Sanisco Machines at $1.70 per container of 725 wafers, or you can order direct from us.

these to our readers upon request, without obligation and without giving our readers' names to any manufacturer. All that is necessary is to write to the delivery department of The Ice Cream Review, asking for a copy of the electric truck book. This offer is limited to the executives and delivery superintendents of ice cream companies. The book is a valuable one and we are under obligation to distribute it only to such executives and superintendents.

KANSAS HOLDS SUCCESSFUL SCORING CONTEST.

There were 41 samples of ice cream entered, and about 40 persons attended the two-day meeting. Professor A. S. Ambrose of the University of Illinois assisted with the scoring and addressed the meeting on the subject of "Shrinkage of Ice Cream During Storage." N. E. Olsen of the Kansas State Agricultural College was in charge of the meeting and discussed the subject of "Homogenization of the Ice Cream Mix in Relation to Yield." Several lively round table sessions were held and an opportunity was given for all to examine the ice cream samples. On the whole the ice cream entered showed a marked improvement over that of last year. Twenty per cent of the samples scored above 95 this year, as compared to 14 per cent in 1924. Sixty-two per cent of the samples scored above 90 this year, as compared to only 44 per cent in 1924. There was also a marked improvement in the bacterial content of the ice cream this year. Forty-eight per cent of the samples received a perfect score (20,000 or less per gram) on bacterial count this year as compared with 24.5 in 1924. Of the samples, 73.7 per cent contained less than 100,000 bacteria, as compared with 61.2 per cent last year.

The week following the scoring contest Professor Olsen held the first one-week short course for experienced ice cream makers which was from March 2nd to the 7th, inclusive. Thirteen ice cream makers attended this short course which consisted of practical ice cream making and laboratory work half days of each day. The other half day was given to lectures and round table talks. Professor Olsen and all who attended are very much elated over the success of the first short course, and they feel assured of increased interest and attendance for next year as the ice cream manufacturers "feel that they were well paid for the time and expense in information and good fellowship they had attending this term."

"Co-operation between the school and the association which is made up of the manufacturers has been of untold benefits to the manufacturers in Kansas in promoting interest and increased quality in Kansas ice cream, as Kansas now claims the reputation of making the best ice cream, as well as growing the best wheat in the world," according to B. T. Perkins, secretary of the Kansas Association of Ice Cream Manufacturers.

PLENTY OF BUSINESS.

There is plenty of business to be had, more desirable business than simply taking it away from the other fellow, if we will join together in letting each manufacturer appreciate that his first and great responsibility is to the industry in which he is engaged, and the realization that if that industry prospers and is efficiently conducted it stands to reason, just as much as does that two and two are four, that he will derive for his own business the benefits that will accrue from the proper conduct of the whole business.—From California and Pacific convention address by W. V. S. Robb.

Cuscaden Re-elected Head of Kentucky Association

One of the South's leading ice cream manufacturers was honored when Harry A. Cuscaden of the Cuscaden Ice Cream Works, Louisville, was re-elected president of The Dairy Products Association of Kentucky, at the second annual meeting of that association at Louisville, March 11. The meeting was held in the Brown Hotel.

This was another step by the Kentuckians toward the success of the coming Southern convention to be held in Lexington, leading ice cream manufacturers of that state believe. Both the out-going and in-coming boards of directors highly commended Mr. Cuscaden's services. He was given a rising vote of thanks as he picked up the gavel for another year of constructive work at the head of dairy manufacturing groups of his state.

C. F. Hoppe, Froznpure Ice Cream Co., Louisville, was named vice-president and chairman of the ice cream division of the Dairy Products Association. John H. Kloecker, Jr., Dixie Ice Cream Co., Lexington, was named vice-president of the general organization and secretary of the ice cream division.

The association discussed two important trade events for this year—the Southern convention at Lexington and the National Dairy Exposition at Indianapolis. R. L. Hammond, general secretary of the Indiana Manufacturers of Dairy Products, Indianapolis, outlined some pre-exposition plans. He told how the Kentucky association and the manufacturers of Indiana could extensively advertise the coming exposition by using rubber stamps and stickers in connection with checks, letterheads, envelopes, etc.

In appearing before the divisional meeting of the ice cream manufacturers, Mr. Hammond explained Indiana's arrangements to stage an ice cream week and school children's essay prizes.

In his announcement regarding developments in the second annual meeting of the Kentucky association, General Secretary Carlton Ball said:

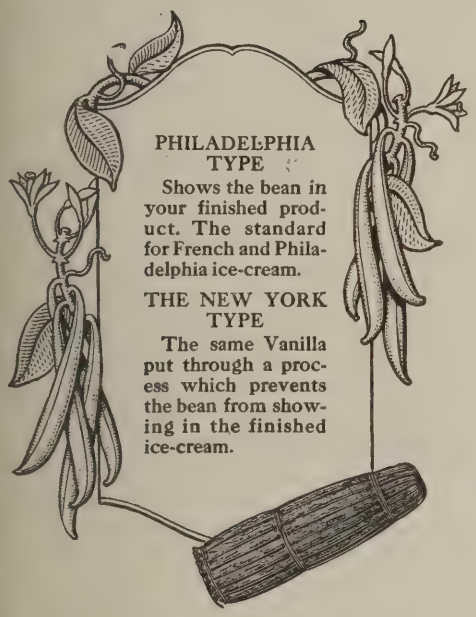
"The retiring board of directors as their record in managing the affairs of the association leave behind a year marked with great success. The personnel of the new official body also makes the outlook for another year of progressive accomplishments equally as encouraging."

The association will hold its next general meeting in Louisville on April 15.

LEXINGTON, "JAMESTOWN OF THE WEST."

The entertainment committee is at work early in preparation for the 1925 Southern convention. Lexington, one of the principal cities of the romantic Blue Grass state, is described in a bulletin recently authorized by the committee and transmitted to the trade publication by Carlton Ball, general secretary of the Dairy Products Association of Kentucky.

The bulletin follows:



"The Jamestown of the West."

America today regards Kentucky as a state of vast undeveloped resources, and does not pause to contemplate that stretch of fertile country that attracted the early settlers of Lexington who founded the city upon a location which is known to the native Kentuckian as an unadvertised museum, rich in ancient and modern historical romance.

The city took its name from a camp founded by a band of hunters under the leadership of Col. Robert Patterson, and was christened on June 25, 1775. Col. Patterson later established Cincinnati. Lexington soon acquired the distinc-

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

Tuning In on a Tub

Why throw your old ice cream tubs on the discard? A tub that is leaking or has missing hoops can be re-conditioned and will give many months more of service.

The Gilmour Hoop Machine is in use by many leading manufacturers and is giving their tubs a new lease on life. It's a simple machine any boy can operate, and will last almost a lifetime. Keep your old tubs in good condition with a Gilmour. Buy fewer new tubs, and save money. The Gilmour will do it. Sent for 30 days free trial, upon request.

Gilmour Hoop Machine Company
Owensboro, Ky.
Third St. Masonic Bldg., Ground Floor

tion of being the Jamestown of the West, and during a long and eventful era was the political, literary and commercial center of what was then known as the Northwest.

Prehistoric defense works and monuments on all sides of Lexington testify that this war cradle was the fixed dominion and the metropolis of a mysterious people of relatively advanced civilization, who were eventually dispossessed by the red man. Lexington at the present time stands upon the dust of an ancient walled city of vast extent where, in 1776, hunters discovered catacombs 300 by 100 feet and 15 feet below the surface, in which were found numerous mummies. Unfortunately, during the stress of war, the entrances were obliterated and their locations lost.

The entire Blue Grass country possesses similar ancient and treasured landmarks, which shall be accessible to the visitors of the 1925 Southern convention of ice cream manufacturers. These together with the modern features of importance that characterize the town will be included in the tours now being planned by the local committee as a part of an extensive entertainment program.

The latter years of Kentucky history are made up of rapid progress and advancement along all lines. Commercial progress and development of natural resources have gone decidedly forward. All of Kentucky is rapidly assuming its rightful place among its sister states in manufacturing, agriculture, mining and road building.

⚜

THE FACTORY BEAUTIFUL AND MODERN SERVICE.

Here is a factory on a busy boulevard. It is spotless in appearance. At night it is briliantly lighted to keep itself constantly before the public. By day, its white walls, its green lawn, its flowers, its well groomed appearance attract constant and favorable attention. It is modern in every detail. It is scrubbed clean, inside and out, at frequent intervals. Its help looks clean and efficient. Everything is quiet and businesslike. Sunlight streams through the wide windows.

There are no dust-gathering, unnecessary tools or equipment in sight. It is as trim as the deck of a battleship ready for action. Corners of walls and floors are rounded. Walls and ceilings are enameled for frequent washing.

A spur track runs right to its receiving room where car loads of fresh milk and cream are delivered with unnecessary handling. Its cooling room is spotless. Its chemical laboratory where all the ingredients pass is an example of efficiency. Its tank room, its pasteurizing vats, its aging tanks—every element in the manufacture of ice cream is up-to-date and so scrupulously clean that every housewife that inspects the plant goes away a booster for the product.

All the workers are in smart, clean uniforms. The delivery trucks have the appearance of being just newly painted and the drivers are trim and immaculate. The product goes to dealers who have been educated through advertising to give the public real service—the very best dealers in the territory.—From California and Pacific convention address by A. A. Comey.

⚜

PERSEVERANCE.

Perseverance will find its way to the White House. It may be born in the humblest cottage, but it will find its way to the head of the biggest ice cream manufacturing companies in the country. And that must be the history of every successful man in this industry.—From national convention address by Harry L. Fogelman.

⚜

More students are receiving training in the manufacture of ice cream at Pennsylvania State University than at any other institution.

Most Complete Dairy Institutions Established in Two Eastern States

Virtually all Phases of Dairy Production, Manufacturing and Merchandising Provided for in New Buildings in Maryland and New Jersey

MARYLAND and New Jersey have erected buildings and established equipment for two of the most complete institutions in the world to teach the science of dairying, dairy manufacturing, and the distribution of dairy products. Brand new building and a complete array of new equipment with which to learn the technicalities of their chosen industry were ready for students who showed up at New Brunswick, N. J. last year, and at the University of Maryland, College Park, Md.

Retail Sales Store—Maryland University.

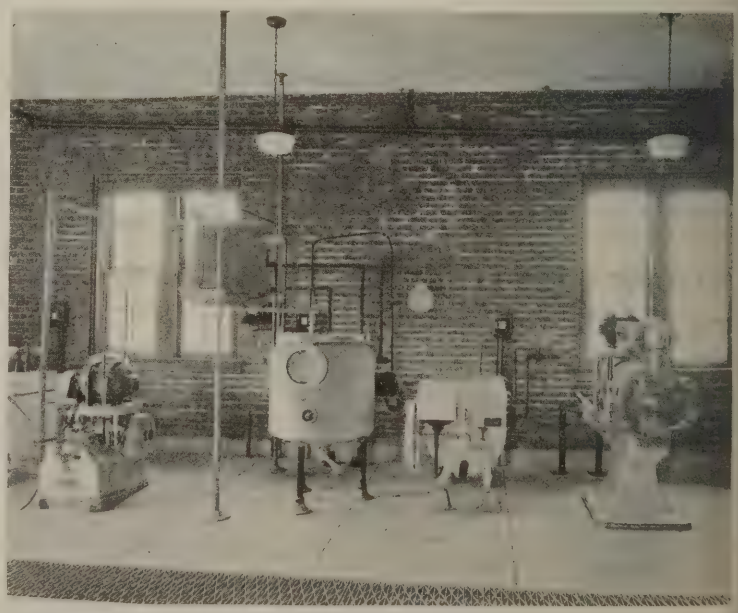
Some interesting information on these two institutions was given in a recent issue of the Bestov Lactonews, the house organ of the Cherry-Bassett Co., of Philadelphia. A total of $400,000 has been expended by these two states for buildings suitably equipped for the best that can be offered in dairy instruction. The sum of $200,000 was spent by the state of New Jersey alone for the main building and the cattle building cost $50,000. An investment of $150,000 was made by the state of Maryland, and before the institution will be completely finished, there will be an additional expenditure of $15,000.

Both institutions have complete market milk plants, ice cream plants, butter and cheese plants, and testing laboratories, and the Cherry-Bassett house organ goes on to add that "almost every type of problem or study necessary to train men for the industries can be conducted in all details without any equipment handicaps, as have heretofore been the case. Actual plant conditions will be experienced, according to that trade reported, which adds:

"New Jersey maintains a herd of over 400 accredited cows and Maryland over 50 famous pure bred cattle, right at the college. Milk production methods are thoroughly covered in their curriculums.

"Both institutions will engage in the sale of the products made by the students. The New Jersey college has begun immediately to bottle and market in New Brunswick, about 500 quarts of special bottled milk, and has plans for selling a limited amount of ice cream. The dining halls of the university are also supplied with butter, cottage cheese and milk. The University of Maryland is out to win a reputation as a market place for dairy products. Already 1,500 pounds of butter a month and 100 gallons of milk a day are supplied to its dining halls. Its marketing plans and facilities are a special feature of the new college. By the photographs you will observe that along the front of the building is a large salesroom. Fortunately the Lincoln highway between Baltimore and Washington, passes directly in front of the building, always filled with a stream of automobiles. It is planned to dispense milk, buttermilk, chocolate milk, ice cream, butter and cheese in this store the year around. Patrons of the place may observe the bottling of milk and the freezing of ice cream through the glass partitions along the rear of the store. Another feature of the store is that behind it is a refrigerator room where tanks for the various milk drinks are installed, connected directly with faucets along the wall in the salesroom. The authorities of the college are confident that a part of their indebtedness for their new school will be promptly paid off by this unusual marketing project. Students only will be employed in the store."

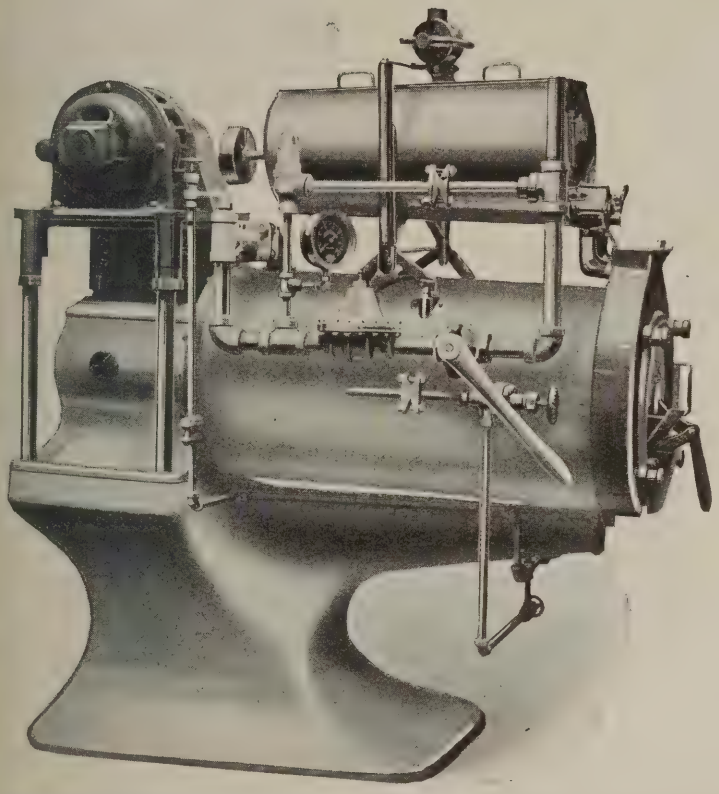
The Maryland dairy manufacturing building is of the factory style and the equipment in it is placed so as to form one big dairy products plant, we are told. Virtually all of the first two floors are given over to plant equipment. On the first floor front, is the milk bottling, ice cream and butter room.



Then we are told:

"A Quaker City bottle washer and sterilizer handles the bottles. On the next floor are the storage tanks and vats, the cheese making equipment and the pasteurizers. A pre-heater, separator, and a Bestov filter are in the line up. The piping is so arranged that milk may be pumped from storage to be used for bottled milk, cheese, butter or ice cream; also skimmed or left whole."

And then we come to the third floor, which consists of class rooms and testing laboratories, and the basement of boilers, refrigeration equipment and lockers, etc. The building as a whole contrasts sharply with the old original dairy manufacturing building established at the university thirty years ago.



"It was here that Charles Francis Doane made his important research with mottled butter and its causes. He was at that time in charge of the very modest dairy husbandry department."

A definite progressive program has been followed in the development of the state and its educational facilities in dairying, according to Prof. J. A. Gamble, who for the last six years headed the dairy husbandry de-

partment of the University of Maryland. The new school, according to Prof. Gamble, is endeavoring to meet the state's demand for men trained in dairy manufacturing. "It is just as important as that of developing better cows and better products," he said.

The Original Maryland Building.

J. W. Bartlett of the New Jersey college believes that these two new state experiment stations are in position to do research work with dairy products such as before never was possible. Prof. Bartlett states that with these increased facilities, the institution is making efforts to know more of the problems of dairy manufacturers, particularly with regard to the manufacture of ice cream. He invites letters submitting such problems, particularly from manufacturers in New Jersey, although he will be glad to hear from manufacturers in other parts of the country, too.

Pasteurizing, Filtering and Separating Units—Maryland School.

NEW ENGLAND MANUFACTURERS TO ISSUE BOOKLET ON ICE CREAM FOR UNDER-NOURISHMENT.

Beginning with the March meeting, every monthly meeting of the New England Association of Ice Cream Manufacturers will be a closed session, it was decided at the February meeting, held at the American House, Boston, February 18. The association adopted resolutions deploring the death of J. N. Gurdy of Lawrence, Mass., who is a charter member of the New England association, "and stood ever ready to give advice, counsel and service to it."

The association further voted to co-operate with Mr. Reynolds of Tait Bros., in getting together material for a booklet for publication, this booklet to concern the use of ice cream in overcoming under-nourishment in school children of New England. Mr. Reynolds reported that he collected material bearing on the subject and that Tait Bros. would be very glad to put this matter in booklet form if the association would publish it. The booklets will be sold to members of the association at cost, it was decided.

Members of the association discussed the contract for refrigerated cabinets, and efforts are being made to find out how many association members are using the contract that had been drawn up at a previous meeting.

The Pennsylvania State College lays claim to being the first institution in the United States to offer instruction in ice cream manufacturing, such courses having been offered at that institution in 1892.

CERELOSE

CERELOSE is a pure white refined corn sugar which has been found to be of advantage to ice cream manufacturers for use in conjunction with cane sugar in the proportion of 25 to 50% Cerelose instead of 100% cane sugar, for the following reasons:

1.—Cerelose emphasizes the richness of the butter fat with the result that Cerelose develops the natural flavor of ice cream.

2.—Cerelose produces a smoother cream.

3.—Cerelose is the new solid builder for ice cream because it improves the body and texture. It will not crystallize nor form sandy cream.

4.—Ice cream made with Cerelose is more digestible than when made entirely with cane sugar because Cerelose is a dextrose sugar being directly assimilated by the blood, therefore, more ice cream may be consumed, particularly by infants and invalids.

5.—Cerelose is approximately 25% cheaper in price than cane sugar.

Cerelose should be used in the same manner as cane sugar, the amount depending upon the type of cream desired. 25 to 50% is recommended.

The National Dairy Exposition

To Be Held at Indianapolis, October 10-17, 1925

WHEN announcement was made early in February that the 1925 National Dairy Exposition was to be held in Indianapolis, Ind., we published the following editorial in the Butter, Cheese & Egg Journal. It contains some facts about Indianapolis as a convention city that are of interest to readers of The Ice Cream Review:

We're glad it's settled. It's going to be held in Indianapolis this year, and the dates are October 10 to 17. At the start of each new year we just can't get down to business until we know where the National Dairy Exposition is to be held. Now it's all fixed and we are fixed to help make it bigger and better than ever before.

We believe the committee made a good selection. Indianapolis is a wonderful city, in a wonderful state. Indiana is a great dairy state, although many folks persist in thinking that its chief products are poets and vice-presidents.

In 1923 the creameries of the state manufactured 51,662,093 pounds of butter, just double the output of 1914. State authorities estimate that an additional 25 million pounds of butter were churned from Indiana cream in creameries outside the state. 33,356,332 pounds of condensed milk, 7,498,232 gallons of ice cream, along with the usual production of milk and cream for home consumption, help to swell the total production to a point which puts the Hoosier state among the real dairy states of the nation.

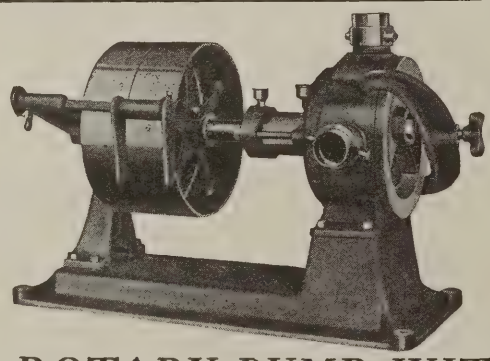
Those who are "in the know" have long credited Indiana folks with following a real constructive program for dairy development. In the first place it is a great agricultural state. Markets for dairy products are close at hand, in fact, conditions are ideal for profitable dairying in most sections of the state.

But, what is still more important, the dairy leaders in that state are always found pulling and working together. The writer of these lines has been in close touch with Indiana dairy leaders for the past 15 years. We know their ambitions and we have been familiar with their programs. You never hear of "dairy politics" in Indiana, except as you hear of everybody working for the same objective, that objective being the further development of the industry. Purdue University, with one of the strongest dairy departments in the country, heads the dairy movement in the state. The state dairymen's association, one of the oldest in the country, meets there each year and special short courses attract dairy products manufacturers there each winter.

These dairy products manufacturers maintain a state organization with a secretary who devotes his entire time to the association, maintaining an office in Indianapolis. If our memory serves us correctly, it was the first state organization of its kind to be organized. The buttermen, the milkmen and the ice cream men are all banded together under the Indiana Manufacturers of Dairy Products, but each branch also has its special officers. This organization can be, and undoubtedly will be, of great assistance to the dairy show management in enlisting the support and interest of dairy products manufacturers, not only in Indiana but of the entire country.

Indianapolis is a great convention city, in fact one of the few noted convention cities of the country. It boasts of railroad facilities second only to Chicago. It is in fact the greatest electric railway terminal in the country. Its transportation advantages are further emphasized by the fact that no state in the Union enjoys better automobile roads, the state being a pioneer in the good roads movement.

Indianapolis is a city of nearly 400,000 people, and, being a great convention city, it is supplied with splendid hotels, and lots of them. There should be no trouble in properly caring for the thousands of guests who will flock to the city at exposition time.



These brief claims for Indianapolis as a good location for the show are not inspired by the glowing writeup of some city convention bureau. They are rather inspired by our knowledge of Indiana and her dairy folks.

We feel that we are only stating a fact when we say that before many years roll by the exposition will be permanently "housed" in Chicago. The Windy City as a fixed home will meet with the approval of the vast majority of the men and interests that are the backbone of the show.

Until Chicago is ready to properly care for the show we feel that it is wise to hold it in some nearby city. The wisdom of such a course was amply verified last year when Milwaukee was host.

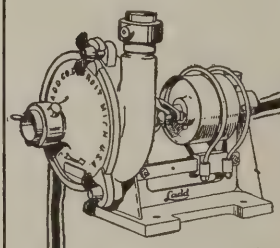
No man who prefers Chicago as a location should take less interest in the 1925 show because of its being held in the Indiana metropolis. Indianapolis is just five hours ride from Chicago, through an agricultural section made famous by its sturdy people, its thriving industries and last, but not least, by the beautiful scenery which has inspired Indiana's poetical notorieties.

So, we're strong for Indianapolis for the 1925 National

A ROTARY PUMP WITH HIGHER EFFICIENCY

Operating at a low R. P. M., and with a minimum power requirement, the Viking Rotary Pump delivers an unusually high efficiency, even under extremely difficult conditions.

Built ruggedly of best materials and involving an improved pumping principle, the Viking has become the universal choice for every pumping purpose.



Could you ask for greater proof of what the Viking will do in your plant than that over 50,000 are now in successful use?

New, enlarged catalog, showing Vikings for every use, mailed upon request. Ask today.

You Need Both

The 5c pie has proven a money maker for many hundreds of progressive ice cream manufacturers, because with the Northwestern Cutting and Dipping machine they cut and dip as many as 120 dozen pies per hour. This gives them big production at low cost as the complete investment is only $375.

Then they use the Northwestern Bar Cabinet for distribution. Each cabinet is a silent salesman that can be placed at innumerable advantageous locations.

We will be glad to tell you how other ice cream men have profited. Just write.

NORTHWESTERN CORPORATION
MORRIS - ILLINOIS

Dairy Exposition. We are not familiar with the reasons why Milwaukee was not chosen for a "return engagement," or why Chicago could not properly take care of the show this year, and we are not going to spend any time worrying about these reasons. We know they were good ones and we have abundant faith in the committee that made the selection. It was a hard job well done.

We do know that Indianapolis is a good city, abundantly equipped to take care of the show, as pointed out in another article in this issue, and now it's up to all of us to "put it over" in great shape. Here's to the success of the Indianapolis National Dairy Exposition!

⚜

KENTUCKY TO CO-OPERATE WITH INDIANA FOR NATIONAL DAIRY EXPOSITION'S SUCCESS.

G. W. Schneider, Gray-Von Allmen Sanitary Milk Co., Louisville, was named vice-president and chairman of the milk division of the Dairy Products Association of Kentucky, at the annual meeting of that organization at Louisville, March 11. The meeting was held in the Brown Hotel.

Charles G. Vahlkamp, City Consumers Co., Paducah, was named vice-president of the Dairy Products Association and secretary of the milk division.

In making this announcement, a bulletin from Carlton Ball, general secretary of the dairy products association, says:

"The retiring board of directors as their record in managing the affairs of the association leave behind a year marked with great success. The personnel of the new official body also makes the outlook for another year of progressive accomplishments equally as encouraging."

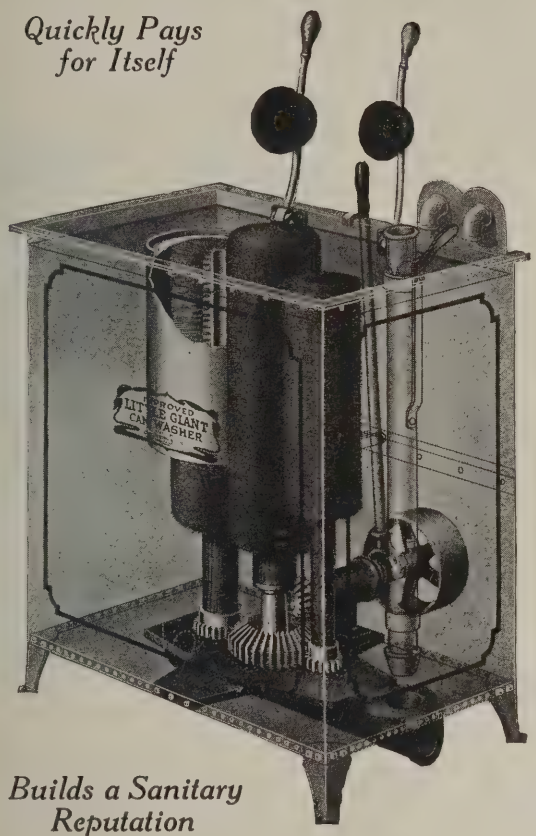
Plans whereby the Kentucky association would cooperate with the Dairy Products Manufacturers of Indiana were outlined by R. L. Hammond, general secretary of the latter association, in which he suggested that the Kentuckians and the Hoosier manufacturers join hands in the use of rubber stamps and stickers to use in advertising the coming National Dairy Exposition on checks, letterheads and envelopes.

Upon recommendation of Prof. J. J. Hooper of the College of Agriculture, the association laid out plans to help defray expenses of a children's dairy judging team to compete at the National Dairy Exposition. Other plans in this connection were discussed.

The next general meeting of the Dairy Products Association will be held April 15 in Louisville.

⚜

ICE CREAM FROM TRUCKS.



Ice cream drawn from the freezer in molten state is approximately 23 degrees F. If placed immediately on a truck and packed in a mixture of ice and salt in the ratio of four to one, it will gradually reduce to a temperature of 0 degrees F. This will take about five hours, or the time required in running approximately 100 miles, At the expiration of this time the ice cream will be set and while not completely hard, will be in condition to serve. Such a short time having elapsed since freezing, there will be a very small amount of shrinkage.—L. W. Martin, service manager, Supplee-Wills-Jones Milk Co., Philadelphia, Pa.

WANTS PRETTY KANSAS GIRL TO PRESENT PRESIDENT COOLIDGE WITH PRIZE ICE CREAM BRICK.

B. T. Perkins, secretary of the Kansas Association of Ice Cream Manufacturers, which recently concluded its annual scoring contest, has started something. He expects to suggest that President Coolidge be sent a brick of the highest score ice cream from next year's scoring contest, this brick "to be delivered by one of our beautiful young ladies who have been raised and educated by the profits of the ice cream industry."

B. T. PERKINS.

"And why not?" asks Mr. Perkins. "We have the best ice cream in the United States, and the best looking girls as well."

Now, let the argument go on, and heaven pity the man who attempts to decide what state has the prettiest girl or makes the best ice cream.

The publicity, however, won't hurt the industry.

⚜

1926 Pacific Joint Convention Set for January

The second joint convention of the Pacific and the California and Southwestern States Ice Cream Manufacturers' Associations will be held during the week beginning January 11, 1926, at Portland, Ore., it was recently announced by Jay H. Kugler, secretary of the latter association. He reported the Pacific Coast Association had approved the tentative dates at a meeting of the board of directors. These tentative dates were agreed upon by the California and Southwestern States Association some weeks previous.

There will not be an exhibit in connection with the joint convention this year, it is indicated, according to Russell B. Tripp, secretary of the Supply Men of the Pacific Ice Cream Industry. Multnomah Hotel has been selected as convention headquarters.

E. B. McKnight of the O. J. Weber Co., Los Angeles, is the new president of the Supply Men of the Pacific Ice Cream Industry, succeeding H. P. Jacobsen. Clarence G. Harris of M. Getz & Co., San Francisco, is vice-president. The directors are: J. C. Capron, Menasha Printing & Carton Co., Los Angeles; R. E. MacFarland, Essex Gelatine Co., Los Angeles, and Charles M. Lee, Lee-Greefkens Co., Inc., San Francisco.

ANOTHER INNOVATION.

The perfection of IMPRUV-MIX in Powder Form furnishes the basis upon which we have constructed something entirely new—A CUSTARD-MIX—also added during pasteurization.

Tests have demonstrated that CUSTARD-MIX produces an Old Fashioned Custard Ice Cream. Holding the Ice Cream in a hardening-room for a period of four months did not impair the egg flavor, custard effect, texture or eating desirability.

We therefore adopted CUSTARD-MIX as the name of the new product, as it truly signifies its purpose and effect.

Name of plant where above tests were made will be furnished upon request.

THE IMPRUV-MIX COMPANY

2460 Amsterdam Avenue New York, N. Y.

MEMBER

Impruv-Mix

Powder  Form

IMPRUV-MIX (in semi-paste form) was first introduced in the year of 1916, since which time it has become known from Coast to Coast. It has become an important factor in the production of Superior Quality Ice Cream, because it impels—incites—the cream flavor and neutralizes milk tastes—condensed or milk powder. It also dispels butter flavor in a reconstituted cream mix.

IMPRUV-MIX is not an enzyme ripener.

It is added during pasteurization and its beneficial properties become effective immediately.

POWDER FORM.

In order to facilitate the application of IMPRUV-MIX, we have, by a concentration, evaporation and aeration process, removed the moisture content and now offer it in Powder Form, with all of its strength completely preserved.

IMPRUV-MIX produces Ice Cream of a quality that never begs for business. It never disappoints. A trial package will convince you of its merits.

Movie Takes Ice Cream to Public In Baltimore Feature Film Extraordinary

Fans Take Much Interest in Seeing How America's National Food Dessert is Made

THE movie was used as the vehicle to take the ice cream plant to the people in an extraordinary undertaking carried out by the Hendler Creamery Company of Baltimore. Much has been said and written about bringing the public into closer contact with the ice cream plant. An article in the March issue of The Ice Cream Review by A. A. Comey being particularly interesting in this connection. The Hendler Creamery Co. went this idea one better in deciding upon the plan to take their business institution and set it before the eyes of the public.

MANUEL HENDLER.

This was accomplished when the Hendler plant was featured in a film made in Baltimore, entitled, "Baltimore — City of Firsts." It was shown in virtually every theatre in the city and vicinity, and is reported to have been a "hit."

For a long time it has been generally recognized that the screen is a splendid medium of advertising, providing there is satisfactory distribution in an interesting manner. It is a scientific fact that over 87 per cent of all human knowledge comes through the eye, and officials of the Hendler Company state that since they could not bring all the people they wanted to to their plant, they did the next best thing—they took the Hendler Creamery Company's plant to the people.

MILTON STARK of Stark & Edwards, the "movie men," who snapped the film, "Baltimore—City of Firsts," has made an interesting report. The film was one reel in length, and was produced by Stark & Edwards, and distributed through the Association of Moving Picture Theatre Owners of Maryland, a state organization affiliated with the Motion Picture Owners of America. This association agreed to show the Hendler film, providing a committee of exhibitors approved the scenario. This was done.

The percentage of the cost of the film was paid to the association for distribution. The plan was worked as a state advertising idea, the distribution being paid on the basis of so much circulation, this being figured out at so much a person, according to Mr. Stark, who adds:

"Practically every theatre in the city and vicinity showed it, and, judging from the expressions of evident satisfaction and comments, it was a hit. * * The people were enabled to see just how ice cream is made. While we showed only the headlights of the manufacture of ice cream (people are not interested in seeing only wheels turning) we stressed the fact that this was the first automatic ice cream plant in the world. The average person has no idea how CLEAN an ice cream plant is—and when the 'shots' showed all the machinery spotless and the employees in white uniforms—the fact stuck to their minds and left a most favorable and pleasing impression."

Baltimore has many records for first. It was in Baltimore that the first metallic writing pen was made; the first monuments of Washington and Columbus were erected; the first city in which a national convention was held; that the first submarine in the United States was manufactured.

THE high lights of the film as applying to the ice cream industry, were built around the fact that the first automatic ice cream plant in the world was operated by the Hendler Creamery Co. at Baltimore, according to Mr. Stark.

He says that film has been shown to a half million people. It has proved so interesting and educationa

"IDEAL ONCE-IDEAL ALWAYS"

Massachusetts College Conducts Two Successful Short Courses in Ice Cream Making

By H. F. JUDKINS

THE 1925 ten-day short courses in ice cream making at the Massachusetts Agricultural College came to a successful close Saturday, Feb. 28. The first course was held Jan. 20-31 with an enrollment of eleven and the second course February 17-28 with an enrollment of fifteen. The enrollment was varied, consisting of ice cream plant owners, managers, workers, supply men and some without any ice cream experience at all.

In general the students followed a scheduled program of laboratory work and discussion, although men after a particular thing, such as freezing for example, devoted more time to this one thing. Considerable time was spent in figuring mixes and other problems relating to business economy and this was one of the most important phases of the course. Laboratory work included comparison of untreated, homogenized, viscolized and emulsified mixes; comparison of ice creams containing a variety of vanillas and various amounts of vanilla and sugar; comparison of single and double homogenizing on the body and texture of ice cream; the effect of using egg powder in the mix; effect of using corn sugar in the mix; comparison of ice cream containing butter of varying quality, using varying amounts of butter and frozen cream; comparison of ice cream varying in fat and total solid content; effect of neutralizing the mix; controlling overrun and effect on dishing properties; effect of cleanliness of equipment on the bacteria count of ice cream; a comparison of various makes and grades of gelatines, and making fancy forms.

Many discussion groups were held at which time all angles of the ice cream industry were discussed. Some of the outside speakers included: G. W. Kenison of the Jersey Ice Cream Company of Lawrence, Mass., C. A. Reynolds of Tait Bros., Springfield, Mass., Fred E. Wheeler and M. J. McNamara of the Producers' Dairy Company, Brockton, Mass. Joe Laraia of the Worcester plant of Tait Bros., probably as clever at making and decorating fancy forms as anybody in New England, helped us out in both courses. Everyone was most interested in watching him "doll up" the fancy molds.

The big feature of the second course was an ice cream scoring. Thirty-one samples from Vermont, Maine, Connecticut and Massachusetts were submitted. The flavors were vanilla, strawberry and chocolate. The samples were judged officially for flavor, body and texture and color on Thursday, February 26. On February 27 we had a regular ice cream day. Companies submitting samples sent representatives to swell our enrollment to thirty-seven. The whole crowd judged several of the samples in a systematic way and it was most interesting, and I may say gratifying, to the judges to see how closely the two groups agreed.

Those who attended Massachusetts Ice Cream Course.

A banquet was held at Draper Hall at noon and after some speaking and discussion, more ice cream was judged and the writer spent some time in discussing the score on individual samples with the manufacturers of the samples. This is the most helpful part of the scoring. Results of the scoring are not complete at this date. The samples showed considerable improvement over those submitted at the first scoring three years ago.

THE ICE CREAM MAN WHO MOTORS.

And here is to the ice cream man that motors;
May you travel the years on high,
With never a punctured promise,
Or skid as the days go by.

With gas tank overflowing
And oil that is fine and rich,
Straight down the road of destiny,
With never a slip in the ditch.

Then when life's journey is ending
And you are traveling careful and slow,
May you enter the garage in safety,
With all your lights a-glow.

ANNOUNCING

The Garrett

SEMI-ICELESS ICE CREAM CABINET

The Solution of the Service Problem

THE proper care of your ice cream on the premises of your retailer is the one big problem facing you today. Your only solution is to cut down your icing and delivery expense, keep your cream saleable, and to do it with the smallest investment.

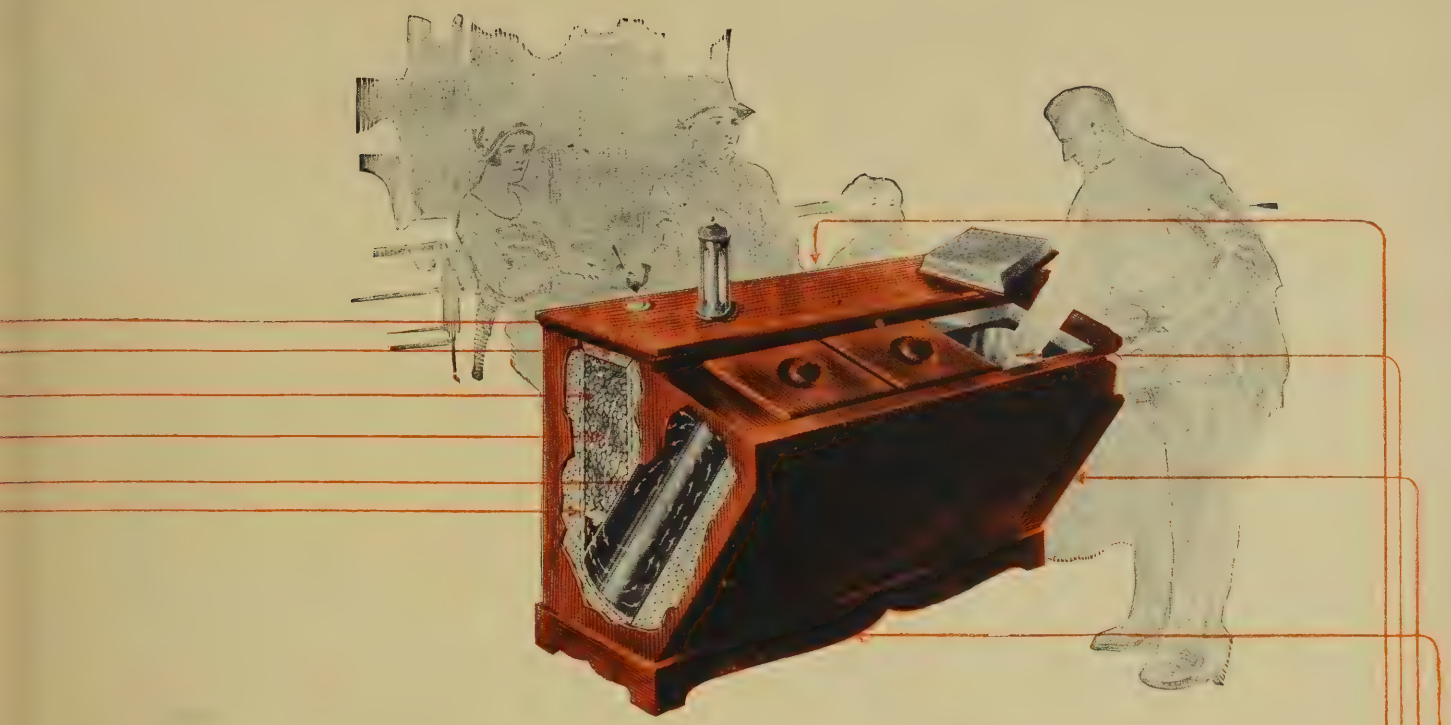
At a recent authentic test, made in the plant of a leading ice cream manufacturer (name on request) the Garrett Semi-Iceless Ice Cream Cabinet kept three 5-gallon cans of ice cream at a temperature below 18° for a period of 82 hours with one icing of 91 pounds of ice and 13 pounds of salt. In another test made in a steam heated store, with ordinary dippings, cream was kept in saleable condition for 96 hours with one icing.

As a solution of your biggest problem, we offer you a complete refrigerating unit guaranteed to eliminate two-thirds of your service costs, prevent spoilage of your cream, and at a price that is within your reach.

The Garrett Needs Ice Not More than Twice a Week—Enables same size truck to serve three times as many dealers, cover more territory, reach more distant points, and carry two-thirds ice cream to one-third ice and salt.

Only One-third as Much Ice and Salt Is Used per Season—Ice and salt are sealed in ice chamber and never exposed to outside temperature until re-iced. Thorough refrigeration is always obtained until the last piece of ice is melted.

One-half the Time Required for Icing—Simply remove the counter lid and fill the ice chamber with ice and salt for the temperature desired.



No Ice Packing Needed—No wear on the ice chamber. Increases life of cans because of lack of contact with salt and brine.

Your Ice Is Always Above the Top of Your Cream—Over head ice chamber keeping the top of your cream as hard as the bottom until entirely consumed.

Perfect Cold Dry Air Circulating System—Only the pure cold air descends into the refrigerating compartment and circulates around the cans.

No Salty Ice nor Brine Can Get Into Your Ice Cream—It is sealed in the ice chamber and never comes in contact with the cans. Drain valve inside cabinet. Drain pipe can be carried out wherever desired.

Your Ice Chamber Can Be LOCKED—Key can be carried by truck driver—eliminating chance of dealer placing meats, cold drinks, etc., in ice chamber, or using the ice for any other purposes.

This Is an Ice Cream Cabinet that Is a Perfect Refrigerator Counter— It embodies the service counter with refrigeration features, making a valuable addition to your dealer's equipment.

The Ice Cream Is Easily Dipped from Cans at a Natural Angle of 30 Degrees— The clerk's sleeve does not touch the can even when dipping from the bottom of the can.

A Compact Unit Which Is Doubly Efficient— It takes up no more space than the ordinary counter.

The Best Built Cabinet on the Market— Thoroughly insulated with five to eight inches of cork board with building paper and asphalt used according to the most improved refrigeration methods, made of redwood with glued joints. Counter lids are insulated with two inches of cork. Outside made in any finish to match fixtures and guaranteed not to sweat.

You can install three Garrett Semi-Iceless Ice Cream Cabinets and serve them at the same cost of serving one of the old style. You will not be experimenting. This is the only refrigerator counter cabinet with an over head ice chamber and cold dry air circulating system. It is designed by E. V. Garrett after years of practical experience in the ice cream business. It is sold direct to ice cream manufacturers everywhere with a guarantee for every claim made for its performance.

FAT CONTENT DOES NOT OFFSET HARDNESS.

Some interesting facts as to whether the hardness of ice cream is influenced by the different percentages of butterfat are given in a pamphlet recently issued by the University of Missouri, in which Prof. Wm. H. E. Reid, associate professor of dairy manufactures of that institution, discusses some interesting tests under the title of "The Effect of Different Percentages of Butterfat on the Physical Properties of Ice Cream."

Table 1—Showing the Effect of Different Percentages of Butterfat on the Hardness of Ice Cream.

Fat content	Hours tempered	Temp. of ice cream	Size of needle (mm.)	Penetration in millimeters			
				Center	End	End	Average
4%	7½	—10.4°	5.35	23.0	24.0	25.0	24.0
6%	7½	—10.5°	6.35	25.0	26.0	26.0	25.7
8%	7½	—10.0°	6.35	25.0	26.0	26.0	25.7
10%	7½	—10.2°	6.35	24.0	25.0	25.0	24.7
12%	7½	—10.2°	6.35	23.5	23.5	23.5	23.5
14%	7½	— 9.7°	6.35	26.0	25.0	25.0	25.3
16%	7½	—10.1°	6.35	25.2	24.2	24.0	24.5
18%	7½	—10.0°	6.35	22.5	23.0	23.5	23.4
20%	7½	—10.3°	6.35	23.0	23.7	23.7	23.5
25%	7½	— 9.0°	6.35	24.5	26.0	25.7	25.4

In the test relating to butterfat content on the hardness of ice cream we are told that it was found desirable for each brick of a particular mixture to have a uniform temperature in preparing different creams for this test. Seven and a half hours were expended in hardening four bricks from each mixture. The hardness of each brick, we are told—

"was determined by making six penetrations, two in each end and two in the center, thus giving a check upon the uniformity of the hardness of the cream. Making six penetrations on each brick and using four bricks from each mixture gave a total of 24 determinations for each change in the fat content of the mixture and would eliminate any effect which the overrun might have upon the hardness of the cream."

A direct relation of the uniform penetration to the temperature which indicates that the temperature of the cream has a decided effect upon the hardness is shown in Table 1. Complete evidence that the butterfat content of ice cream does not influence hardness is seen when it is reflected that there is no uniform variation in the depth of penetration, it was shown.

It is stated in the discussion, which was prepared jointly by D. H. Nelson and Prof. Reid, that the investigation corroborates the test completed at the Virginia Station when it was shown that there was no apparent effect on the hardness of the ice cream from fat content.

Table 2—Stability of Ice Cream When Exposed to Summer Temperatures (Temperatures Recorded in Centigrade and Weights in Grams.)

Percentage fat		4%	6%	8%	10%	12%	14%	16%	18%	20%	25%
Temperature fat—degrees		30	30	30	30	30	30	30	30	30	30
Temperature of ice cream		—10.4	—10.5	—10.0	—10.2	—10.1	—10.6	—10.3	—10.0	—10.3	— 9.0
Original weight of brick		525.0	531.0	510.0	502.0	555.75	531.25	570.25	525.75	529.00	528.25

Fifth and Cherry Sts. Milwaukee, Wis.

ICE CREAM IS SOLD WHERE IT IS ADVERTISED.

It is intersting to note that Philadelphia as a unit, although starting the four-year period with a per capita consumption nearly double the national per capita consumption, has today, on top of that, an increase of nearly fifty per cent. True, ice cream had its start in Philadelphia, and we all know that Philadelphia makes a splendid ice cream. These two factors would have an influence in putting Philadelphia as a city apart when considering per capita consumption of ice cream, yet we must face the fact that the Philadelphia manufacturers have done a good advertising job and that this advertising has influenced the buying habit of the people of their city.

In other cities, such as Baltimore, Cleveland and Detroit, where special ice cream campaigns have been consistently run, it has been demonstrated that the right kind of advertising can be made to increase the consumption of ice cream.—From Illinois convention address by W. H. Schwindeler.

SOUTHERN CONVENTION PLANS.

Vicksburg, Miss., March 20, 1925.

Editor The Ice Cream Review:

In regard to our coming convention at Lexington, am pleased to say we think this will be the best convention yet.

Hargis Hughes of Lexington is chairman of the entertainment committee and Mr. Barritt of Tampa is chairman of the program committee. The other members of these committees have been selected from our active workers in various parts of the country, and everything is moving along smoothly. Secretary Clopton is on the job and has already done a great deal of active work in getting things lined up.

S. N. SUTTON.

We hope every manufacturer is laying his plans right now to go to Lexington and that he will waste no time in making his hotel reservations as we are sure that we will have the largest attendance at this meeting of any Southern convention yet.

We wish to thank The Ice Cream Review for the hearty co-operation they have always exhibited in assisting the officers of the Southern association.

With kindest regards, I am,

Yours very truly,
S. N. SUTTON, President,
Southern Association of Ice Cream Manufacturers.

There are approximately 600 iceless cabinets in operation in the city of Detroit.

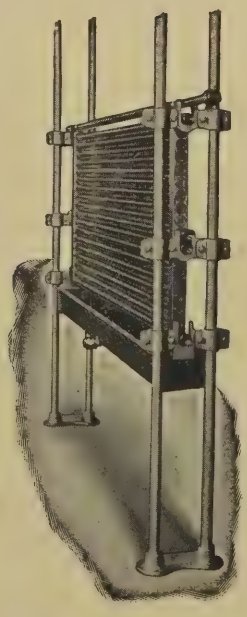
SEIDEL AGAIN HEADS MICHIGAN ALLIED DAIRY ASSOCIATION.

Martin Seidel of Bay City was re-elected president of the Michigan Allied Dairy Association at a meeting of the board of directors at Hotel Fort Shelby, Detroit, March 13. The directors voted to hold the next annual convention, with exhibits, in February, 1926, appointing a committee to decide upon location and dates.

Other officers elected are:

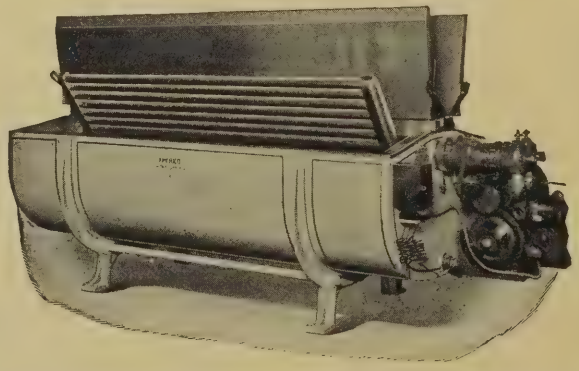
LeRoy S. Wilson, Port Huron, vice-president; D. W. Shiel, Hillsdale, treasurer, and Lloyd L. Hughes, secretary, the latter being re-elected to this post, which he assumed upon the resignation last fall of R. F. Frary.

MOVIE TAKES ICE CREAM TO PUBLIC.



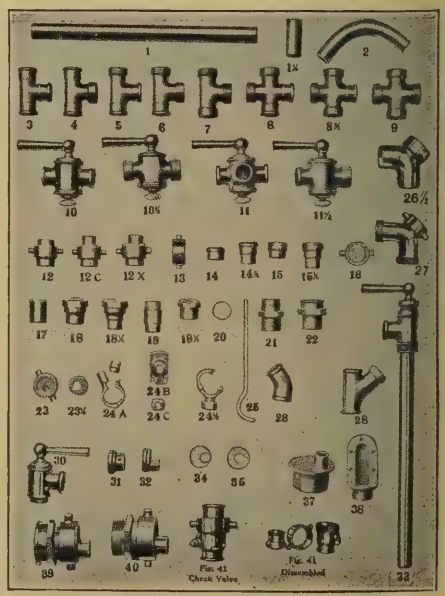
(Continued from page 140)

that it will be shown through non-theatrical channels, such as schools, churches, community organizations, etc., as soon as it has finished its run of approximately 90 theatres in Baltimore and vicinity. Mr. Stark continued:



"At first the theatres of Baltimore strenuously objected to running advertising films, because—well, because—do you like to spend 50 or 75 cents to be entertained and then be shown advertisements? No one does—BUT, if the advertising is cleverly concealed, is not offensive and doesn't stick out like a sore finger, and the story is not only educational but interesting as well, none of us mind, in fact, we welcome films of that character, as a change from the straight diet of out-and-out dramatic and comedy films."

With this thought in mind, he worked out a plan whereby the theatres of Baltimore and vicinity, 95 per cent of which are members of the Motion Picture Theatre Owners of Maryland, a state organization affiliated with the Motion Picture Theatre Owners of America, consented to show the Hendler film.



The greatest ability is reliability. Not that you are not reliable, but the man isn't living who cannot grow in reliability. That is the keystone in the Arch of Success. Reliability is that something within you, Mr. Ice Cream Man, that makes the people feel that they are going to be served honestly and that they are going to get a square deal in every way at your hands.—From national convention address by Harry L. Fogelman.

The GLASS LINING

An Equipment and Service Magazine for the Dairy Industries

Mar.-Apr. 1925 Vol. 2. No. 2

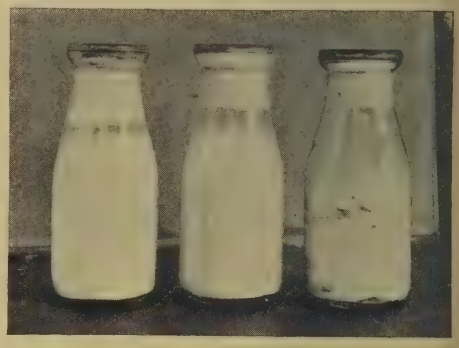
Just to Acquaint You with "*The* GLASS LINING"

THIS is an invitaton to subscribe to a Junior Trade Magazine. The cost to you is merely the cost of signing and mailing the coupon in the lower right hand corner of this advertisement. The obligation attached to doing this is nothing but your good-will.

Last month we carried an exclusive article on "The Thermokept Process," a new method for vacuumizing condensed and evaporated milk to prevent the development of yeasts and mold; an engineering article on the proper operation and maintenance of recording thermometers; and other articles written exclusively for "THE GLASS LINING."

Following are some of the highlights in the March-April issue:

A Dining Car Service which Maintains Its Own Dairy Herds



THIS is an illustrated article describing the Fred Harvey method of operating diners, restaurants, and lunch rooms on the Santa Fe Railroad. Fred Harvey maintains his own dairy herds, and the economies exercised in the serving of 15,000,000 meals annually will be of interest to every up-to-date manufacturer of dairy products.

"Pin-Point" Bacteria

AN ORIGINAL article explaining how to detect pin-point bacteria in milk, and how to effectively combat them.

You may or may not have had experience with this particular form of bacteria, but in any case you will be interested in how one plant meets the situation.

Results of Pasteurization in 3 Different Systems

HERE is an interesting one! We made this test not long ago in a city located near Rochester, and it gave us considerable valuable information. We recommend that you try it yourself.

This is the way it goes:—Pick a bottle of pasteurized milk out of one of your cases at random. Then go out into the open market and buy two bottles of pasteurized milk, each put up by a different concern in town. Try to get milk which will be comparable to yours in butter-fat content. Then set your bottle aside, along with the other two and allow them to sour and separate in the natural way. The results should show you how much gas there is in the product, and what kind of cream line you have comparatively. If you can get samples of milk pasteurized in other equipment than that you are now using, it will throw some light on the effect of various pasteurizing systems on the milk, i. e., on the cream line in particular.

The three bottles shown in the accompanying photograph are all 3½% milk of the same age and were photographed five days after bottling. The bottle at the left with the heavy cream line and the very narrow streak of separation is a milk which was pasteurized in a Glass Lined Tank. The center bottle shows a product pasteurized in a competitive batch-type pasteurizer, and the third bottle, which shows excessive gas in the cream and solids, and great separation, contains milk pasteurized in a continuous system.

The Origin of Vanilla

By Robert Rosenbaum.*

THE use of vanilla in the world at large dates back to the year 1518 A. D., when the Spanish expedition headed by Hernando Cortez entered Mexico. When Cortez arrived Montezuma despatched one hundred couriers bearing gifts of the finest natural products, as well as various manufactures of the country.

Among many wonderful things they were introduced to a delicious beverage prepared from the fruit of the cocoa tree and which was greatly enriched with the delicate bouquet of the vanilla bean. These products of the New World met with immediate favor in Spain and their use spread rapidly over the entire civilized world until today in our own industry vanilla ice cream comprises almost half the entire production.

In the beginning, the bean was gathered by the Indians from its wild haunts in the depths of the tropical forests, principally in the district of Papantla, not far from the landing place of the Spanish conquerors. As the demand increased vanilla became the subject of agricultural enterprise and vanilleries were established for its cultivation. The exact time of this step forward is not known, but records show that as early as 1760 forests were already under cultivation.

There are many varieties of the vanilla vine, but the one which is cultivated and which has been transplanted in other sections of the world is known botanically as Vanilla Planifolia. While it occurs in many sections of Mexico, the center of production is still, as in the olden days, a section of the canton of Papantla, about nine miles from the county seat.

Contrary to our conceptions, a vanilla field is not a carefully tilled, snugly fenced and finely cultivated tract of land but a wild, boundless and almost impenetrable forest with undergrowth so dense and rank that foot paths offer the only means of entrance. Even the most progressive cultivators must forego the use of the family flivver if they wish to survey their crops, which is probably the reason why most of the work is still done in the good old Indian manner.

Imagine a Mexican cedar tree, twenty feet in height, covered with dark green luxuriant verdure and clinging to it and apparently growing out of its bark a strange looking vine—little larger than a lead pencil in diameter, shooting up into the tree, covering its branches and running from it into the adjoining trees, often forming festoons and arbors so thick as to almost exclude the rays of the sun at midday.

Imagine green pods from four to ten inches long covered with rich green and spear-shaped leaves and hanging pendant from the interlacing branches. Tree after tree in this vast forest is covered with those vines, peeping from which, in all the glory of tropical luxuriance, are countless hundreds of the long, luscious tapering vanilla beans, in circumference almost equal to a banana and from two to three inches longer; some of a dark green and others of a bright yellow. Sometimes, where growing most luxuriantly, they indeed resemble bunches of bananas apparently growing upon the native trees of the forests.

Vanilla Planifolia is a member of the orchid family, which ivy-like coils itself, by means of tendrils, around trees or supports placed within its reach. The prime requisites for successful cultivation are humid, fertile districts rich in top soil and humus, with temperature

INTENSIVE MERCHANDISING.

(Continued from page 8)

Kritzman, sales manager of the Max Tauber Sons' Co., Chicago, but—

"We have overcome this difficulty in the following manner:

"1. We paint the customers' windows with a good looking panel, correctly worded. That stays up all the year around, delivering its message.

"2. Twice a year we enter into an agreement with the customer to circularize five thousand customers in the neighborhood, and on the circular there is a coupon attached for the customer's name and address. This coupon, when properly signed, entitles the customer to a quarter-pint package of ice cream, free of charge.

"3. The dealer then sends us all these coupons and we in turn send a letter to all those who have received free packages of ice cream, asking their opinion as to quality, flavor and smoothness of our product. To those who send the best replies, we mail four credit coupons, each one good for a quart brick of ice cream. The results have been wonderful and the cost has been on a fifty-fifty basis with the dealer.

"All the above as outlined increased our business for 1923 about 29 per cent."

The dealer is letting his ice cream slip in a good many places, according to William Islesmon, local manager of the New Haven Dairy Co., Hartford, Conn., and he adds:

"In regard to advertising, I believe if the dealer displayed the advertising which is given generously by the ice cream manufacturer in his window and around the store, we would do more business. As a rule it is put on the table or floor in the back room, and neglected until it is either fly-specked or dirty for display. You may say the manufacturer should see that same is put in proper place. True, but you can lead a horse to water and cannot make him drink. If one-half of the enthusiasm was used with the ice cream advertising as is sometimes used with some patented articles and medicines, the dealer would have a pleasant smile and a better word for the ice cream business."

The dealers are expecting too much of the ice cream manufacturers with regard to carrying this burden of better merchandising methods, it is pointed out in an interesting statement by A. C. Brunsell, manager of the Gloria Ice Cream Co., Inc., Stockton, Cal., who further believes that while the latter must take the initiative in bearing the major burden of the expense—

"We think the dealer is losing golden opportunities to increase his own business if he does not listen attentively and open-mindedly to the manufacturer's suggestions and intelligently supplement and persistently follow up the manufacturer's efforts."

Dealers have not been made to understand that the ice cream business has grown extensively in recent years, is now a staple business, and has become less seasonal, Mr. Brunsell points out. He then goes on to say:

"We think it would be a distinct advantage for the dealer to play up ice cream in his windows by using well-designed and artistically printed pictures. These should be pictures that show how the various kinds and dishes of ice cream look when served—pictures that will arouse a desire to eat the ice cream—pictures that will "make the mouth water.

"It is our belief that the window displays should be simple and attractive and should be changed frequently. Each display should make its silent appeal for not more than two or three kinds of dishes of ice cream at a time. A multiplicity of appeals confuses the customer and he does not know what to order. Make an appeal for only one or two or three kinds or dishes and then make a different appeal each day or every two or three days, depending upon the weather, the density of traffic, etc. The smartest and best shops in other lines change their displays frequently.

"Having aroused a desire for ice cream, a dealer should give prompt, neat, sanitary and courteous treatment behind the counter. The ice cream should be in the best of condition and should look attractive when served. If he serves luncheons, he can use ice cream in many luncheon dishes—pie **a la mode**, ice cream with chocolate sauce, etc."

An attractive window display prepared by Colonial Ice Cream Co.

With regard to building up house trade, Mr. Brunsell believes that the dealer could encourage consumption by telling customers the advantages of ice cream for desserts, as it is especially desirable when an appetizing dessert is wanted on quick notice. He adds:

"It is our belief that many people would use ice cream more frequently if they were educated to the fact that they can obtain special flavors or combinations any time from their dealer. He would not need to stock all of these at one time. He can vary them each week and let his patrons know that he will have something different each week. In a short time he will learn each customer's preference. Then.

Good business judgement prompts the leaders in Cleveland to sell the 10c package of Ice Cream

They have given the 5c size package a trial. It's a past number. The 10c size package has been adopted because it earns real profits for both the manufacturer and the dealer. If you are interested in the small size packaged ice cream business you want the facts and story of the "Situation in Cleveland"— ask us for it —

and ask for samples of the Mono-made-package with a label specially designed for *your* exclusive use, with *your* name prominently displayed. It *sells* ice cream at a *real profit.*

KLEENKUP

the package that sells Ice Cream at a Profit

Mono Service Co.
NEWARK NEW JERSEY

Sanitary Ice Cream Truck

The Sanitary Ice Cream Truck facilitates handling cream from freezers to hardening room.

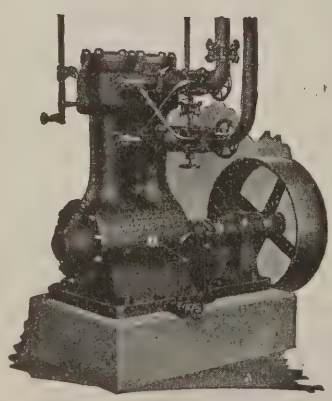
Will handle any size can in common usage. Avoids accidents in handling, as the operator does not touch the cans until he reaches the hardening rooms.

One man with truck will handle the cream from the freezers as fast as it will flow, no helper being necessary.

Substantially built to stand usage, nothing to get out of order. Can container revolves on a thrust roller bearing and is easily turned.

Style	Diameter	Capacity	Freezer Opening	F.O.B. Price
A	28½ in.	6 cans	30 in.	$50.00
B	23 in.	4 cans	24 in.	45.00
C	34 in.	8 cans	36 in.	62.50
D	40 in.	10 cans	42 in.	75.00

Two or three can containers, placed so that two or three freezers can discharge at one time, can be mounted on one truck, increasing capacity, making less trips to the hardening room necessary. Prices for these special trucks made on application, specifications required.



One regular size truck will be shipped, acceptance on approval.

when a customer comes in to make a routine purchase the dealer can say: 'I have your favorite ice cream this week (or today). Wouldn't you like a brick for dinner?'

"To increase the consumption of ice cream we must increase the desire for it. To do that we must all (dealers as well as makers) talk it and make attractive and subtle appeals to the palate."

Good results have been brought about through a plan being worked out by the Globe Ice Cream Co., Los Angeles, which is described as follows by A. A. Comey vice-president and general manager:

"Many dealers look upon ice cream as a minor product in the drug store, while as a matter of fact it should be a major product. Ice cream is a food, and it should be eaten every day, while drugs are used only in case of absolute necessity—likewise with tooth brushes, tooth pastes, stationery, perfumes, kodaks, and in fact practically all the other articles as sold in a drug store. The man, woman or child who buys ice cream more or less does so as a matter of daily routine, while on the other hand, the matter of purchasing articles as sold in drug stores naturally happen when the client of the store is in need of something at his home which he does not purchase regularly.

"The druggists and dealers who realize that if they would put forth the same efforts as the ice cream manufacturer does to educate the public that ice cream is a food and not a luxury, this would have a tendency to boost sales considerably. In other words, the dealer should dress up his soda fountain and windows with the advertising matter as given out by the ice cream manufacturer—the dealer and manufacturer should be linked together, and eventually the public would realize the necessity of eating ice cream as a pure food.

"The success of the ice cream dealer in the future—that is if he wants to attain a big success in the ice cream end of his business—it occurs to us that he will have to waken to the fact that it is essential to co-operate with the ice cream manufacturer, and hook up with the ice cream manufacturer's campaign, so that newspapers, billboards, printed matter, etc., as supplied by the manufacturer, will have a double effect by being seen in the drug store windows, and on the back bar of the soda fountain. The problem of educating the dealer to advertise ice cream is a hard one. We are gradually working this plan out with our dealers, and it has already brought good results."

MORE ABOUT MERCHANDISING.

Recognizing the importance of merchandising angles, this subject will be followed up in coming issues of The Ice Cream Review. In the next issue we shall tell of the merchandising efforts being made by different manufacturers through house organs, window displays, cross-word puzzles and the radio.

We have asked ice cream manufacturers to place us on their mailing list to receive all pamphlets and educational printed matter issued from their offices. If we are not on your mailing list, kindly accommodate us.

Much good work is being done through the house organ. This medium is bringing about more progress toward co-operative merchandising than anything that has developed in recent years.

J. J. Little of the Arctic Ice Cream Co., Detroit, stresses the importance of satisfied customers, pointing out in an article in a recent issue of this company's house organ, "Arctic Circle," how dealers should be taught to keep their brick ice cream fresh.

This idea, he said, is not being kept in the minds of all ice cream dealers, for—

"I called on a customer the other day and upon removing the cover of his cabinet found his supply of brick ice cream very low. Another glance into the cabinet and I noticed a pint brick of vanilla in a carton which we had not used for two months. I called this to the attention of the fountain clerk and explained to him that the brick in question was very old and also asked the reason why it had not been sold.

"He promptly replied that as far as he knew there was no real reason, only that he never let his brick stock get very low, and that when the fresh brick was delivered it was always put on top, allowing the brick on the bottom to remain untouched. I then went into a detailed explanation,

showing him that it was absolutely necessary that all brick be removed from the container, putting the fresh to the bottom and the remainder of the stock on top, so that a dealer is constantly giving his customer fresh ice cream.

"As we were busily engaged in our conversation, the ice cream delivery man came with an order of Frost Bites. He immediately went to the cabinet, removed the cover of the Frost Bite compartment, opened the cartons of Frost Bites and put them into the chamber. I knew there were at least three or four dozen Frost Bites in the container before the fresh ones were put in, and right away I began to wonder about the condition of the Frost Bites in the bottom."

Mr. Little then mentioned the matter to the fountain clerk, and it was investigated. The result was—

"We found eight crushed. I suggested that he keep the Frost Bites in their original packing cartons, which would keep them from getting crushed so easily.

"I also reminded him that the same idea should be applied to Frost Bites as well as ice cream, that is, to always keep the stock moving—then every customer would receive a fresh article.

"Too much stress cannot be placed on this fact, as it would be very hard to measure the harm which is being done by not keeping your brick ice cream and Frost Bites fresh."

WINTER FROLIC FOR ICE CREAM EMPLOYEES.

The March lion's frown melted to a grin and soon became a laugh under the warming spirit radiated at the first winter frolic held by employees of the Moores & Ross Milk Co., March 18, in Columbus, O.

More than 800 employees, their wives, children and friends, participated in the affair, and delegations were on hand from the various company plants in Zanesville, Lancaster, Sabina and Marion.

The Zanesville group contributed largely to the enjoyment of the evening by providing a saxophone sextette which featured the vaudeville program. All other acts except one were "put on" by strictly Moores & Ross talent. At the conclusion of the vaudeville, dancing and card playing filled the time up to midnight, when refreshments were served.

The frolic was staged under the direction of a committee composed of A. B. Osler, sales manager of the Columbus plant; Frank Moores, in charge of milk sales at Columbus, and Miss Florence Peters of the auditing department at Columbus.

The winter frolic takes the place of the annual Moores & Ross picnic usually held in the summer. This year the organization will join the associated dairy interests of Columbus in picnic plans.

MOTORIZED DELIVERY IN THE ICE CREAM TRADE.

(Continued from page 28)

on their routes electric trucks of 3½ tons capacity. These trucks have not been in use long enough to report on their performance or costs, but indications point to large savings in stable equipment and the land occupied with the stables as well as in actual operating costs. In addition the trucks are proving valuable as an advertising medium, an up-to-date equipment like this attracting much attention and receiving favorable comment from the general public.

A lady competing for the prize offered by the ice cream slogan committee offered this slogan: "Every shiver is good for your liver." She seemed to be serious, committeemen say.

Replies to Inquiries

Dear Sir:—The following is our mix we are using at the present. We are not entirely satisfied with it. Would you analyze this formula and pass your opinion upon same?

530 lbs. 40% cream.
833 lbs. 3.6% whole milk.
107 lbs. cond. skim (unsweetened) approx. 32.5% T. Sol.
200 lbs. sugar.
55 lbs. glucose.
11 lbs. gelatine.
62 lbs. water.
2 lbs. ripener.

Also kindly give us a formula for a 100 gallon mix—containing 13.4 per cent butterfat, using the following ingredients:

270.0 lbs. 40% cream.
367.6 lbs. 3.5% fresh whole milk.
80.0 lbs. cond. skim (unsweetened) approx. 32.50% T. S.
114.0 lbs. sugar.
25.0 lbs. glucose.
4.0 lbs. powdered egg yolk.
5.4 lbs. gelatine.
33.0 lbs. water.
1.0 lb. ripener.
900.0 lbs.

Reply: You will find the calculations of your mix given below in table one.

Table One.

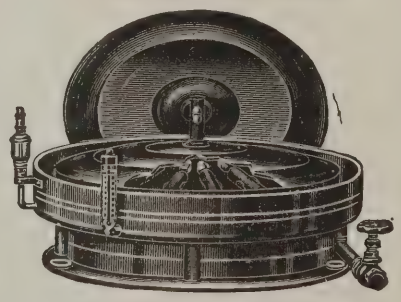
Ingredients	Fat	Serum Sol.	Total Sol.
530.00 lbs. 40% cream	212.00	28.30	240.30
833.00 lbs. 3.6% milk	29.98	71.47	101.45
107.00 lbs. cond. skim, 32.5%			190.00
200.00 lbs. sugar			33.00
55.00 lbs. glucose			10.45
11.00 lbs. gelatine			
62.00 lbs. water			
2.00 lbs. ripener			19.0
1800.00 lbs. mix.	241.98	134.54	611.87
Per cent	13.44	7.47	33.90
Per cent sugar and sugar equiv.	12.70	.....	.....
Per cent gelatine	0.61	.....	.....

You will notice that the per cent of sugar and sugar equivalent furnished by the glucose, gives you a sugar content of 12 per cent. You will also notice that this gives you a relatively low total solids content with the butterfat content as high as 13.4 per cent. This is undoubtedly the cause of the ice cream not being quite satisfactory.

I am indicating below in table two a nine hundred pound mix made up with the ingredients suggested.

Table Two.

Ingredients	Fat	Serum Sol.	Total Sol.
270.00 lbs. 40% cream	108.00	14.42	122.42
367.60 lbs. 3.5% milk	12.90	31.56	44.46
80.00 lbs. cond. skim	.....	26.00	26.00
114.00 lbs. sugar			108.30
25.00 lbs. glucose			15.00
4.00 lbs. powdered egg yolk			3.80
5.40 lbs. gelatine			5.13
33.00 lbs. water			
1.00 lb. improver			.95
900.00 lbs. mix.	120.90	71.98	326.06
Per cent	13.40	8.00	36.20
Per cent sugar	14.00	.....	.....
Per cent gelatine	.60	.....	.....



You will notice that I have increased the sugar content to 14 per cent, leaving the gelatine 0.6 per cent, the same as in your present formula. I have slightly increased the per cent of serum solids and this also, of course, helps to bring the total solids to about 36 per cent, which is about as low as it should be with a butterfat content of 13.4 per cent.

* * *

Dear Sir:—In connection with our ice cream plant we operate a pasteurizing plant for the sale of sweet milk. We use sweet milk (whole milk) and sweet cream in our ice cream mix (we use some sweet butter also) to make up the 10 per cent butterfat content and part of the milk solids not fat content. Last summer we had some difficulty in making our cream stand up like it should during the hottest days. What we want to know is whether a mix composed of powdered skimmed milk and sweet butter in the proper proportions will make a better commercial cream for drug stores and confectioners than an ice cream in which the butterfat con-

K-W TYPE A ICE CREAM CANS

Tinned on all surfaces — inside and out.

Soldered in just one essential place — where the bottom is set in.

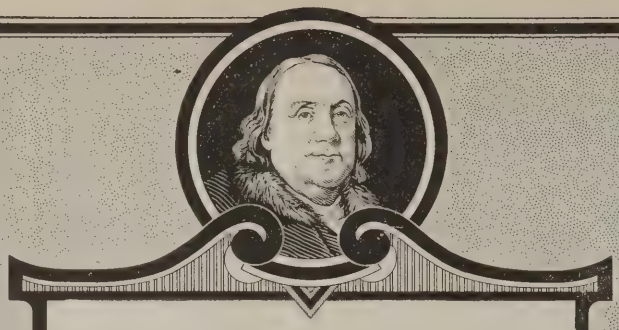
(Patented)

EVEN WHERE YOU CAN'T SEE

You must have noticed that we have said over and over again that K-W Type A Ice Cream Cans are tinned on ALL surfaces.

Here's something to add to that:—All parts of K-W Type A Cans are tinned BEFORE ASSEMBLY. Even the parts you can't see —the parts that are joined, the part between the bottom and the cylinder and the hoop and the cylinder—are all thoroughly tinned.

This careful tinning of all parts BEFORE ASSEMBLY prevents premature rusting, and especially rusting from the inside out.



All of which means to say that K-W Type A Cans are right, even in the parts you can't see.

tent is largely sweet cream and the milk solids not fat mostly sweet milk (with some sweetened skimmed milk condensed).

Yesterday we made a 1,400 pound mix, the contents of which we submit herewith for your consideration.

102.7 lbs. sweet butter.
890.0 lbs. whole fresh milk, 4.2%, includes 40.0 lbs. cream 45%.
200.0 lbs. sugar cond.
31.5 lbs. skimmed milk powder.
98.0 lbs. sugar.
5.5 lbs. gelatine.
62.3 lbs. water.

Reply: In this letter you stated that you were making your ice cream mix largely from sweet milk and sweet cream along with some sweet butter. You stated that you appeared to have had difficulty with cream standing up during the warmer weather. You desired to know whether a mix composed of powdered skim milk and sweet butter in the proper proportions would make a better product for the soda fountain than a product made largely from milk and cream. You can be assured that it is possible to make a much better ice cream using cream and milk than if you use powder and butter, especially from the standpoint of flavor. You can easily build up the correct amount of solids in the cream and milk mixture.

I have analyzed your 1,400 pound mix which you stated you made the day before you wrote this letter. You will notice the calculations given below in table one where your mix analyzes 10 per cent butterfat, 11.4 per cent serum solids and 34.4 per cent total solids. You will also notice that the per cent of sugar figures 12.8 per cent and the per cent of gelatine .395 per cent.

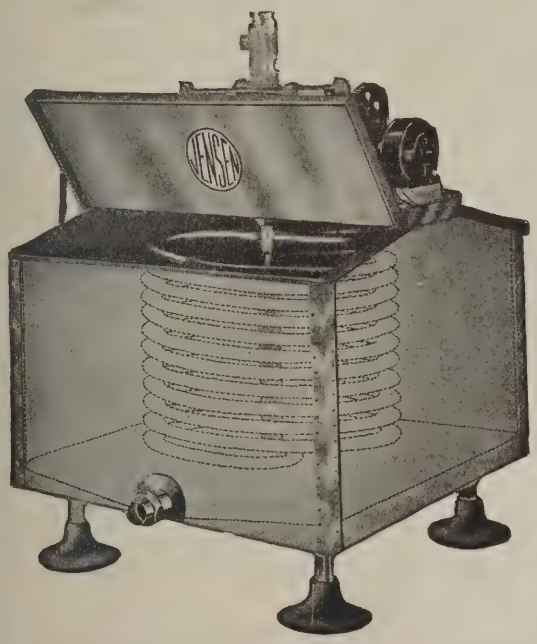
Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
102.70 lbs. butter, 84%	86.27	.....	86.27
850.00 lbs. 4.2% milk	35.70	72.45	108.15
40.00 lbs. 45% cream	18.00	1.96	19.96
200.00 lbs. sweet cond. skim		54.00	134.00
31.50 lbs. skim powder		29.90	29.90
98.00 lbs. sugar			93.10
5.50 lbs. gelatine			5.22
62.30 lbs. water			
1390.00 lbs. mix.	139.97	158.31	476.60
Per cent	10.00	11.40	34.40
Per cent sugar	12.80	.....	.....
Per cent gelatine	0.395	.....	.....

It is possible that last summer when you had difficulty with the ice cream standing up properly at the fountain it was due to insufficient amounts of gelatine unless your gelatine was of very high jelly strength.

If I were to improve your mix I would possibly add a little more sugar so as to bring your sugar content to 14 per cent and I would experiment a little with the use of the product to determine just how much gelatine it would take to hold the cream in the proper physcial condition.

* * *



Dear Sir:—I have one of your latest books, but am going to ask you to give me formula—eleven per cent fat—fourteen per cent sugar, total solids 34 or 35 per cent, but not over thirty-five using 4 per cent milk, dry milk, sweet butter, and are using dry milk water and sweet butter 84 per cent.

Reply: I am indicating below two formulas; one of them made with butter, skim milk powder and water, and the other with skim milk powder, butter and milk.

for Convenience—

Leffel Creamery Boilers

It's easy to install Leffel Creamery Boilers, and their convenience is one of the reasons for their popularity throughout the milk handling industry. No masonry foundation is necessary, as these boilers come already mounted on heavy wooden skids, and require only a level spot on which to rest. Heavy expense and delay are thus avoided, and the boiler can be easily moved if need arises.

All fire brick walls are built into Leffel Creamery Boilers at the factory —saving another expense for the creamery, dairy, or ice cream plant. Just set up the smoke pipe and fire them.

Leffel Creamery Boilers are made in sizes from 6 to 100 H. P. and conform to all state boiler laws.

* * *

Dear Sir:—Since the advent of the iceless cabinets we are having some hard competition with the largest ice cream manufacturer in ————. An iceless cabinet was installed in one of the local drug stores recently and for a short while we were supplying them with their cream. When they ordered from out of town and had cream from two different factories in the cabinet it was found that when they had the cabinet adjusted to keep our cream just right our competitor's cream was too soft. Then, when they adjusted it to keep the competitor's cream right for serving, ours was much to hard.

Reply: The apparent difficulty you have in keeping your cream and your competitor's cream in the same cabinet is undoubtedly due to a difference in the solids content of the two creams.

I suggest you send me the ingredients of your present mix and if possible also a sample of your competitor's cream so that we can analyze it for solids. I am sure that we could in this case easily adjust your mix so that it would require about the same temperature as your competitor's.

* * *

Dear Sir:—We once again are taking advantage of being subscribers to your Ice Cream Review, and are writing you regarding ice cream. We give below a few particulars of the mixture we have been using this season and you will notice from this that we have by no means put it on a scientific basis regarding its component parts.

The type of freezer we are using at present is of the rotary type, with just side blades, and no center part whatever—driven by direct motor power. Freezing mixture, ice and salt.

The mixture we have been using is:
2 lbs. corn flour.
3 lbs. sugar.
3 oz. vanilla essence (with milk).
Heated up into a mixture and left over night.
We then have this put into the freezer with
3 gallons of dairy milk.
1 gallon double rich cream.

One of the things we have found with this mixture is that it does not keep very well. We do not mean by that that it goes sour, but it has a way of dissolving itself into minute particles.

Reply: From the data which you gave in your letter it is impossible to analyze your ice cream mixture for butterfat and solids in order to determine what might be the cause of the trouble you attempted to describe. It appears that your mixture does not contain enough solids and also does not contain a colloid such as a good grade of gelatine to prevent crystallizing of the ice

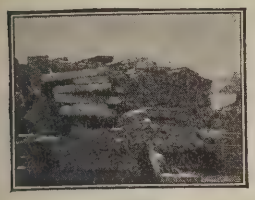
cream. You are undoubtedly using the corn flour because it is a custom in your country. We do not use products of this kind in America. I am indicating below in table one a formula for one hundred pounds of ice cream mix, and which I trust you will understand so that you could try this formula. If your capacity will not warrant making one hundred pounds you could use one-half the ingredients and make fifty pounds.

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
14.00 lbs. sugar	.....	.....	13.30
.50 lbs. gelatine	.....	.....	.47
4.00 lbs. skim milk powder.	.....	3.80	3.80
81.50 lbs. milk and cream...	10.00	6.36	16.36
Vanilla to flavor.			
700.00 lb. mix.	10.00	10.16	33.93
Per cent sugar.....	14.00	.....	.....

You will notice in the formula is included one-half pound of gelatine and I am referring to a good grade of gelatine, which in America costs about $0.65 a pound. You will also note that I have included four pounds of skim milk powder. This is for the purpose of adding additional salts and also to prevent crystallizing. You will notice I have indicated eighty-one and one-half pounds of milk and cream to make up the balance of the mix to total one hundred pounds, and I am indicating that this eighty-one and one-half pounds of milk and cream should contain ten pounds of butterfat. You will thus see that the proportion of milk and cream to use will depend upon the richness of the milk and cream. The gelatine will take the place of corn flour and will prevent crystallizing and will smoothen the ice cream much better than the corn flour.

If you are not able to secure the ingredients as suggested in the table and will give me more specific data as to the ingredients you are using, stating the amount of milk mixed with the corn flour, sugar and vanilla before heating and the per cent of butterfat in your dairy milk and in your double rich cream, I will be able to give you much better advice as to how you might correct any difficulties you now have.

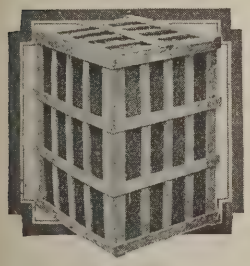


* * *

Reply to F. G.: You have asked for advice on how to make up a 40 per cent cream from sweet butter and 4 per cent milk, with a viscolizer. The usual method of standardizing a 40 per cent cream is by the so-called "square" method which I am indicating below, where the per cent of cream desired is put into the center of the square and the 84 per cent butter and 4 per cent milk to the opposite corners. Subtracting diagonally the four from the forty shows thirty-six parts of butter. Subtracting the forty from eighty-four shows forty-four pounds of 40 per cent cream. Thus you would put together thirty-six pounds of butter with forty-four pounds of 4 per cent milk to make eighty pounds, or ten gallons of 40 per cent cream.

As far as I know there is no law which would prevent you from making this cream for restaurant and hotel purposes. If there is such a law it is probably not operative as this manufactured cream is very common throughout the country.

The pressure of your viscolizer would not need to be over two thousand pounds and a temperature of about 120 degrees is correct for viscolizing.



The **fourth** of a series; read it and watch for the next!

Avoidable Waste

You inspect the ***center*** of every sheet of **NOVOID**

All Material Crated—
No Bulk Shipments—
No Breakage—No Open Joints

No "DAMAGED GOODS" with Novoid!

If it were not for the fact, first, that corkboard must possess sufficient structural strength to permit of proper erection without damage and, second, that it must be so manufactured that it will successfully withstand destructive cold storage temperatures after being installed, it would be possible to increase the insulating value of the average commercial corkboard considerably beyond that known to users today.

But even when corkboard is **properly processed** so that it meets the second requirement—as Novoid Corkboard does—the sheets are even then not strong enough, especially the corners and edges, to withstand the many handlings of the material from factory ovens to final point of application, unless the corkboards are ALL PROPERLY CRATED.

NOVOID CORKBOARD, marketed in conformity with this principle of crating all material—one of six basic principles followed by Manufacturas de Corcho, S. A., at their modern plants in Spain, home of cork—is justly entitled to be known as a UNIFORM HIGH QUALITY insulation, absolutely dependable in **actual** service. Whether the quantity purchased is car lot or less car, whether it comes direct from the factory or thru local warehouse, every sheet of Novoid Corkboard is protected against all damage until the crates are opened right at the point where the material is to be used.

Furthermore, proper processing of Novoid Corkboard eliminates all voids or "air-ways" between the particles and confines the "dead-air" entirely to the hermetically sealed microscopic air cells contained in the cork bark itself. Manufactured 25" x 37", SPLIT and finished full standard 12" x 36"—every sheet, no odd widths or lengths—in 1", 1½", 2", 3" and 4" thicknesses, **the user inspects the inside** of every sheet of Novoid Corkboard against dangerous and costly "green-centers." You, too, will benefit by these features of a superior product.

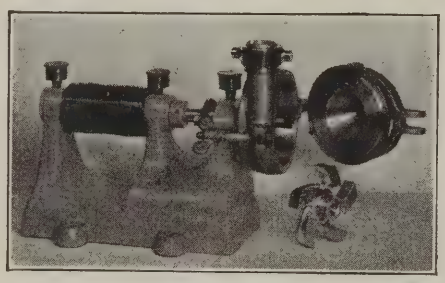
Truck Problems from the Angle of the Small-Town Manufacturer

Keeping Down Distance Between Stops Means Better Service to Dealers—and Better Retail Merchandising

TRUCK problems from the angle of the manufacturer in a small town were presented in an address before the Illinois convention by W. L. Hart of the Litchfield Creamery Co., Litchfield, Ill. As is generally known, the long haul across country is a delivery proposition with which it is difficult to cope, and that is the lot of the average small-town manufacturer of ice cream. The ice cream manufacturer, the convention was told, must guard against "the lure to go faster and farther," which yearly grows more pronounced, if he wants to keep out of "situations which may mean creating an expense beyond the profits."

City manufacturers and those in the small towns have a common delivery problem in that the routes must so be planned and laid out that they will not cover too great a distance or consume more time than is economical, allowing the route man to complete his task in a reasonable time, Mr. Hart said—this to make it possible for customers to be served at the time that is suited to their conditions.



The speaker brought out a particularly interesting thought in connection with merchandising ice cream when he pointed out that this "makes it convenient and interesting as well as profitable for them to handle ice cream." He warned against undertaking to serve unprofitable stands. He continued:

"Service is everything, and if we manufacturers can place our product in the hands of more dealers in more communities and neighborhoods, more people will have access to ice cream daily and the ice cream industry in general will be increased. But there is always a tendency to take all the business there is on a given route, excusing yourself by the fact that you have to pass the place and might as well stop, but this is a false idea, as these small places take up your time and usually require much more ice per gallon than the better stops, as well as making it impossible for you to give the proper service to the really worth while places."

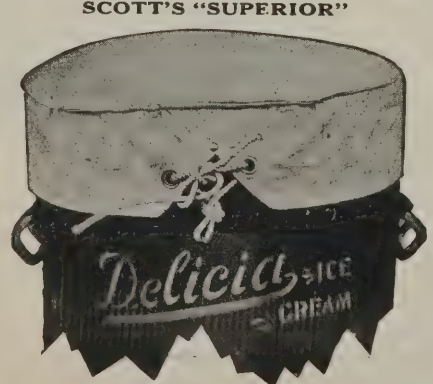
The motor truck brings about temptations to take on unprofitable stops, the speaker pointed out, explaining that with the use of the motor truck it is so easy to "get there quick" one hardly notices one more stop until stops gradually multiply and create a burden.

In speaking of the matter of delivery cost, the speaker was convinced that a light truck is best suited for trips of 20, 30 or 40 miles over country roads in all kinds of weather.

A TRUCK operating on a paying basis is one carrying gallonage large enough that the cost of transporting it by express will be enough to pay for operating the truck, according to whatever your price may be, Mr. Hart pointed out, adding, that it is generally agreed that

The Simplest Thing in Milk Pumps

Has but one moving part



Not a tool is needed. Pump head is built like a breach block on a cannon. One wing nut locks it. A single tinned bronze impeller revolving on monel metal shaft lifts the milk. Light running. Easily cleaned.

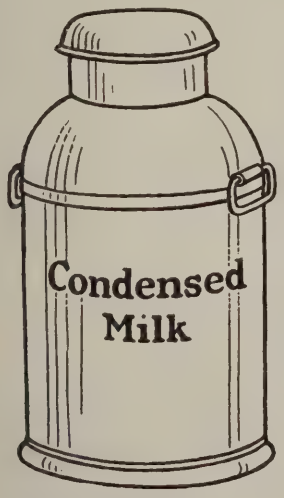
That Priceless Asset— *Reputation*

DELFT GELATINE has won an enviable reputation among quality consumers—Buyers who appreciate the value of a gelatine that for two decades has never failed to pass the rigid inspection of U. S. Food Control Officials, and always analyzes better than the U. S. Food Laws require. Free from metallic impurities and all harmful and liquefying bacteria. **No other gelatine equals this long record of consistent excellence.**

The confidence of your trade depends upon the quality of your product.

Therefore—Protect your product with DELFT—the gelatine that is always pure, uniform and rightly priced.



Send for samples—Comparison will bring us your orders.

CREASEY
ICE BREAKERS

Better Ice for Cabinets

IMPROVED efficiency in ice cream cabinets requires ice broken to uniform size. The Creasey Ice Breaker provides five different means for controlling the size of the broken ice, namely, variations of speed, spacing of picks, type of pick, number of teeth in the comb, and position of movable front plate. A Creasey Ice Breaker will deliver the ice just the size you want, without excessive ice chunks or slush, so that there will be no waste and the icing of cabinets becomes easy work. Creasey Ice Breakers are built for all capacities up to 50 tons per hour and for hand, belt or motor drive. Our Engineers have specialized on improved arrangements for the quick and inexpensive handling of ice cakes and broken ice and the icing of trucks, and would be glad to give you the benefit of their experience.

SINCE 1864

fifty cents for a five-gallon can should be the cost of delivering ice cream by truck, and added, that in all fairness fifteen cents can be added as a cost of returning the empty tub by express, making a total of 65 cents, or 13 cents a gallon one can get for delivering ice cream direct to the customer.

He continued:

"The cost of operating a light truck over a route of 20 miles, that is 10 miles out and 10 miles back, is about $7.70. You should then sell 60 gallons of ice cream daily to cover the cost. On the same basis, over a route of 30 miles the cost would be $8.40 and 65 gallons should be sold. Now a 40 mile route adds considerable to the cost of operating and I think $10.00 is a very fair estimate of the cost, requiring 80 gallons of cream to be sold for each trip made. I believe the above figures are a fair estimate under average conditions. If you employ careful drivers and limit your number of stops to, say about 20, you should have no difficulty in making your truck service a success.

"But let us not count the profits and advantages of the truck all together in the terms of definite figures, for there are many advantages of the motor truck that cannot be counted in so many dollars and cents, but which contribute very materially to the welfare of the business in general.

"When you deliver by truck you have the transportation of your product fully in your own hands and under your own supervision. You are not depending on the employees of the express and railroad companies to make your deliveries, not knowing whether or not your goods have reached their destination. But the same personnel that manufactures and sells your ice cream is also making the deliveries. By this system you form a tie between your firm and the customer that cannot be obtained in any other way. Then let us not forget the advertising feature.

"Above all things make your truck as attractive and beautiful as possible, not counting the cost that it takes to make and keep your truck looking as nice as the bakery, laundry or candy truck. For remember that ice cream is the most delicate food or refreshment that man has ever produced. With this in mind think of the effect on the prospective buyer when he sees it being delivered in a dirty, rusty and mud splattered truck."

He urged manufacturers to remember that "with all the fine things we can truthfully say about ice cream, it is very largely a habit that makes people eat it, and a great many times they are prompted to buy ice cream by suggestion coming through the eyes in the way of attractive advertisements and catchy slogans.

"So with the beautifully painted ice cream trucks properly lettered, the manufacturer appeals to the public to eat more of his delicious product and also is attracting dealers," he added, "as any merchant is flattered to have his order delivered in a classy conveyance."

The ice cream business is surging ahead faster today than any other big industry, "so let us not detract anything from our product by the appearance of our motor trucks," he concluded.

ATTERBURY-STONE.

Friends in the ice cream industry of the West particularly will be interested in the announcement of the marriage of Blanche Marion Atterbury to John L. Stone. The bride, who is well-known in the industry, represents the Hudson Manufacturing Co., Chicago, on the coast. The wedding took place March 15 at Los Angeles. The couple is at home at 1834½ North Van Ness Ave., Hollywood, Cal. The bride is the daughter of Mr. and Mrs. William F. Huffman.

THE

Waltham System

[PATENTED]

ICELESS SALTLESS NON-MECHANICAL

A Complete System of Refrigeration for Ice Cream Distribution

Just the right amount of refrigerant to hold your cream in the dealers' cabinets and soda fountains is provided by the Waltham System cartridge. Waste energy through leakage of refrigerant in transportation and in the service cabinet is reduced to a minimum. Naturally costs of operation are much lower.

Waltham System Cabinets give complete satisfaction to the dealer. With the elimination of ice and salt all his brine and clean-up troubles are over, and the ice-cream is delivered in a minimum time. Absolutely no service troubles or responsibility for operation of mechanical equipment. Nothing to get out of order.

And his cream is kept at just the right temperature *all the time.* Every scoop is just the same, and nothing wasted.

This is accomplished by the Waltham System with greater efficiency and economy and with less equipment investment than by any other system of ice-cream distribution.

Write for the facts.
They will surprise you.

THE ORIGIN OF VANILLA.

(Continued from page 153)

never below 65-70 degrees Fahrenheit. Great care must be exercised at all times.

The vanilla vine is propagated by means of cuttings taken from already grown up and healthy vines. They are usually about three feet in length. One-third of this cutting is placed into the specially prepared soil and the rest of the stalk is anchored to the future supports, which usually are trees of a type developing low branches so that after the vines have enfolded them the fruit can more easily be reached from the ground. The shade of these trees should not be so dense as to shut out the life-giving sunlight, but then again the vine loves neither extreme bright light nor the gloom of unbroken shade; thriving best in a happy medium of checkered light and shade. The trees best suited are the mango, the medlar, the dwarf bucare and the cocoa tree. Planting takes place at the end of the dry season from March to June and at the same time it is necessary to clear away the undergrowth which would otherwise sap the nourishment of the vines. This clearing again takes place in October.

In the third or fourth month after planting those vines which have not taken hold and the vines which are not bearing in the right direction on the support or are not securely attached are replanted. As the wet season extends until October these replantings are thereby given further opportunity to prove successful.

Three years after planting the vines are in full bloom. The orchids, of a pale yellow color and sweet in smell, are borne on branches which sprout from the axis of the leaves and are arranged in the form of an ear of corn. They have a common stalk and number 15 to 20 in each bunch. The blossoming season runs for seven or eight weeks from March until May. This extended period is a blessing to the planters, for the flowers must be hand pollenated. One of the most troublesome and expensive processes is this fertilization of the flower. If natural agencies such as the four winds and the insect life were depended upon the crop would not only be very uncertain but also of a medicore quality, due to the maturing of too many pods on a single plant. Artificial fertilization is performed with the use of a small wooden or bamboo sliver, the pollen from the antler of one flower being transferred to the stigma on another flower. They fertilize only the healthiest and best flowers on each vine, thereby cutting down the total number. The resultant fruit is not only larger in size, but also richer in flavor and aroma, and more easily cured.

From this time on the flowers develop, reaching maturity in June. The fruit takes six to eight months to ripen and are ready for harvest in the months of January and February.

To give an idea of what this cultivation produces, Papantla growers have made the following calculations: An area of ground 100 varas (or 300 ft.) square produces in the third year from 300-400 vanilla beans; in the fourth from 1,000-1,500; in the fifth from two to three thousand. Thereafter the yield decreases until the tenth year, by which time there is no advantage offered in keeping up the care of the vanillery. As a rule, they are abandoned in order to establish new ones.

The yield of each vine fluctuates between very wide limits. Some vines at the period of their greatest vigor produce only 15-20 beans while others bear as high as 100 and some are reported as having borne about 200 healthy beans. The average is about 80 beans to the vine.

Indian women and children carefully pick the matured fruit, placing it into baskets which are sent to the curing sheds. As yet the beans have neither flavor nor aroma. They are fleshly light yellow pods, from two to three inches in circumference. After being treated they shrink to one-fourth of the original size.

As a rule planters do not know how to prepare the bean which they sell in the ripened state to the curers, who employ experts for that purpose. The beans are brought in by the natives in large and small lots, very similar to the way in which our own country people used to bring in butter and eggs to the town storekeeper.

In curing vanilla it is an easy matter to impair the bean by an excess or lack of moisture. Perfect curing

The American Kron Scale

Just Load and Look

WITH modern methods of making ice cream mix it is highly essential To have speedy, accurate and practical weighing apparatus.

Speedy—to handle large batches in limited time; its action is instantaneous; it saves half or more of your weighing time.

Accurate—so that you will know that each batch contains the proper amount of each ingredient.

Practical—so that it will save labor, simplify the recording of weights, and lower your weighing costs.

The KRON Scale gives you *all* of these advantages, and speeds up the entire plant. It has no springs to put it out of adjustment. Its uncanny accuracy eliminates the possibility of dispute, and removes your weighing worries once for all.

If you will tell us briefly the capacity of your plant and your weighing requirements we shall be glad to recommend the proper KRON equipment for your use and tell you exactly what it will cost you.

Accumulative Indicator

AN added and exclusive feature of the KRON Scale. Not necessary to add the separate weights—the second indicator does that for you automatically and instantly, always giving the total at a glance. Saves work, eliminates mistakes, avoids disputes.

There's a KRON Scale Exactly Fitted to Your Needs—Let us Tell You About It

is attained only when the bean is left in such a condition that it will remain juicy and retains its greatest possible weight, a consummation experts constantly aim for. If the vanilla is cut when ripe, success is comparatively easy, but when cut prematurely great care and delicacy of manipulation must be exercised.

Here it might be well to mention that a lot of beans is not left to mature on the vine until January or February, but is cut down in November while still green and unripe. Bands of robbers often enter the forests which someone else has cultivated and steal the product of many hard months of labor. When this occurs in a district the owners often cut their crop for self-protection, but the practice is a bad one and for a time was prohibited by law. Naturally when a grower found his crops being stolen he would not wait for the slow and majestic arm of the law to protect him, so this law has long since been passed into the archives as ancient history. Conditions are improving at the present time but due to the location of the vanilleries it is doubtful if the robberies can ever be stamped out entirely.

The pods are brought into a special chamber sheltered from the rain. Here they are deposited on screens for 24 hours and during this time the workers are kept busy separating the well matured pods from the unripe and the damaged, as well as the windfalls and split beans. Each of these classes requires individual attention. Some curers first place the green beans in a sweat box for thirty-six hours.

On the second day the pods are brought out and placed between coverings of heavy dark colored blankets or mats. This exposure to the sun is made in a patio on the south side of the building. The tendal, as it is called, should have an impermeable sloping floor by means of which the rain waters can easily drain off. The wall is painted white so as to reflect as much light as possible onto the rows of blanketed beans—which run from east to west to receive an even distribution of heat. Just before sunset the pods are removed from the mats and placed in wooden boxes, provided on the inside with a heavy doubling of woolen blankets—now the fruit is so hot that one can hardly touch it. Another blanket is placed over the fruit and the box closed. Sweating takes place and during the night the beans acquire a brown color.

The following day, if weather permits, the pods are removed from the sweat box and again wrapped in blankets and once more exposed to the sun.

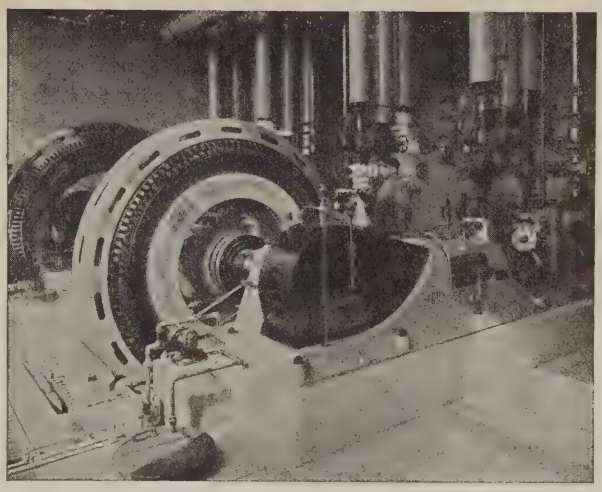
During the late afternoon and overnight the beans repose in racks indoors in a warm room where they are permitted to dessicate. This process of alternate exposure to the sun and subsequent dying on screens indoors is continued until the beans turn to a deep chocolate color and the greatest portion of the moisture has been removed. Four or five times during this period they are placed in the sweat box to hasten the development of the fermentation which produces the aromatic flavoring resins and vanilla in the bean. The final drying takes place when the moisture has been reduced to a minimum. The beans are exposed to the air outside if the weather permits, or in a heated room in case of rain, for a period of twenty to thirty days.

During the sweating process, in case of inclement weather, instead of exposure to the sun, packages of from 100-400 beans are placed in an oven and kept at a heat of from 89-125 c. for from 16-22 hours. After this they are exposed to the sun or hung up in the drying chamber in the regular way.

All through the process the curer goes over his beans with watchful eyes, using the wisdom of long experience

(Continued on page 180)

Another Triumph for Frick Equipment



—the New Plant of Seattle Ice Cream Company

The refrigerating equipment installed in the Seattle Ice Cream Company's new plant is modern to the last bolt.

The main ammonia compressors are very heavily built and work on the long stroke principle. They are equipped with central and forced-feed oiling systems, metallic packing, plate valves, and triple suction connections.

A 5"x5" enclosed ammonia compressor is installed for standby service. The condensers, ice tanks, brine coolers, and room coils are built on most recent designs.

Frick machinery was chosen by the owners after extended inspection trips, covering all types of machines. The plant is a living testimony to the worth of Frick Equipment.

Ice Cream Educational Film to be Distributed by New England Association.

Boston, Mass.—Distribution in different cities of the interesting ice cream film, "The Winning Way," will be started in the near future, it was brought out at the March meeting of the New England Association of Ice Cream Manufacturers at the American House, Boston, March 18. The film was shown at this meeting, and the secretary announced that bookings were being made to show the film, starting April 1. The booking agency of Wells & Douglas will handle distribution of this film, which is an educational movie on the many ways to serve ice cream.

W. P. E. LOCKWOOD.

The film will not be over $2 a showing, according to the secretary, who added, that notices will be sent from his office in advance as to when the film will be shown in different cities, the cost of showing to be split among the manufacturers of each city, bills to be sent from the secretary's office. Each showing will cost $2.50.

The September meeting will be an outing meeting at Poland Springs, the same as last year, and the same committee will have charge of arrangements.

Mr. Kenison reported on the advertising program to date. There was some discussion on mechanically refrigerated cabinets. The president announced that the executive committee had decided to have the next annual meeting in Boston. The secretary was instructed to look up a hotel and see what dates were available.

The secretary announced that the leaflet on ice cream as a food, containing the results of the work done in New London is progressing. He announced that these leaflets in two colors, eight pages, would cost not over $15 per thousand, depending upon the quantity.

The formal meeting broke up early but a large number of the men stayed around and discussed problems for sometime after.

* * *

EXPERT LAUDS ICE CREAM.

Brooklyn, N. Y.—A high tribute to the food value of ice cream was paid in an article published in a recent issue of the Brooklyn Standard Union, from the pen of Dr. Daniel R. Hodgon, formerly president of the Hahnemann Medical College and Hospital of Chicago.

Writing from investigations made by the Food Investigation Service, Dr. Hodgon went on to show "why everybody should eat ice cream." Declaring that it is one of our most useful foods, and that it is even better for us in winter than in summer, "because it provides extra heat for the body and extra energy to fight against colds and disease," Dr. Hodgon added that ice cream is as palatable as it is nourishing.

With regard to ice cream's importance to children, Dr. Hodgon told of examination of children in the fourth grade in one of the Brooklyn public schools. He said:

"The test showed that 63 per cent of the children were undernourished. Now that school was not in a poor community. The children were from the homes of well-to-do business men. It is a crime against civilization that parents show so much neglect about the food value of the material they allow their children to eat and permit them to buy."

* * *

Ice Cream Weight Bill Defeated in New Jersey.

Harrisburg, Pa.—A bill that would have made the sale of ice cream by weight compulsory in that state has been defeated in the New Jersey assembly. In making this announcement Fred Rasmussen, executive secretary of the National Association of Ice Cream Manufacturers, stated that the bill differed from other proposed weight standards in that no specific weight was insisted upon, it simply being asked that the law require the manufacturer to mark each package of ice cream with the net weight of the contents of "said can, package or carton."

Action of this nature in other states is anticipated by the secretary.

* * *

SOUTHEAST

Lays Dairying Foundation—Ice Cream Manufacturers, Creamerymen and Milk Dealers Co-operate With State Officials to Boost Consumption of Dairy Products and Educate Dairymen.

Wilmington, N. C. — Dairy leaders, including farmers, creamery and ice cream men and experts attached to the federal and state agricultural bureaus are laying the foundation in southeast North Carolina, and especially along the coastal plains, for the development of the dairy industry.

This foundation, which has been in course of development for the last four years, has arrived at a stage where, E. W. Gaither, district agent acting jointly for the federal bureau at Washington and the state agricultural department at Raleigh, feels absolutely safe in forecasting an immediate and rapid increase. And he declares that this increase will be primarily, if not virtually entirely due to better pastures — lespedeza, in particular, and also carpet, Bermuda and Dallis grasses.

"It is a hard dose to swallow, but facts are facts and must be stated," he recently declared by way of indicating the positive demand for a bigger dairy industry in this section. "These facts are that the average milk consumption in this area is only one-third of one pint per person per day and probably no other section is compelled to admit so low an average. The only reason, up to now, that has been offered is 'they don't like cows.' Some say, of course, they don't like milk. That isn't true. Everyone likes milk and will drink it if it can be obtained. This was shown in a recent campaign when the milk consumption almost doubled the cow population in this country."

Mr. Gaither is not speaking for this one county of New Hanover. He is in charge of a large portion of the state, including nineteen of the hundred counties in North Carolina. These, in addition to New Hanover, in which Wilmington is located, such otherwise progressive counties as Brunswick, Columbus, Robinson, Bladen, Pender, Onslow, Duplin, Sampson, Johnson, Wayne, Lenoir, Jones, Carterett, Craven, Pamlico, Wilson, Nash and Cumberland. It has required courage to keep constantly at a decidedly up-hill job of converting farmers and truckers to utilize otherwise worthless ground for pasturage to maintain cows. He, together with his associates, finally have succeeded and now feels perfectly safe in forecasting an era of rapid dairy development throughout his entire jurisdiction.

"This increase has been spotted," he said. "The eradication of the tick and the introduction of the dipping vat has helped most materially. The prospects right now are exceedingly bright. This is evidenced by the establishment of 25 or 30 commercial dairies in the district during the last three

years. Most of the herds are grade cows—some are pure breds. One dairy at Beaufort, in Carterett county, is composed wholly of scrubs, regular old woods cows. He started with only a few but his trade increased, and he doubled in six months. He will double again in another comparatively short period. That is proof that the demand for milk is here if the farmers will undertake to supply it. The establishment of a creamery at Raleigh and another at Florence, S. C., paying top prices, also creates another and certain market. In this immediate vicinity the Cape Fear Milk and Cattle Growers' Association is lending vigorous impetus to dairy development. Allie Brown of Burgaw is president, and George R. Foulke, general manager. They now are negotiating, and with every prospect of success, with the Wilmington Ice Cream Company, to take the milk. The ice cream company, it is known, is anxious to take the entire morning supply of whole milk of the thirty-five members of the association. This disposed of, the association will ship the evening's milk and sour cream to the creameries at Florence and Raleigh."

County agents have succeeded in persuading farmers to plant approximately 10,000 acres in lespedeza within the last four years. It is particularly adapted to rough land and especially is profitable for grazing.

* * *

SHETLER ESTABLISHES NEW COMPANY.

Wheeling, W. Va.—George W. Shetler, formerly manager of the Shetler Hygrade Ice Cream Co., will head a new company, which will operate under the name of the Shetler Ice Cream Co. and conduct business in Wheeling, Moundsville, and Bellaire, W. Va.

The new concern is organized with a capital of $50,000. It is reported that the new company already has acquired two plants, the Old Home Dairy Co. at Bellaire, and the Purity Ice Cream Co. at Moundsville. Mr. Shetler advises that a plant will be established at Wheeling as soon as suitable location can be secured.

According to reports, the plants will be thoroughly modern in equipment. Remodeling of the two plants has already begun. One feature of the new company is that no ice system is to be used by its retail customers. It is reported that all dealers are to be equipped with electric cabinets.

SOUTH.

One Hundred Plants Proposed to Manufacture Eskimo Pie Exclusively.

Louisville, Ky.—Christian Nelson, of "Eskimo Pie" fame, recently was in Louisville on business, and while here was the subject of a newspaper article, commenting on plans for merchandising the "Eskimo Pie" product from centrally located, or district plants, scattered in various cities. The article read:

Louisville is to become headquarters of a mammoth corporation, composed of 100 manufacturing plants located here and at various sections of the United States, in which "Eskimo pies," one of the most popular of modern confections, will be made in huge quantities, it was learned today through an interview with Christian K. Nelson of Chicago, inventor of the pie, who is here conferring with a group of local financiers relative to final details of the launching of the project.

The identity of the Louisville men interested in the concern has not been made known publicly, although Mr. Nelson told a Louisville Post reporter that he would have a more detailed announcemnt to make within the near future. Conferences are being held in the offices of the United States Foil Company, who have been engaged in the exclusive manufacture of Eskimo pie wrappers for the past year.

It is Mr. Nelson's plan to erect a chain of plants throughout the United States and to promote the distribution of the product he invented in his home town of Onawa, Ia., during the winter of 1920. The story of the invention and development of the pies is one of the most romantic accounts of modern industry and its present magnitude can be realized when it is considered that during 1923 a total of 250,000,000 were sold in the United States alone.

Offered $1,200,000 for Patent.

Mr. Nelson and his former partner, Russell Stover of Omaha, Neb., were offered $1,200,000 for the pie patents by Morris Rosenthal, brother of Julius Rosenthal of the Sears-Roebuck Company, now deceased. This offer was turned down, largely through the argument of Mr. Stover.

The inventor is no longer connected with the corporation engaged in the merchandising of patents and sale rights of the pies. He still receives huge monthly royalties from his product from this company, of which he was head until last year, when he realized that the big money lay in the real manufacture of the pies.

How He Invented Them.

Eskimo pies were invented as a result of a chance visit of one of Mr. Nelson's customers when the latter operated a small retail and wholesale confectionery in Onawa. One frosty morning, during a period when the clouds of financial disaster hovered overhead, a friend of Mr. Nelson called and asked for a popular brand of chocolate bar. Upon search of the case it was found the stock had been depleted and so the customer then asked for an "ice cream sandwich," or a slice of ice cream placed between two wafers.

"I started to make the sandwich," Mr. Nelson told the reporter, "when the customer again changed his mind and asked for another brand of chocolate bar. That started me thinking. I was hard up and knew that I had to make a lot of money before spring—and it's tough business selling ice cream in Iowa in the winter. I sensed that the customer wanted both a chocolate bar and ice cream. He wanted ice cream he could take out with him. So I began working to combine the two substances."

In connection with this announcement, Mr. Nelson told The Ice Cream Review's correspondent that the newspaper statement was premature, adding that final plans had not been worked out.

Lee Lewis to Devote Entire Time to Ice Cream Industry.

Louisville, Ky.—Lee Lewis, who over the past several years has been operating Lee Lewis, Inc., which has an ice cream plant supplying local retailers, and which also operates a couple of retail establishments, has recently resigned as general manager of the John C. Lewis Co., department store of Louisville, and will now devote his entire time to his own company affairs.

The John C. Lewis Co. has been re-organized with Leland G. Lewis as secretary-treasurer and general manager, and his brother, Llewelyn Lewis, as president, their father, John C. Lewis, over eighty years of age, becoming chairman of the board, with E. H. Rolfe as merchandising manager, and Ed. Early, who has been active manager of the Lee Lewis organization, becoming superintendent.

One of the most successful organizations in Louisville is the U. S. Foil Co., which produces foil wrappers for various lines of merchandise, and which has done a tremendous business in furnishing "Eskimo Pie" wrappers. The company was established here in the war period to make tobacco foil, and was controlled by the Reynolds Tobacco Corporation, which later released control. Stock of the company, which has a par value of $10 a share, is now quoted in the sixties, and improving right along. The company, since establishing its original plant, has enlarged several times.

Roger Salesberry, formerly an employe of the National Ice Cream Co., Louisville, indicted by the Jefferson Circuit Court, Louisville, more than two years ago, charged with embezzlement of $300 from the company, was recently arrested at Colby, Kan., and brought to Louisville to stand trial. Salesberry, according to company officials, obtained the money by manipulation of his report book, containing entries of money paid and due from customers.

There have been a number of recent changes in supply houses of Louisville. Bessire & Co. incorporated the Louisville business with a capital of $300,000, naming E. H. Bessire, P. A. Bessire and A. M. Morrison as incorporators. The company has other houses at Atlanta, Memphis and Indianapolis.

Earl I. Seaman recently left the house of Wilkes & Seaman, and has established the Quest & Seaman Co., capital $50,000, W. O. Quest, Earl I. Seaman and E. G. Quest.

The Wilkes & Seaman Co. has filed amended articles of incorporation, increasing capital stock from $15,000 to $60,000. J. W. and S. O. Seaman are among the signers of the amended articles.

Tom J. Hines of the Standard Milk Machinery Co., Louisville, reports that while the company has had its new patented automatic positive continuous holder on the market for a year or more, it is now making a drive on the new type of pasteurizer. One of these machines has recently been installed in the plant of R. G. Miller & Son Dairy, at Hartford, Conn., where it is being closely watched by the Eastern dairy people. The Polk Sanitary Milk Co., known as leaders in modern sanitary milk handlers, have installed two, one of which is in the old plant, and the other in the new plant. Other installations or the Mortensen holder are going in at Gadsden, Birmingham and Southern points, and as soon as the doubters can see the results accomplished with this equipment, the company anticipates a flood of orders.

MIDDLE WEST.

Extra Dividend Declared by Arctic Dairy Products Co.

Detroit.—At a recent meeting of directors of the Arctic Dairy Products Co. an extra cash dividend of four per cent was declared from the earnings of 1924, payable on Feb. 1 to holders of record on Jan. 20. This is in addition to the regular dividend of eight per cent which was paid at the rate of two per cent quarterly.

The Arctic Dairy Products Co. reports that the year 1924 was the largest in the company's history, both in point of sales and earnings. Throughout the country generally the ice cream business showed a decrease of 15 to 20 per cent in volume, as a result of the cool weather, but in spite of the weather conditions, the Arctic Company shows larger earnings than ever before in its history.

This showing is largely attributable to centralization of management and purchasing, and to economies effected in the distribution of its products through the use of the Nizer electric ice cream cabinet.

The Arctic Company, in addition to eleven ice cream plants, operates three large milk condensing plants, located at Grand Ledge, Hastings and Ovid, Mich., manufactures and jobs soda fountain supplies and fixtures through its subsidiary, the Connor Fountain Supply Co. of Owosso, Mich., and also conducts a retail and wholesale milk business in Detroit, covering the down-town section and the west side. The products of the condensing plants are sold to other ice cream manufacturers throughout the state and the baking and confectionery trade.

The company was incorporated in 1908, with an original capitalization of $25,000.00. From that small beginning it has grown to a $4,000,000.00 company, conducting a business of over $5,000,000.00. It has a long history of uninterrupted earnings, showing an increase almost every year over the previous year. Dividends have been paid on the common stock continuously since 1916. The capitalization of the company consists of $1,000,000 7 per cent preferred stock, $2,000,000 common stock, $5,000,000 6½ per cent bonds. Of these various issues $619,200 of the 7 per cent preferred, $1,133,480 of the common stock, and $1,250,000 of the 6½ per cent bonds are outstanding. While the auditor's report for the year 1924 is not yet available, the company's books show that the earnings for 1924, after deducting the interest paid on the $1,250,000 bonds which were sold January 1, 1924, exceed by a considerable margin the earnings of the preceding year which were the largest in the history of the company .

The Arctic company has maintained a policy for several years of spending liberal amounts for development and research work affecting their various products and the handling of them. A considerable part of this work is done by the Nizer Laboratories Company, which is a subsidiary. One of the developments of this laboratory is the Nizer mechanically refrigerated ice cream cabinet, now manufactured and sold by the Nizer Corporation of Detroit. Over 2,000 of these cabinets are now in use in the city of Detroit by the various local ice cream companies, and a total of over 11,000 are in use throughout the United States, officials say. Small shipments have also been made to foreign countries.

The executive committee of the Arctic company recently declared a bonus of three per cent on the preferred stock held by employees and purchased through the Employees Stock Purchase Plan. It is the company's policy to sell its employees seven per cent preferred stock on the installment basis, and it has pledged itself to pay the employees holding such stock a bonus of from nothing to five per cent additional at the end of each year on their stock holdings, the amount paid depending on the degree of prosperity the company enjoyed that year. The company is also extending the stock purchase plan this year to include dealers buying the company's products and farmers throughout the state from whom the company purchases milk. The arctic company is selling its products to over 3,000 dealers in the state of Michigan, and is buying milk from approximately 3,000 farmers.

The balance sheet of the company, officials say, discloses that it is in excellent shape, financially, the last figures available show a bank balance of over $400,000.00, with nothing owing other than current bills, it is reported. Stock of the Arctic company is quite closely held, there having been only 79 shares sold through the Detroit Stock Exchange during the year 1924.

Ice Cream Men Attend Iowa Dairy Short Course.

Ames, Ia.—The thirty-second annual ten-day dairy short course ended with a banquet, Friday evening, February 20, given in honor of the short course students by the Iowa State College Dairy Club.

Eighteen states and three foreign countries were represented among the 135 students registered for the short course for experienced men, surpassing the record of last year both in number of students, and states represented. Interest was shown particularly in securing high quality in dairy products. This increased interest was not confined to manufactured products alone, but much more attention than formerly was given to the quality of milk supply, and the handling of market milk.

L. R. Sanders, general superintendent of the Hutchison Ice Cream Co., Cedar Rapids, Ia., was an instructor. Mr. Sanders has had wide experience in both educational and manufacturing phases of ice cream work, and is widely known among ice cream men for efforts along the lines of efficiency and quality control.

Shortly before coming to Ames to instruct short course students, Mr. Sanders spent ten days in Detroit, where he made a study of mechanically refrigerated units for ice cream cabinets.

Lectures were given on refrigeration, efficiency, iceless cabinets, standardization of mix, homogenization, hardening rooms, making bricks and fancy molds, and much emphasis

Our Own Page

You wonder why we run Our Own page.

We are so thoroughly sold on the fact that the advertising pages of this magazine are of great value and help to concerns selling ice cream machinery, supplies and equipment, that we use them ourselves.

We want to use an advertising page to tell the entire ice cream industry about our product.

The Ice Cream Review is a product made of two things—editorial pages and advertising pages.

Frankly, our job is to sell space to ice cream machinery, equipment and supply houses. In this space they are to place the best possible information, data and material they have for ice cream manufacturers to read. The success of the advertising space used depends on how well the advertiser tells his story.

The Editorial Department working on this publication have their "say-so" in every issue.

That's why we, the Advertising Department, want to run Our Own Page.

Business Insurance

WRITTEN FOR THE SUPPLY MEN TO READ.

Do you know that the average business concern spends about 80 per cent more for advertising than they do for fire insurance in a year?

The relation between those two amounts in dollars and cents is of little consequence, but the principle back of these two expenditures is the same.

One is insurance against loss by fire while the other is insurance against loss by diminishing sales volume.

Year after year goes by and the average business man pays out fire insurance premiums, not because of the return he expects to get from it, but for the protection it gives him in case a fire should occur, which, in the absence of insurance, would ruin him and his associates.

Loss by diminishing sales volume is much more likely to occur than a fire, yet the same precaution is seldom exercised as regards advertising.

Although generally regarded from the standpoint of the actual return in sales volume, Trade Paper Advertising should much more be regarded as insurance.

Obviously, results may accrue from advertising. But these results may be in a different form than increased sales volume. They are sales protection.

Further, the Trade Paper Advertising appropriation protects business against sudden depression, against inroads of competition, against the difficulties that may consume many a business not properly insured with the good will and the stamina that good Trade Paper Advertising brings.

If at the end of the year, the sales results from advertising do not justify the appropriation expended, the cost of advertising should no more be regarded as a loss, than the cost of fire insurance should be regarded as a loss.

This is no justification of failure on the part of advertising to show a proper return, but it is a suggestion that advertising has two functions to perform. First, the procuring of business; second, the insuring of business.

was given to sanitation and improvement in methods of handling raw material and finished products.

Bacteriology of ice cream and testing ice cream for fat and solids were given prominence. The testing and the chemical and bacteriological laboratories were available at all times for study of standard methods of determinations. On the last day of the short course an examination was given over the work that had been taken up during the ten days of instruction. Prizes were awarded to the men making the highest scores in the test.

The following awards were made by Professor Mortensen, head of the department of dairying, as a special feature of the banquet: First—J. O. Overton, Perry, Ia., watch and chain, score 100. Second—E. M. Doege, Appleton, Minn., ice cream cabinet, score 99. Third—E. R. Armilk, Davenport, Ia., 1 gallon vanilla, score 97. Fourth—H. M. Gilbert, Ames, Ia., $5.00, score 95. Fifth—Andrew Andersen, Iowa City, Ia., $3.00, score 90. Sixth—E. W. Spence, Cedar Rapids, Ia., $2.00, score 87½.

School Children Test Ice Cream.

Richland Center, Wis.—The Carter Ice Cream Co., with the aid of the teachers and pupils of the West Side school is conducting a test as to the food value of ice cream. On the first of February all the children were weighed. About 100 pupils are receiving daily a serving of ice cream. Fifteen pupils who are under normal weight, are receiving two helpings of ice cream. At the end of February, and at the end of March the weights of the different groups will be compared, viz., those pupils receiving two servings, with those receiving one, and with those receiving none.

Fire Destroys Dakota Plant.

Minot, N. D.—Damage estimated at from $8,000 to $9,000 was done to the stock and equipment of the Purity Ice Cream Co., Third Street, Northeast, February 26, by fire thought to have been caused by an electric wire.

The Purity Ice Cream Co.'s loss is fully covered by insurance. The company owned an equipment and stock valued at $14,000. On a portion of this the loss is total, while on the remainder the insurance adjusters have agreed on a 75 per cent loss.

The officers of the Purity Ice Cream Co. are: Wm. D. Campbell, president; V. R. Tompkins, secretary-treasurer, and Geo. Sagen, vice-president.

Mr. Campbell states that the company is looking for a new location and undoubtedly will remain in business. The company manufactures ice cream and butter and handles dairy products. The wagons went out on the milk route as usual the morning after the fire.

PACIFIC WEST.

Addition to Globe Plant Rises as by Magic.

Los Angeles, Cal.—The Globe Ice Cream Co. on Wednesday, March 11, began the erection of another addition to its plant, this addition to be 50 feet wide by 150 feet long, and to have six stories.

The structure is being built of reinforced concrete and announcement is made by A. A. Comey, vice-president and general manager, that the method of slip-form concrete is being employed. A photograph is taken at the end of each day's work, and the rapidity with which it is rising is creating much excitement locally, the story being told by the photographs. This is not the first addition to be made to the large plant the Globe Ice Cream Co. erected here more than a year ago.

Ice Cream Production by Half Million Gallons in California.

Constant progress is reported for the California dairy industry in a year's review recently issued by the California State Department of Agriculture. This advancement was made in the face of unusual hardships, it is pointed out by G. H. Hecke, director of the department of agriculture, who added that despite the long drouth which resulted in cutting down feed production and high feed costs, to say nothing of foot and mouth disease, and low prices for butterfat during later months, the production of butterfat in that state has advanced to 125,274,369 pounds. This was a net gain of more than 5,000,000 pounds over the preceding year.

Dairy products and market milk increased in wholesale values from $104,000,000 to $118,000,000. This net gain of $14,000,000 was made possible largely because the average prices of butter, cheese and other dairy products were higher during this fiscal year than at any time since 1920.

Butter production has increased more than one and a half million pounds. There is a slight increase also reported for cheese. The increase in evaporated whole milk is reported to amount to fourteen and one-half million pounds. Powdered milk production has advanced three million pounds. In market milk there was an increase of approximately thirteen million gallons, counting all classes and grades. Approximately half of this was reported from Los Angeles county.

An increase of about one and a half million gallons in the production of ice cream was reported. This was a gain of nearly 20 per cent. The state total ice cream production amounts to 9,058,896, valued at $12,229,510.

California last year produced 78,562,263 pounds of butter, valued at approximately $37,513,481. The cheese production, including all types except cottage and full skim cheese, amounted to 7,947,854 pounds, valued at $1,798,588.

CANADA.

Canadians Plan New Organization of Dairy Manufacturers.

Vancouver, B. C.—Formation of an association to include within the limits of its authority the provincial dairymen's associations in British Columbia, Alberta, Saskatchewan and Manitoba, and all of the organizations of the manufacturing dairymen, including the buttermakers, cheesemakers, ice cream men, and all others in any way identified with the dairy industry, is practically assured, as the result of action taken at the final session of the Western Canada Dairy Convention in the Hotel Vancouver.

J. A. CAULDER.

This matter has been a subject of consideration by dairymen throughout the West for two or three years, and the big gathering of dairymen seemed to be practically a unit in the opinion that such an organization was necessary. The only question seemed to be how, and on what basis, it could be formed.

W. W. Prevey, manager of the Edmonton City Dairy, presided, and explained the purpose of the meeting. J. A. Caulder, Moose Jaw, Sask., who, the chairman said, had been working on the matter for months, carefully explained the purpose of the proposed organization, and what he believed it would accomplish for the dairy industry.

"We have been working on this proposal for several years," he said. Each of the provinces have good provincial dairy organizations, and at the top we have the National Dairy Council, but we have nothing between. The objects of the national organization, education, legislation and transportation as they affect the industry are being fairly well looked after, but there is little co-operation between them.

"There are 20 members from the East on the National Dairy Council and 13 from the West," the speaker continued, "but up to the present it has been difficult to select these representatives. We must remedy that condition."

Discussing the question of some of the benefits that would accrue from the proposed organization, Mr. Caulder said it was not so long ago that the matter of a market for butter and other dairy products was not a serious problem. Home consumption took care of everything the dairyman could produce. It was different today, and with the rapidly increasing production the question of disposal of surplus production was becoming a really serious problem. This would become an even greater difficulty when British Columbia, now a buyer of butter, became able to take care of her own requirements in that respect.

"In the Middle West," said Mr. Caulder, "we have doubled

our butter production in the past seven years, and within the next five years we will be producing at least 100,000,000 pounds of butter."

One of the chief functions of the proposed central dairy organization would be the development of markets for this great production.

The matter of production, standardization and everything of that kind could be considered, and complete co-operation between all of the interests concerned in the dairy industry could be brought about.

Discussing the matter of financing the organization, the speaker suggested that the provincial organizations could fix and collect the fees, a certain proportion of them going to the National Council, another portion to the central Western organization, and the remainder to the provincial associations.

In the conduct of business, purely provincial matters would be looked after by the provincial organizations, national matters would be cared for by the National Dairy Council, and inter-provincial matters by the union of the provinces.

S. H. Shannon, president of the B. C. Dairymen's Association, expressed himself in favor of the proposed scheme.

"The time has come," he said, "when co-operation between the Western provinces should be effected."

"Our interests are mutual and I think we ought to have closer contact with one another," said W. J. Park, president of the Fraser Valley Milk Producers' Association, and a member of the National Dairy Council. "We should line up with the East and have one head and that the National Dairy Council."

A committee was chosen as follows:

British Columbia—W. J. Park, chairman; S. H. Shannon and A. H. Hoy.

Alberta—W. W. Prevey, chairman; D. J. Christie and J. W. Skelly.

Saskatchewan—J. A. Caulder, chairman; R. W. Heim and J. A. Smith.

Manitoba—J. M. Carruthers, chairman; G. Tovell and I. Ingleson.

J. A. Caulder was chosen as chairman of the committee of the whole, and the committee instructed to at once get busy, secure all needed information, report to the provincial organizations, and finally work out details of the organization.

Reference was made to the serious illness of Blake Wilson, and a resolution of sympathy with him was passed and a bouquet ordered to be sent to him.

A vote of thanks to the members of the British Columbia organization for the splendid entertainment provided by them for the visiting delegates was moved by J. A. Caulder and passed.

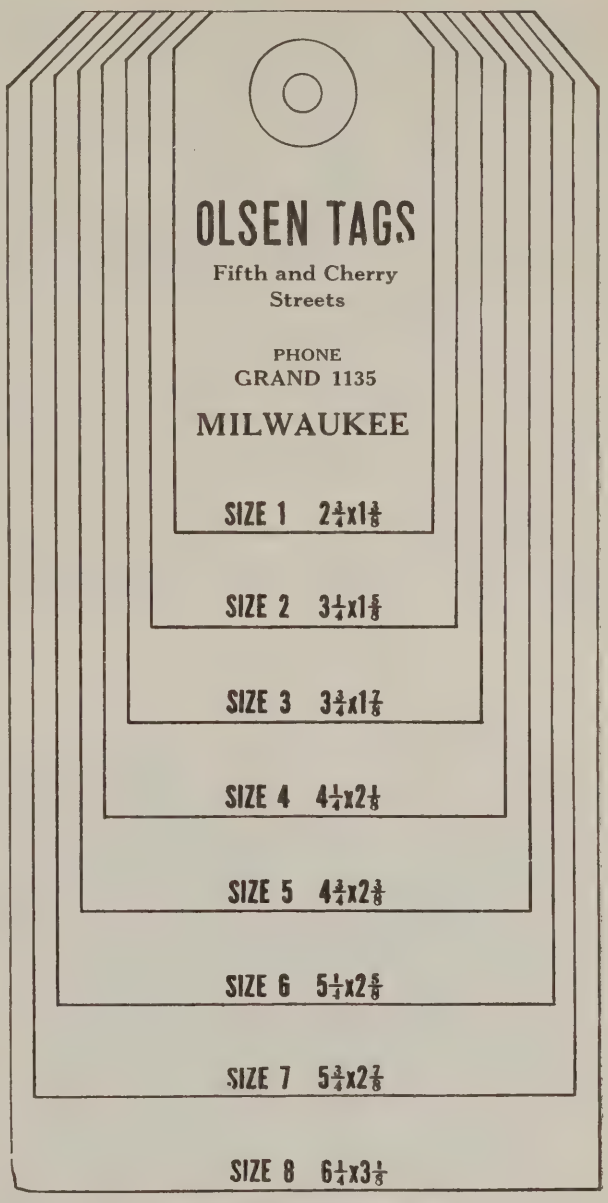
* * *

Tuscaloosa, Ala.—The Velvet Ice Cream Co. has been incorporated with a capital of $5,000. W. R. Orgain and Hull Cummins are the incorporators.

Conway, Ark.—A concrete building will be erected by the Faulkner Co. Dairymen's Ass'n and plans are underway for the installation of butter and ice cream equipment. A complete refrigeration plant will be installed.

Los Angeles, Cal.—The Hughes Ice Cream Co. is considering the erection of an ice cream manufacturing and distributing plant in San Luis Obispo, according to E. Elk, a representative of the company, who recently visited that city.

Jacksonville, Fla.—Phillips Ice Cream Co. was incorporated by Philip B. Vaisilion and Geo. H. Garamonont. The capital is reported as $75,000.



Chicago, Ill.—The National Ice Cream Co., 2749 W. Harrison St., has been incorporated with a capital of $100,000. The incorporators are: John F. Power, Joseph A. McInerney and George Davelos. Correspondence should be addressed to 160 N. LaSalle St.

DeKalb, Ill.—The Peerless Ice Cream Co. is scheduled to move into its new building soon.

Flora, Ill.—The Gassmann Ice Cream Co. of Olney has purchased the plant and buildings of The Borders Ice Cream Co. of this city. John Borders has been retained by the Gassmann interests to manage the plant.

South Bend, Ind.—Schlosser Bros. are making improvements at the Plymouth creamery and ice cream plant to increase its production 50 per cent. Additional freezers are among the new equipment added.

Augusta, Me.—The property on State Street formerly occupied as Campbell's garage has recently been purchased by the Simmons and Hammond Mfg. Co., makers of S. &. H. quality ice cream. Special machinery is being installed to provide a refrigerating plant and holding station in thorough keeping with the most improved and modern methods in manufacture. It was expected that the work would be completed by April 1.

Charleston, W. Va.—The Imperial Ice Cream Co. has taken over the plant of the Diamond Ice Cream Co. on Cummers St. The plant will be remodeled and Zeno Pyre will be in charge.

THE ORIGIN OF VANILLA.

(Continued from page 172)

to determine the exact length of time required for each bean. Curing cannot be done in bulk in a haphazard way, but each separate bean must be given individual attention. The workers are constantly sorting and reclassifying their curings.

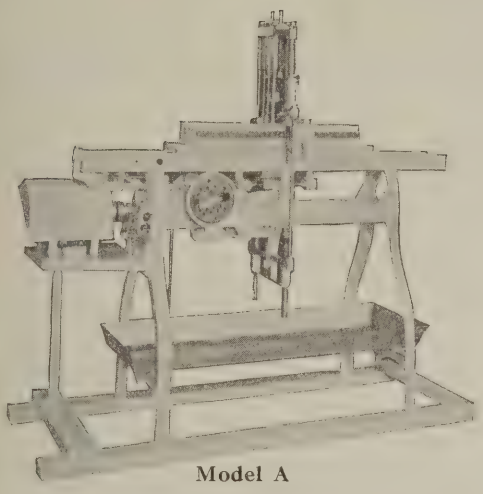
Vanilla improperly cured deteriorates rapidly and becomes moldy. Great care and fine eyesight are required in the separation of the unfit from the sound, because if only one bad bean remains undetected it will mold and endanger other bundles in a short time.

After the beans are thoroughly cured, which takes about three months, they are assorted into different sizes and bundled. Each bundle contains from 50-75 beans, depending on the custom of the curer. These weigh from 14-16 ounces. Forty of these bundles are placed in tin cans lined with waxed paper and four or five cans to a case, made of Mexican red cedar. These are placed on mules or burros and taken to the seacoast town of Misantla where they are sent by small boat to Vera Cruz for shipment to all parts of the world.

The U. S. Department of Agriculture made investigations which caused officials to make the following statement in Agricultural Bulletin No. 1161.

"In 394 or 63.2 per cent of the sales (which were conducted for the purpose of the experiment as to people's preference for ice cream with gelatine) the purchaser asked for ice cream that contained one per cent of gelatine. In 143 sales, or 23 per cent, they asked for ice cream that contained no gelatine; and in 86 or 13.8 per cent, they asked for ice cream that contained 0.5 per cent gelatine."

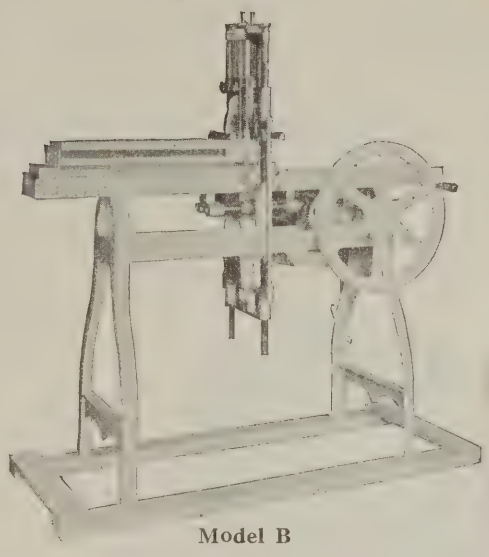
The ration was a little less than 3 to 1 in favor of ice cream with gelatine.



A canvass of one hundred of the leading ice cream manufacturers of the United States, doing business in 31 states, showed that these manufacturers have an average butterfat content of 11.52 per cent. The average gelatine content is .453.

ARE YOU BUILDING?

Leaders in the ice cream industry are working together, planning, overcoming obstacles, making some mistakes and correcting them, but always moving forward. Every one connected with the industry either builds up or tears down, either gives to it or takes from it.



What goes into the picture in the future depends on the vision of the men in the industry and what they put into it.

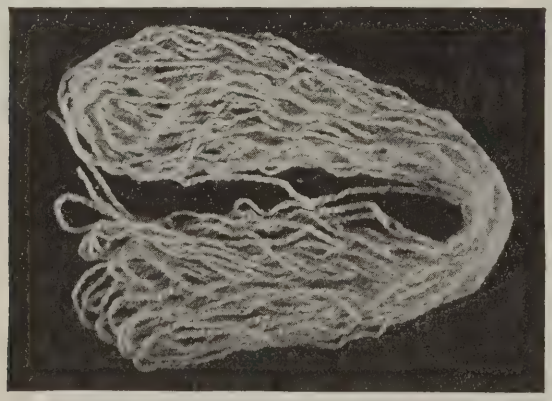
SMALL-MOTOR LUBRICATION.



For years much attention has been centered on the problem of adequate lubrication for fractional h. p. motors.

Announcement has been made of the development of a system of small motor lubrication which has been perfected, it is claimed, to the point which assures the user of continuous 24-hour-per-day service, for several years, without re-oiling.

This new, small motor lubrication system, developed by the Century Electric Co. of St. Louis, depends for its unusual effectiveness on the use of a number of continuous strands of pure wool yarn introduced into the bearing housing and oil well in such a manner as to replace the present methods of carrying oil to the shaft surface, officials say, directing attention to Fig. 1.

As illustrated in Fig. 2, the continuous strands of wool yarn are packed into the oil well so as comfortably to fill it, and are in direct contact with the surface of the armature shaft, it is explained. Constant contact of the wool yarn with the shaft surface is assured, we are told, by a spring

attached to the underside of the oil well cover, so arranged that it exerts a downward pressure against the wool.

It is claimed that the wool yarn used in this newly developed type of lubrication will in itself hold sufficient oil in suspension to properly lubricate a small motor for at least one year's continuous 24-hour-per-day operation.

REPORTS EARLY-SEASON INTEREST.

The California Crushed Fruit Corporation of Los Angeles reports early-season interest in pure fruit juices from ice cream manufacturers in virtually every part of the country.

Topping all previous records for one day's sales, the California Crushed Fruit Corporation one day late in February shipped three carloads of Mission orange juice to Eastern centers, officials report. One carload went to Chicago, another to Philadelphia and the third to New Orleans. The following day another carload shipment was dispatched to San Francisco.

The California Crushed Fruit Corp. is now rushing to completion a $75,000 addition to its main crushery at Los Angeles, adjacent to the citrus groves. The new construction will have the effect of doubling the present production capacity of the Mission plant. A spacious modern refrigerating plant is being installed to provide storage for the whole fruit as it arrives from the groves and for the finished product awaiting shipment.

IMPROVEMENTS ON BRICK BUTTER.

The New Era Co. has made two "very advantageous improvements" on the "New Era" ice cream brick cutter, it is announced. The company now has a screw adjustment on feed plate which makes it possible to modify the distance of travel of the feed pawl to a fraction of an inch. This means, officials say, it is possible to adjust the machine so it will automatically space with unfailing accuracy.

The new style scale board is equipped with an adjustable scale rack that has six different spacings. The spacings are so arranged, we are told, that with proper adjustment of feed plate it is possible to cut the following slices with each scale board; namely, 2, 3, 4, 5, 6, 7, 8, 9, 10 and 12 to the quart brick.

"The New Era Co. of Oshkosh, Wis., manufacturers and designers of the 'New Era' ice cream brick cutter are in constant touch with ice cream manufacturing and in this way are able to put out a cutter that keeps pace with the game," the company's announcement reads.

* * *

HOW "CONSOLIDATED" CONES ARE MADE.

Knowledge of the different phases of the ice cream industry is very important to every ice cream man. Many members of the industry, although they can conscientiously assure the public the ice cream they make is the most pure and wholesome, often are not posted on how ice cream cones are made.

Max Goldberg, vice-president of the Consolidated Wafer Co., Chicago, recently made it possible for information of this kind to be gained about his plant. Starting at the top, where cones have their beginning, the visitor passes many sacks of flour, and notices the walls and woodwork of the entire factory are gleaming with white paint. Arriving at the mixing room, the visitor sees a man portioning out the ingredients—flour, milk, vanilla, sugar. Care is shown in getting the right proportions. When the mixer was opened one could see a batter the color of creamy molasses taffy when it is being pulled from the hook.

Passing down to the big wheels where the cones are baked, the visitor finds the batter is delivered by gravity feed from the mixing room. The wheels drop six cones in a row at regular intervals and never stop. The cups on the wheels, set at regular intervals, come around to a point where the mold fits itself into the cup. This serves to distribute the batter in the cup evenly and molds the cone with the reinforced rim. The base of the wheel is so perfectly timed that the cones come out without being overdone or underdone.

Passing from the molds, the cones disappear down a chute. They stop on the next floor below, where they drop directly into a cardboard container, each cone fitting snugly in its hole. A slowly moving conveyor advances another row of holes as each row is filled. The filled cardboards are moved from the conveyor by girls, who stack just the right number together to fill a big corrugated carton. The carton is sealed and made airtight before being made ready for shipment. Cones are not touched by the hands.

This plant, Mr. Goldberg says, produces a million cones a day.

EVANS JOINS MANNING MFG. CO.

Geo. A. Evans, formerly sales manager of the De Laval Separator Co., has taken a position with the Manning Mfg. Co. of Rutland, Vt. Mr. Evans will be manager of that company's branch at New Haven, Conn.

NEW PFAUDLER "HAND-TIGHT" FITTINGS.

The new Pfaudler fittings just placed on the market have been built on the principle of compression, and officials say a very thorough study was made of the existing types of valves used. Essential oils and alcohol are held with a compression type valve in all up-to-date plants, it is pointed out. In order "to hold pressure, use pressure," officials advise. "That is the principle on which the Pfaudler fittings have been built." They added:

"To illustrate the principle, the diagram has been lettered so that the various parts may be easily identified. It will be noted that by unscrewing the valve stem nut, the entire stem and bonnet may be removed for cleaning. Thus, the valve itself can remain in the line and be thoroughly washed in that position.

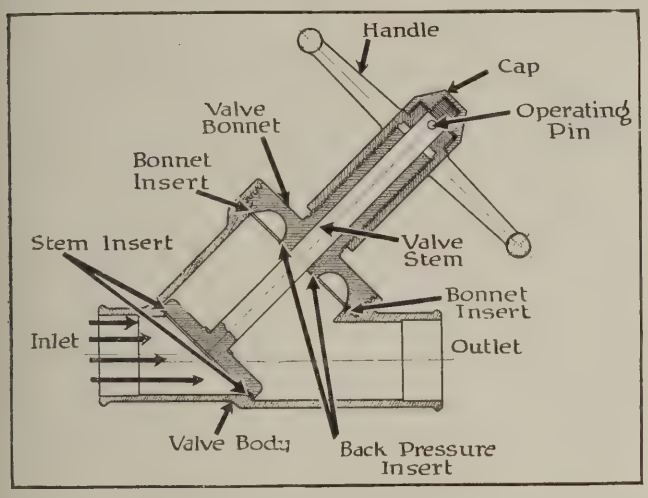

Diagram shows cross-section of Pfaudler No. 10 Straightway Valve. Note that the three inserts (stem, back-pressure and bonnet) are located at the only possible points of leakage. The "perfect" seal afforded by these inserts renders leakage impossible, officials say.

"All union nuts are furnished with ears which enable the operator to grip the fitting with his hands and either tighten or loosen it without he use of a wrench or other mechanical device. This eliminates pounding the fitting, and prevents changing the shape of the nut or burring of the threads, as is often done in an attempt to obtain a perfect seal.

"In the actual sealing of the value or fitting a raised seat presses against a special alloy insert, making a seal which is leak-proof. There is no grinding-in process as in the case of the ground-seat valve. Consequently there is no place where the plating can wear away by friction. The insert is easily replaceable and is good for years of regular service. This is the only point in the valve or fitting which can wear. There is no wear on the valve proper.

"All valves and fittings are made of a high-grade bronze alloy and the inside and outside are heavily nickel-plated.

"Patents have been applied for on the principle of the raised seat against the special alloy insert.

"All Pfaudler fittings and valves are interchangeable with the present fittings and valves now on the market, being provided with the international sanitary thread. However, 'hand-tight' union nuts and ferrules should be used in connection with the fittings requiring such parts in order to obtain a perfect seal.

"This line of fittings is made in three standard sizes, 1½ in., 2 in. and 3 in. O. D. measurements."

CHOCOLATE PRODUCTS CORPORATION ABSORBS DAIGGER.

The Chocolate Products Company, 215 West Schiller St., Chicago, Ill., has bought out the business of the Daigger Corporation of Chicago. Daigger has been manufacturing Washburn's ice cream improver and flavoring extracts for several years, and have also been making Superior chocolate syrup. New and additional equipment has been installed by the Chocolate Products Company to care for an increased volume of business in chocolate concentrate for ice cream and chocolate syrup for milk drinks. Officials of the Chocolate Products Company are: L. P. Anderson and A. D. Pashkow, the latter having had charge of laboratories of the "400" Products Company during 1922 and 1923.

* * *

"A DRINK ON A STICK."

Popsicle is a product of some popularity that seems to effect a compromise between ice cream and soft drinks. Portable machines for making this product are offered by The Popsicle Corporation of the United States, 465 Washington St., New York City. The product is described by officials of this company as being a "sanitary frozen confection—a simple, clean and wholesome frozen confection for children and grownups." In the automatic Popsicle machine the product can be manufactured at the rate of many thou-

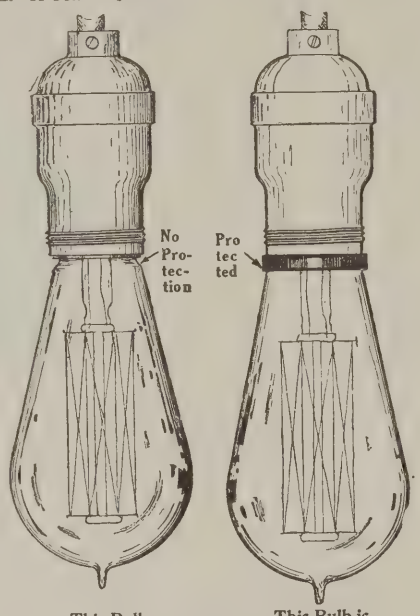
A LOCK FOR ELECTRIC LIGHT BULBS.

What is described as a simple and effective lock to prevent the theft of electric light bulbs has recently been put on the market by the Ren Manufacturing Co., 523 Main Street, Winchester, Mass. It is called the Ren-Lock (patents pending, trade mark registered.)

The REN-LOCK consists of only two parts

1. A Coiled Spring



2. A Grooved Ring

The Ren-Lock consists of only two parts, a coiled spring and a grooved ring. A special punch is used to attach the Ren-Lock to the socket. This device can be used with standard electric light bulbs and standard brass, porcelain and weather-proof sockets.

Officials of the company say, when a lamp is locked in by means of the Ren-Lock, it cannot be removed except by breaking the glass. A special bag is provided for this purpose.

Ren-Locks are packed in boxes of 100 and are not sold in smaller quantities. Thousands are in use in machine shops, power plants, textile mills, hotels, dairies, ice cream plants, theaters, schools, etc., we are told. The company sells Ren-Locks direct to the consumer

USED MACHINERY.

Average savings realized when used machinery is purchased, amounts to about 50 per cent of the cost of new equipment, according to Lester D. Kehoe of the firm of Robert F. Kehoe. In some cases as low as 33 1/3 per cent and in others as high as 75 per cent, dependent upon the class and condition of the apparatus, he says, adding, "The chemical industry has recognized the value of used equipment to a very large extent, likewise the power and electrical field, so why not this great industry which is so important in our daily lives?"

He reports that recently his firm sold two small refrigerating systems and two lots of milk station equipment that were purchased "by one of the largest industrial plants in the country, but never used or even unpacked," and also, according to Mr. Kehoe, "We frequently liquidate the complete mechanical equipment in refrigerating, ice cream and dairy plants that have gone into bankruptcy. Generally this machinery has been in service only a short time, and is just as good as new apparatus for all practical purposes. For example, one large plant taken over by us, was only in operation two months. The mechanical equipment in this plant, consisting of refrigerating machines, ice plant, freezers, hardening rooms, glass-lined tanks, pasteurizers, coolers, pumps, homogenizer, etc., costing approximately $140,000.00 was sold for approximately $70,000.00. Such opportunities should not be overlooked by any operator."

He believes that, since time and money are major considerations, "the used machinery field offers prompt shipment on good apparatus at reasonable prices, making it well worth your investigation."

TAGLIABUE EXTENDS SCOPE OF SERVICE.

The C. J. Tagliabue Mfg. Co., 18 33rd St., Brooklyn, N. Y., announces an expansion of its service and the creation of new functional departments. Engineering research hereafter will be conducted as a separate department, known as the engineering research department, to be headed by Victor Wichum, M. E., who continues as chief engineer.

The development work on indicating, recording and controlling instruments will continue to be carried on under Frank Bast, whose department is known as the experimental department. Development of oil-testing instruments continues with R. M. Wilhelm, formerly of the bureau of standards, being in charge. Daniel C. Day will work on some of the more important problems of the users of Tag instruments, under General Sales Manager Harvey D. Cooke. William C. Begeebing now heads the division in charge of automatic controllers, dial indicating and recording thermometers.

BIRNSTOCK RESIGNS FROM YORK CO.

W. W. Birnstock, for many years connected with the York Milk Machinery Co., York, Pa., has announced his resignation as treasurer and general manager of that company. Mr. Birnstock has not made known his plans for the future, except that he now is taking a rest before again engaging in business.

Mr. Birnstock began as a machinist and tool worker. He built up a splendid reputation from the work he performed for the York Milk Machinery Co., having designed the plant and all the special machinery and equipment for making 5,000 milk bottle crates a day, as well as crate trucks, bottle washing machines, milk pumps, etc. He is well known in dairy circles.

W. W. BIRNSTOCK.

EAST PACO
Can Tops Index the
Contents of your Flavoring Room

How Do You Know?

After the miscellaneous flavors are stored in your hardening room, how much time do your men spend in finding out what's what?

Eastpaco can tops not only form a protective liner, preventing ice and salt from finding its way to the ice cream, but they put real system to the storing of flavors in the hardening room.

No trouble to put on and very reasonable in cost. They pay for themselves in the time they save.

ANNEX FOR CANVAS PRODUCTS.

Announcement has been made by P. C. Goodrick, secretary of the Canvas Products Corporation, Fond du Lac, Wis., that that company is building a new addition to its factory. Work began March 6. The addition is intended to take care of some of the processes involved in the manufacture of iceless shippers manufactured by this company, Mr. Goodrick says. The addition will be two stories, and will involve a considerable investment, it is said.

* * *

U. S. LAW REQUIRES HIGH GELATINE STANDARDS.

The United State srequires by law purer edible gelatine than any other nation. One reason American imports of edible gelatine are relatively small is because few foreign manufacturers are able to meet the standards of purity demanded in this country. All edible gelatine—the term used to designate an animal gelatine suitable for food purposes—placed on American markets must conform to certain governmental standards or specifications of purity as tentatively fixed by the United States Department of Agriculture in its bureaus of chemistry and animal husbandry. Certain states have exacted even higher standards.

* * *

JELINE.

The Horine & Bowey Co., Chicago, describes "an improved product" in speaking of the Jeline the company is now putting before the trade. It is claimed that from five to six ounces can be used with a ten-gallon pot of water ice, sherbet, etc., and that it is an improvement over the Jeline the company formerly offered. The company offers any reader of The Ice Cream Review a sample sufficient to make a ten-gallon batch free.

Trade Literature

DELIVERY EQUIPMENT AND SALES.

The importance of delivery equipment to increased sales of ice cream is dealt with in a booklet issued by the Walker Vehicle Co., manufacturers of electric trucks in Chicago, entitled, "Profitable Ice Cream Delivery."

"Your plant equipment and plant management may be the best in the land, and yet success and profit are not assured," reads one paragraph in the foreword of the booklet, which continues:

"The final step in the process is the most vital of all. Here your salesmen, your drivers and your trucks are involved. What are they doing? Are your salesmen bringing in the orders? Are your drivers giving the right kind of service? Are your trucks delivering on time? Are they dependable. Are they reasonable in cost?"

CARBONDALE BULLETINS.

Two bulletins were issued in January by the Carbondale Machine Co., manufacturers of ice and refrigerating machines, Carbondale, Pa. One of the bulletins is entitled, "Carbondale Spira-Flo Condenser." It describes the company's product, the Spira-Flo condenser, and endeavors to point out that for years users of refrigeration machinery have demanded an ammonia condenser which would incorporate the features of simplicity, economy of space and practical ease of cleaning without interrupting service.

The other bulletin, "Carbondale in California," is a brief summary of some of the recent accomplishments of the Los Angeles office of the company. This bulletin in its foreword states, "the entire country has in recent years marveled at the unprecedented development and achievemnts of California," in which Carbondal is said to have served its purpose well.

"C-P" ISSUES PRICE CURRENT.

The Creamery Package Mfg. Co. has issued its 1925 spring and summer catalog, giving current prices, etc. The catalog contains 320 pages, and includes an index in which the company's products are listed. The catalog is printed in a size to fit the pocket.

* * *

WARD CATALOG.

The new catalog issued by the Ward Motor Vehicle Co., Mt. Vernon, N. Y., contains 65 handsome illustrated pages. A circular accompanying the catalog states that the company last year sold more cars than any other time in history. Many different views are shown of Ward electric trucks in the catalog. Some of the leading ice cream factories of the country are shown, together with their fleets of Ward electric trucks.

DOUBLE COMPETITION.

Ice cream manufacturers, like most other manufacturers, face a double competition—the competition within the industry and that outside the industry. Plant A and plant B are ever competing with each other for the business of certain dealers. At the same time the industry as a whole is competing with other industries manufacturing food products. We dairymen are trying to convince the people that they should eat more ice cream. Likewise an attempt is being made by the raisin growers, the citrus producers, the meat packers, and other such industries to persuade consumers to use more of their products. It is necessary, in order to meet this double competition, that the product manufactured and the service rendered be of the best. A dissatisfied dealer may mean more business for your rival manufacturer and dissatisfied consumers may result in the consumption of less ice cream and more of some other food. There are always problems of production and distribution arising that must be solved. This means the making of a product and market analysis. Some of the larger plants have the equipment and the personnel to conduct their own investigations. Others, however, are not so fortunate and must rely upon such organizations as the trade associations and our colleges and universities.—From convention address by P. H. Tracy, Dairy Department, University of Illinois, Urbana.

The shrinkage is to a great extent a time and temperature process. The longer the ice cream is held the greater the danger of shrinkage. Likewise alternate raising and lowering of the temperature at which ice cream is held encourages shrinkage.—P. H. Tracy, Dairy Department, University of Illinois.

We want to remind you that if you do not find advertised in this issue what you are seeking, it will cost you only 2c a word to let the world know through "The Ice Cream Review" what you want. Get busy before the other fellow gets ahead of you.

WARD IS NEW SECRETARY OF CHICAGO ASSOCIATION.

H. J. Ward is the new secretary of the Chicago District Association of Ice Cream Manufacturers, succeeding Howard O. Shedd of the W. J. Shedd Ice Cream Co., who has served the association well in that capacity for several years. Mr. Shedd was re-elected secretary at the annual meeting in December, but later on was forced, by business duties, to give over this post to Mr. Ward.

H. J. WARD.

Edward Llinenberg is chairman of the association's executive board. The Chicago manufacturers hold regular monthly meetings to discuss matters pertaining to the welfare of the industry.

COLORADO MANUFACTURERS STANDARDIZE ICELESS CABINET RENTALS.

Ice cream manufacturers of Colorado have standardized the rentals on ice cream cabinets in their territory, according to E. L. Carlson, secretary of the Colorado association. The Colorado manufacturers have established the following rates:

Four-hole cabinet.....	$10.00 per month
Six-hole cabinet.....	11.00 per month
Eight-hole cabinet.....	12.00 per month

Cabinets on packed routes are installed without expense to the dealer and electric power and water charges are paid for by the ice cream manufacturer.

Although one or two manufacturers offered to deed the cabinet to the dealer after a few years' rental had been paid, Mr. Carlson does not believe anyone has accepted this proposition, stating that "the general feeling among the dealers seems to be that the purchase of a completely iceless fountain within the next few years will be necessary."

HELP WANTED

AGENCY WANTED — Chicago supply and engineering firm, long established, well acquainted, experienced and competent on operation and erection of machinery, wants representation of additional lines for the milk and produce trade in general. Address: R-140, The Ice Cream Review. 4-25

WANTED—Experienced ice cream maker. Prefer one with a butter making experience. This, however, is not absolutely necessary. Plant near Chicago. About 100,000 gal. Must come well recommended. State salary expected. Address: R-174, The Ice Cream Review. 4-25

POSITION WANTED

POSITION WANTED—By man who understands ice cream in all branches. 10 years practical experience. Steady worker. Employed at present, but could make change by April 15. Give full description and particulars and salary in first letter. Prefer West, but any good offer considered. Address: R-232, The Ice Cream Review. 4-25

POSITION WANTED — In modern ice cream or milk plant. Practical experience in both lines. College graduate, specialized in dairy products manufacturing. Willing and capable worker. Desires position with future. Address: R-234, The Ice Cream Review. 4-25

POSITION WANTED — By man of 44 with successful record as manager of ice cream plant of 200,000 gallons in Southern state. Legitimate reason for wanting to change. Address R-238, The Ice Cream Review. 4-25

POSITION WANTED — By experienced college and short course man as ice cream maker in Washington or Oregon. Makes a quality product at minimum cost. Understands technical points, all tests; restandardizing. Desire a position with a future rather than big money to start. Creamery experience also. Write J. G. Binns, Shelton, Wash. 4-25

POSITION WANTED—As factory superintendent or assistant manager by man with executive ability and many years practical experience. Can make a high grade of butter, cheese and ice cream. Can handle help and operate any size plant with success. Would like to get in a large co-operative creamery or centralizer. Address: R-172, The Ice Cream Review. 4-25

POSITION WANTED — Connection desired with reliable creamery, butter or supply house for representation in Maryland, Virginia, Delaware and District of Columbia by one who has the practical experience in all branches. Address: R-222, The Ice Cream Review. 4-25

POSITION WANTED—As plant foreman or superintendent by man with 10 years experience in centralizer and ice cream plants. Dairy school training. Can make fancy creams. Good reference. Address: R-248, The Ice Cream Review. 4-25

FOR SALE BARGAINS
BUSINESS

FOR SALE—Small ice cream plant complete with hardening room, brine freezer and up-to-date machine. Very good condition. I will sell this for small cash payment, balance in 10 equal monthly notes. B. D. Arthur, 105 S. Oakland Ave., Ventnor, N. J. 4-25

FOR SALE—Ice cream factory doing an annual business of fifty thousand in the heart of the best agricultural country in America. Trade radius as far as we care to go. Everything new and modern. Half cash, rest easy. Address: R-226, The Ice Cream Review. 4-25

"You'll make better ice cream if you get the "Ice Cream Review."

CHERRY BRINE FREEZERS

40 QT. 50 QT. 80 QT. 100 QT.

CHERRY offers one of the most complete lines of brine freezers on the market — and each and every model is a finished product with a long enviable record behind it. Pick any model Cherry Freezer that you wish and you will find hundreds of prominent, successful ice cream manufacturers using that machine with positive success.

JUST ASK US TO PROVE THESE CLAIMS!

(1) "Cherry Freezers have exceedingly low operating costs."

(2) "Cherry Freezers give maximum over-capacity."

(3) "Cherry Freezers are mechanically perfect."

(4) "Cherry Freezers are easier to clean and to keep clean than most other freezers."

(5) "Cherry Freezers are unusually simple to operate."

We have always taken an uncompromising stand on the above claims — we won't "back water" now. If you need a freezer, consider these points and tell us you want our bulletin 2063 which proves these facts.

MAY 1925

THE general feeling of optimism which prevails in ice cream trade channels augurs well for the industry. Each man in the industry, so far as we have been able to learn, seems to be bubbling over with enthusiasm. He is determined to make this the biggest and best year he has ever had. Just the other day we heard an ice cream manufacturer say "last year I sold a little over 70,000 gallons, this year it is going over 100,000." Pressed for the reasons for his hopes he came back at us with a woman's reason, "because." He just feels it in his bones.

Believing that one can do a thing is a start in the right direction in the case of the individual. "Well begun is half done" is just as true as when you were a schoolboy. We believe it is just as applicable to a group of men in a trade industry as in the case of the individual.

We are not overlooking the fact that factors entirely outside the control of the men in the ice cream industry figure largely in determining final results. We need the weather man on our side in this ice cream business. He failed us last year and confidence that he will not repeat is undoubtedly responsible for considerable of our optimism right now at the beginning of the summer season.

General business conditions also greatly influence the consumption of ice cream. Men in position to know tell us that 1925 is to be a banner year for business of all kinds. There will be plenty of money in the pockets of people who may be influenced to eat more ice cream, providing the weather man does his part.

So, why shouldn't we enter upon the summer season with high hopes? Why shouldn't we expect the greatest consumption of ice cream in the history of the business? We believe in that sort of business optimism.

SOMEONE has said that salesmanship is the art of creating the desire to buy in the mind of the prospect, or words to that effect. If this be true, and we believe it is, then merely keeping goods in stock waiting for the customer to come and buy them does not constitute salesmanship.

Measured by this rule there appears to be little salesmanship connected with the ice cream business. The manufacturer, no matter how good a salesman he may be, is limited in his operations if he confines them to the dealers in his territory. The dealer may be induced to buy, but he buys only to sell again. The volume of business depends on the dealer's ability as a salesman, not on the ability of the manufacturer.

The consumer determines sales volume in the ice cream business. That is true in most any business, but in the case of necessities he creates demand whether he is influenced by salesmanship or not. Ice cream is not on his list of necessities. He can use a lot of it or get along with little, depending on his purchasing power and desire to buy.

Herein, as we see it, lies the reason for a widespread sales effort in the industry such as is contemplated by the officials of the National Association of Ice Cream Manufacturers. A national advertising campaign of the right sort will create the desire to buy in the minds of consumers. Such an expenditure of money and effort will be in the right direction. It will carry the sales effort of the manufacturer right past the dealer and reach the men and women who fix the volume of sales for the industry. Create a permanent desire to buy ice cream in the mind of Mrs. American Housewife and that will be real salesmanship.

ACCORDING to announcement made by Fred Rasmussen, executive secretary of the National Association of Ice Cream Manufacturers, definite progress has been made in the effort to accomplish uniform cost accounting for the ice cream industry. The advisory

committee, after a four-days' session in Chicago, voted for the direct method of cost accounting.

Men in the industry who have not been familiar with the work of the cost accounting committee cannot fully realize the "labor of love" such work is. Forty-seven members of the committee, made up of accountants and administrative officials representing ice cream companies from all over the country, worked four days, and a real impetus has been given to the big movement which will mean so much for the ice cream industry of this country. When this system is eventually worked out, it will mean that men in the ice cream manufacturing business will know what they are doing. They can quit guessing at costs, such guessing being one of the reasons for cut-rate competition in the industry. When manufacturers guess at costs with a desire in their hearts to get business away from competitors it is easy to guess the cost too low.

When this cost accounting system is worked out and put into practice, ice cream manufacturers will be able to compare costs. The man with small gallonage can compare his costs with a manufacturer having a similar gallonage, or he can compare his costs with the manufacturer who enjoys a big gallonage. Everything will be worked out for a thorough comparison.

There are many men in the ice cream manufacturing business who are also in the milk business. They know what uniform cost accounting is doing for the milk bottling industry, and they know it can do the same thing for the ice cream industry. More power to the accounting committee.

THERE is a natural desire in the minds of most people to visit factories and witness the operations connected with manufacturing things. Perhaps it is but curiosity, but whatever it is the desire is there. It may be a paper mill, a packing plant or an automobile factory that attracts visitors, or it may be a food factory.

We believe people, as a rule, are most interested in visiting plants where food is prepared for market. Not all are particularly interested in paper mills or packing plants or automobiles, but all are interested in dairy plants. All eat dairy products in some form or another. All understand, too, that dairy products are very easily contaminated, that much depends on the way they are handled. These people like to be assured that the dairy products they are in the habit of buying are clean and wholesome.

Recognizing this fact, many ice cream manufacturers make special efforts to get visitors into their factories. They welcome visitors at any time, but they don't stop there. They arrange for delegations from churches and clubs and schools to come and see ice cream made. They provide special entertainment and, of course, treat each visitor to a sample of the National Dish. It's a good way to "sell" ice cream and the visitor thus "sold" stays sold.

The manufacturer who has a fine, modern plant, arranged perhaps as a "show place," has an advantage over his less fortunate brother who is compelled to do business in a less pretentious place. The same trait that prompts his wife to enjoy showing her new china or silverware to her friends leads him to proudly lead visitors through his fine new factory. It's easy for him to appreciate the value of getting his customers and prospective customers into his plant where they can see his ice cream made.

Even the less pretentious plants can be kept clean and we believe that the owners of such plants make a mistake when they do not solicit visits. Most visitors are more interested in the matter of cleanliness than in anything else. They are curious, of course, to learn just how ice cream is made, but if they go away with a favorable impression, so far as cleanliness is concerned, they will have the utmost confidence in the product made there.

Ice cream manufacturers who thus spend money and effort to get visitors into their plants recognize the fact that the real "customer" for ice cream lives in a home, not a drug store.

Now, we haven't a thing against the dealer. He is a necessary factor in our present scheme of getting ice cream from the freezer to the palate. He is, in many instances, a real promoter of ice cream sales, but in more cases he is not. Ice cream with him is a mere commodity and, although it brings him big profits, he is inclined to feel that he is favoring the manufacturer by handling it. He isn't the customer for ice cream. He doesn't care a tinker's whoop how and where it is made so long as his patrons keep on buying it and so long as his shrinkage is low.

Never mind spending money to get him into your factory. Even if you should succeed in doing so he will probably find some excuse for thinking that you should reduce your prices to him. The way to please him is to increase the consumption of ice cream in his neighborhood. To do that you must, in most cases, get your story about your product to the consumer right past him. Getting that consumer into your plant is one good way to do it.

NATURE is smiling on a happy people this morning in this city of poor beer and good ice cream. The thermometer hanging on our kitchen window registered 30 degrees higher than yesterday morning. Yesterday was a cold, gloomy day—the sort of a day that an ice cream manufacturer would select to commit suicide. The wind blew, the rain came down in torrents and a real hailstorm added to the variety. The weather man had an awful time purging his system.

But he did a thorough job of it. The birds are singing this morning and we suspect that they are no happier than the ice cream men in this territory. Each manufacturer hurried to his place of business earlier than usual this morning to give orders for bigger production. He is going about his work today with a light

heart. He has forgotten all about yesterday. Hope runs high. He is in just the right frame of mind to buy something.

He is entitled to a lot of this sort of weather. With an early start, and if he can enjoy a normal summer season, he is going to square himself with his banker again. That's the determination we see in his eye. He has our best wishes.

⚜

PREVAILING sentiment in the industry indicates that the national advertising program is in good hands. Ice cream manufacturers the country over seem to have abundant faith in the executive committee of the National Association of Ice Cream Manufacturers. Both in regard to plans for raising the money and for spending it there appears to be general satisfaction to have matters in the hands of the committee. Whatever the members of that committee decide to do will meet the hearty approval of the great majority of the men who are putting up the money.

This is splendid. It is the sort of spirit that must prevail in order to get best results. With this sort of spirit prevailing the job is half done. It should make the raising of the necessary funds easier. Contributors can give freely and feel assured that they are making a good investment.

⚜

THE ice cream manufacturer who pays membership dues in one or more trade associations shows by his actions that he believes in them. He follows this up by attending all the conventions possible.

We wonder, however, whether many manufacturers, even in this class, fully appreciate what the good trade association means to the ice cream industry. We might put it this way, what would be the condition of the industry today if there were no trade associations connected with it? If there were no mass effort of any kind at work?

True, individual effort is responsible for the planning and building of fine plants and building up efficient business organizations, but what inspires individual effort in a fast developing industry? The question suggests the answer. The trade association furnishes the contact that business men must have if individual effort is to be properly directed.

We don't have to go back many years to recall when trade organizations were looked upon with suspicion. They were considered as price fixing institutions and many of them deserved the opprobrium attached to them by the general public. The good trade association of today is the result of necessity. Proper development of an industry requires it.

There are those, of course, even among ice cream manufacturers who refuse to have any connection whatever with trade organizations in their industry. These men have various excuses, but few of them are honest excuses. Back of the average man's refusal to support his trade association is a spirit of selfishness. He hopes to profit by the efforts of others. He is perfectly willing to share in the benefits of mass effort in the industry so long as it doesn't cost him anything. He is perfectly willing that his competitor shall support trade associations. In fact he would be pleased to have his competitor spend all his time at conventions and in association work.

Such a man is "a drone in the hive of industry." There is nothing that can be done about the problem either. All industries support such slackers and, no doubt, always will support them. The only thing to do is to go along without them. The forward looking men in the ice cream industry must pass them by and not worry about them.

Long live our trade associations! To them goes much of the credit for the wonderful progress made in the past few years in the development and stabilizing of the ice cream industry.

⚜

NOT long ago we were visiting with an ice cream manufacturer who has been in business over ten years in a thriving little city of about 35,000 people. He makes excellent ice cream and does a nice business, both shipping and local. He complained that he has been unable to make any money for the past three years. "I would have been money ahead if I had got out of the business three years ago," he said.

He says that unwholesome competition is entirely responsible. Sales have been good, and fair prices have been maintained, but all the profits have been spent in getting and holding business. Profits have been dissipated in extending favors to dealers.

He gave us one illustration. A certain dealer started in business out in a new subdivision. He put in a line of groceries and confectionery, his total stock not exceeding five hundred dollars in value. "I arranged with him even before he started building to handle my ice cream," remarked our friend, "and told him that I would paint a sign for him across the front of his small store. About the time he was ready to open up he called me on the telephone and told me that a competitor had offered to paint his entire building two coats and also give him a special sign, the entire cost totalling about $75.00. He wanted my ice cream, and asked whether I would meet the bid. I met it although there is absolutely no chance of my ever getting my money back out of the profits on that stop."

When business men are guided by anger instead of sound judgment there is little hope of profits. Our friend didn't hurt his competitor a bit by taking this stop at a loss. He injured himself. He might better have let the other fellow take it at a loss. Some men can get a certain degree of satisfaction out of a deal of this kind but it is mighty expensive.

$75 in Cash Prizes for Best Ideas on Merchandising Ice Cream

Manufacturers of Every State Eligible to Enter *Sales Ideas* Contest Opened by The Ice Cream Review

THE Ice Cream Review herewith announces a contest in which this publication will pay $75 in cash prizes for the best ideas on merchandising ice cream—sales promotion campaigns, window-display campaigns, advertising campaigns, dealer-manufacturer co-operative undertakings, etc. The contest closes June 15. All letters must be in this office by that time or bear a postmark dated no later than June 15 to receive consideration.

There will be five prizes. The winner will receive $25. Second prize will be $20, third prize $15, fourth prize $10, and fifth prize $5.

Contributions will be judged solely on the merits of the ideas and the results obtained, not upon literary excellence. Tell your story straight from the point. Describe your most successful merchandising effort, tell what gave you the idea for the undertaking, what made you think it would "go over," how you worked out each detail, the obstacles you encountered, how you overcame them—and what were the results in the way of increased sales, new business, etc. The last, of course, is of particular importance in deciding the winner.

It is understood that the money involved, in itself, is no particular inducement for readers of The Ice Cream Review to take the trouble to outline the work they have done in this direction. But the greatest rewards are what these sums of money stand for as tangible evidence that different men will have presented some thoughts that will be of value to the industry as a whole.

THE Ice Cream Review will have nothing to do with the contest except to make the announcements of the winners and to print the contributions to be submitted in the contest.

The judges will be five representative men in the industry. Their names will be announced in the June issue of The Ice Cream Review. No one connected with this publication will have any voice in the matter.

It is not to be understood that a large manufacturer will have any advantage over "the little fellow." The value of the merchandising idea is the thing.

THE decision of The Ice Cream Review to offer these cash prizes was not made with any idea of awakening interest in cash-prize campaigns, but is to stimulate interest in ice cream merchandising, an end of the business that has been sadly neglected until late years, and none too vigorously promoted at this time. It is generally agreed among progressive manufacturers of today that our industry's future lies through the new avenues of ice cream distribution that we can create among members of the general public. In other words, we must give more thought to selling ice cream to more consumers and potential consumers than to getting new dealers.

We are not particularly interested in sales promotional work where the primary aim was to win new dealer representatives, but we are intensely interested in efforts by which your dealers were encouraged to sell more ice cream.

For instance, an ice cream manufacturer in the Middle West recently conducted a campaign in which he offered certain prizes to the dealers who would sell the most ice cream in a given period. Those prizes, small though they were, awakened the spirit of contest and caused virtually every one of that manufacturers' retail representatives to sell more ice cream than he ever had before in that length of time at that season of the year. Even just a small increase would have been important, but when you reflect that a very decided increase was shown by **each** dealer, you readily can understand what this meant to that company's increase in total volume.

We want to know what you have been doing to get dealers to sell more ice cream. You may think your plan was pretty simple and did not call for much thought, and yet it may be the very plan to be judged the winner—the very plan that will enable ice cream manufacturers all over the country to increase their volume of business.

And, too, you must remember, while you are telling us what **you** have been doing in this connection, many **other** manufacturers will be writing something that will be of interest to you. This is a proposition in which all of us will benefit, for it is sure to bring out some interesting thoughts on building up sales of ice cream.

That is, it is sure to bring out many valuable thoughts if you do your duty and send in your contribution, but if you wait for the other fellow to do it all, and yourself hang back to profit from somebody else's experiences without telling any of your own—then you probably will find the other fellow hanging back, too, and there won't be much information for anybody.

Don't trouble yourself over any particular style of

(Continued on page 160)

Rules of $75-Cash-Prize Contest.

Letters should be written on one side of the paper only, preferably typewritten. Typewritten letters should be double-spaced. Letters must not be written on your letter head, and the name of the author must not appear anywhere in the letter, but must be written, together with address and firm style, and attached on a separate sheet of paper.

Letters can be of any length from 100 to 1,500 words, but the most desirable length is from 500 to 1,000 words; that is, from two to three pages of paper typewritten and double-spaced.

If it is not convenient for you to dictate or have your letter typewritten, then write it out in clear longhand.

Contest closes June 15. All letters must be in this office by that time or bear a postmark not later than that date.

You are to write us about some sales promotional campaign that you have actually carried out, giving all details of how your plans were worked out, how they were carried out and what were the results.

Frigidaire Ice Cream Cabinets—*Efficient* and *Economical*—Insure Larger Profits

Frigidaire Ice Cream Cabinets reduce delivery charges by eliminating the cost of ice and salt used in packing. They enable the manufacturer to serve the same number of dealers with fewer trucks.

They decrease the amount of time and labor required at each stop—full cans of cream are simply exchanged for empty cans by the driver—there is no mixing of salt and ice, no packing of containers, no cabinet to drain, no muss to clean up.

There are no special calls for repacking, and no special equipment need be reserved for this service. Lighter trucks may be used, or more stops may be made with the same number of trucks. Country stops are made far more convenient and profitable.

Frigidaire Cabinets *increase sales* by enabling the retailer to offer a wider variety of flavors. The creams he serves will be cold, uniformly firm and pure.

All the advantages of electric refrigeration are offered to you in Frigidaire Ice Cream Cabinets, and with these advantages there is absolute assurance of dependability and long-lived satisfaction that can come only from a cabinet that is properly made and backed by a nation-wide organization of trained sales and service representatives.

Write today for further information.

Models for Every Requirement

Frigidaire Cabinets are made in 4 and 6-hole single-row models, and in 4, 6 and 8-hole double-row models. All double row cabinets are 30" wide and 30" high, to conform with standard fountain interiors. Frigidaire Cabinets are equipped with either water-cooled or air-cooled compressors, as desired.

Many fountain manufacturers today are building fountains equipped with the Frigidaire mechanism. Insist that the next fountains you buy are Frigidaire-equipped.

ELECTRIC ICE CREAM CABINETS

Mechanical Refrigeration Applied to Fountains

Refrigerated Fountains Have Been on Market 15 Years and Now Are Being Perfected

*By C. J. PALMER**

THERE are three interests involved in the conditions created by the perfecting of the small refrigerating units and the growth of the mechanical cabinet: 1st, the ice cream manufacturer; 2nd, the soda fountain manufacturer; 3rd, the retailer of ice cream.

You men who have been in business for many years will recall that ice cream was first sold through soda fountains, and that, as a matter of fact, the fountain antedates ice cream in the country.

There has been constant improvement in the appearance, design and efficiency of soda fountains and your industry and ours have progressed hand in hand over that period. Perhaps there was not the close harmony between us that there should have been, but the fact remains that our interests are mutual and a discussion of mechanical refrigeration should be approached with that idea in mind.

Hundreds of thousands of dollars have been spent in the effort to make the soda fountain a more efficient medium for dispensing your product and others. However, that is now all ancient history. What you and we and the innocent bystander, the retailer, are interested in, is the outcome of the revolution which is taking place in the methods of storing and servicing ice cream.

I state an axiom when I say that if overnight all cabinets and fountains could be converted from salt and ice to mechanical refrigeration you men would be perfectly satisfied. The only controversy is over the best way to hasten this situation. No one has any doubt as to the advantages to be derived by everyone through the elimination of the old, expensive, wasteful salt and ice method of keeping ice cream. Let's give everyone credit for being honest in their convictions as to the proper plan to follow and try and analyze the arguments.

WE HAVE no quarrel with the manufacturers of ice cream cabinets nor with those who are loaning or selling them to retailers. There is a legitimate place for cabinets as storage cabinets but we are very firmly of the opinion that a very serious mistake is being made when they are offered or installed as substitutes for soda fountains. This opinion is naturally influenced somewhat by the reason of the fact that we are soda fountain manufacturers, but aside from this I believe I can show you where the attempt to substitute the cabinet for a soda fountain is a detriment to your business, where it hurts your pocketbook and where you cannot afford to push it except for its legitimate purpose, i. e., a storage cabinet.

The soda fountain has grown in popularity for several reasons:

1st: Because of the wholesomeness of the food and beverages dispensed.

2nd: Because of the attractiveness of the fountain itself.

3rd: Because of speed with which service can be given.

Take No. 1. The quality of the ice cream and beverages will be the same whether mechanical cabinet or fountain is used.

No. 2. There is no comparison between the appearance of a modern fountain and the ice cream cabinet with its bob-tail unit for syrups, water, etc.

No. 3. Speed in dispensing. Here is the biggest stumbling block. For 20 years the demand has been for improvement in arrangement that will permit of quick dispensing. This demand has been met by the soda fountain manufacturers, and today it would be hard to conceive of a more convenient arrangement of ice cream, syrups, fruits, etc., than is offered in the mechanical fountain. Everything is at the dispenser's finger tips and there is no lost motion in running from one end of the fountain to the other, and back again, lifting lids weighing four or five pounds and replacing them, getting in the way of the other clerks, etc.

There have always been salt and ice ice cream cabinets, yet you never saw anyone build a successful retail business using them in place of a convenient soda fountain. Electrical cabinets instead of salt and ice fountains, yes—but not in the place of mechanically refrigerated fountains.

RECENTLY there has come on the market a mechanically refrigerated bob-tail unit to be used in connection with a cabinet. We have followed suit and are making one also—not because we think it is the proper thing or a solution of the problem, but because we make it a practice to be in the forefront in the development of any apparatus pertaining to soda fountains.

The mechanically refrigerated bob-tail unit with a cabinet is just as inconvenient as the direct iced unit.

ALL of this, gentlemen, is in the nature of a prelude to the solution we have to offer. Mechanically refrigerated fountains have been on the market for at least 15 years, but as a rule the machines used were of large capacity, and beyond the reach of the average buyer. The perfecting of the small unit has made it possible to apply this system to either small or large fountains.

The prominence given the electric ice cream cabinet by its manufacturers and by ice cream manufacturers has opened the eyes of the retailer to the possibilities of the small unit.

The retailer has been quick to appreciate the advantages of the mechanical fountain and, reports to the contrary notwithstanding, most of them are willing and eager to pay the price for them.

Through their direct sales efforts, through jobbers and advertising, the soda fountain manufacturers are carrying on a vigorous campaign. It is estimated that today seventy-five per cent of all the fountains sold in the United States are mechanically refrigerated and within a comparatively short time the percentage will reach 100 per cent. Many fountains which have been in use for less than a year are being exchanged for mechanical fountains.

Downtown Branch

February 23, 1925.

The Russ Manufacturing Co.,
Cleveland, Ohio

Dear Sirs:

We have been operating since September 15, 1924, one of your Walker-Mizer type soda fountains. The results obtained are satisfactory in every way.

I do not hesitate to recommend similar equipment at any time.

Sincerely yours,
Building Superintendent

HHS:DL

HOOK DRUG COMPANY
MARKET AND NOBLE STREETS
INDIANAPOLIS

April 8, 1925

The Russ Manufacturing Co.
W. 58th & Walworth Ave.
Cleveland, Ohio

Gentlemen:

We wish to express our appreciation of the prompt and careful installation of the thirty-five-foot Russ "Bilt-Rite" fountain just made at our Meridian & Washington Store. Not only was the work well done but the installation is one of the most beautiful we have ever seen.

The first installation, the 20-foot job, was made the early part of March, 1924, and except for a few minor adjustments to regulate the temperature has given us no trouble whatever. We have been able to maintain a temperature that would keep soda and drinking water as cold as we desired and a zero temperature on ice cream, if we wish it.

There is a great economy in the dipping of the ice cream due to the fact that it is always hard - besides the many other advantages that the fountain offers.

Sincerely yours,
President

JAH/ts

WHATEVER a manufacturer may say for his product, or his competitors may say against it, counts for little in the final analysis. The important thing is what the buyer or user has to say, based on actual experience.

The Russ WALKER-MIZER PATENTS **Bilt-Rite** *Fountain*
3 temperatures without icing

has proved its true worth to many users throughout the country. It is saving them money, labor, time, bother, mess. It is increasing their business and profits by enabling them to serve perfectly conditioned ice cream, refreshingly cold fountain drinks and bottled goods, and stopping all shrinkage losses.

BILT-RITE Fountains MORE than earn their way. Catalog on request

THE RUSS MANUFACTURING CO.

PHONE LINCOLN 2147

BERT A. SMYSER
PHARMACIST
14TH STREET AND PENNSYLVANIA AVENUE S. E.

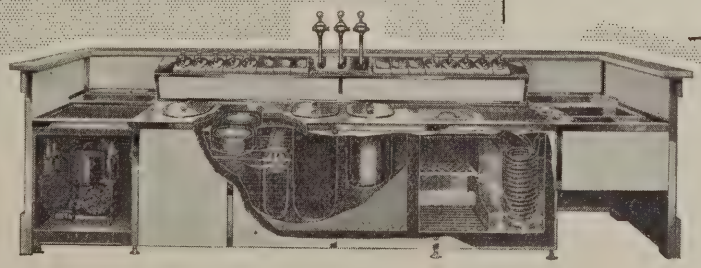
WASHINGTON, D. C., Feb. 14th, 1925

The Russ Manufacturing Company,
5700 Walworth Avenue,
Cleveland, Ohio.

Gentlemen:

I am glad to answer your inquiry as to the service rendered by the new Walker Type mechanically refrigerated fountain which you installed for me.

At the outset let me say that the appearance of my store alone would justify the expenditure. The mess of ice and salt packing is gone and my store is always clean. The ice cream is in perfect condition day and night. The bottle goods are very cold and the labels are always on the bottles, as the bottle compartment is perfectly dry.



Now comes the important part; the soda and drinking water is colder than I have ever been able to draw from any other type of fountain and I have eliminated entirely the use of chipped ice in drinks. My customers comment daily of the coldness of the drinks and tell me that my sodas have improved greatly.

The ice cream manufacturer has made me a better price by ten cents per gallon on the ice cream and this, together with the saving in shrinkage and ice purchases will soon pay for the fountain.

It will be a pleasure to answer any inquiries from prospective purchasers and I will recommend that they purchase the Walker Type fountain which does the work one hundred percent.

With best wishes for your success, I am,

Respectfully yours,
Bert A Smyser

Ice Cream is a Rich Relative of Nature's Most Complete Food

8,500 Employees of World's Greatest Life Insurance Company Last Year Consumed 118,000 Quarts of Ice Cream

*By PHILLIP H. WELCH**

WHAT makes ice cream popular? In a certain orphan asylum, some of the children get ice cream six times a year and some of them get it seven times a year. The ones who get it seven times a year are the envy of the others, even though the extra annual dish is only achieved by a method that some of us outside of the orphan asylum might not consider an unmixed blessing. It is achieved by having tonsilitis.

Herein is a hint of the popularity of ice cream; it is appreciated both by the pathetic youngsters, whose pleasures are carefully doled out, and by the wise physician curing a sick patient. And yet it would be difficult to say what is the real explanation of the popularity of ice cream. Many a man has made an excellent living over a period of years by selling ice cream to a hungry public and he will go to his grave ignorant of what it really is that gives magic to the words "ice cream."

In the home office of the Metropolitan Life Insurance Co., 8,500 employees, to whom luncheon is served by the company, consumed 118,000 quarts of ice cream or an average of fourteen quarts apiece last year. Considering the fact that this is one of several desserts from which each diner may have a choice, the ice cream item is a large one. In our popularity, study, however, the significance lies in the fact that the ice cream demand in the Metropolitan lunch room is **not seasonal.** The consumption increases slightly on a very hot day in summer, but it **maintains a high level average all the year around.** When the bleak winds are howling out of the north and the snow is blocking the streets the Metropolitan workers still have an appetite for several hundred quarts of this delicious frozen dessert.

Ice cream is popular because it is sweet; it is popular because it is cold, but it is popular in a more fundamental way because it is wholesome—because it is milk.

THERE is true magic in the word "milk." Milk will take ink stains out of cloth and milk was used last year in Chicago as fuel to run a locomotive. You can make billiard balls out of milk, but when all is said and done the greatness of milk lies in its completeness as a food. It is the purpose of this article to supply to the sellers of milk—frozen milk—the rather dramatic facts about the faith of a great insurance company in this basic food. The Metropolitan carries on never-ending propaganda with the general public and its own public of sixteen million industrial policy holders to spread the facts about disease prevention and to inculcate good health habits. In a milk advertisement published in twenty-five leading national magazines, the company urged the value of milk in a powerful message, the conclusion of which indicated the importance of ice cream.

"Save on other things if you must, but not on milk," says this advertising editorial. "If anybody in your family objects to drinking raw milk, there are many ways in which it can be served—in soups, custards, ice cream, desserts, cocoa, cream sauce—lots of good things. Use it—if you are run down, to build you up. Use it—if you are well, to keep you healthy and strong."

It is more probable that the strong milk propaganda, which is well-known to every home office employee in the Metropolitan, accounts in some measures for the popularity of the ice cream in the lunch room.

HERE is a field for advertising emphasis, which ice cream manufacturers do not stress often enough nor urgently enough. To say that ice cream is wholesome does not get over to the public. The dealer could do well to tell them ice cream is wholesome because it is milk and milk is wholesome. There seems to be a tradition in the ice cream business that all commercial ice cream must be sold to the public as cream with a butterfat content of 'steen thousand per cent. Now, it is quite true that one of the best ways to know about a business is to go into it; in other words, it is more than probable that the ice cream men know what they are doing when they shout "Rich cream" even if they actually use skim milk in their formula. "Richness" is a time-honored virtue in ice cream, which is of primary selling importance.

(Continued on page 112)

Dairy Health—and Ice Cream.

The dairy industry is the foundation of the ice cream industry. There are reasons to believe that ice cream men do not fully appreciate the importance of keeping their property identified with dairy production. In other words, while people are being easily sold on the wholesomeness of milk, ice cream still is regarded by too many people merely as a toothsome delicacy—a frozen confection.

This was pointed out in the March issue of The Ice Cream Review, in an article that brought out some interesting points regarding the importance of keeping ice cream identified with dairy health, these points being advanced by A. C. ("Bob") White, Flint, Mich., ice cream manufacturer, and being supported by Prof. A. C. Baer, "technical editor" of The Ice Cream Review.

Some interesting food for thought is given in this connection in the article printed here, which shows how the Metropolitan Life Insurance Co., the world's greatest life insurance company, insists that ice cream must be classed as a health food—and to be so classed, the public must be constantly reminded of its connection with milk.

The more we think of ice cream in comparison with the growing popularity of other dairy products, the more we are reminded that this industry has an indissoluble connection with the dairy cow—that the dairy cow, the symbol of dairy health, is the foundation of our claims for the food value of ice cream.

*Written for the exclusive use of The Ice Cream Review.

"I'd Rather Have A Cone"

Cone Gives Natural Enjoyment, Without Artificialties, Which Appeals to Youngsters

*By FRED RASMUSSEN**

YESTERDAY, Frederick, Jr., four and one-half years, went with his father to the drug store. It being a fine spring day, and father feeling at peace with all the world, he said, "Son, will you have a dish of ice cream?" In answer to which generous offer the reply was, "I'd rather have a cone." When later inquiry was made in regard to this preference, the reply was, "Well, father, I don't have to use a spoon and I don't have to sit down."

There is an appeal in an ice cream cone. All artificialties and acquired habits can be dispensed with and the entire attention given to enjoying the product. The boy has the same feeling of satisfaction when eating a cone as when eating watermelon, when he holds a piece with both hands and has complete contact from ear to ear; in other words, he is getting back to nature. Also, let us not overlook the fact that the four-year-old healthy child, who in our humble judgment, has nothing to do, is the busiest person in the world.

Children eat cones by prefference, and grown-ups generally for the sake of convenience, and then not to be forgotten it is only a "nickel."

Having never seen any figures on the total number of cones sold annually, the writer had no idea whether it is 10,000,000 or 1,000,000,000.

TO GET an estimate a progressive manufacturer was asked how many ice cream cones to allow for each child per year; the answer was two a week, one hundred annually. "Too high," says I; "let's cut it in half and make it one a week. Remember there are some who don't get any." "Yes," said my friend, "but also remember those who eat five a day."

There are in this country 26,219,930 children from 4 to 16 years of age or 25 per cent of the total population, according to the last U. S. Census. Allowing one cone a week on the average for each child, it will total approximately 1,300,000,000 cones. Allowing 60 cones to the gallon (varies with heaviness of ice cream dishing), it represents over 20 million gallons of ice cream. No allowance has been made for the thousands of gallons of ice cream sold in cones at fairs, picnics, festivals and elsewhere to grown ups.

Anyone who does not agree with the foregoing figures and estimate is advised to make out his own.

The following table of population of young folks in the United States from one to nineteen years of age can be made the basis for many calculations and every man can use them in his own way. It was a surprise to the writer to find that 43,042,998 people, or 40.7 per cent of the total population of the United States, are between the ages of one and nineteen years of age.

Distribution of Total U. S. Population, By Years of Age up to 19 Years Old.

WE ALL agree that millions of gallons of ice cream is consumed by way of the cone; that there is an appeal in the ice cream cone for the young; that it is a good deal easier to get father and mother to part with two nickels consecutively than one dime; that you are selling a food product containing all elements essential to life and growth, that there are millions of children who would like to have several cones a day.

All this we agree to, but the question is, have we ever as manufacturers and dealers of ice cream tried to exhaust all the possibilities to increase the sale of ice cream by way of the cone?

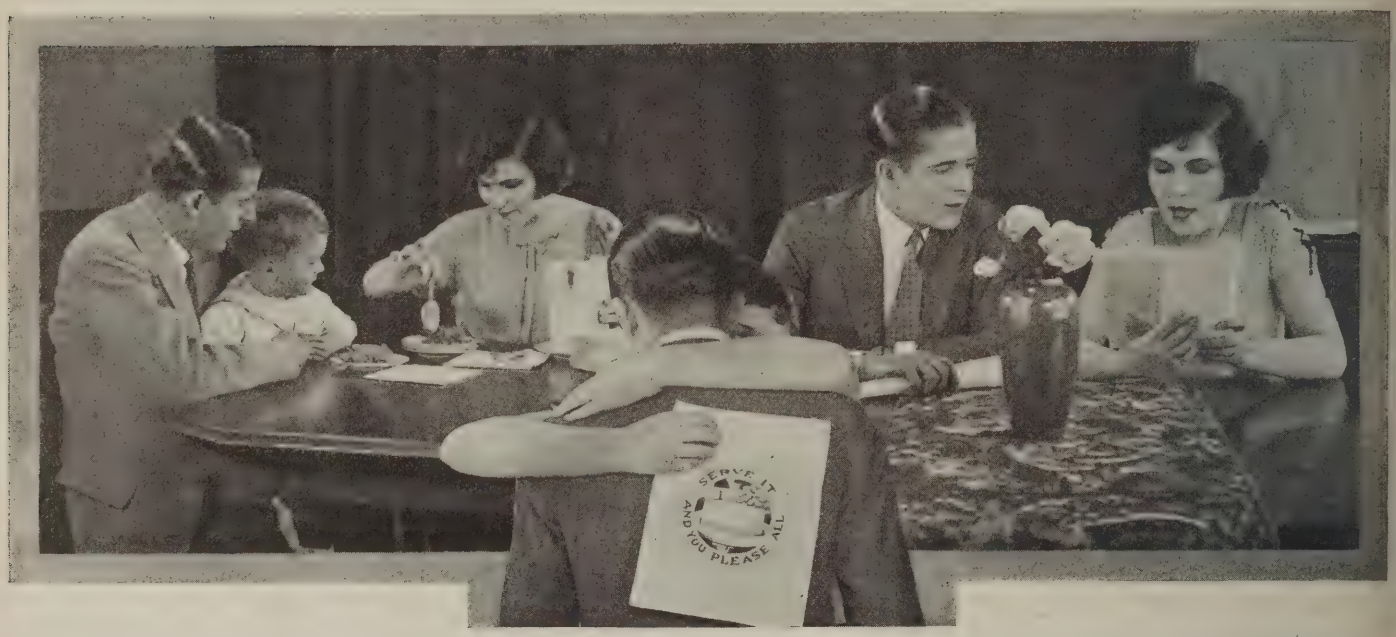
If you search for it, there is always a new way to tell an old story. Why not try it during Ice Cream Cone Week, May 10 to 16.

Prepare for Ice Cream Cone Week

Ice cream manufacturers of many parts of the country are making preparations to observe National Ice Cream Cone Week, May 10 to 16. The idea was enthusiastically seized upon in virtually every section when it was launched last spring, and this year there are reasons to believe that much more effective work will be done through encouraging the public to eat more ice cream cones.

Dealers are taking well to the idea. It means less work to them. With their increased interest, the dealers are not only doing much to make ice cream cone week bear results, but they are also developing a new enthusiasm for the handling of ice cream all during the year.

Information reaches The Ice Cream Review that many manufacturers are advertising ice cream cone week, publications going to soda fountains acquiring several pages of ice cream cone week ads.



TEXANS TO MEET IN NOVEMBER.

A. J. White, secretary of the Texas Ice Cream Manufacturers' Association, announces that dates for the next convention of that association have been set for November 18, 19 and 20. The convention will be held at Houston. A. J. White is vice-president of the Mistletoe Creameries, San Antonio, Texas.

*Executive secretary, National Association of Ice Cream Manufacturers.

Ice Cream Films Offered Manufacturers

"The Winning Way" is Title of Story Filmed by New England Association to Teach Public About Manufacture and Methods of Serving Ice Cream—Now Available for Associations Anywhere

Scenes from the ice cream film "The Winning Way," produced by New England Association of Ice Cream Manufacturers.

MUCH interest was created in the ice cream industry a few months ago when the New England Association of Ice Cream Manufacturers launched an undertaking to tell the ice cream story in a movie film. This was accomplished through the work of a committee from that association in co-operation with the Worcester Film Corporation. If this undertaking is successful, according to W. P. B. Lockwood, secretary of the association, the New England organization probably will develop another and larger film.

Early in April announcement was made by Mr. Lockwood that this association had decided to offer this film to manufacturers in all parts of the country at the rate of $200 a copy, a single reel of one thousand feet. The film was made in this size for the reason that theaters will accept nothing longer than that. The title of the film is "The Winning Way."

After seeing the film shown at Hartford in January Vernon F. Hovey, president of the National Association of Ice Cream Manufacturers, made the following statement:

"While at the Hartford convention, I had the pleasure of seeing the ice cream film made for the New England manufacturers. This film is an unusually good job, that is going to get for the ice cream men increased public confidence. The film is educational, showing how ice cream is made, today, in modern, sanitary factories, and we are all justified in feeling that increased knowledge of the ice cream business, as conducted today, will result in increased sales.

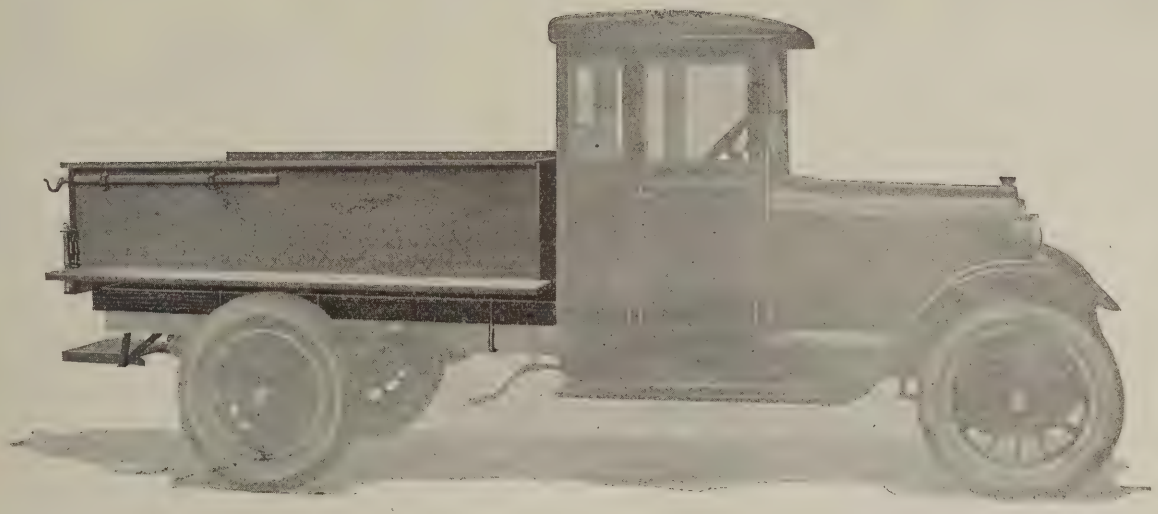
"The name of no manufacturer appears in the film, and I very much hope that the state and regional associations throughout the country will take advantage of the opportunity to get copies of this film for the use of their members."

JUST enough romance and love-interest are introduced in the film to make it spicy and interesting, and it is never apparent that the real purpose of the film is to promote facts about ice cream, how it is made and how it is served, but those facts are interwoven into the film narrative.

Here is the story:

THE couple want to get married, but cannot because of the lack of money. While they were discussing it the girl's small brother comes in and the man sends him out for some ice cream. He comes back with the ice cream and is sent to his mother with some. He then comes back for his own.

The girl finds a notice on the outside of the package in which it states that $1,000 is being offered for the best article on the manufacture and uses of ice cream. The young couple decide this is their opportunity. The man says he will find out how ice cream is made, manufactured and handled. The girl says she will find out how it is served.



After a lapse of time they start to read their story. The man's part of the story on manufacturing and handling is a visualization of the ice cream manufacturing process, including an animated chart showing the increase in use and consumption in different periods. The girl's part of the story tells about the use of ice cream as a food and some colored pictures show the use of the product.

They finally receive a letter with an enclosure of a check from the New England Association of Ice Cream Manufacturers. The girl immediately calls up her fiance, shows him the letter and throws her arms around his neck. In doing so she holds the letter across his back. Facing the audience is the imprint of the new ice cream slogan—"Serve it and you please all."

The first principle in successful merchandising is to create a desire for the merchandise and then give the consumer what they want, when they want it, and in the way they want it.—From Illinois Convention remarks by Mr. Bridges of the Hydrox Co.

5 Big Reasons
Why You Should Buy This Body

GALION Allsteel Ice and Ice Cream Bodies form an important part of any motorized delivery service.

1 They're ECONOMICAL because they wear. They WEAR, because they're made of 10 gauge special "Purity" copper bearing metal, which resists rust and corrosion.

2 They're SANITARY, because every seam is electric arc welded so the body CAN'T LEAK.

3 They PROTECT THE TRUCK because the drain pipes are arranged to keep the brine off of the frame, and they're equipped with FULL LENGTH STEEL RUNNING BOARDS.

4 They SAVE the OPERATOR'S TIME, because they're smooth as glass on the bottom and the sides, and the contents are easily removed.

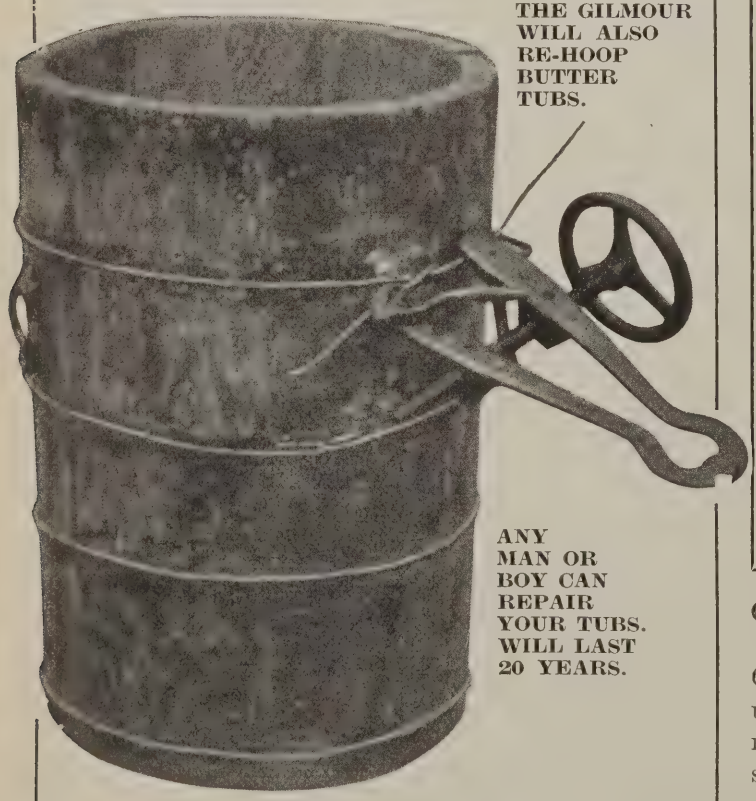
5 They are YOUR BEST ADVERTISING MEDIUM, because the clean, smooth sides provide the best sign-board space on earth.

The Galion Allsteel Dairy Slip-on Body for the Ford Roadster is the ideal light delivery unit.

GALION Allsteel Ice and Ice Cream Bodies are manufactured in standard sizes for Fords and other well known trucks up to two ton rated capacity. If one of these sizes don't meet your requirements, we'll be glad to make a body to your specifications. If your truck dealer can't give you prices and full information, we'll be glad to.

TELL US YOUR BODY PROBLEMS

"We guarantee that any Galion Allsteel Body will outlast three or four wood bodies in actual service."



THE GALION ALLSTEEL BODY CO.

GALION, OHIO, U. S. A.

Tuning In on a Tub

Why throw your old ice cream tubs on the discard? A tub that is leaking or has missing hoops can be re-conditioned and will give many months more of service.

The Gilmour Hoop Machine is in use by many leading manufacturers and is giving their tubs a new lease on life. It's a simple machine any boy can operate, and will last almost a lifetime. Keep your old tubs in good condition with a Gilmour. Buy fewer new tubs, and save money. The Gilmour will do it. Sent for 30 days free trial, upon request.

Third St. Masonic Bldg., Ground Floor

ALL SET FOR ICE CREAM CONE WEEK.

This youngster, son of E. A. Caum, president of the Caum Ice Cream Co., Altoona, Pa., seems to have a very enthusiastic interest in ice cream cones. He will help his father celebrate the 37th anniversary of the Caum Ice Cream Co. on May 30. This company began the manufacture of ice cream in Altoona in 1888, and ever since that time

"Oh, Boy! Look What Daddy Brought Me!"

has been one of the leading ice cream manufacturers of Pennsylvania, one of the leading ice cream states in the Union.

The junior Caum, shown in the accompanying picture, is one of the biggest boosters for National Ice Cream Cone Week. Ice cream manufacturers can look him over and readily decide how well the little folks in the country like their ice cream served in a cone.

OHIO ASSOCIATION SETS CONVENTION DATES.

The annual convention of the Ohio Association of Ice Cream Manufacturers will be held the last week of January, 1926 at Columbus, O., according to recent announcement by W. A. Wentworth, secretary of the association. Although hotel headquarters have not been selected, the secretary advises that it is probable that the New Neil hotel will be the scene of the convention. Specific dates will be announced later, though it is known now that it will be a two-day convention, beginning either Tuesday or Wednesday of the last week in January.

A Sales Increase of

Half a Million Dollars

One manufacturer alone has sold more than half a million dollars worth of his ice cream in 5c Dixie-packed portions.

After marketing them for one year through all seasons, he is so well pleased with Dixies that he has installed completely automatic feeding, filling and capping equipment to enable him to take care of a growing demand.

This Dixie business is steady and profitable.

If you have any questions about Dixie Containers, just write us and we will answer you promptly.

$100,000.00 Extra Income from Ice Cream

This is the amount another manufacturer finds his dealers secured from the 5c sales of Dixie-packed ice cream in four months' time last winter.

He says Dixies help to—

"Keep cabinets working right through dull season."

"Secure for the dealer a sales volume which justifies his giving floor space to cabinet."

"Make sales which could not be secured with larger packages or novelties."

"Give the dealer such a volume of sales that he will want to hold on to the cabinet—ready for the Spring business."

"Reduce necessity of running extra inducement sales and expensive booster specials in which there is no profit."

Silver Anniversary Slogan Adopted

"Let's Meet in Detroit in October," is Rally-Cry Issued by National Association of Ice Cream Manufacturers

ALTHOUGH ice cream manufacturers of the country have come out of winter quarters and are poised upon the threshold of what many believe will be the most active ice cream year in the ice cream industry's history, there is an extraordinary note of widespread interest in the silver anniversary convention of the national association to be held in Detroit from October 19 to 24. This is not based alone upon reports reaching The Ice Cream Review, but also is supported by the observations of the executive secretary of the national association, Fred Rasmussen, who reports that interest is particularly keen among manufacturers of the South and West.

Although manufacturers are used to optimistic advance reports on national conventions, it cannot be recalled when there has been so much keen interest in a convention in this industry so far in advance of the actual convention dates. This cannot alone be due to the selection of the city of Detroit, for other cities that have been visited by the ice cream men have proved to be very popular.

THE foregoing true, it is quite evident that the big magnet drawing the early attention of ice cream men to the 1925 trade classic is due for the most part to the many important activities now engaging the attention of the national association, these activities being more or less of a national nature, all bearing in some degree upon the industry's expansion.

In view of the early interest taken in the coming anniversary convention, national association officials have adopted a convention slogan—"Let's meet in Detroit in October."

This slogan was announced in an interesting communication recently received from Secretary Rasmussen, in which the secretary says:

"Already letters have come to the office of the National Association of Ice Cream Manufacturers from the South and West, telling of the interest taken in the Silver Anniversary Convention of the national association to be held in Detroit from October 19 to 24, in connection with the big show staged by the Association of Ice Cream Supply Men. To have a real convention and show with which everyone will be pleased requires comfortable and sufficient hotel facilities, a spacious, well lighted exhibition hall with interesting exhibits, a good literary program with some time for recreation and fun—all of this is assured in Detroit; but, after all, as important as these factors are for success they do not make a convention or a show. The success of the convention and the show depends upon the number of interested ice cream manufacturers who will come to Detroit from the North, East, South and West. It is the energy, activity and intelligence of the people in the ice cream industry which is the driving force of its activities.

"Wherever groups of people interested in the same line of endeavor gather for the exchange of thought, their vision is enlarged and new possibilities are brought to light which give faith in the future, all of which is fundamental to our progress. The convention and show and the people attend-

TRAY-PACK

The 100% Dry Pack Cabinet

(PATENT PENDING)

To service TRAY-PACK remove trays, carry to street or other suitable place and dump brine, repack at truck, replace trays—that's all—no slop or muss in the dealer's store.

TRAY-PACK was developed to meet the demand for a cabinet which would combine the convenience of the mechanical unit, with the time proven advantages of ice refrigeration — absolute reliability, low investment cost, and minimum cost of upkeep.

That TRAY-PACK completely meets this demand is evidenced by the large number of leading manufacturers who, after careful investigation, have standardized on this wonderful new cabinet.

Judge for yourself whether these manufacturers acted wisely. Send for complete descriptive literature that fully explains why TRAY-PACK is the only ice refrigerated cabinet that can be serviced without slop or muss in the dealer's store—why it offers the utmost in sanitation, uniformity of ice cream temperatures, speedy trouble-free service and increased life of cabinet.

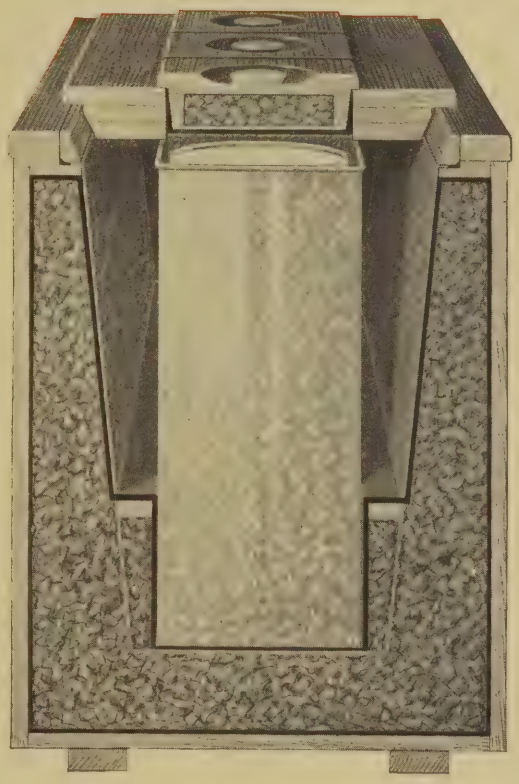
In other words, learn how TRAY-PACK makes possible the safest, most reliable and economical method of supplying PERFECT service to your customers.

GRAND RAPIDS

DRY-TANK

[Cabinet Style No. 9]

THE manufacturer, situated where conditions do not demand such exceptional service as is possible with TRAY-PACK, will recognize in our DRY-TANK cabinet an extraordinarily fine value.



Exhaustive, painstaking, competitive tests have proved conclusively that this cabinet is more efficient than any other of its type. A few of the structural superiorities that stamp it as the leader in its field follow:—

DRY-TANK is fitted with a special icing cover to facilitate packing which is done around all four sides.

THE COVER is equipped with individual square lids for each can, and the tank fits up against the cover so that the ice and salt are not exposed at any time after icing.

THIS CABINET will give very satisfactory service under usual summer conditions for 48 hours.

Prices and literature describing in detail the many distinct structural and insulating superiorities of this cabinet will be sent on request.

"Not a Single Day's Layup in Two Years of Hard Service"

The New City Car Company, Chicago, Ill., reports, "Not a single day's layup in 2 years' hard service is the record of our Howell Red Band Electric Motors.

"After investigating the best known motors and consulting electrical engineers, we purchased three different makes of motors for comparative operation.

"All tests convinced us that Howell Red Band Motors are the most serviceable, durable, economical and efficient motors on the market, and we accordingly standardized on them. We are using 40 Howell Motors, from 5 to 40 H.P., and find them satisfactory under the severest service.

"The large 40 H.P. unit is used for air compressor work. As the load is often thrown on suddenly, this requires sturdy construction to withstand the strain. Other motors are used on punch machines, bull dozers, and wood-working drills, saws, mortise machines, etc.

"Our Howell Motors have needed very little attention from the local dealer; but when called upon he gives 'right now' service, and is very efficient."

Howell Red Band Motors are made in all types and sizes from ½ H. P. to 100 H. P. Sales and Service blankets the nation. Catalog on request.

LEXINGTON LINKS PAST WITH MODERN PROGRESS.

By Carlton Ball.*

Visitors to the 1925 convention of the Southern Association of Ice Cream Manufacturers are sure to be fascinated by the unusual manner in which Lexington projects her enviable history into her present day progress. This is just another incentive for your early planning to be one of those chosen, attending individuals.

For example, start with her colleges; Transylvania University, established in 1783, endowed by Washington and Adams, visited by Boone and others of pioneer fame, is the oldest institution of higher education west of the Allegheny Mountains. There may be seen the first known medical library in the world, which contains old files recorded as "missing" in some of the royal libraries of Europe. Transylvania is today a thriving university.

CARLTON BALL.

Sayre Institute is still accorded the privilege, and is reputed to be the first school in Christendom devoted exclusively to the higher education of women.

The University of Kentucky, continually outgrowing itself and clamoring for more space and equipment, is honor-giving to every tax payer in the state. For the benefit of those who measure progress by the pay roll, we may say that Lexington's colleges alone bring four million dollars annually into local coffers. Preserved on the campus of the University of Kentucky is the exhibit of the iron strap rail bolted to rock, as used on the second railroad built in America, the Lexington and Ohio railroad running between Frankfort and Lexington. Over these rails moved the first locomotive built in this country.

Lexington has continued to advance through the several stages of transportation from steam railroads to interurban lines, from the stage coach to the motor bus, and is now recognized as one of the great centers of automotive passenger carriers in the United States today, carrying an average of 2,000 passengers daily and covering appproximately 11,000 miles of Blue Grass highway.

This series of articles is leading to the final announcement that the extensive entertainment that is provided for the guests at the Southern convention.

* Secretary, Kentucky Dairy Products Manufacturers.

STANDING IN OUR LIGHT.

Co-operation is an economic necessity, and when we cultivate this thought among our competitors we are casting bread upon the waters that will not return unto us void. Just as long as we refuse to accept the idea that it is best for us to lay our cards on the table and be frank and above board with our associates, just so long are we standing in our own light and impeding our progress.—From Mississippi address by S. N. Sutton, president of the Southern association.

RICUT

Ice Cream for Breakfast Is Reality—In England

Once Again the Thing "That Can't Be Done" is Being Done, This Time in the Old World. Britons, Who Once Rebelled Against Ice Cream Altogether, Now Eat It for Breakfast, Without Encouragement

Why Can't Americans be Taught the Habit?

ALMOST every cub newspaper reporter many times has used the trite expression, "Truth is stranger than fiction." For many years it never has occurred to anyone to suggest that ice cream be served at breakfast. The new secretary of the National Association of Ice Cream Manufacturers, Fred Rasmussen, some weeks ago had the temerity to make this casual suggestion in the presence of a representative of The Ice Cream Review. This remark later was touched upon in The Ice Cream Review.

It was hardly to be expected that this would be taken seriously, not even by members of the ice cream industry themselves, for no doubt many hard boiled, dyed-in-the-wool veterans of the industry smiled and shrugged their shoulders upon reading about the thought of ice cream for breakfast.

But it remains for our friends across the sea, our fair British cousins, to show us that this is not only a possibility, but actually is being done—in England.

Read this extract from the Daily Chronicle, London:

A year or two ago no self-respecting Englishman ever dreamt of eating ice cream during the winter. Today no matter how cold the weather people go in search of frozen food. So says the manager of one of the largest popular restaurants in London: "A short time ago only children and a few women ate ices except when the weather was hot," he continued. "Now many men not only have ice cream instead of pudding with their meals in winter, but come in for it at all sorts of odd times of the day and night. When in search of a quick lunch men often feed largely on ices and some of our customers breakfast regularly off ice cream."

THIS newspaper item so excited a gentleman writing in the March issue of The Milk Messenger, under the name of A. C. Ockney, that he made an investigation. He reports that, according to the manager of the restaurant mentioned in the London newspaper, the British public at last is "waking up to the fact that ice cream is not a sweet, to be taken after meals, but is a wholesome food."

Then this gentleman asks himself the question, "Why is it that the public has been so slow in getting hold of this ice cream idea?"

It seems that the same question might be brought up in America. We are accustomed to speaking of the people of the old world as folks who have a habit of following the old beaten path of their ancient and honored ancestors, doing pretty much the same thing today that they did yesterday, following certain rules, precepts and accepts that have held their own down to centuries.

Yet is not our potential ice cream consuming public in America doing this very thing to the detriment of increased ice cream consumption? Do we not have pretty much the same thought of breakfasts that we have been eating for the last many, many years, such as ham and eggs, toast and coffee, oranges, cereal, etc.? Ice cream for breakfast? Why not? In the summer time it has long been popular in this country to serve cold strawberries and cream, peaches and cream, and other delightful delicacies of this nature at breakfast. Is there any real worthwhile reason why the public cannot be educated to strawberries and ice cream?

THERE are so many different ways that ice cream can sensibly be served at breakfast that it is hardly necessary to enumerate any of them now. No really thoughtful person will argue that ice cream would not make an appetizing dish when served with fruit, maple syrup, berries, and other palatable things at breakfast—or even just ice cream alone!

One of the things that has kept back the eating of ice cream at breakfast for so long—the really important thing, too—is members of this industry have not waked up to the old proverb about the early bird and the worm, according to Mr. Ockney in The Milk Messenger, which is published by the Storer, Rodgers & Hughes, Ltd., London. Mr. Ockney goes on to say:

"You will agree with me that all people in the dairy line are early risers, but it appears that a very large percentage of the dairymen have not risen early enough to catch this ice cream worm yet. However, you have no need to rise any earlier as it's lying there right under your nose, waiting to be dealt with. It is true a few of the larger concerns are alive to the fact, but why aren't the smaller concerns waking up? I know what a good many of them think: 'Oh! I'm doing all right—I'm getting a decent living, why should I bother?' Well, there's no progress in a man like that, and, to my mind, he sholdn't be in business at all; furthermore, he is not doing justice to his fellow countrymen. America saw its chance years ago, why not us? Are we always going to be last in everything?

"Look at the splendid systems the Americans use in handling all their food stuffs. They know the benefit of it, they wouldn't go back to the old-fashioned ideas."

Now, let us in America be as honest with ourselves as Mr. Ockney asks Britons to be with themselves.

(Continued on page 114)

Sell More Pies in Summer

Over 5,000,000 Pies were sold at Coney Island last summer.

Eskimo Pie sales need no pushing during the hot months. The summer demand far outstrips the winter consumption.

Wherever crowds congregate—at amusement parks, ball games, beaches, circuses, boardwalks, fairs, summer resorts—you can sell Pies by the thousands as fast as made.

A good advertising stunt is to put an Anderson machine at work in a booth where people can watch the Pies pouring out at the rate of 16 per minute—80 dozen per hour—wrapped and ready for sale.

Summer means quick sales. And quick sales plus volume production means larger profits.

The Anderson machine delivers uniform, neatly wrapped Pies—automatically at minimum cost. Write for information about our deferred payment or lease plans.

THE *GENUINE* CHOCOLATE-COATED ICE CREAM BAR

Cleanliness is Next to Godliness—and to Increased Consumption

Like Charity, it Begins at Home, Should be Followed Out in Regard to Clean, Shiny Trucks, and Should be Encouraged, Above All Things, Where Ice Cream is Served

IT IS but natural that each individual engaged in ice cream making should desire to expand his business and to increase the consumption of his product. It is also a rule of human conduct that with each reduction in price of any given article the number of possible buyers is automatically increased. But price-cutting and price wars do little for the industry or for the individual participant. Those concerns that keep on making good ice cream also keep on selling their product at a reasonable profit.

The principles underlying price-cutting are just as unchangeable as the laws of the Medes and Persians. Yet ever so often some misguided concern, believing it has found the very latest stunt to increase consumption, goes the limit in price-cutting practices. This, at best, merely is profitable for sane competitors.

But, on the other hand, there is no discounting the fact that advertising is a profitable factor in increasing consumption. Quite recently the success of advertising in relation to the increasing consumption of oranges, lemons, walnuts, almonds, raisins, sauer kraut, etc., has been discussed in detail. Advertising is no longer a theory, or an "ism," in American business, but there is a common bond in each of the above instances that is not yet true of the ice cream industry.

The "Sunkist," "Sun Maid," and "Blue Diamond" brands imply that a certain standard of quality and flavor is to be found in each article bearing this designation, and that this standard is carefully maintained. Nuts, raisins and oranges differ just as much as do ice creams, and yet the first mentioned products are successfully marketed under a single national brand and hundreds of local brands.

IT IS true that a standard mix would not be possible for any national industry such as ice cream making. And yet would not a national brand name, nationally advertised, and available only to association members who upheld certain standards, be a valuable factor in increasing ice cream consumption? The many local brands would naturally still be maintained but as a part of the national designation.

Advertising by the individual firm is also a valuable business asset. Yet advertising is not a substitute for quality. Unfortunately, in every section there is some firm that thinks that substitute materials and low quality can be covered up by a mass of publicity. Such practices will in the end show advertising charges an expense and not an investment.

It is true that both reasonable price and sane advertising are a part of the ice cream maker's service to the public, but too many ice cream makers are today at sea regarding the public's wants and what the buyer is thinking about. The consumer is actually not interested in, nor is he thinking about, fat content, or solids, or swell, or any of the dozen other points that the fadists would lead us to believe are paramount in the public mind.

THE buying public is interested in but three factors, with regard to ice cream—its price, its quality, and whether it was made under sanitary conditions. And despite the opinion of many, price is the least important of these three factors.

Quality and cleanliness are almost analogous in the mind of the modern buyer. And although cleanliness is not a substitute for quality, if customers are assured that the ice cream they buy was produced under cleanly surroundings, they are less apt to be critical of quality.

The desire to be clean and the resolution to maintain cleanliness is in itself not sufficient. And just as having the right tools is important for performing certain mechanical work, so, too, is the use of the proper sanitary cleanser essential for successfully doing cleaning in the ice cream plant.

The money you spend for cleaning materials may either be an investment or an expense. The cost of any cleaning material is not its initial price per pound but its upkeep—its operating expense. Naturally, the only cleaners that are suitable for use in ice cream plants are those that produce a true, sanitary, sweet smelling cleanliness. And unless these desirable conditions are secured quickly, easily, and with the use of a minimum of cleaning powder, the operating cost of the material used, no matter what its price per pound, immediately exceeds the limits of economy.

Fortunately for all concerned the ice cream industry appreciates that cleaners containing grease or ones making suds in any quantity are not adapted to their needs. And more and more are buyers realizing that the active part of any cleaning material is its alkali content—an alkali so modified and so harmless as to freely rinse from all washed surfaces and leave them truly clean and sweet smelling as well.

THE public is ever increasing its interest in and demand for cleanliness. Truck bodies, signs, and all painted surfaces belonging to any individual company that are shining bright and clean are a profit making factor. Modern cleaners have made the cleaning of oil painted surfaces so easy, so harmless, and yet so efficient that there is today little excuse for soiled or dingy painted areas. And many times such cleaning saves the cost of repainting.

Just as the gaining of sanitary plant cleanliness de-

Increases Ice Cream Sales 33 1/3% During January and February

Morgan Bros. Drug Stores

Store No.I
3001 P St. Nw.

Washington, D.C.

March 27, 1925

Zero Products, Inc.,
623 B Street, N.W.,
Washington, D.C.

Gentlemen:

Confirming our recent conversation; while I was favorably impressed with the claims made by your salesmen to me regarding Zero Heathized Ice Cream, I was not fully sold on your product until I had personally examined the official records of the Board of Health of Washington, D.C. These records clearly evidenced that Zero Heathized Ice Cream was not only the purest, (indicated by lowest bacterial count) but the richest.

Proof of Purity

Since I made the change to Zero Heathized Ice Cream, about six months ago, I have noted a very marked increase in my Ice Cream business. I have just carefully checked my gallonage purchases and find that; comparing the months of January and February of 1925 with the corresponding months of last year, I have purchased and sold 33-1/3% more Ice Cream.

33 1/3% Increase

While these figures are very gratifying, they do not express my ultimate satisfaction, namely; the pleasing of my customers. Several of my patrons, not knowing of my changed Ice Cream, were under the impression that Zero Heathized Ice Cream was one of the fancy Ice Creams made by one of Washington's leading caterers. I have had more favorable comments on the quality of Zero Heathized Ice Cream in the last six months, than I have received in all my previous many years experience, combined.

Pleased Customers

In addition to the above, it gives me great pleasure to state that the service I have received from your company is of the best. I have found it dependable, courteous and most satisfactory.

Yours very truly,

MORGAN BROS. DRUG STORES,

By M. W. Morgan

There's proof for you! An ever-growing following is demanding Heathized Ice Cream from our clients' dealers. They may not have told you that they do, but the hundreds of thousands of gallons added to our business tell us they know about it and that they seek the dealers who display the Heathized sign.

Write us today and let us show you how Heathized Ice Cream will increase your sales and profits.

Heathized Products Company

Experts Differ on Matter of Color

Local Conditions Must Govern Matter to Great Extent, and Middle-Ground Course Seems to be Favored

THE matter of color in ice cream has been the subject of pro and con discussions in this industry for many years. Some interesting views on this subject have been obtained by The Ice Cream Review in a general canvass in which the opinions of ice cream experts were solicited. Looking over the statement of the ice cream authorities of the country, it appears that the consensus of opinion would be in favor of a middle-ground position with regard to color, though some of our correspondents express the opinion that this is a matter of personal thought. Neither extreme is to be encouraged, it is conclusviely shown, and local conditions must largely govern in this matter.

An ice cream manufacturer in a Western state sets forth some ideas that give striking examples of how unwise it is for color to be pushed too much. He stated that his company increased color until it was thought that a nice cream color had been obtained, much similar to what is considered a cream color, and it was thought this would be the limit, but—

"Others kept on increasing the shade a little deeper until our dealers began complaining that our ice cream was not as rich as that put out by other manufacturers. This continued until we were forced to go the limit and we are now satisfied that the trade here wants the high colored cream, the more color, the better.

"Just how far this will go before it reaches the limit the writer has no idea. Just a few miles to the north of us is the state of ——, where there exists a law prohibiting the adding of artificial color to the ice cream and we note that most of the ice cream in that state is white. I understand that Wisconsin also has a similar rule that is being enforced."

The question of coloring was touched upon in an address before the joint convention of the California and Southwestern States Ice Cream Manufacturers' and the Pacific Ice Cream Manufacturers' Associations by Dr. J. J. Frey, who said—

"Practically everybody is agreed with the precedent which has been established in the other dairy products, in the case of butter and cheese be followed, that coloring with the natural color of ice cream should be permitted, and this further fact in that connection was recognized, if we allow butter in the manufacture of ice cream, and butter is already colored, then we place the man who uses fresh sweet cream in the manufacture of ice cream at an unfair disadvantage because the man who uses butter would already have a uniform color and the man who buys sweet cream would get all the variations of color which comes from the individual farms, so I think it was unanimously agreed that coloring with the natural color of ice cream should be permitted and not considered adulteration and there was only one or two who considered if that was done it should be labeled, so I do not think there is any question as to what the joint committee will do as to that question when it comes up for federal consideration."

THE head of the dairy department of a well known Western university expresses the opinion that a desirable color is one imitating the mixture of Jersey and Guernsey cream, produced on fresh grass, but he added that, since the matter of color depends on personal opinion, "a wide latitude must be allowed in scoring of ice cream on this item."

An ice cream expert in a Northwestern state university is of the opinion that ice cream should not be colored at all, "because it is so easily carried to extremes."

A small amount of color in vanilla ice cream is favored by an ice cream expert of a Middle Western college—"just enough to overcome the dead white or cottage cheese appearance." He continued:

"Winter ice cream is like winter butter in so far as color is concerned and if it is a legitimate practice to color butter to conform to the June standard, it seems there should be no objection to the practice in ice cream manufacture provided that it is not overdone.

"At a scoring contest (quite awhile ago) the writer instructed all present not to score ice cream off for being uncolored, that is for possessing a natural color. I believe that we should follow this rule until we have established a definite color standard to which all manufacturers can conform. Certainly too high or unnaturally colored ice cream should be cut severely.

"A committee was appointed to pick out samples of ice cream from among the entries which they considered an ideal color and all present agreed. The writer was instructed to work out a color standard for the use of ice cream makers. It is impossible to tell a maker to use so many ounces or cubic centimeters of cheese color since there are too many factors which may affect the results."

An ice cream authority in a Northern university brings up the thought of market demand in connection with color in ice cream, as well as personal taste of the ice cream maker. With regard to his experiences, he went on to show that—

"A delicate colored ice cream has about the same relation to some of the heavily colored products that a fine work of art has to a blotch of bright colored paints. The color of ice cream should be suggestive of the flavor of the fruit imitated, but this color should not be so pronounced that it is able to bespeak its own merits in loud tones. The writer very much prefers a light colored vanilla which resembles the natural color of cream, rather than a deep orange shade, which is quite commonly found. We have noticed in three

EAST PACO
Can Tops Index the
Contents of your Flavoring Room

How Do You Know?

After the miscellaneous flavors are stored in your hardening room, how much time do your men spend in finding out what's what?

Eastpaco can tops not only form a protective liner, preventing ice and salt from finding its way to the ice cream, but they put real system to the storing of flavors in the hardening room.

No trouble to put on and very reasonable in cost. They pay for themselves in the time they save.

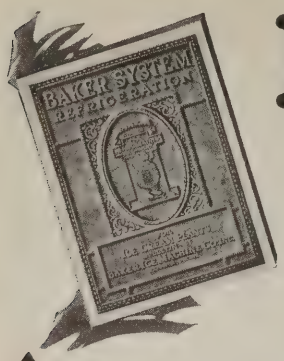
TEMPUS FUGIT!

Time flies! Even the small space of one year sometimes bring changes, improvements and definite progress—in the Ice Cream Can industry as in the automobile or radio industry.

No one can afford to stand still. The man who boasts about standing still hasn't very much to boast about.

Back in 1907, when the first K-W Ice Cream Can was made, we were mighty proud of that Can. But we didn't let our pride run away with us. We kept on studying our customers' Can problems. We kept experimenting. Constantly we improved our Cans, so that K-W on a Can has come to mean a good deal thruout the Ice Cream industry.

Today in our K-W Type A Can we offer what is the best Can our organization has ever produced.



But we shall not stop there. We shall seek to improve. And whenever it is possible to produce a still better Can, you may be sure that our K-W mark will be on it.

WE ALSO MANUFACTURE
MILK CANS AND SODA WATER TANKS

or four cases that have come to our attention that dealers quite often mistake the dislike of their consuming people on this matter. We wish to express ourselves very much in favor of tinted rather than colored ice cream."

VANILLA ice cream should be colored just enough to give it "a creamy cast," according to a prominent ice cream manufacturer in the state of Indiana. He believes, however, that it is entirely wrong to color it a very deep yellow, though he thinks that a little color "used in the right proportion" will increase the sale of ice cream. In other words, he believes that this is just as true of ice cream as it is of butter, asking, "How much less butter would be used provided it was not colored?"

It would be difficult to adopt a very definite standard which "would be absolutely fair to all concerned," according to a New England college ice cream authority, who went on to say:

"In our particular locality the consumer demands a product which has the appearance of Jersey cream produced on June pasture. He objects to ice cream which is too white in appearance or so highly colored as to appear artificial. Under our conditions, then, this Jersey cream color is the standard.

"In certain other sections of the country, however, a much more highly colored product is demanded. The consumer prefers it to one which is light in color, therefore, our standard could not be successfully applied to all other markets.

"The color of ice cream is greatly influenced by the demands of the consumer. We should consider this point in establishing a color standard and make allowance for the variation in market demands."

The real reason for the item of color in the score card for ice cream "is to discriminate against lack of uniformity, against lack of harmony and against artificiality of color in the ice cream," is the belief of an ice cream expert in a college in Idaho. He does not believe that plain vanilla ice cream should be criticised for lack of color as long as it contains the legal percentage of fat, but he thinks it may be a desirable practice, if the ice cream manufacturer wishes, to use color during the winter months. He doubts whether the general consuming public will value the appearance of extra richness in ice cream.

DIFFERENT sections of the country feel toward the color of ice cream as they do toward the color of butter; that is, they give a preference to certain shades, in the opinion of the head of the ice cream department of a college in Iowa. For this reason, he says, the manufacturers should give much thought to this problem and endeavor to give his customers the particular shade of ice cream that they desire. The "standard shade" has been eliminated at this institution's scoring contest.

Interesting experiences in an ice cream plant in connection with coloring of vanilla ice cream are related by a Montana authority as follows:

"I worked at a factory at one time where they colored their ice cream very much, in fact it almost looked like orange ice cream. They got so much coloring in it that the people began to object and some people demanded a colorless ice cream and later on other people wanted a little coloring in it and other people wanted it colored to quite an extent, so that company was almost forced to put out three different shades of ice cream, which just arose through starting to color.

"If ice cream was naturally yellow during part of the season like butter then I would see a reason for coloring in order to give uniformity of color, but under the circumstances I can see no use for coloring and I am not in favor of coloring. As far as the fruit ice creams are concerned, I believe it is all right to color them, as I believe the color should coincide with the flavor. For instance, a strawberry flavored ice cream should be red, a coffee ice cream should be brown, a mint ice cream should be green, etc. I hope that the ice cream makers may come to see that it is only folly to color the plain vanilla ice cream."

THE

Waltham System

[PATENTED]

ICELESS SALTLESS NON-MECHANICAL

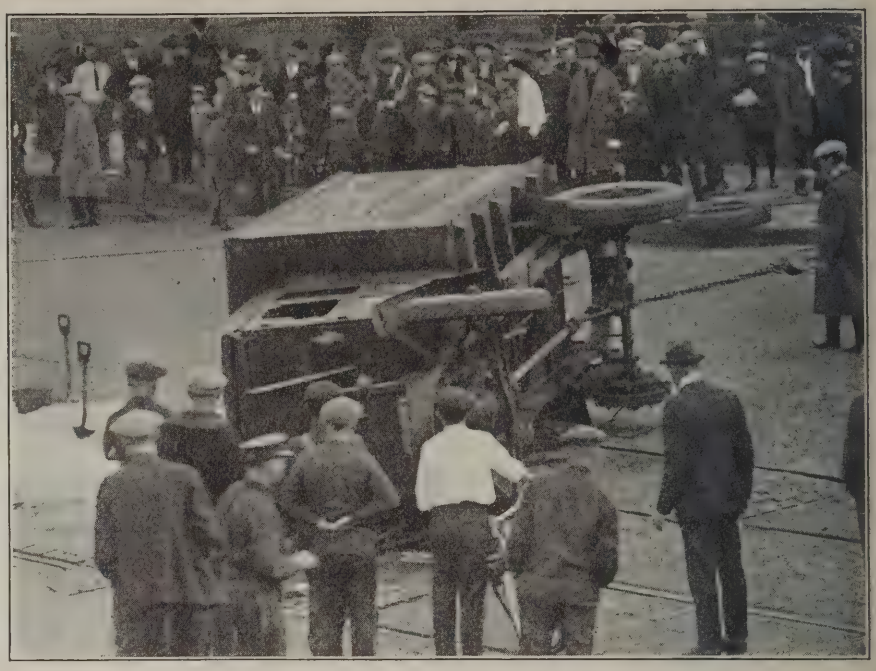
A Complete System of Refrigeration for Ice Cream Distribution

Just the right amount of refrigerant to hold your cream in the dealers' cabinets and soda fountains is provided by the Waltham System cartridge. Waste energy through leakage of refrigerant in transportation and in the service cabinet is reduced to a minimum. Naturally costs of operation are much lower.

Waltham System Cabinets give complete satisfaction to the dealer. With the elimination of ice and salt all his brine and clean-up troubles are over, and the ice-cream is delivered in a minimum time. Absolutely no service troubles or responsibility for operation of mechanical equipment. Nothing to get out of order.

And his cream is kept at just the right temperature *all the time.* Every scoop is just the same, and nothing wasted.

This is accomplished by the Waltham System with greater efficiency and economy and with less equipment investment than by any other system of ice-cream distribution.



Write for the facts.
They will surprise you.

Why So Many Delivery Accidents?

Growing Number of Wrecks in Which Dairy and Ice Cream Trucks Figure Cause Several Owners to Take Precautions Against Unsafe Driving

This illustration shows how a Minnesota ice cream man's truck came to grief.

DUE to the very large number of trucks of varying sizes operated by dairy, ice cream and allied concerns, the number of accidents in which such trucks are mentioned appears to run quite large, and for that matter is large, although considering the number of trucks, and the hour in which they are on the streets, the percentage per truck is not so large. The early morning milk wagon or truck has always had trouble with the drunken "night owl" drivers of pleasure cars, and quite often the driver of the milk vehicle is at fault, through his habit of cutting from one side of the street to the other, without proper regard for right or left side of traffic.

The ice cream trucks, of course, are making deliveries during the busier hours and when streets are full of traffic. Many light trucks are used, and due to long skips between deliveries, such trucks, unfortunately, are often driven much faster than they should be.

One company with which the writer is quite familiar has had a long run of accidents of late. One of its ice cream truck drivers has killed two persons within a year. In the first of the cases the driver did not appear to be at fault, and while arrested on the usual manslaughter charge, was later cleared and released. In the second case he was indicted for manslaughter, by the grand jury. The very next day after the indictment was returned, another driver for the same company mixed up with a street car at an intersection. The truck mounted the curbing and turned over in a church yard, but before reaching the yard, knocked a man down, and almost unclothed him. These are just three of a good many accidents that the company has had.

ONE of the drivers when asked about the company's record, admitted that the concern was trying to handle too much business and too many long jumps, for the number of trucks in use, and that the men were having to make time, and getting "bawled out" for being slow. Time lost at homes, stores, etc., is made up on speed where possible. In such cases the company naturally is to blame.

In many other cases drivers are to blame for racing light trucks, when there is no need for high speed. Conditions are such that juries today are giving larger judgments, and owners of cars have to carry increased liability insurance, while rates are mounting steadily due to increased traffic.

There was a time when the taxicab companies carelessly hired men, but today the leading companies are very careful in hiring drivers. Married men, five years a resident of the towns in which the companies are operating, are the only class of drivers accepted by some cab companies.

The operator of a big bus lines company, attending the last National Safety Conference, held that accidents could be stopped at the source, through the employment department, and told how his company generally examines ten men or more, for every driver employed. Of course, bus drivers have the lives of many passengers in their hands, and must be cool, level headed men, who know how to drive, and also how to think in an emergency.

The ice cream or dairy company, operated in the cities, and over congested streets, needs good drivers, and the policy of hiring any man who can drive a flivver, is not a good one. Experienced men with clean accident records are needed. Instead of boys more settled men are needed.

INVESTIGATE the majority of light-truck accidents and it is found that the drivers were men under twenty-five years of age, and often under twenty years of age. Men of the type who like to step on the gas and hear the exhaust roar. Such men are not reliable, and while through nerve and quick thinking, some avoid many accidents, eventually they will pile up and bring a nice damage suit to the company, which is not always fully protected on its insurance, especially if a truck goes into a crowd, or through a store front, and injures or kills several persons.

One of the street railway companies two years ago established a bus line service, and called on its organization for drivers. It found that it had a lot of experienced drivers, who had driven army trucks in France, but over the first year its accident ratio was

(Continued on page 126)

Two New TRUCKS that set a New Standard

GMC again has provided a new measure of motor truck quality with the new 1 ton and 1½ ton models.

Not only do these trucks embody the well known GMC principles of design, but they provide further refinements in construction and arrangement which are revealed in more power, more speed, more safety, more comfort for the driver, and easier and quicker adjustment or replacement of wearing parts.

New and more powerful engines, mechanical four-wheel brakes, new type rear axles with banjo housing, new transmissions, new design radiators and hoods, new and easier steering gears, magneto ignition, cord tires, electric starting and lighting.

These are among the many improvements found in the new GMC models—improvements which establish their quality as second to none among motor trucks of their capacities.

Increasing Profits by Reducing Delivery Costs

Reductions of 50 Per Cent on Delivery Costs Can Be Effected if Equipment is Selected on Basis of Transportation and Cost Analysis

*By RAYMOND ZINDLE**

ARE you interested in securing a better return on your business investment? Are you looking for a means to increase your facilities? Do you want more money to increase your advertising? If your problem is one of these or if it is any other depending upon additional funds, by cutting your delivery costs you will be able to do it.

According to analysis, the cost of delivery in the ice cream industry averages about 25 cents out of every dollar taken in. In virtually every instance this cost can materially be reduced if delivery equipment is selected on the basis of transportation and cost analysis —in some cases effecting a reduction of as much as 50 per cent. And every dollar saved in delivery costs is a dollar added to the profits.

The average successful ice cream manufacturer is making, I believe, about 8 to 10 per cent on his gross volume. Let us arbitrarily choose 10 per cent. If you reduce your delivery costs only 10 per cent, that alone will increase your profits to 12½ per cent. If you are doing $100,000 worth of business annually your profits will thus be increased from $10,000 to $12,500—an increase of $25,000 in 10 years.

It has been estimated by those who have studied delivery conditions in the ice cream industry that 70 and 80 per cent of all ice cream routes can be electric truck routes, the other 20 to 30 per cent being gas truck routes, to take care of the very long hauls to suburban and country points (instead of using express shipments as formerly). It has been stated by an authority in the field that on the most favorable horse route in the most congested district, the electric truck can do the work just about as economically as the horse, and from there on up on each route the electric truck enjoys an increasing advantage in economy. Investigation shows that the ice cream job is usually a 3½-ton truck, with a few makers using 2-ton jobs and some 5-ton. The ice cream truck is subjected to severe overloading during the summer, and, therefore, the ice cream manufacturer is necessarily interested in sturdy construction.

IN OTHER words we are proceeding on the hypothesis —an hypothesis, however, which facts drawn from every section of the country are proving to be correct —that the horse is passing as a means of city delivery, that motorization of delivery service, the gas truck and the electric truck, each especially fitted to do a particular type of work, are more economical, more efficient, more dependable and are, therefore, the demands of modern business.

If then, between 70 and 80 per cent of all ice cream routes can be electric routes and the other 20 to 30 per cent gas truck routes, and close study of the industry shows this to be true, it is up to the ice cream manufacturer to select his motorized delivery equipment on the basis of transportation and cost analysis in order that he may minimize in each instance the cost of delivery.

Now, then, because 70 and 80 per cent of all ice cream routes can be electric truck routes, which is due to the fact that the average mileage per truck ranges from 16 to 30 miles a day, that the average number of customers supplied per truck per day is about 35 or 40, etc., etc., let us consider the characteristics and the capabilities of the electric truck in this kind of service.

From the point of view of operating cost, conditions in the ice cream industry are admirable for electric truck use because of the large current demand of the

*Commodity Supervisor, The Society for Electrical Development. This was written especially for The Ice Cream Review.

Trucks used by three large Eastern Dealers.

DELIVERY COST is determined by the various items of expense entering into continued use over a period of years.

The high quality built into Walker Electric Trucks, as a result of twenty-two years of observation and experience, converts expensive delivery into PROFITABLE DELIVERY.

On frequent stop routes, Walkers, as compared with horse-and-wagon units and gas trucks, reduce ice cream delivery expense by 25% to 50%.

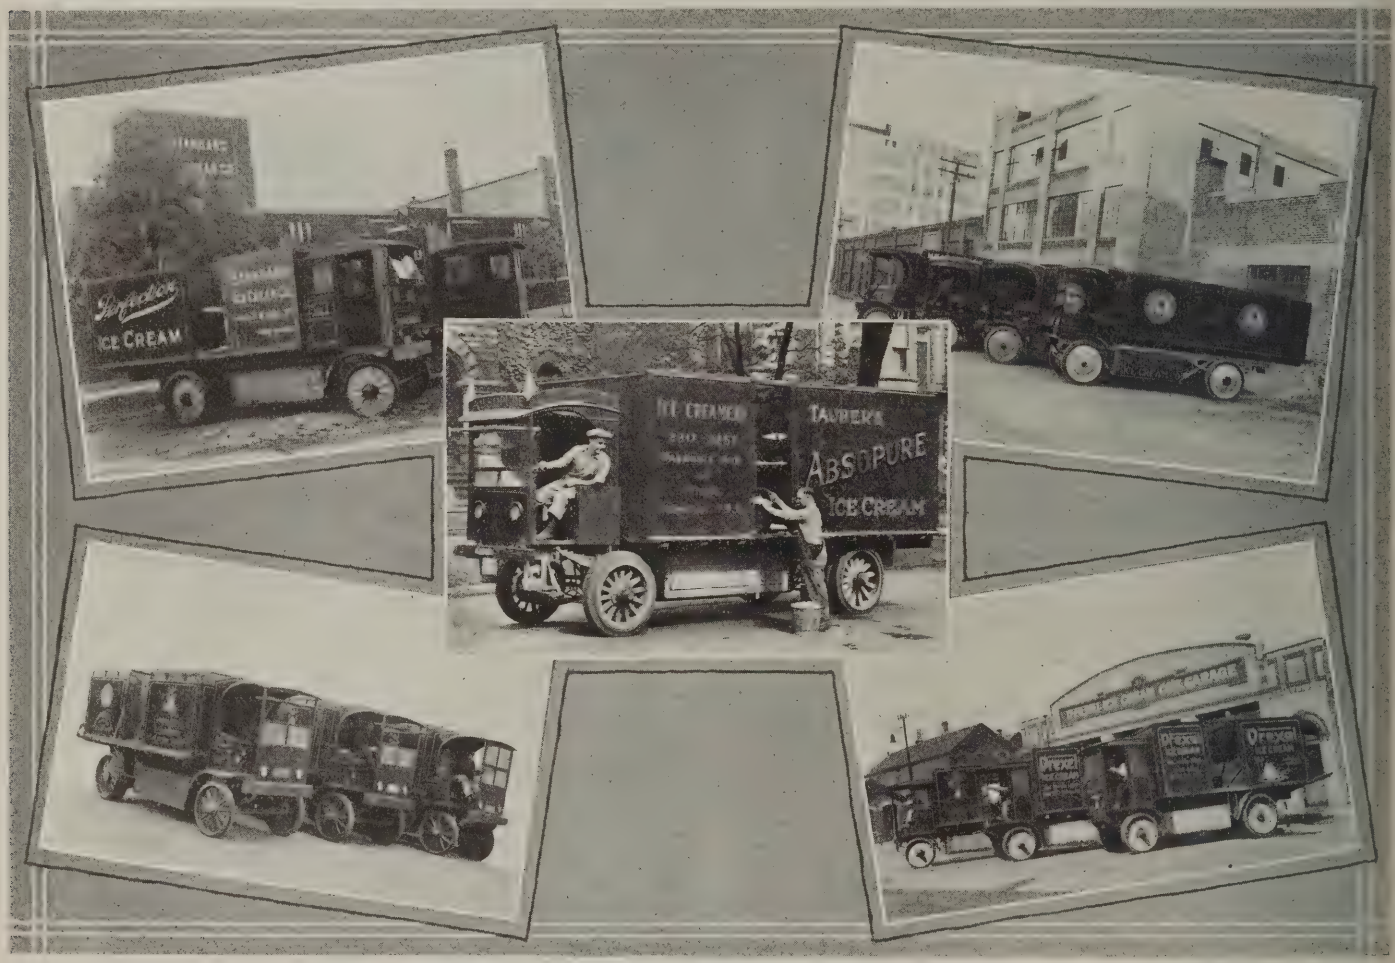
WALKER ELECTRIC TRUCKS

LOWEST TRUCKING COST ON CITY ROUTES

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.



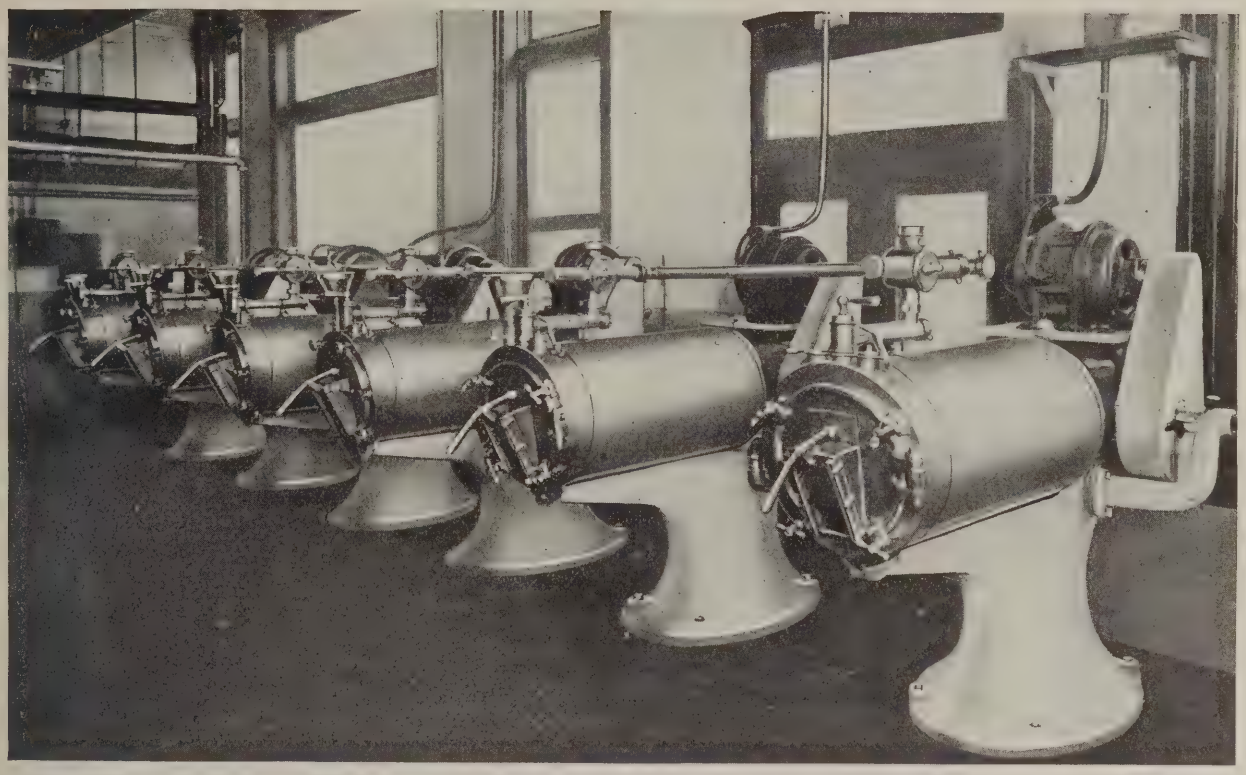
ice cream plant, beside which the cost of current for the trucks is a small item. In all probability, due to this condition, electric trucks in the service of ice cream manufacturers are costing probably only between 1½ to 2½ cents per k.w. hour to charge.

AN ICE cream manufacturer in Chicago, employing 14 electric trucks, has replaced 48 horses and 3 gas trucks and is now using nothing but electrics. In so doing the delivery cost has been cut in half. Two men do the entire work in connection with the upkeep of his fleet. It has been found that two men can overhaul three electric trucks in the same time required to overhaul one 3½-ton gas truck. The former does not require an overhauling oftener than every two years while the gas truck needs overhauling much oftener. In Chicago, 75 per cent of all ice cream manufacturers have already adopted the electric truck.

In addition to its inherent ability better to stand overloading—the manner in which rugged electric trucks have stood the gaff in the ice cream industry is in striking contrast with other types of delivery construction—special electric truck bodies have been designed to take care of the drainage of salted water.

In the case of a New Jersey ice cream manufacturer, electric trucks have bodies designed to have drainage of the salted water from the melting ice carried clear of all metal work so that rust will not cause destruction and, therefore, very rapidly deteriorate the vehicle. The decks of the trucks were first covered with tar paper, with the seams lapped, which was carried up the sides of the bodies to a height of about six inches, the seams being filled with tar. Galvanized sheet metal was fastened to the front and sides of the bodies to a height of 36 inches. The tar paper was covered with longitudinal wood flooring. At the front ends of the floor holes were cut, pipe nipples inserted and rubber hose attached to take care of the drainage.

Electric truck manufacturers point to the following reasons why electric trucks reduce delivery costs on frequent-stop delivery routes. Yet, in pointing to these inherent characteristics, they urge users to select delivery equipment on the basis of transportation and cost analysis. The electric truck, according to the manufacturers—



Electrics operated by manufacturers of Chicago and Cambridge.

You'll Get Quick Action

If you want one or several Emery Thompson Ice Cream Freezers — just as quick as rapid transportation can get them to you — send in your order. YOU WILL GET QUICK ACTION.

Emery Thompson Freezers

Hardly ever before have ice cream factories been so taxed to keep up with the demand for high grade ice cream as this spring of 1925. That means an increased demand for Emery Thompson Ice Cream Freezers. The refinements made on the standard horizontal models for this year meet with the approval of the ice cream factory manager. The excellent service rendered by Emery Thompson Freezers throughout the industry is creating a powerful impression in our favor. Almost invariably, an E. T. owner's next machine is another Emery Thompson. More new foreign customers than ever before are going on our books. Of course the practical reason for this may be witnessed by viewing with your own eyes a battery of Emery Thompson's, such as you see in the above illustration, and talking with the management—but you can get a fairly clear idea of Emery Thompson efficiency, speed, economy, and durability if you have our catalog on your desk before you.

Ren Manufacturing Co.

R. E. NAUMBERG, President

520 Main St. Winchester, Mass.

"The electric truck serves a definite transportation need," was the report made by the Advertisers' Service Bureau of the A. W. Shaw Company, upon completing, recently, a survey of motor truck experience. The following were given among its advantages over gas trucks:

Easier to handle in crowded traffic
Better for frequent stop hauling
Lower cost of upkeep
Less likely to be laid up for repairs
Controlled speed prevents reckless driving
Cleaner—quieter—without offensive gas odors
Lower insurance rates

Some of the advantages over horse-drawn vehicles are:

More deliveries per dollar invested
Give more days of service annually
Free from stable odors
Better advertisement for owner

EVERY ice cream manufacturer owes it to himself to select that delivery equipment which will minimize his delivery costs, which will give the most efficient and dependable service. The same unit cannot be used on every route; the ice cream manufacture must consider on the basis of transportation and cost analysis whether the gas truck or the electric truck is best suited for his conditions. There are still some cases, perhaps, where the horse will perform a cheaper service. The cost analysis, taking into consideration every item which rightfully belongs under delivery, will enable you to face the facts of delivery costs and to increase your profits by reducing these costs. If, as has been said, "more money has been sunk in the ice cream business than has ever been taken out in profits" is true, isn't it about time to reverse this situation?

THE MOTOR IN EUROPE.

America's experience in the field of motorized transportation will be a subject of international business consideration at the biennial meeting of the International Chamber of Commerce at Brussels, next June.

In a report to the Council of the international body the American committee credits the motor with these achievements in this country:

"It has relieved the congestion in the older portion of urban centers and created a vast suburban development.

"It has revolutionized the life of the farm.

"It has brought town and country into closer touch.

"It has permitted the extension of educational facilities and has widened the area of medical relief for scattered populations.

"It has permitted the farmer to remain a producer and not a marketer and transporter."

IS THE SMALL MANUFACTURER PASSING?

Is the small manufacturer being crowded out of business by his larger competitor, or is he putting himself out of business by his failure to realize the evolution in production and distribution going on about him?

The Department of Manufacture of the Chamber of Commerce of the United States says he has little to fear if he fights the inroads of time by adapting his plant to meet changing conditions. His field of operation might become more restricted, but within it he is stronger than he would be if it were spread out. He is in closer touch with conditions and the needs of his trade.

But the mortuary tables of business show that the small manufacturer must be as alert as his bigger brethren. The blame for failure rests upon those who fail, not upon the more successful and larger manufacturers who succeed.

The Innovation of 1925

A

Directions

First decide upon a Standard of cream fat and the correct milk solids, not fat, for the desired butterfat. Every Ice Cream Mix should be in proper balance to assure texture and eating desirability of the finished product. *Proposed formula may be submitted to our Service Department for comment.*

How to Produce a Pleasing EGG-CUSTARD Consistency and Flavor.

For every 100 lbs. of Ice Cream Mix, use 14 to 16 oz. of CUSTARD-MIX, extended in 1 lb. of sugar, which stir thoroughly into 1½ qts. of milk and allow it to stand for at least 30 minutes, (*sugar and milk so used being part of the adopted mix*). Agitate the CUSTARD-MIX solution again before pouring it into the pasteurizer. The best results will be obtained, if added 20 to 30 minutes prior to homogenization or viscolization, the holding temperature not to exceed 145 degrees. Age, flavor and freeze as usual.

The Impruv-Mix Company *2460 Amsterdam Ave.,* New York.

Custard-Mix

S

The above is a fac-simile of our CUSTARD-MIX label.

We now have two distinctive and meritorious products—IMPRUV-MIX and CUSTARD-MIX. They are not to be used conjunctively, as the former is the basis of the CUSTARD-MIX.

We will supply experimental quantities in the following units:—5 lb. package at $4.00; 10 lbs. at $7.75; 15 lbs. at $11.00; 20 lbs. at $14.00. Prepaid Parcel Post.

Manufacturers' Campaign to Make Friends For Ice Cream

Printed Matter Used Largely in Merchandising Efforts—Sales Contests Are Becoming Popular—Radio and Cross-word Puzzles Adopted

EFFORTS toward merchandising are centered largely upon printed matter—house organs, circulars, etc. The popularity of this method of driving home sales thoughts to dealers, and food value to the ultimate consumer, has been pushed to a great extent in the last few years.

It is interesting to note just what different ice cream manufacturers are achieving through the medium of house organs, both to dealers and ultimate consumers, and The Ice Cream Review has found it worth while to study the results that come of this work.

Going through some hand-picked house organs that have been collected from different ice cream manufacturers in the past few weeks, we come across some interesting sales efforts. In some of the house organs the work is centered upon the salesmen of the ice cream manufacturers, in others upon the retail dealers, and many manufacturers go straight into the home with their story. The divisions of press merchandising efforts seem to be directed under these three groups.

Sales contests are directed by the Belle Isle Creamery Co., Detroit, and a recent issue of The Organ tells of a meeting of the salesmen held one evening early this spring, at which prizes were awarded to the most successful salesman for work done since the inauguration of the sales promotion campaign.

In the general discussion that took place at this meeting, covering the work that has been accomplished during the fifteen months that the sales promotion movement has been underway, it was brought out by one of the speakers that the campaign has been very successful. He said:

"The New Method, which the Belle Isle Creamery Company has adopted, consists of a series of letters and educational booklets to the school children on each man's route. The salesman first visits prospective customers on his route and obtains the names of a hundred or more school children, to whom these lectures are to be mailed direct. In his first visit the salesman presents the housewife with a booklet about milk. This creates a good impression to start with and, as the messages continue to come to the children, coupled with an occasional visit by the salesman, the making of the sale progresses rapidly. By this method the efforts of the salesman, the co-operation of his company, and the aid of the children who receive these messages, are all combined in one great force, and many sales are thus certain to be completed."

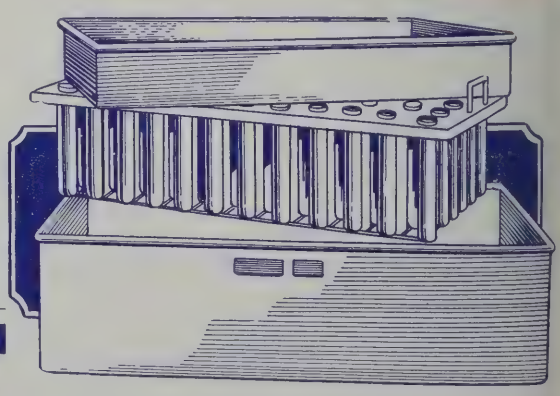
He explained this campaign as being in reality a "campaign of making friends." It is his company's desire to win the hearts of the children, and when this is

"Wishing for something good went out of fashion when Frozen Suckers came in."

Millions of kids in all parts of the land will be made happy during 1925 with FROZEN SUCKERS. Every one a mouth full of satisfaction.

Installing RADFORD'S FROZEN SUCKER UNITS means a 300% profit maker for you and a satisfactory profit for the retailer.

Tune in on profits—ask us more about this outfit.



Remember this — If it wasn't a good thing we would not be boosting it!

Valentine Machinery & Supply Co.
552 Wrigley Bldg., Chicago, Ill.

The Valentine Frozen Sucker Mold

The Valentine Frozen Sucker Mold requires no extra filling pan or unsanitary drip pan—tubes are made without overflow holes, thus doing away with dripping syrup and mess—no possibility of syrup spoiling brine or brine spoiling syrup—each tube can be completely submerged in brine, insuring uniform freezing the entire length of the Sucker—made of highest grade acid and rust-proof, imported dairy tin and Monel metal. The price is only $29.50, F. O. B. Chicago, terms 2% ten days, net 30 days. The Valentine Spill-drain costs $8.50 but only one is needed for the average size plant and only two for the largest plants. All Valentine equipment is sold under money back guarantee as to quality and performance.

The only easy, rapid, and sanitary method of making "Frozen Suckers."

done, it is believed the good will of the parents are automatically gained.

VERY satisfying results are reported for a campaign recently carried out by the Arctic Ice Cream Co., as related in "The Arctic Circle," the company's house organ. This campaign, which ended March 14, succeeded "beyond our fondest expectations," to quote the house organ, which went on to say,

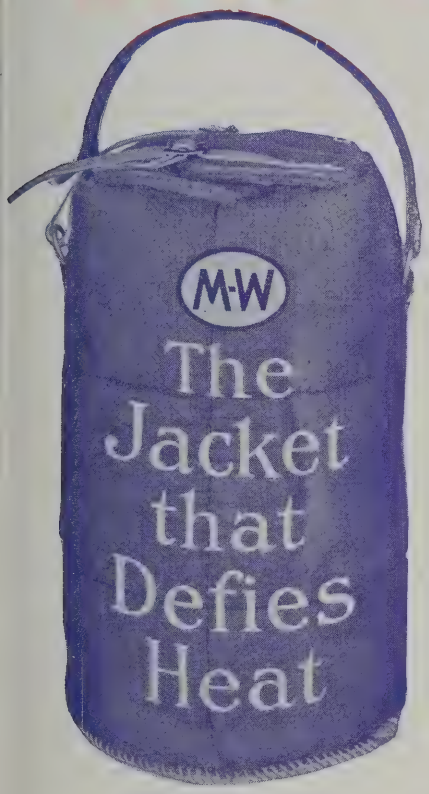
"When our ads appeared, hundreds of people went out of their way to take home a brick to the family. Beautiful window posters announced the brick from windows and back bars and helped materially to draw new patrons into our dealers' stores. The popularity of chocolate-almond ice cream no doubt is due to the wonderful chocolate flavor we have developed in our ice cream, while crisp, roasted almonds just added another ingredient loved by everyone. This campaign ended March 14. Another success scored by our program of merchandising events which we inaugurated to help our dealers grow!"

In keeping with the spirit of St. Patrick's day, the company featured a shamrock center brick on March 17. The green shamrock center was flavored with pistachio and burnt almonds, while the outside brick was white vanilla ice cream.

At this writing, the company is about to launch some new store display advertising pieces and, we are told, that special effort must be made this year to "display it consistently and where it will do the most good."

THE housewife is told some good general ideas on what the Decatur Ice Cream Co., Decatur, Ill., can design in the way of ice cream novelties, in a special pamphlet issued by that company. The pamphlet is beautifully illustrated with novelty designs. On one page of the booklet the company gives an ice cream mould calendar, which gives suggestions for appropriate moulds for special occasions. The calendar follows:

January	New Year's	Bell, Candlestick
February	Lincoln's Birthday	Lincoln Bust
	Washington's Birthday,	Cupids, Heart, Valentine
	Valentine Day	Log and Axe
March	St. Patrick's Day	Shamrock, Harp
April	April Fool	Animals, Goat, etc.
	Easter	Bunny, Chickens, Lily
May	Mother's Day	Carnation
	Decoration Day	Flag, Shield
June	Flag Day	Flag
July	Independence Day	Liberty Bell, Flag, Shield
September	Labor Day	Flag, Horn of Plenty
October	Halloween	Witch, Apple, Cat
November	Armistice Day	Flag
	Thanksgiving	Turkey, Football
December	Christmas	Santa Claus



AN INTERESTING idea on creating public interest in ice cream comes from Columbus, Ga., where the Muscogee Ice Cream Co. recently made arrangements for getting members of the public to familiarize themselves more with this modern industry. Arrangements were made with a local pharmacy to hold what the company called an exposition of a mechanically cooled soda fountain with an iceless cabinet built in.

The Muscogee Ice Cream Co. sent out invitation cards, and each recipient was invited to bring a group of from three to five friends to the store, where the exposition was held from March 20 to April 5. The iceless cabinet was exploited in this invitation as providing "better goods, better service, lower cost, no loss."

Radio is becoming popular in many lines of industries and the ice cream industry is taking to it in different parts of the country.

The Caum Ice Cream Co., Altoona, Pa., gets out regular post cards announcing concerts over radio from its plant.

EVERY AD IN THE REVIEW HAS AN INTERESTING MESSAGE FOR YOU.

Minnesota ice cream manufacturers have jumped into preparations for cone week with both feet. Starting out with an early rush as they did last year, when cone week was inaugurated, the manufacturers of the Gopher state are out this year to make this occasion the means of selling a lot of ice cream through the cone.

The week of May 10 to 16 has been set as National Ice Cream Cone Week. Ice cream cone posters, bearing the dates of national ice cream cone week, have been ordered by the Minnesota manufacturers, and will be distributed among dealers through the state. This has been done under the auspices of the Minnesota State Association of Ice Cream Manufacturers. The campaign conducted in that state last spring in the interest of cone week will be eclipsed by the activities this year, there is every reason to believe.

Last year everywhere one went in towns and cities in which the campaign was inaugurated, it was to be greeted with suggestions to eat an ice cream cone. Virtually every dealer's store bore an ice cream cone poster in St. Paul and Minneapolis last year.

Special care should be taken by the ice cream manufacturer to see that each and every ingredient entering into its composition is fresh and wholesome. With this in mind, we will manufacture a wholesome product at a reasonable price, and thereby steadily create an increasing number of ice cream eaters.

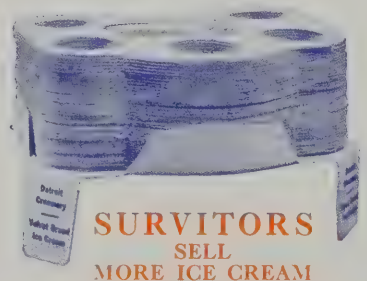
What I mean to say is this, that under such conditions, people will form the habit of eating a saucer of ice cream or a cone once or twice a day, as they have formed a habit of drinking cocoa-cola or other products. —From Southern convention remarks by M. J. Costa.

BIG FELLOWS AND LITTLE FELLOWS.

Our task today, as I see it, is not so much the education of the large manufacturer as it is the smaller ones. The big fellow has been over the rough places; he has sailed in stormy weather and in fair, and knows the pitfalls. His accounting system is such that he has costs at his finger tips. Not so with the smaller manufacturer. He thinks he knows more about the business than the big fellow will ever know, and his imagination has led him to believe he can sell his product at a cut price and get rich. Everything goes fairly well while his equipment is new, and his volume is up, but let bad weather come and reverses confront him and replacements be necessary, and additional capital be required, he then gets in a hole and bankruptcy follows.

If the smaller manufacturer in this country should ask me for advice, I would say: "Follow the big fellow. Go out of your way to make him your friend, and your pathway of life will be smoother and your exchequer better filled with material things."—From Southern convention address by Ben C. Brown.

The trend of this industry is just the trend of every other industry. It is the progressive man, it's the man who can finance himself and the man who can organize himself and shape himself to do what might be called a small thing in a big way. The ice cream manufacturer finds himself just where all other men in all other industries find themselves today.—From Illinois convention remarks by Ross Woodhull, first president of Illinois association.



Five million pounds of edible gelatine are consumed annually by the ice cream industry in its products.

THE ICE CREAM INDUSTRY AND LABOR.

Personal contact with employees is a vital factor in developing the best relationship between employee and employer in the ice cream factory, it was declared in an interesting address before the Mississippi convention last January by A. A. McLeran, Tupelo, Miss., speaking on the subject of "Mutual Interest of Employer and Employees."

Labor should be developed in the ice cream factory the same as an ice cream manufacturer develops his trade territory, declared Mr. McLeran, and he added that in his opinion "a mere wage increase is very seldom sufficient to bring forth the best there is in a really high-class man."

This personal relationship matter is particularly important in a small business, it was pointed out in an address at the same time by V. L. King, Westpoint, Miss., who added, that a small ice cream manufacturer cannot have various department heads as do the larger enterprises, and consequently—

"More dependence and responsibility must be placed in individuals. Just the absence or dropping out of one man affects the entire organization. In this connection I think it of prime importance to impress upon each member of the organization the importance of regularity, promptness and efficiency in his particular job, for it is by such effort on the part of each individual that the organization morale is maintained. This means the proper execution of the day's business and adds satisfaction to both employer and employee, for the conscientiousness of having done a thing promptly and well adds pride to the employee in his work and merits the commendation of the employer and it should not be withheld.

"Most of us have a plant superintendent, and he in turn perhaps has an assistant, a man filling some position in the plant in whom authority is vested in the absence of the superintendent, and to whom during such absence, other employees understand they are to look for direction if it is needed. The proprietor or manager himself may have an assistant who is also filling a regular job in the office as secretary or bookkeeper, or some such position, who is familiar with the working of the business and understands the manager's mind working sufficiently well that he can fill his shoes in his absence.

"The folks filling these positions are key men, and make the backbone of the organization. Following right down the line, I like to have each man's position indicated in some way and arranged so there is some degree of promotion attached if he steps into the job just ahead of him. The promotion to be merited by ability, efficiency, length of service, or all of these, in the attainment let him feel in some way the promotion idea."

Mr. King related an interesting idea carried out at his plant. A plan was worked out whereby all the employees were let off every other Sunday, being explained by the speaker as follows:

"The superintendent suggested to me the idea of trying to let half of our force off every other Sunday. At first thought I didn't see how we could do it. I told him if he thought he could get by it was all right with me. He suggested that they use part of the day for church and Sunday school, and I know that some of them are doing it, and two at least have joined some local churches.

"In doing this, as well as closing the plant during the holidays, we of course, sent out letters advising our customers, telling them why and asking their co-operation. We did not have a single complaint, but instead, received a number of expressions from them complimenting us for it."

EXPERT TEACHES HOW TO DRESS ICE CREAM WINDOWS.

The Rochester Ice Cream Co., Rochester, N. Y., has engaged the services of an expert window trimmer to teach its salesmen the proper manner in which to lay out window displays. This is a step toward very intensive merchandising of the company's product. Karl B. Mory, director of sales and advertising for the Rochester Ice Cream Co., reports that results of this training by an expert window man "have been most gratifying."

Get Your Cans Ready Now

Facts About Fancy Molds

The process of putting up Ice Cream in styles new to the consumer, various sizes, shapes, etc.

*By T. G. Yaxis**

THE object of this article is two-fold, to explain the processes of putting up ice cream in styles which are new to the consumer, the various sizes of molds and the many possibilities which the different shapes offer; to explain briefly, with a few suggestions, how these molds may be decorated for different occasions. The demand for such ice cream could be made as great as the manufacturer would wish to supply; or in other words, it is as great as the manufacture is able to make it.

A big field is open to the ice cream manufacturer or dealer who will become acquainted with the clientele of the communities which he serves and who will make it his business to find out when celebrations such as birthday parties, weddings, anniversaries, showers for the bride-to-be, are to take place. It would pay him to become a social part of the community in which he lives.

*Dairy department, Massachusetts Agricultural College. This was prepared exclusively for The Ice Cream Review.

Besides the parties I have mentioned above, we all know that there are innumerable days on the calendar when people are likely to have celebrations such as Thanksgiving Day, Christmas Day, New Year's, St. Valentine's, Easter Day, the Fourth of July—and so on throughout the year.

Often times a hostess wishes she might have something a little different from the ordinary to serve her guests and when a mold of beautifully decorated ice cream is suggested to her, you may feel very sure she will take it in preference to just plain ice cream because she knows it will delight her company and that she will score "a hit" among her acquaintances.

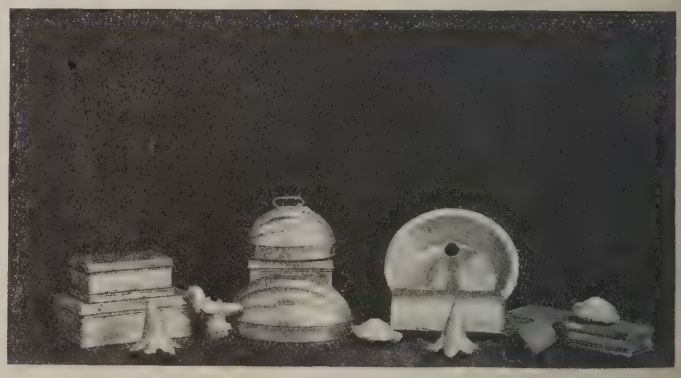

Fig. 1. Showing different types and sizes of molds.

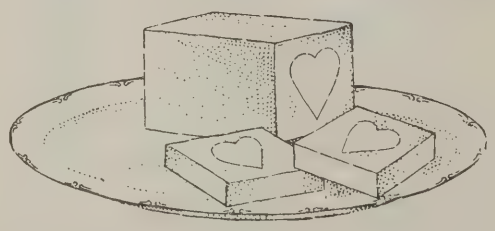
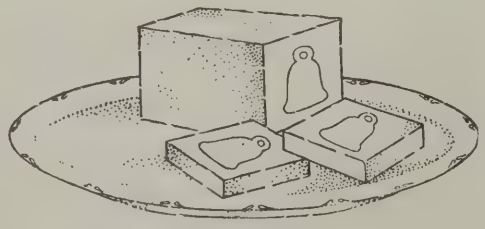


HAVE you ever attended a children's birthday party? At a recent birthday party which we gave for my seven-year-old son, this is what happened. Just before the birthday supper was served, the youngsters had become a bit tired of acting "company" and of being amused with games and contests and they began, as children will, to be a little uneasy. Well, they all bounced into the dining room with great glee, ate a simple supper and talked a great deal about the ice cream which was to follow.

At last the ice cream was brought in—a quart rectangular mold, decorated with pink rose-buds, green leaves, and festoons of white draped the sides. On top in pink was written my son's name and his age. With their eyes fairly popping out of their heads, and gasping with admiration, each one of those husky little fellows said, "It's most too pretty to eat."



The important part of all this is the fact that the mother of each child at that party made it her business to ask my wife all about that ice cream.

For the fancy ice cream trade the so-called melon mold is without doubt one of the best molds to make. It is pretty, is simple to fill, and because of its splendid

The Vacuum Pan with the Efficient Condenser

IT HAS been tried for years and has proved an acknowledged success. It is designed to condense the maximum amount of milk with a minimum amount of steam and water in the shortest length of time. Coils are of basket type, producing a rolling motion of the milk. The deep-dished bottom insures a rapid movement of the milk, and therefore, more rapid evaporation.

All over the country, Mojonnier Vacuum Pans are in successful operation.

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS—READ THEM.

lines it lends itself to such a variety of designs. For a formal or an informal party the melon mold can be decorated to follow out any color scheme which the hostess may have in mind. These molds are made in one, two, three and four-quart sizes. Presently I shall give a few suggestions on decorating melon molds. Then, too, the rectangular mold is one which is very well adapted to fancy decorating.

The round cake tins having a tube in the center are popular and unique. These molds have a particular charm for the hostess who prefers to serve cookies instead of cake with the ice cream. While fancy center molds do not require any fancy decorating they are used quite extensively. In the same way the individual fancy molds, such as lilies, birds, roses, automobiles, apples, other fruits, ear of corn, hearts, etc., etc., are attractive.

The Sultana roll is popular because it not only can be decorated as a whole cake, but also because the roll of ice cream can be cut and each individual piece may be decorated with some pleasing and fancy design. The individual four-ounce paper cups are a joy to the hostess who has no help—for each service is ready to be placed in its dainty container upon a platter, and when empty the container is thrown away. These individual paper cups are very popular for card parties.

THE filling for any of the molds mentioned above is prepared according to the individual taste of the consumer who knows what the ice cream manufacturer has to offer, and what he can make for special orders. The lining may be any of the plain ice creams, such as vanilla, chocolate or strawberry, or an ice may be used. Orange ice makes an unusually pleasing lining. To line a mold, the ice cream is slightly softened by allowing the container to stand in a warm temperature for a few minutes, the length of time depending, of course, upon the amount of cream there is to be softened. The softened ice cream is then taken out with clean hands and is spread very evenly inside of the mold. This lining is spoken of as the "shell." This "shell" is then filled with some fancy filling.

A contrast of colors should be aimed for when two different kinds of ice cream are put into the "shell." For the best filling I would personally recommend a mousse of banana, coffee, maple walnut, strawberry or any other flavor.

I mention mousse for two reasons; one is, it is easily and very quickly made so that short notice orders are satisfactorily filled; and the other is, that it is different and comparatively new to the ice cream consuming public.

The base of any of the above mentioned mousses is made up as follows: Whip two quarts of heavy cream stiff (but not as stiff as one uses for decorating); whip the whites of two dozen eggs stiff. Mix the yolks of two dozen eggs with two pounds of confectioner's sugar, add two ounces of vanilla, heat the yolks and sugar gradually until fairly thin, then chill in cold water. When cool mix with the whipped whites and the whipped cream. Add any other flavoring, such as banana, coffee, etc., as desired. Again the melon mold is strongly recommended for mousses.

The rectangular mold may be filled with two or more layers of different ice creams before being decorated. The shell with the filling, however, gives the better appearance. The small individual molds are generally filled with properly colored ice cream. The lily mold, for instance, is filled with vanilla ice cream colored fairly yellow; the rose mold with strawberry or cherry ice cream. It is needless to say that the aim of the decorator should be to carry out the color scheme in the flower molds to represent as nearly as possible the flower itself. Colors, judiciously used and properly combined, can be very attractive.

For the Sultana roll the molds may have for a "shell" pistachio ice cream with a tutti frutti filling; although other combinations are satisfactory. When Sultana rolls are cut into individual slices for decorating, from six to eight pieces to a quart are allowed. The individual paper cups may also be lined with any ice and filled with any of the fillings—but because of the fact that the mixture is not removed for the cups, the double fillings are not much used in them.

After the mold has been filled it is placed in an especially made galvanized iron box with a tightly fitting cover and packed in ice and salt or it is placed upon a tray covered with waxed paper and put into the hardening room until time for delivery. The individual slices are cut and placed upon a tray before being decorated. If one wishes the ice cream to harden quickly, the ice and salt method is the one to use.

Because of the fact that in preparing fancy ice cream it must be handled so much and so many times it is essential that absolute cleanliness be observed.

THE molds with ice cream are first very carefully dipped into warm water. The contents of each mold is then carefully emptied upon a clean sheet of paper. These molds of ice cream are next put into the hardening room or into an ice cave where they should remain until they are properly rehardened. This process should not take longer than from fifteen to thirty minutes. The next step is to prepare the cream which is to be used for decorating the mold or molds. For this some thick cream, which must be more than twenty-four hours old, is whipped until it is stiff; add a small amount of confectioner's sugar and mix well with the whipped cream. The next step is to divide the whole amount of whipped cream into as many portions as there are colors to be used for the decorations. Each separate color is then very carefully added to its portion of whipped cream. Care must be exercised if you want to have good, clear colors without streaks. Next make a number of funnels of ordinary clean wrapping paper, having at least one funnel for each color to be used. The operator is now ready to do the decorating. For this purpose a set of pastry tubes, such as are used by bakers and housewives, should be purchased, and the operator or decorator should become thoroughly acquainted with each tube or tip. With a little practice and patience he will become quite expert in handling these tubes in a very short time.

If a plain melon mold is to be decorated and no preference as to color, etc., has been made by the one order-

It Is Easy To Be Right About Insulation

Why should you experiment with insulation? No matter how simple—or how unusual—your requirements may be, competent, responsible advice will help you to get a better job. It will assure you insulation that is suited to your conditions, efficient, economical, permanent.

Problems like yours have been met before in this Company's experience and satisfactorily solved. The advantage of that experience and of years of research work is at your service. The best that is known today about cold storage insulation is available to you without charge or obligation through the Armstrong representatives.

There is an Armstrong office or agent in your city or near it. (See list on the left.) When you are ready to consider insulation, call or write the nearest office, or address Armstrong Cork & Insulation Company, 164 Twenty-fourth Street, Pittsburgh, Pa.

Nonpareil Corkboard Insulation

For All Cold Storage Rooms

ing, I would suggest using three cloors—pink, green and white whipped cream. The decorator, taking the tube with which he can make a leaf, can then execute all the way across on one section of the mold a green leaf and a pink rose-bud (with the rose-bud tube); the next row may be the same and so on all the way across. The white whipped cream may be put on the lines dividing each section. The effect of such a decoration is very beautiful and is bound to please even the most fastidious person. Or the decorator may put several green leaves on top of the mold and about the middle—then he may put a large rose on the leaves and several small roses on the sides of the center rose. The idea of the whole

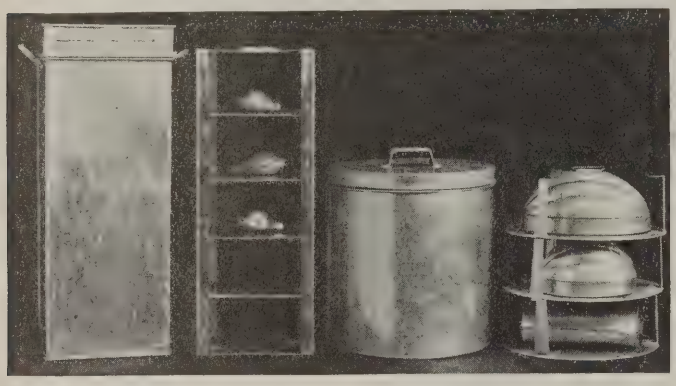

Fig. 2. Ice caves with compartments.

scheme is to have enough green leaves for all of the roses the sizes of the leaves varying according to the size of the rose-buds.

For special occasions such as birthdays, wedding anniversaries, Thanksgiving Day, Christmas, etc., the rectangular mold binds itself to more appropriate decorations. The birthday cake may be decorated as follows: The top is fenced in on four sides with any colored whipped cream and the inscription within the fence may be Happy Birthday, Alexander, or Birthday Greetings may be put on in contrasting colored whipped cream. For a Washington's birthday party the American flag may be done or alternating stripes of red, white and blue are effective. Then, too, there are many possibilities in varying the red cherry tree design with green leaves and the hatchet beside it.

For Thanksgiving Day what could be more appropriate than a pumpkin design surrounded with autumn leaves or who would not be charmed with a "Merry Christmas" inscription surrounded either with candles or small conventional evergreen trees, on a Christmas dinner mold. For a St. Valentine's party the cake mold having a hollow center is well adapted to a design of red hearts pierced with a red arrow, each heart being joined to the other with white lover's knots.

An Easter ice cream cake might well and effectively be decorated with individual lilies and foliage surrounding each flower. The individual cups are simple to decorate because there is only the upper surface exposed to view. On that a maraschino cherry surrounded with four green leaves may be placed thus making an exceedingly ornate dainty. The Sultana roll, by using a little ingenuity and having an ordinary amount of patience, has no limits to the designs which even an amateur can carry out in decorating ice cream.

MANY ice cream manufacturers hesitate about going into the business of making fancy ice cream because they have an erroneous idea that such creams are too much out of the ordinary to be packed and delivered safely and in perfect form. The cuts, Figs. 2 and 3, illustrate the simplest ways of packing any decorated ice cream for delivery. Care should be taken to have the ice cave absolutely water tight so that no brine can leak into the ice cream. For delivering but one cake or block of decorated ice cream the individual galvanized iron can, as illustrated in Fig. 3, is used.

A low, oblong tub, which can be easily made by any dairy supply concern, will hold any of the above individual packing cans. Care should be taken to have this can large enough so that the fancy mold can be placed in it without touching the sides. It is well to have a supply of these packing cans in various sizes on hand.

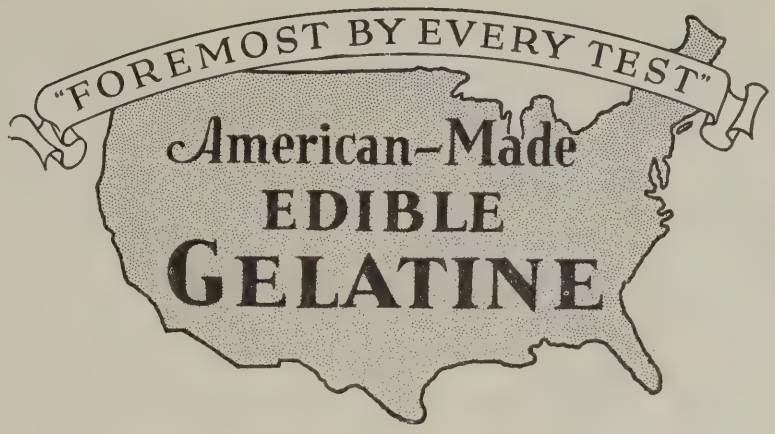

Fig. 3. Five gallons of ice cream fitted out for packing.

The other packing cans illustrated can be very easily and conveniently packed in large cylindrical tubs such as are ordinarily used in the trade.

JUST a word in regard to prices. Like any other commodity the prices for fancy ice cream vary in different localities. The public, however, expects to and is willing to pay more for fancy decorated ice cream. On the other hand, the manufacturer, if he is wise, will not make the retail price of decorated ice cream too high as compared with the retail price of plain ice cream. A one quart mold of fancy ice cream is retailing at present in New England for about one dollar and a quarter per quart delivered; this also is true of the one quart Sultana roll. The individual decorated slices are retailing at twenty cents per slice. Individual cups filled with an ice sell for ten cents a piece, while those filled with ice cream sell for fifteen cents a cup.

Once a manufacturer has established his reputation for making and decorating fancy ice cream as a side issue he may be sure to have as many orders for such ice cream as he will have time to fill.

WHY?

Many Ice Cream Manufacturers are now using only *American-made* Gelatine in their product.

Because—

It is made where government standards for purity, cleanliness and quality are the highest of any country in the world.

Because—

American manufacturers of gelatine are spending thousands of dollars to tell the public of the health value of gelatine products.

Because—

In every way, American made gelatine is "Foremost by Every Test."

Relation of Electrical Energy to Production Cost

Certain Changes Must be Made from Present Common Practices to Obtain Highest Efficiency, Expert Declares

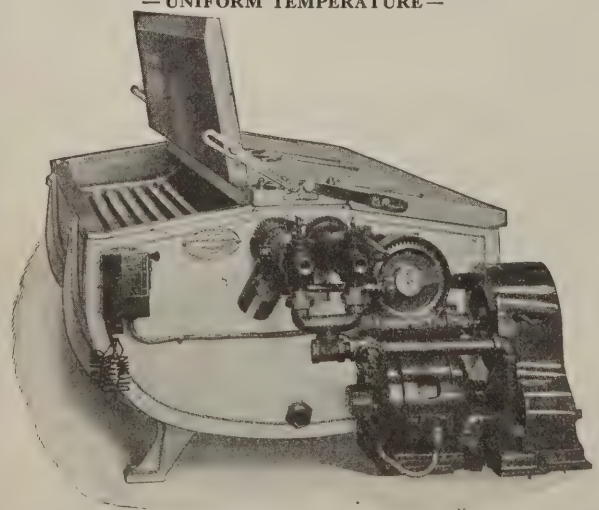
THE ice cream industry as a whole has given very little thought to the relation of electrical energy to the cost of production. Manufacturers who have taken the time to study out this proposition are of the opinion that it is questionable whether or not this electrical energy is being used most economically. Prof. G. D. Turnbow and A. W. Farrall of the University of California go even further in saying there may be no profitable uses in this available energy.

PROF. G. D. TURNBOW.

Data that these gentlemen have gathered on the subject have convinced them that certain changes from some of the common practices must be made "to obtain the highest efficiency."

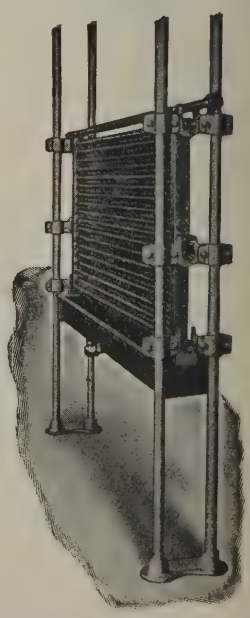
This data, brought out at the joint Pacific-California convention in an address by Prof. Turnbow, who, in asking that consideration be given to the effect of motors to the power factor, pointed out that—

"In an electrical system which has a low power factor, more current must be sent through the lines and motors, in order to transmit a given amount of power than would be necessary if the system had a higher power factor. This results in loss of energy in different circuits and causes a drop in voltage and causes undue heating of motors. Loss of energy in the form of heat occurs in all circuits even though no sensible heat is felt. These losses are proportionate to the square of the current. One of the principal causes of low factor is the operation of induction motors at part load. If we have only one motor in a circuit operating at part load, it decreases the efficiency of all other motor installations on that circuit, whether they be properly loaded or not.



"To illustrate the increased cost due to low power factor, let us consider a motor of medium size operating at two-thirds load and having a power factor of .81. This motor draws, for example, as shown by the watt motor, 7460 watts. On a 220 volt circuit this motor would draw 42 amps at 81 per cent power factor. If this motor had been operating at full load, the power factor should have been 86 per cent. In this case the current drawn would have been only 40 amps. If we go a step further and install a synchronous motor we may approach a unity power factor on our system in which case only 33.9 amps would be necessary to transmit the 7460 watts. Let us say that the resistance of our motor and connections is .31 ohms, which is equal to the resistance of 500 feet of copper wire of the proper size to carrying 7460 watts. If the motor was operating at 81 per cent power factor, the heat loss would amount to 546.8 watts. This is a continual loss. In case the motor is operating at 86 per cent power factor the loss is only 495 watts or a continual saving of 50.8 watts, over the loss at 81 per cent power factor. In case the power factor can be raised to unity (1) the loss will be only 390 watts, or a continual saving of 156 watts over the loss at 81 per cent power factor."

Another angle from which ice cream men are concerned with the size of the motor is that of its effect upon the power rate. Power companies, as a rule, base their rates upon the size of the motors, the greatest maximum demand over a 15-minute interval and the amount of energy used, we are told. A certain minimum demand charge is made for each horsepower of connected load, described by the speaker in the following table:



A TYPICAL POWER SCHEDULE FOR GENERAL SERVICE.

Rate: A.C. Service	Rate per k.w.h. for monthly consump. of			
H.P. of Connected load	first 50 k.w.h. per h.p.	next 50 k.w.h. per h.p.	next 50 k.w.h. per h.p.	all over 250 k.w.h. per h.p.
2- 9 H.P.....	4.0c	2.1c	1.3c	.9c
10- 24 H.P.....	3.6c	2.0c	1.2c	.9c
25- 49 H.P.....	3.1c	1.9c	1.1c	.8c
40- 99 H.P.....	2.6c	1.7c	1.1c	.75c
100-249 H.P.....	2.3c	1.5c	1.0c	.7c
250-299 H.P.....	2.1c	1.3c	.9c	.65c

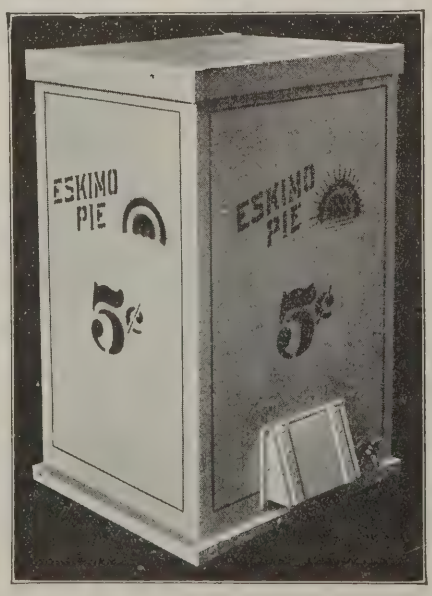
When the 5c Pie Brings a Profit

Only when production cost is low and sales distribution large can the 5c pie be counted on for profit.

This Combination Does It.



The Northwestern Cutting and Dipping machine cuts and dips 120 dozen pies per hour, and involves only an investment of $375.00 for the complete outfit.

The Northwestern Bar Cabinet is the silent salesman that makes wide distribution easy and practical.

Over 350 users now operate these units with success.

Write and learn more about how they do it.

NORTHWESTERN CORPORATION
MORRIS - ILLINOIS

Regarding this table, the speaker said:

"The above rates and minimum charges may at the option of the consumer be based on the h.p. of measured maximum demand instead of h.p. of connected load, providing the installation has a total connected capacity of at least 50 h.p., in which case the h.p. of demand on which the rates and minimum charges will be based will not be less than 20 per cent of the total connected load, but in no case shall the minimum be less than $50.00 per month.

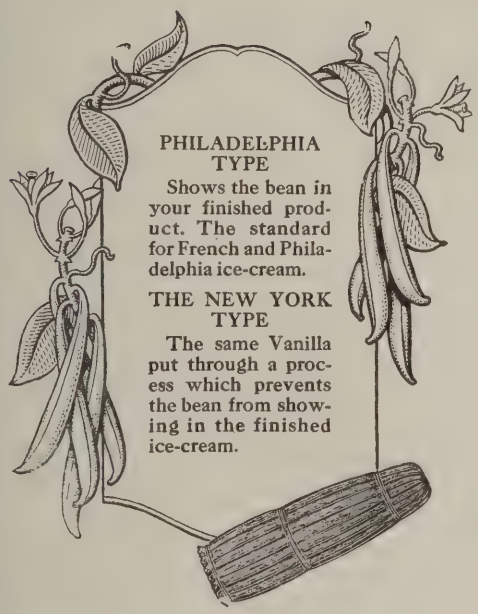
"The maximum demand in any month will be the average h.p. input (746 watts equivalent) indicated or recorded by instruments to be supplied, owned and maintained by the company and at the company's expense upon the consumer's premises adjacent to the watt hour motors, in the fifteen minute interval in which the consumption of electrical energy is more than in any other fifteen-minute interval in the month for installation of less than 750 h.p. and a 30-minute interval for larger sized installations or at the option of the company the maximum demand may be determined by test.

"It is evident, the greater the motor load or the greater the maximum demand, the more energy at higher power rate must be used before the lower rate comes into effect.

"An oversize motor, due to the heavy starting current drawn, will increase the maximum demand or your motors may be of the proper size and yet you are paying on a power rate which is higher than necessary because you start all of your motors at practically the same time, and since the maximum power consumption during any 15-minute interval is the basis for determining power rates, it is very likely the starting load which determines your rate. In order to lower this maximum demand, it is often possible to start your motors in succession and thereby spread the starting load over a longer period of time."

WITH regard to new methods in determining yield Prof. Turnbow declared that new applications and appliances for electrical energy are being found every day, stating that "during the past year there has been developed at least one new application, and a device to more nearly control the yield of ice cream." He then quoted Prof. Mortensen as follows:

"During the freezing process a considerable amount of air is incorporated into the mix, the air is beaten into the mix in the form of very small air bubbles or cells. The size of the air cell plays a big part in the final results. A small air cell is stronger than the larger, as the pressure within decreases as the air cell increases in size. You have possibly experienced at times that an ice cream of light and fluffy texture would settle in the container. Such an ice cream contains relatively large air cells. They are not strong enough to withstand the pressure from above. They collapse and the cell walls, consisting of several, crumble together, forming a coarse particle, and as a result thereof, ice cream which has settled in the container has always acquired a coarse texture.



"The size of the air cells is also of great importance for the reason that a great portion of the mix is taken up, forming the walls around these numerous air cells. The ice cream maker is usually obtaining the same overrun from day to day, which means that the amount of air incorporated into the ice cream is nearly constant. The finer we have the division of the incorporated air, the more mix will be required to form the air cell walls and there will be less serum left in a free state. The maker who is interested in producing a smooth ice cream should so standardize his mix that the greatest amount of serum will be fixed, with only a small amount of the liquid remaining in the free state.

"The size of the air cells is governed primarily by the viscosity and the specific gravity of the mix, as both the viscosity or the specific gravity increases the resistance toward the incorporation of air, and as a result it is incorporated into the mix or ice cream in smaller volumes and more finely divided, it is for that reason that more time is required to secure the desired yield when the mix is of higher viscosity or higher specific gravity."

A smile on the face of some sales people often reminds us of the top layer of apples in a box, or berries in a basket.

The BEST Vanilla Sells the MOST Ice Cream

Switch to Michael's Mexican and watch your sales go up!

Spend a trifle more to get genuine Michael's Mexican—your ice-cream sales will automatically increase—*as much as 25%*.

MICHAEL'S Mexican

"America's Flavorite"

There's no deep, dark secret about it. People simply eat more and more vanilla ice-cream when it is flavored with this mellow-mild, delicious flavoring, made from the Mexican bean. Don't take our word for it. Make the test. Know for yourself.

DAVID MICHAEL & CO., Inc.
Front and Master Sts. Philadelphia, Pa.

Make This Test at Our Expense

Place a trial order. Use all you can to give it a full, fair trial. If MICHAEL'S Mexican Vanilla Bean, Vanillin and Sugar Pulverized does not produce the finest vanilla ice-cream you ever tasted, return the remainder at our expense, and we will cancel the charge. DO this, by all means.

Bill Proposing Sale of Ice Cream by Weight Killed by Prompt Action

Committee Consisting of Manufacturers of Pennsylvania and New Jersey Show Jersey Legislature Why Practice Would be Unfair to Manufacturers, Dealers and Consumers*

PREAMBLE:—It is estimated that there are in the United States 3,300 larger and in addition over 2,000 smaller ice cream factories, with an annual output of approximately 300,000,000 gallons, representing an investment of about $300,000,000 with an annual turnover considerably in excess of this amount. The state of New Jersey contributes her proportionate share of the business of this great industry.

House bill 219, now before the New Jersey Legislature, requires that ice cream be sold by weight. We are advised that this bill is fostered by the Department of Weights and Measures of the State of New Jersey and by some of the retailers of ice cream in that state who contend that under the present method of dispensing ice cream they are unable to make a profit. Whether or not the selling of ice cream by weight is the solution of the retailers' problem is the question. In the end, all problems of the industry must be solved on the fundamental principle that any practice in manufacturing or in distributing which is impractical and uneconomical, and which does not accrue the public benefit, is unsound and cannot survive.

The question of selling ice cream by weight is not alone a problem of the retailers, it is a problem which greatly affects the manufacture, distribution, and dispensing of the cream, and therefore is also of great concern to manufacturers and consumers.

In analyzing this bill the following disadvantages to (1) manufacturer, (2) retailer, and (3) consumer, are apparent:

(1) DISADVANTAGES TO THE MANUFACTURER.

A.—Selling ice cream by weight will increase the cost of manufacture for the following reasons:

1. All empty cans must be weighed and marked. To mark tin cans is almost impossible. Paint, crayon and pencil cannot be used. Tags are impractical, because they are difficult to attach and they get lost in handling in the hardening room and on the trucks. Tags cannot be attached to lids because of the danger of lids being exchanged; furthermore, many cans have no handles on the lids.

2. The full cans must be weighed and the net weight determined and marked on the cans, which, as previously stated, is impractical.

3. It will be necessary to keep records of the weight of every can going into the hardening room.

4. It will be necessary to keep a record of every can loaded and to check the load. This extra work will delay the morning deliveries.

5. It will be necessary to check weights at time of delivery to customer, which will delay deliveries.

6. When driver returns remaining cans must be checked and records kept.

7. Complication of accounts with customers is sure to take place, with consequent loss of time and good will.

8. It will be necessary to change the method of keeping both manufacturing records and customers' accounts to pounds and ounces instead of gallons, making considerable additional work, not only in keeping the records, but in endless explanation to customers.

9. Full or part full returned cans must be weighed, both by the retailer and by the manufacturer, and credits issued for which the weight of the can is necessary.

10. Collectors' problems will be increased and complicated by many added controversies.

11. Daily inventory of stock is practically impossible, because cans of different weights stacked in piles in hardening room cannot be inventoried.

12. Owing to the slowing up of deliveries, extra trucks and men will be required.

B.—Difficulty to sell brick and cup ice cream by weight:

1. It is impractical to sell bricks by weight, because it is impossible to make them all uniform weights and it is also practically impossible to mark them with exact net weight on each package on account of the sanitary paraffined package used. The same difficulty also

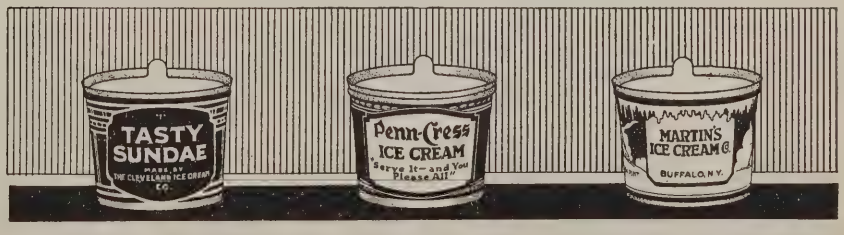
*Brief Pertaining to Assembly Bill No. 219, Introduced Into the Legislature of New Jersey, February 3, 1925. The brief was prepared by Fred Rasmussen, executive secretary of the National Association of Ice Cream Manufacturers, and Thomas Hall for the committee appointed at the Trenton, N. J., conference of January 28, 1925, this committee consisting of the following: W. H. List, Puritan Ice Cream Co., Newark, N. J.; George Brink, Crane Ice Cream Co., Philadelphia, Pa.; Mr. Kennedy, Abbott Alderney Dairies, Philadelphia, Pa.; Thomas Hall, Russ Bros. Ice Cream Co., Harrisburg, Pa., and Fred Rasmussen, secretary of the national association, Harrisburg, Pa.

The bill proposed an act regulating the sale or exposure for sale of ice cream, ices and kindred frozen products by avoirdupois weight, and providing penalties for the violation thereof.

9,000,000 less gallons of ice cream sold in 1924 than in 1923—

help overcome this loss by selling ice cream as they buy other foods—

Candies, Crackers, sugar, pickels, raisins, and other foods are not, in this present day of merchandising, sold from the barrel or in bulk. People demand packaged oods—they buy products sold in convenient form. The small size package of ice cream meets the demand—that's the reason more than 100,000,000 convenient size packages of ice cream have been sold in the past several months. The demand is increasing—the volume is growing.



The 10c package proves profitable for both the manufacturer and retailer. It is just the size for serving (in the package) on the home table, office, at social affairs, fraternal gatherings, at base-ball, amusement parks and road-side stands. It's what the people desire—meeting desire means increased sales volume. Use the Mono-made 10c size package, printed with *your* own specially designed label on the kup and on the lid, with *your* trade-mark and name prominent. Ask for samples and helpful suggestions.

KLEEN KUP

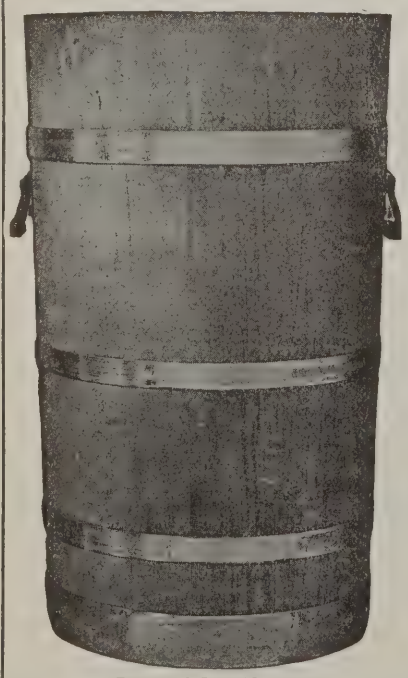
the package that sells Ice Cream—

Mono Service Co.
NEWARK NEW JERSEY

applies to individual brick slices. A difficulty also arises due to the fact that bricks decrease in weight during storage.

2. There are numerous cups and packages which are now machine filled and which it is not possible to fill with such machine to exactly the same weight. Hence each package, if required to be sold by net weight, must be weighed individually, the expense of which would make the sale of such packages impractical. If the proposed bill becomes a law, machinery used for this purpose would be obsolete. It must be kept in mind that special packages can only be marketed at a reasonable price on the basis of quantity and production.

(2) DISADVANTAGES TO DEALERS.



A.—Selling ice cream by weight will increase the cost to the dealer for the following reasons:

1. If purchasing and selling by weight the dealers will require one set of scales for checking purchases and another for retail sales.

2. It is difficult to weigh ice cream in small quantities because of its viscous nature. Being a frozen product, the exposure to warm air and the ordinary method of weighing out ice cream is objectionable from a sanitary standpoint.

3. Selling ice cream by weight because of the extra time required is objectionable to the busy retailer and as expressed by several retailers, "If compelled to sell by weight, they will quit handling it."

4. Difficulty in explaining variation in volume for the same weight. Customers will object to boxes not being full. If the ice cream is soft, the volume for a given weight will be small, while if it is hard it may be as much as 50 per cent larger. Customers buy by the eye, and object to small volume.

Patented Jan. 21, 1923

Texas Barrel Company has installed one of the largest Barrel, keg and Ice Cream Tub plants in the South and will be ready to serve its tub customers at an early date. Texas Barrel Company had the misfortune to lose its Tub plant by fire in August but in its place has arisen a magnificent factory capable of serving a wider territory.

Service and good workmanship our motto.

TEXAS BARREL COMPANY
Box 665 HOUSTON, TEXAS

5. Unless the retailer is willing to purchase scales and weigh all cans received there will be an increased opportunity for drivers to be dishonest with the dealers, by charging for more than delivered and pocketing the difference.

6. Complication of account with manufacturers.

7. As ices have greater weight per gallon than ice cream, it will be necessary to establish a different price per pound.

8. The retailers, like the manufacturers, will have an increased cost, due to handling by weight, and will have a lot of explaining and controversies with customers because of difference in volume of the same weight. In handling ice cream by weight we have assumed above that all standard cans are filled and marked with the actual weight. Another way would be to fill a definite weight in each can, the weight in all cans of the same size being alike. This would make the inventory problem simpler, but would introduce the objection that the retailer would discriminate against the heavier ice cream, which showed less volume in the can, refusing to take it. What would the manufacturer do with it, when returned?

B.—Selling ice cream by weight was considered in California and was found after investigation to be impractical as set forth in the following telegram from Charles C. Johnson, state treasurer of California, and formerly superintendent of weights and measures, who wired to the secretary of the joint committee on definitions and standards in Washington the following: "Upon learning you will have a hearing upon matter of defining proper butterfat and weight standard for ice cream and thinking my experience and investigations into question as former superintendent of weights and measures in California extending over considerable period might be of assistance. Can assure your committee that after spending over one year making investigations with assistance of all prominent dairy and food officials in California we found that fixing a weight standard for ice cream entirely impractical and abandoned any attempt of introducing regulations for such enforcement."

Upon inquiry of the California, Southwestern States Ice Cream Manufacturers' Association in regard to experiences of retailers selling by weight, the following telegram was received: "Only California retailers who tried selling by weight were druggists Los Angeles and vicinity who abandoned idea three years ago. Too much trouble explaining to public why containers were not packed full. Several arrests for slack filled packages. Idea not popular with public. Dealers convinced of the impracticability as demonstrated by tests by officials state department of agriculture and dairy division, University of California."

(3) DISADVANTAGE TO THE PUBLIC.

A.—Selling ice cream by weight will increase the cost to the public, as enumerated under disadvantages to the manufacturers and dealers. The public will pay not only the increased cost to the manufacturers and dealers, but also an additional profit to the dealers, which is contemplated by the change to selling by weight. It is estimated that this increased cost will be from five to seven cents per quart.

B.—There is no advantage to the public in selling by weight as weight has no relation to quality and food value, as will be seen from the following table prepared by Professor R. N. Washburn, University of Minnesota. All food value is contained in the solids; the table shows that the amount of total solids may be greatly varied.

A great addition
to our plant is being rushed to completion
—35,000 square feet more
of manufacturing space—promising
an early increase of 50%
in Nizer Ice Cream Cabinet production.
This is in accord with the
Nizer policy of serving well the
ever growing list of leading ice cream
manufacturers who specify Nizers
exclusively for their retailers.

Visit the Nizer plant when you attend the National Ice Cream Manufacturers' Convention, Detroit, Oct. 19th to 24th.

NIZER

Reg. U. S. Patent Office

Automatic Electric Ice Cream Cabinets

Made in 4, 6, 8, 10 and 12-hole sizes—water or air-cooled—single or double row—self-contained or remote.

Nizer Corp.: Detroit, New York, Atlanta, Chicago, St. Louis, San Francisco
A. P. McLendon, Waco, Texas. Linde Canadian Refrigeration Co., Montreal

Copyright, 1925, Nizer Corporation

as in the first column, and the weight of a gallon of ice cream may vary very considerably, as in the third column, and yet the total solids or food value in each gallon may be the same, as given in the fourth column; therefore, weight is not a measure of value for ice cream.

Total solids in %	Weight of gallon of mix, lbs.	Weight of gallon of ice cream in lbs.	Weight of total solids in gallon of ice cream, lbs.	Per cent of overrun
30	8.80	5.0	1.50	76.0
33	8.85	4.5	1.50	92.6
37.5	8.90	4.0	1.50	122.4
42.8	8.95	3.5	1.50	156.0
50	9.00	3.0	1.50	220.0

C.—If sold by weight the public is without any method of checking ice cream for festivals, fairs, churches, picnics, fire companies, lodges, family orders, etc., while with the present method of selling it is possible to check up standard measure.

D.—Sales by weight will be detrimental to the quality of ice cream, because there will be a demand from the retailers and public for the largest possible volume for a given weight, and because of the slowing up in manufacture and dispensing on account of deterioration, due to changes of temperature.

GENERAL STATEMENTS:—Since the beginning of the industry, ice cream has to be dealt with in terms of volume. Irrespective of any laws which may be passed, requiring ice cream to be sold by weight, it will still be sold in the same containers and the quantity sold will be judged on the basis of volume rather than weight.

Because of the fact that the public purchases largely by the eye, and because of the fact that weight is not a measure of value or quality and because of the lesser expense involved, volumetric measure in the sale of ice cream, is a more desirable method of dispensing than selling by weight.

The impossibility of standardizing bulk for a given weight would result in continuous arguments between manufacturer and dealer and consumer, tending to demoralize the business and destroy good will.

The few who have tried and approved the sale of ice cream by weight and the more intelligent, capable dealers who naturally would succeed, and furthermore, did it because they wanted to, and not because they were forced by law. Some people are always desiring to try new things.

Under the present methods of selling ice cream, if for any reason a dealer feels that he is unable to dispense bulk ice cream at a profit, he has the alternative of selling package goods where a fair and definite profit is assured.

Any retailer is privileged to sell ice cream by weight if he prefers, whether the manufacturer sells by weight or volume, the total cost to the retailer of his week's supply will be the same. If, therefore, a retailer buying ice cream by volume desires to sell by weight, all that it would be necessary for him to do would be to determine the average weight of ice cream purchased and from this establish a selling price per pound, which would net him a reasonable profit. The majority of ice

Summer Sales Are Money Makers

The Anderson Eskimo Pie Machine which automatically cuts - dips - wraps, and the Universal Machine which cuts-dips are distributed solely by us. Information on request.

On the back of this page is reproduced one of the monthly series of placards our licensees receive free.

Amusement parks, ball games, beaches, and summer resorts, where crowds congregate, offer a golden opportunity for selling Pies in large volume this summer.

At Coney Island last season during the summer months alone over 5,000,000 Eskimo Pies were sold; in Central Park, New York City, over 1,000,000.

Let people watch the Pies being made before their eyes. Put an Anderson machine in a window and crowds will gather to watch it work—and to buy the Pies as fast as they come streaming out.

Now is the time to make your arrangements for these summer concessions.

Our Service Department will be glad to help you.

Keep your Eskimo Pie Department running this Summer. It will pay.

cream dealers and manufacturers do not want to sell by weight; why, then, pass laws to force them to do so?

Different retailers frequently sell ice cream at prices varying from 40 to 70 cents per quart, and it is a well known fact that some dealers who are not making a profit, are trying to gain trade by underselling their competitors.

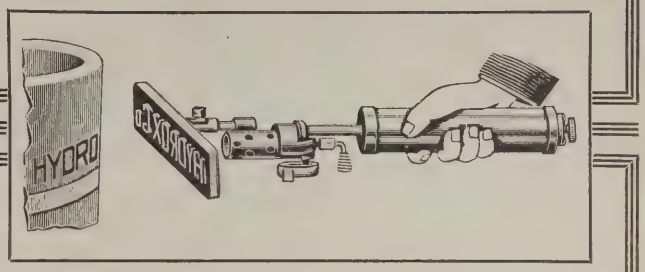
In analysing the losses of which the dealer is complaining, it is found that in many cases he is giving the customer an excess measure, in order to please him and outdo his competitor, and it is also due to his insistence on keeping the ice cream too soft for ease in dipping. Investigation conducted by Professor H. A. Ruehe of the University of Illinois shows that 80 per cent of the shrinkage loss to retailers is due to dispensing too soft ice cream and nearly 20 per cent due to overrun.

Ice cream supplies are generally purchased in the spring for the season, and undoubtedly there are large quantities of package supplies contracted for by manufacturers and dealers which would not be practical for distributing ice cream by weight, and which, therefore, would be a total loss.

The administration of this law in thousands of places in New Jersey, if the law is to be enforced, will be an added expense to the people of the state.

No state in the Union has a law requiring ice cream to be sold by weight and such a radical change should not be put into effect and made compulsory, without a thorough investigation of its practicability.

It is also a question whether the manufacturers and the retailers, under the proposed bill, could not mark permanently all containers with a minimun, low, safe weight, and determine a corresponding price per pound, and thus defeat the object of the framers of the bill.



OUR GROWING PROSPERITY.

The steadily advancing prosperity and growth of productive capacity within the United States is one of the best indices of our competitive powers in international commerce. We hear much of mass production and of its vast powers in determining competitive ability but we do not always realize the tremendous advantages which the United States actually has in this particular connection. Our manufactures were valued at about $25,000,000,000 in 1914; their value in the recent census of 1923 was indicated at approximately $60,000,000,000 —a most impressive increase even after allowance is made for liberal price changes during the decade. In pig iron, for example, the gross tonnage produced by the United States in 1913 was 30,500,000 which was practically the same as the combined output of the United Kingdom and Germany, namely 29,300,000 tons. By 1924 this predominance had been almost doubled, that is to say, the American output was 31,000,000 tons, whereas the combined British and German output was only 15,600,000 tons. A similar situation prevailed in ingot steel in which the American production in 1913 was some 31,300,000 whereas the British and German combined total was slightly in excess of 26,000,000 tons. By 1924, however, the American production had risen to 37,500,000 tons whereas the production of our European rivals was slightly under 17,000,000 tons.

You can get somebody to sell you anything you want, if you use "The Ice Cream Review" Want Department.

Don't Replace Your Tubs *Until* They Are Worn Out

Prevent the loss of your property by branding your tubs, cartons, packing boxes, tools, etc., with the Everhot Branding Tool. All doubt as to ownership is settled. Your name is put on to stay. The temptation to pick up and carry away your property is removed, for the Everhot Brand cannot be changed or erased.

And further, wherever your property is seen—on station platforms, in your dealers' stores, or on delivery trucks—your name will be a perpetual advertisement of your business.

The Everhot can also be used as a soldering iron or blow torch.

Write today for complete information!

The Everhot Tool can be used anywhere — any time. The fuel is ordinary gasoline. The flame will keep the brand hot for hours of continuous use. Cost of operation is very low.

Ice Cream In International Commerce

Since Development of Industry to National Scope in America, Peoples of Other Continents Are Beginning to Cultivate Appetite for Uncle Sam's Favorite Dish

FROM a national industry in America ice cream has developed into an international dish. Exporting of ice cream mix to the Orient has been carried on by manufacturers of the Pacific Coast for years. The Latin Americans are learning how to make our ice cream and serve it commercially. England is taking lessons from our industry. American machinery, flavors, etc., are going into Germany, Japan, and other countries every year.

Ice cream is destined in the not distant future to become a factor in international commerce, according to the more recent consulate reports received at the department of commerce. The frozen dish of cream is winning its way in many foreign lands where cold foods had hardly been heard of a few short years ago.

There are government officials who see this country as the great ice cream exporter of the world, for with a market assured, the ability to send it to foreign ports profitably will be worked out. This may not seem as fantastic as it sounds, for such close neighbors as Mexico and the thickly populated South American and Central American countries to the south of us are ice cream hungry and the various substitutes for the rich, tasty ices and creams of the United States fail to satisfy.

These same government officials point out the fact that already there are many opportunities for American manufacturers of ice cream supplies, equipment and machinery to develop a large market in these countries that are showing a rapidly increasing consumption of the frozen dainties.

WHAT might well be termed, the spread of the "ice cream idea" is shown in some of the reports, a few of a confidential nature, that have recently been received by the department of commerce, the bureau of foreign and domestic commerce.

Mexico is rapidly acquiring the ice cream eating habit. Mexico City now has five modern ice cream factories that deliver frozen cream to the house for four pesos a liter, which is approximately $2.00 a quart. But in addition to these large establishments that endeavor to maintain a high grade there are numerous small street venders that sell from carts. In Guadalajara and the larger towns of the district ice cream is a favorite dish.

Panama, due to the proximty of the Americanized strip of country, is a large consumer of ice cream. During the last part of 1923 a large company installed a plant in Panama solely for the manufacture of ice cream. The capacity of the plant is about 300 gallons of ice cream daily. From this central point the cities of Colon and Panama and the Canal Zone and the army and navy posts are supplied. It is estimated, however, that auxiliary plants may soon be required to supply the year round demand.

CUBA is a more experienced connoiseur of frozen cream than some of the other Spanish countries due to influence of the American tourist trade. Practically all the important cafes make their own supplies in the way of ice cream and in addition to these there are numerous small makers in nearly all the larger cities and towns, who make cream which is peddled on the streets by venders with small carts in Cienfuegos.

The people of Cienfuegos as well as other parts of that consular district do use ice cream extensively.

Ice cream is sold by the cafes at from 20 to 30 cents or more a glass. The street venders sell it in a form of brick-package—a card-board box of a small size—or in a cone, at the price of five cents. There is no regular wholesale business in ice cream except that when the street venders buy of the makers they usually pay 50 cents a liter which makes 16 packages or cones.

There is an adequate supply of fluid milk of a medium quality, but there is very little cream and the milk is not separated. The ice cream is made from imported evaporated milk which is cheaper in Cuba than the milk from the local dairies.

BRAZIL, according to Commissioner M. A. Cramer stationed there, is acquiring the ice cream habit. However, the ice cream sold in Brazil is not the same as that sold in this country. It contains very little milk or cream and is more like American ices. There is only one place in Rio de Janeiro, the capital city, where ice cream of a quality found in our large cities can be obtained, and that is manufactured by a Greek, a former resident of the United States, who does a good business and his product is exceedingly popular both with resident Americans and Brazilians.

Brazil undoubtedly offers a field for some enterprising American who is able to adapt himself to local conditions. In Sao Paulo there are 12 large ice cream parlors that do a good business with the indifferent product that is sold.

Chile is learning that the taste of ice cream is most

Accumulative Indicator

AN added and exclusive feature of the KRON Scale. Not necessary to add the separate weights—the second indicator does that for you automatically and instantly, always giving the total at a glance. Saves work, eliminates mistakes, avoids disputes.

The American Kron Scale

Just Load and Look

WITH modern methods of making ice cream mix it is highly essential To have speedy, accurate and practical weighing apparatus.

Speedy—to handle large batches in limited time; its action is instantaneous; it saves half or more of your weighing time.

Accurate—so that you will know that each batch contains the proper amount of each ingredient.

Practical—so that it will save labor, simplify the recording of weights, and lower your weighing costs.

The KRON Scale gives you *all* of these advantages, and speeds up the entire plant. It has no springs to put it out of adjustment. Its uncanny accuracy eliminates the possibility of dispute, and removes your weighing worries once for all.

If you will tell us briefly the capacity of your plant and your weighing requirements we shall be glad to recommend the proper KRON equipment for your use and tell you exactly what it will cost you.

There's a KRON Scale Exactly Fitted to Your Needs—Let us Tell You About It

ATLAS MAPLE FLAVOR

is a pure vegetable compound that possesses all the appealing aroma of the sugar maple, yet is more practical for use in the manufacture of ice cream than true maple.

Its delicate flavor persists throughout the hardening process with no suggestion of that artificial taste characteristic of ordinary synthetic maple flavors.

ATLAS MAPLE FLAVOR contains the proper amount of coloring to produce a true maple shade and is the finest maple flavor on the market, proven by comparative test and popular choice.

ATLAS MAPLE FLAVOR as a part of your product means complete satisfaction, increased consumption and a growing business.

The ideal Maple Flavor for the Ice Cream Manufacturer.

ESTABLISHED 1851

agreeable. During the hot months the cafes are full of patrons, particularly between 4 and 6 in the afternoon, and ice cream is sold that is made on the premises. Even during the cold months there is some demand for it which could be greatly increased.

Other South American countries are interested in ice cream, for they are users of cold drinks and an iced food has little opposition, if rightly introduced. In many of the cities ice cream products have first been introduced by way of the bar where strong drinks are sold and thus the women and children have not been reached.

THOSE who have visited London and the chief cities of Great Britain a score of years ago would be agreeably surprised should they visit these same cities today and wished a cooling dish of ice cream. The English are slow to adapt their own food habits to new introductions, but once finding a product agreeable they learn the making from the ground up.

Alfred Nutting of the American Consulate in London says that "a new departure in the retail sale of ice cream has been initiated in London within the past three months. In place of the consumer purchasing from the makers at the shops, of ice cream blocks (bricks), which are advertised to remain firm and good for two hours after opening, a London firm has organized a method of house to house delivery."

NOW IT'S IN CHINA.

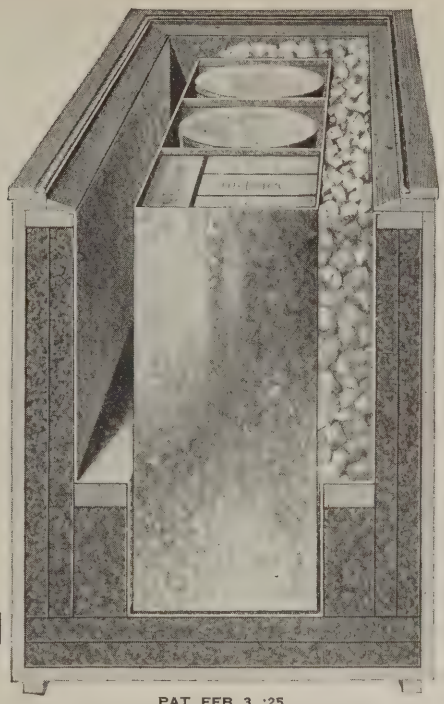
Ice cream eating has become such an institution in America that when Americans go abroad the habit goes with them. And so on the continent today the American can appease his cravings in the innumerable ice cream shops. But how about those travelers who go to ice-creamless China? They no longer have to miss their ice cream—for the great American dish will now be available in Shanghai.

The Navy Y. M. C. A. Building in Shanghai, the headquarters of the United States fleet in the Near East, is being equipped with an up-to-date soda fountain. It is of Tennessee marble, 16 feet long, and has two attendants, 13 syrup pumps, six crushed fruit bowls and four five-gallon ice cream cabinets. No longer will the American sailors and marines have to miss that good old American delicacy.

—Colonial Mixer.

They advertise it by saying that their cream is "identical with the world-famed American cream ices, and contains a large percentage of pure cream and must not be confused with the mixture of frozen corn-flour or custard so often sold as 'ice cream.' It is made by a special process under the most hygienic conditions, the mix being pasteurized and then run into special glass enameled vats, each holding one thousand gallons. . . Before leaving the factory the ice cream is hardened in special rooms at a temperature well below zero."

House-to-house delivery is made by means of distribution in insulated boxes fitted between the side wheels of tricycles that are peddled along. The firm attempting this system that might be adapted in this country, has a fleet of 400 in London alone. These vending tricycles are supplied from central depots.



Householders who desire to purchase ice cream signify it very much as eastern housewives notify the ice delivery trucks. In London they place a card in their windows that bears the initial of the manufacturer and the carts stop. Delivery by this unique system is three times a day. Orders are also taken for larger quantities to be delivered at some time in the future.

The prices at which ice cream is retailed under this plan are as follows:

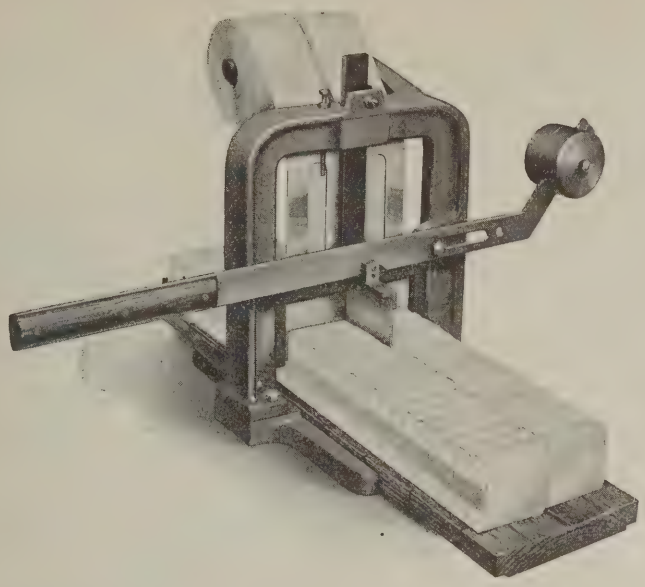
Standard cream bricks (sufficient for 4 persons) 1s.
Standard cream bricks (double size).....1s.8d.
Brickettes .....2d.
Special chocolate-coated bars .....4d.
Tubs with spoon .....4d.

Note: A shilling (s.) is about 25 cents and a pence (d.) is about 2 cents in our values.

The standard cream bricks are wrapped in greaseproof paper and enclosed in a carton; the 2d. brickettes are wrapped in similar paper, as are the chocolate bars, while the tubs consist of small waxed cardboard pails with a disk top.

The department says that "since the close of the war, ice cream manufacture and consumption has increased by leaps and bounds. A leading London manufacturer estimates that a total of 35,000,000 gallons was produced during 1923 as compared with 20,000,000 in 1922 and that a steady yearly increase of about 25 per cent may be anticipated in the future."

JAPAN has taken quickly to frozen cream products. Commercial Attache E. G. Babbitt says there are several concerns manufacturing ice cream for wholesale distribution. As there is much milk produced around the district of Tokyo the manufacturers find "it more profitable to make and ship the ice cream into the city than to send in the milk." There is a widely known drug store operated by a Japanese who learned his trade in Los Angeles. He is catering to the popular demand in making both ice cream and ices.



"Fresh milk and cream," he states, "form the basis of most of the ice cream manufactured, but there is much adulteration. Cornstarch, gelatine, and ice cream powders are used to some extent; also eggs. The best is made with imported flavors. According to unofficial estimates there are 4,000 retail establishments with a total yearly consumption of 6,570,000 gallons. The larger restaurants use electric power in the manufacture of ice cream, some hotels use the ammonia process, but the smaller employ hand turned freezers. There is a demand the year around."

It cannot be emphasized too strongly that America may well study the foreign side of the ice cream business for there are opportunities on every hand—flavoring extracts, manufacturing machinery, advertising material, containers, freezers, methods and many others.

A Traveling Ad

The advertising value of a truck is well demonstrated in this picture. An attractive truck is a traveling ad.

Anderson "Cut-Wrap" Machine

"It Wraps Slices as it Cuts"

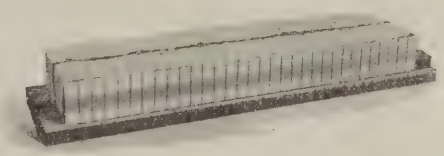
Simple—Practical—Fast Low Priced

In every plant there is considerable cutting done. You know, cutting by hand, with a knife, is a slow, tedious job—an expensive operation to you.

With an Anderson you will be able to work much faster and save enough time to quickly repay for machine, and it will be a big help on those days when you are rushed for time.

It will quickly cut quarts always of uniform size. It cuts pints two at the time so this, too, is done very rapidly.

The same machine also cuts slices quickly and of a size determined by you—one machine can be used for cutting any number of slices to the quart.



The Cut-wrap slice idea is a good one and appeals to plants large and small, and especially the Cut-Wrap quart idea which is ideal for serving Churches and Socials or large gatherings. Hundreds are being used all over this Country.

Send today for literature and price.

Quarts Are Cut Uniform

Individual Bricks—Wrapped 3 Sides

This Reads Like a Fairy Story

30% of the patrons produced milk under 5,000 per c.c.
53% of the patrons produced milk under 10,000 per c.c.
77% of the patrons produced milk under 50,000 per c.c.
95% of the patrons produced milk under 100,000 per c.c.

(These figures are the record of 146 raw milk producers supplying one of the largest cities in the United States. The entire 146 use this simple way to sterilize.)

It costs no more than you pay now to get as fine a product every day as shown in the record above. Good operators know what it means never to have rotten, fishy cream, or dirty, high acid milk. You can't make a reputation for yourself or your plant until you do eliminate them.

We co-operate with you to get patrons to produce purer milk and cream.

Costs You Nothing

Our plan works with any number of patrons. It costs you nothing. Results are noticed the first day.

It is a proved success. For our chemists have worked on hundreds of farms just to find what prevents pure, sweet milk and cream being produced every day.

Even Big Plants Amazed

Recently one of the biggest plants in the West began getting bad milk and cream. They had hundreds of patrons. The trouble seemed everywhere. Our plan was tried. In a few days the raw product was up to standard again.

What We Do

We print letters carrying your name. They are special, tested letters telling farmers how to cheaply sterilize milking machines, cans, separators, utensils, cows' udders, etc. Valuable booklets on effective sterilizing are also sent FREE.

Farmers will follow these more successful ways of sterilizing because the methods are practical and simple.

You get the benefit daily in a better raw product.

Do This

Simply mail this coupon. Fill in the number of your patrons. You will get letters and valuable booklets for the entire list, FREE and POSTPAID by return mail. Send them out with the next checks. Results follow immediately. Sign and mail coupon now.

WHAT DOES IT COST?

IT IS only in comparatively recent years that we have learned how really little the average manufacturer knows about the cost of making ice cream. Manufacturers once showed the disposition to fight against the burden of cost accounting, and when it is taken into consideration the number of worries that the manufacturer has on his hands the most of the time, this is not strange.

But cost accounting is not necessarily a burden—at least, not as large a burden as many manufacturers think—and the expense is not a great drawback, according to Edward A. Burt of Portland, in an address before the joint California-Pacific convention.

Mr. Burt went on to show how, even if the expense were heavy, it might "well stand you in hand to know just how low you can sell ice cream should the occasion ever require it through competition or otherwise."

He continued:

"The first of these elements of cost is material: It requires no extra bookkeeping to keep account of the material that goes into ice cream because every mix man makes a report showing the exact number of pounds of the different materials that he uses for the batch, hence, it is only a matter of multiplication to determine the cost of the batch, and of course, the freezer man makes a report of the gallons of ice cream manufactured from this batch of mix, therefore, it is only a matter of division to ascertain the cost per gallon of the materials. That is what we call cost accounting and I cannot conceive a manufacturer not getting this information daily, otherwise how could he possibly know anything about the business."

Regarding the second element, labor, Burt asserted that he never heard of a business of any kind that does not keep a payroll record, and furthermore—

"You can readily see that without changing your present bookkeeping system in the least and without any added expenses you already have the foundation laid for a cost accounting system, hence there remains only the third group of expenses that we call "overhead" and these are the expenses that should receive our most careful and sincere attention.

"This group comprises every item of expense in the entire business except material and labor, such as heat, light, power, water, repairs, insurance, taxes, freight, advertising, automobile expense, office expenses and salaries, sales expenses, commissions and salaries, administration salaries and expenses, depreciation, bad debts, and the like. Taking it for granted that you know exactly what your material and labor cost is per gallon of ice cream manufactured, you are still short of being safe unless you know what all the various expenses of overhead amount to."

The speaker defined profit as the margin between selling price and cost, which he said is self-evident.

While he thinks there may be some business men working for the fun of it, he does not believe "any man will stay in the ice cream business and work every Sunday and holiday, put in long, hard hours of work, and have the worries that naturally go with such a business, except for one reason only—profit."

The present lack of information existing in the ice cream industry demands a cure, and the only cure that the speaker knows is the cost accounting system for "the entire operation of your business." He set forth a workable cost accounting system as embodying the following principles:

1. The cost of installation must be reasonable.
2. The cost system must not involve "red tape."
3. It must not require a change in the bookkeeping system.
4. It must be maintained at a minimum cost and without excess labor.

THE WALRUS CABINET

(Mechanically Refrigerated)

(Patented)

THE above illustration shows a "tilted" view of the No. 3, four compartment, Walrus Cabinet.

Each compartment in all three sizes of Walrus Cabinets is oval in shape and will accommodate two five-gallon packers of ice cream —one packer in front of the other.

There are two Sliding Lids over each oval compartment. The Sliding Lids are light in weight, but very sturdily constructed, and are easily and quickly shifted, as compared with the ordinary round, bulky, weighty and cumbersome type of lift-off lids.

Dispensing from the front or rear row of packers in the Walrus Cabinet is easy and most convenient. Compare the ease and labor saving of these Sliding Lids with that of lifting off a five or six pound bulky round lid several hundred times a day.

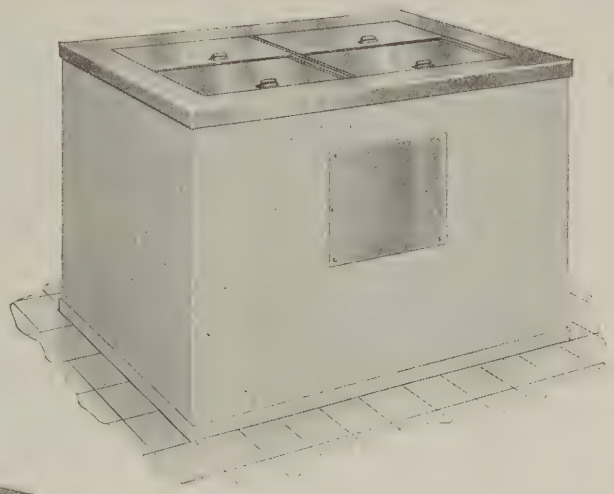
The Walrus Cabinet has a sturdy, strong body construction. The linings are of unusually heavy copper. The top and lids are made of heavy, pure, solid nickel silver. The Sliding Lids slide on nickel silver bars. The heavy copper lining is mounted on a flooring of artificial stone, which affords a substantial foundation and prevents punctures and breaks in the copper lining, which often occur in the ordinary type of cabinet when heavy packers of ice cream are carelessly dropped into the cabinet.

The facings on the Walrus Cabinet are not of heavy marble, that would "sweat," stain and break—or white glass, that would break easily—or enameled iron, that would chip and rust and can not be refinished. They are of aluminized Redwood, specially treated, and can be refinished, and thus renewed, easily, quickly, and at small expense.

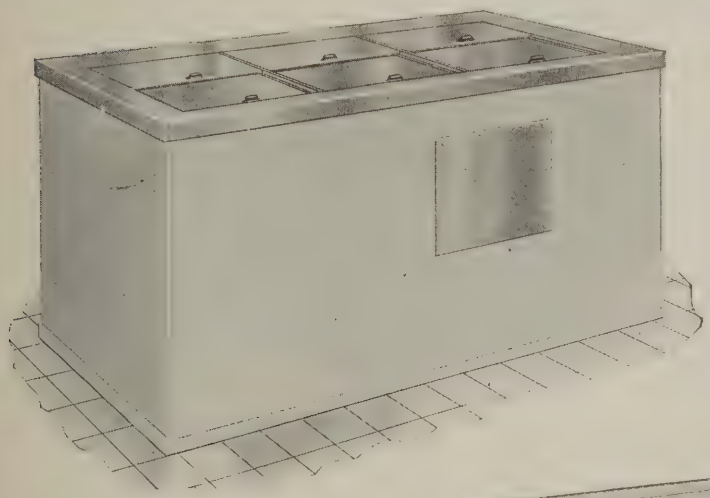
The Walrus Cabinet conforms in height and width to the height and width of the standard Soda Fountain workboard.

Any one temperature desired may be generated and automatically maintained throughout one cabinet.

The Walrus Cabinet pays its cost with what it saves in labor, reducing to a minimum the loss in bulk of ice cream and preventing spoilage of perishable goods.



PRICES AND TERMS QUOTED UPON APPLICATION

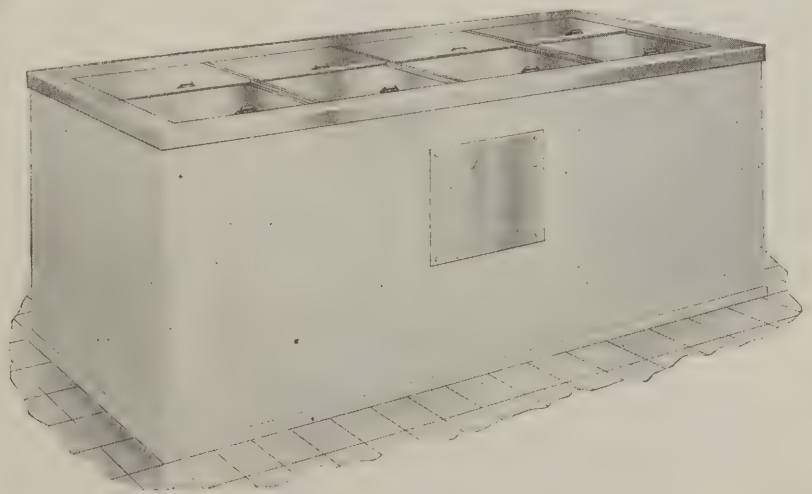


THE WALRUS CABINET

(Made in three sizes only)

NO. 1 WALRUS CABINET
(Two Compartments)
39″ Long, 30¾″ Wide, 30″ High

Each Walrus Cabinet is equipped with a complete Frigidaire Mechanical Cold Storage or Refrigerating Plant. The Frigidaire equipment is put into operation and adjusted without additional charge, if the purchaser resides within a fifty mile radius of a Frigidaire Service Station. Also, six months' free service is included in the price of a Walrus Cabinet, under the same conditions. Frigidaire is guaranteed against all mechanical defects. Many thousands of Frigidaires are in use.



NO. 2 WALRUS CABINET
(Three Compartments)
52″ Long, 30¾″ Wide, 30″ High

Walrus Cabinets have many advantages in construction, convenience, durableness, appearance and efficiency. They eliminate entirely the use of ice and the labor and muss incident thereto. They function automatically and perfectly. They save perishable foods, prevent most of the shrinkage or loss of bulk in ice cream, are a protection to health and are not any more expensive to operate than the iced Cabinets.

NO. 3 WALRUS CABINET
(Four Compartments)
65″ Long
30¾″ Wide
30″ High

Manufactured Only By

WALRUS MANUFACTURING COMPANY

Appraisal—Its Relation to Costs and Insurance

How the Best Auditing Concerns Are Applying Their Expert Accountancy Ability to Working Out Systems of Cost Comparison and Control

ANALYSIS and distribution of costs is receiving the close attention of business men at the present time to a greater extent than ever before, according to William F. Worcester, president of the Rau Appraisal Co. In an address before the past convention of the Illinois association he pointed out that since similar lines of business are drawing closer together and are adopting standardized methods of accounting, it is possible to make comparisons which are "enlightening to the wide-awake manufacturer."

He went on to show that the best auditing concerns are applying their expert accountancy ability to the establishment of costs and the working out of systems of cost comparison and control. The manufacturer, instead of being merely interested in bookkeeping to enable his income tax report to be prepared, is now turning his attention to the costs in his various departments as compared with their importance, and between various months and years, checking more and more closely in the distribution of his overhead, Mr. Worcester pointed out.

He continued:

"It is not my province to invade the prerogatives of accountancy. At no time has appraisal in the slightest degree depreciated the importance of accountancy in the necessary recording of business transactions. By the same token the modern accountant is recommending the utilization of appraisal skill in the ascertainment of actual replacement and depreciated values of permanent plant properties. For the last 25 years appraisal companies, with their organization of architectural and equipment engineers, their libraries of catalogs, price lists and data, their trained pricers and appraisal writers and summarizers, have been called upon to make accurate, disinterested valuations of properties.

"It is obvious that valuations must be prepared which are staple, reliable and correlative. For the distribution of overhead it is necessary to ascertain the correct value of the equipment in the different branches or departments of a business. The accountant can then proportion the indirect expense correctly. 'But how shall we enter appraisal valuations in our books?' is the question constantly asked. The answer is that you don't have to enter appraisal valuations on the books. You can use the appraisal values as corroborative, as far as the books of account are concerned. On financial statements a separate notation as to the appraisal values (in comparison with the book values) should establish beyond a doubt that the plant values shown on the books of account are extremely conservative. However, if you do enter the appraisal sound valuations on the books the difference between the former book values and the appraisal plant values should be carefully recorded separately as 'Contingent Reserve' under Capital Surplus."

He gave several illustrations in simple round numbers which, he said, manufacturers can readily check up in their own establishments, substituting their own values:

"Suppose your book value of plant and equipment showed $50,000 and your balance sheet showed a net profit of $10,000, which would be 20 per cent on the plant investment. Apparently this is perfectly satisfactory. But remembering that your book values are predicated on old costs less depreciation, you turn to your appraisal just made or recently brought down to date and you find that, due largely to appreciation, your sound values are really $100,000 for the property you are carrying on your books for half that sum. The $10,000 profit has shrunk to 10 per cent in comparison with your real investment, based on what it would cost today to replace your property.

"If your cost sheets carry a charge for 'Interest on Investment' using the same illustration before mentioned $50,000 on your books at 6 per cent would be $3,000 for this item, whereas on your real investment (in the illustration) the item should accurately be twice that amount, were you to consider what it would cost today to replace the propery, instead of its original cost. True, the accountant will properly advise you to carry on your books the original cost and depreciate so much per annum. This is the way you show your valuation for federal taxation purposes, but in no other use is such valuation proper. How much better it would be to have real values on your books instead of perhaps the fictitiously low values based on cost of years ago and depreciated down to a sum entirely inadequate as representing your true permanent plant and equipment.

"However, the only way that you can substitute actual values for the low book values, on the books of account, is to carry the difference in a separate 'Contingent Reserve due to appraisal,' so that you can return to the low book values in making out tax schedules. In this way you can use the correct sound values for insurance, statements to banks, mercantile agencies, stockholders, basis of incorporation, increase of capital stock, merger, reorganization and cost system—recognizing your plant at its proper valuation, instead of having your books carry as plant and equipment a sum so low that you feel like apologizing every time you look at it."

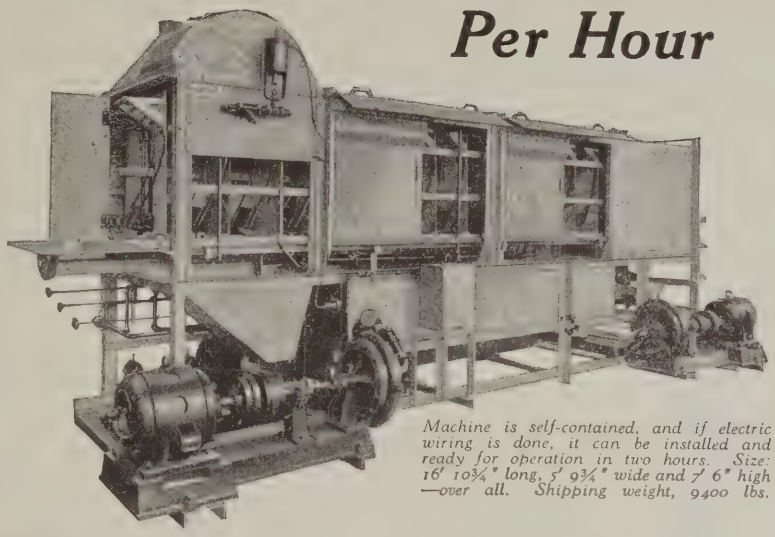
ONE of the "necessary and fundamental questions" to be decided, we are told, is that of depreciation. When a manufacturer is merely making a statement to himself, with no one else to satisfy, the items of plant and equipment can be written on the inventory with whatever depreciation he pleases, or ignoring it entirely, and no one ordinarily may raise a question. Just as soon, however, as any necessary use occurs for those figures, so satisfactorily explained to himself, when they

Don't Let Out of Date Equipment Throttle Your Business

DID you ever stop to analyze your business to find out what holds up output and volume, and what it is that wastes time and "cramps your style?"

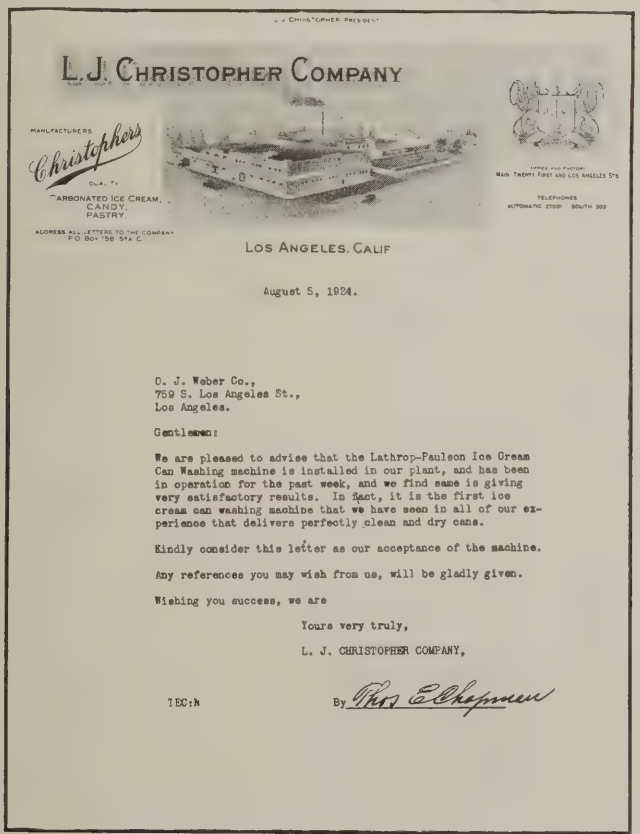
Like as not it is the old style ice breaker which you bought ten or fifteen years ago, before you began to grow. You now need a Model 49J Extra heavy, large capacity

CREASEY ICE BREAKER



like the one shown herewith. This new motor-driven outfit can be set in just about the same space as the old "played-out" machine, and you can also reduce labor in handling ice cakes and broken ice by changing the location of the ice breaker, which the motor drive permits you to do, since it can be placed without regards to belts or shafting. The motor driven 49J Creasey Ice Breaker comes with a motor mounted on top, as shown, or, where the breaker is to be placed below the floor, swung on the back so that it comes below the floor line. Ice-cream men who have installed this husky, compact 49J find that it makes a big difference in keeping their loading platforms from becoming congested.

Ask for Catalog R-1125 and give details, as our engineers may be able to suggest an improved ice handling layout for you.



COCHRANE CORPORATION
Creasey Ice Breaker Dept.
3178 North 17th St. 199 Philadelphia, Pa.

600 Cans and Covers or Brick Pans *Per Hour*

Absolutely clean, sterile and dry. Washes all size cans and covers from 20 qt. down to 4 qt. Cans are fed in and delivered at the same end of machine. Small cans may be washed together with larger cans, increasing the capacity to 1200 per hour. Has two speeds. Each can receives 17 distinct intensive treatments.

Machine is self-contained, and if electric wiring is done, it can be installed and ready for operation in two hours. Size: 16' 10¾" long, 5' 9¾" wide and 7' 6" high —over all. Shipping weight, 9400 lbs.

Los Angeles.

Gentlemen:

We are pleased to advise that the Lathrop-Paulson Ice Cream Can Washing machine is installed in our plant, and has been in operation for the past week, and we find same is giving very satisfactory results. In fact, it is the first ice cream can washing machine that we have seen in all of our experience that delivers perfectly clean and dry cans.

Kindly consider this letter as our acceptance of the machine.

Any references you may wish from us, will be gladly given.

Wishing you success, we are

Yours very truly,

L. J. CHRISTOPHER COMPANY,

TEC:h By Thos E Chapman

L.-P.

ICE CREAM CAN WASHER & DRIER

Only two men are required to operate the machine at maximum speed, and one man can handle the work efficiently at the 300 speed. Cans are washed on outside as well, freeing the cans, lids, pans and covers from brine. This machine eliminates the necessity of washing cans and covers separately. Cans which have been stored and coated with oil do not have to be brush washed. They come out ready for service, or may be piled in storage racks without danger of rust. Machine will also handle brick tanks up to 12 qt. size. All cans are placed in machine upright, and are delivered **absolutely clean, sterile and dry.**

The machine is sturdily constructed and heavily galvanized. Temperatures are thermostatically controlled. Soda solution is automatically controlled by L.-P. Patent Soda Regulator.

Machine is sold on a results-guaranteed basis. Names of users will be gladly submitted upon request. It will not obligate you to obtain full information and price. Send the coupon today.

are presented for somebody's consideration, he is immediately brought to face the question of depreciation.

He went further into the matter, saying:

"Depreciation is much abused and long suffering. If a person is selling a piece of property it is often presented as practically good as new, but if he is buying, then the depreciation may be argued as reducing the value almost to nothing.

"It is easy to see that depreciation must be recognized. Now what about the methods at present in most general use in manufacturing establishments, whereby the lessening in value is figured? In the great majority of instances the annual percentage method is employed. So much off each year, is apparently a simple solution of the problem. The only questions relate to the percentage and manner of deduction. Some concerns take off annually an even per cent of the original price. There is the exceedingly prosperous concern that is making so much money that the owners hesitate to let the profits or surplus appear in their statements. Heavy depreciation of plant is a safety valve, whereby to allow for the vent of a proportion of surplus. Then they have the value but it does not show; it is there but you can't find it. Such establishments often get their values down to practically nothing and regret that they can't charge off still more.

"On the other hand, a struggling business with need to show every dollar of value, dreads the problem of depreciation and necessarily upholds plant value as much as possible."

These are two extremes. In between are inequalities and irregular methods until it is ordinarily impossible to determine the just from the unjust, and the fault for this, according to Mr. Worcester—

"* * lies largely with depreciation deduction methods, designated and applied by the owners of the property, whereby it is possible, by more or less depreciation, for permanent assets to be shown extremely low or very high or at any point between these conditions, in accordance with the policy of the owners or the exigencies of the occasion.

"Is it a statement to stockholders or to banks? The plant values on the books are very low. Our profits have enabled us to write off the value of our intangible assets to a large degree. Is it the tax assessor? Show him these book values frankly. (He may be influenced by their nothingness and cut down the taxes.) But is it a fire loss? Oh, that is quite another thing entirely. We are not going on book values. They don't mean anything and we are not held to them. Here is our real valuation as we carry it on separate inventory on which we have insured."

THERE is another method of depreciation often employed—especially by the manufacturer who prides himself on his practical working knowledge of his business. He says, "I know each machine and every bench and tool in this establishment and I place the depreciation myself on each item." The per cent per annum, believes Mr. Worcester, is better than this system, for "in that method there is some kind of basis that can be considered and understood." With a depreciation personally placed on each item by the owner, no matter how experienced, it is impossible for interested outsiders to gage the accuracy of such valuations. It is an actual fact that experience in the operation of a machine, a department or a business does not necessarily equip the owner with the ability or disinterestedness whereby to place values, he declared, adding:

"He is necessarily an interested party to the values. If it were to his advantage to show the value low, and his financial statement would stand it, you could depend on his honestly seeing a heavy depreciation on all his property. On the other hand if his books required every dollar he could find in the plant his vision would, unconsciously perhaps, be influenced by the needs of the business. At all events, whatever accuracy his depreciation judgment might contain would never receive full credence in the face of possible criticism because of the fact that it was not and never could be disinterested.

"Depreciation systems employed by appraisal companies have stood the test of twenty-five years and are accorded respectful recognition by insurance experts, auditors, banks mercantile agencies and financial authorities.

"In the length of time that appraisal companies have been operating and the many years of study the individuals in these organizations have given to the subject they have become specialists in their line. In the contemplation of the subject of depreciation a system has been devised whereby depreciation can be designated on a scientific basis, and judgment placed by the abstract method. There is no secret, no is it patented or copyrighted, but it will be readily recognized that this method depends largely on trained operatives and disinterested application.

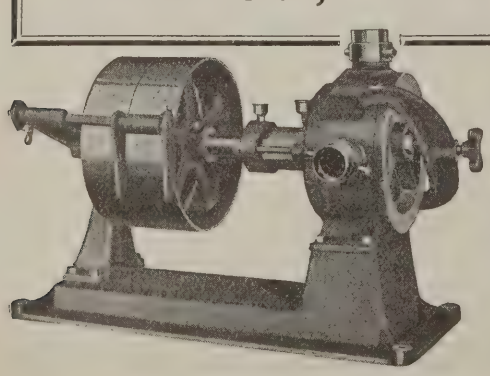
"The appraisal method of depreciation is not based on age alone, although age is recognized in the system. Condition is the primary factor entering into depreciation. Type or style, is next in importance, and age is third in the list.

"When you have depreciated so much off a year you have considered only what may be the least of the factors of depreciatoin. Now see how erroneous this may be. Suppose a machine is ten years old and has been depreciated ten per cent a year. Its value is practically wiped off and yet there is that machine. With worn parts replaced it may be doing almost as good work as a new machine. In this case the good care the machine has received, in other words, its condition, may have offset its age, and depreciation placed on age alone would be entirely too heavy. On the other hand consider another machine that is perhaps only a year or two old, but in that time a new apparatus has been put out that renders that machine to a certain extent obsolete. The depreciation placed on the basis of age might be altogether too low because type has not been considered."

BUT it is not on machinery alone where the standard depreciation system is applicable, but on "all building and equipment property of whatever nature." For instance, the speaker declared, a well constructed building does not depreciate as rapidly as a cheaply-put-up structure. The age might be the same and yet one would be depreciated very little while the other was almost falling to pieces.

To illustrate another point of accuracy in detail—

"* * * a factor may be mentioned that is lost sight of



YOUR Kind of Pump

Your pumping requirement is for a pump you can install and **forget.** One that requires not the slightest attention. One you can rely on to operate efficiently and economically for years without replacement of parts.

The VIKING Rotary Pump, now in its 12th year, so successfully fills every pumping requirement that over 65,000 are now in use. It is a ruggedly built, highly efficient, easy running pump with a new and better pumping principle. Positive suction. Steady flow. Only 2 moving parts. It's YOUR kind of pump. Have us send a copy of our new pump book. It's FREE.

EVERY AD IN THE REVIEW HAS AN INTERESTING MESSAGE FOR YOU.

This will help you to "get squared away" for the season on VANILLA

MANY of the most far-sighted ice cream manufacturers today find themselves face-to-face with a real problem brought about by the chaotic condition of the raw vanilla market.

To help such manufacturers we have bent every effort to devising means for overcoming the trying situation. This has included the development of two remarkable vanilla flavors—VAN VOGUE and VANIM. These, together with our already extensive line, provide unusual opportunity for solving your problem **economically** as well as correctly. The four items listed below merely indicate the wide range of good flavors at your disposal.

VANILLA ISOLATE

A highly concentrated PURE vanilla of delicious flavor made from choicest beans.

VAN VOGUE

A very fine synthetic flavor designed to imitate closely the delicacy of pure vanilla, at a fraction of its present cost.

VANIM

A rich, smooth **concentrate** with more pronounced flavor than VAN VOGUE.

CAVAN

A satisfactory flavor at rock bottom cost. Rich in taste, thoroughly practical — a real aid in meeting close competition.

Write us regarding your individual flavor requirements. We have some suggestions to make that have proved valuable to others and may be as helpful to you.

in ordinary depreciation methods and that is ultimate salvage. Especially in metal machinery there is a percentage of value that never depreciates. We may designate this as scrap, or junk, but it is in reality the ultimate salvage. In some instances this value may equal perhaps ten per cent of the total value of a machine and this never depreciates.

"Depreciation reserve, as demonstrated in accountancy, is a perfectly proper procedure; the laying aside of a certain amount annually to allow for the ultimate replacement of your property. Include this with your costs by all means. But do not let your minds confuse this theoretical depreciation with physical deterioration. Have the condition of your property examined by appraisal and the actual lessening of value determined disinterestedly by expert consideration in standard manner.

"The subject of appraisal is worthy of serious consideration and before entering into any explanation it is well to observe the weakness of other prevailing methods where inventory is personally prepared by the owners of such values as buildings, equipment, machinery, tools and fixtures, that may be considered as permanent. An ordinary inventory is usually a more or less continuous affair, seldom checked over completely. Some inventories are many years old. Items taken out or disposed of in each year are supposed to be marked off. The items purchased are supposed to be added and new totals are struck. Although very careful and painstaking, where stock is concerned many factory owners are inclined to neglect the proper listing and valuation of plant and equipment.

"Items that possess value, such as pieces of shelving put up from time to time, millwright work, and so on, are often entirely forgotten in the rush at inventory time. There may be many omissions of legitimate values. For instance, freight, cartage, and installation should be recorded for each machine. Descriptions on personally prepared inventories are generally very crude, hasty and insufficient to identify the item. This is an important matter in the event of a fire loss destroying the property.

"Even at the very time of purchase, what one pays for an article represents, to a certain extent, the purchasing ability of the buyer. Every factory manager can point to machines that were picked up at a bargain and could not be replaced for any such money. In fact, after a few years, especially under recent conditions, the original purchase price may be a joke, as compared with today's prices. The same thought may be continued throughout the entire extent of the personally prepared inventory of plant and equipment values. Manufacturers will usually admit this condition of affairs. How much better to have a properly prepared listing of every item of building and equipment, with perfect descriptions and under correct classification and arrangement, and with values based on present prevailing prices. About twenty-six years ago the need was realized for trained men in this particular line of work and companies were organized for the valuation of permanent items of plant and equipment."

A recognized standard method has been worked out:

"Bankers and mercantile agencies see in appraisal a means whereby they can be authentically informed by the owners as to the exact valuation of a property. In the incorporation, increase of capital stock, re-organization, bond issue, sale or purchase of any property, the physical valuation placed by appraisal is understood and acceptable under any and all conditions as a basis to whatever transaction.

"If buildings are owned, the manufacturer would naturally be supposed to know what they are worth. Even when a building has just been erected the owner may have a suspicion that it is worth either more or less than he actually paid, depending on the kind of a bargain he struck with his architect or contractor or whether it was put up on percentage or day labor. Where buildings are old it might as well be admitted, without argument, that the valuation placed by an owner is usually more or less conjecture. A manufacturer often says, 'My buildings are worth more because they have a good location.' For his business use it is no doubt true, but a fire insurance company would not pay any more (in an adjustment) on a well located building that had burned than they would for the same building in a less prominent location unless the question of moral hazard came into question. Owners sometimes confuse real estate with buildings. A lump sum may have been paid for a piece of property. The land is valuable because of its location, but for insurance purposes the building should have a standard appraisal.

"An architect or contractor might probably consider himself entirely competent to appraise building values but experience has shown that appraisals made by such authorities

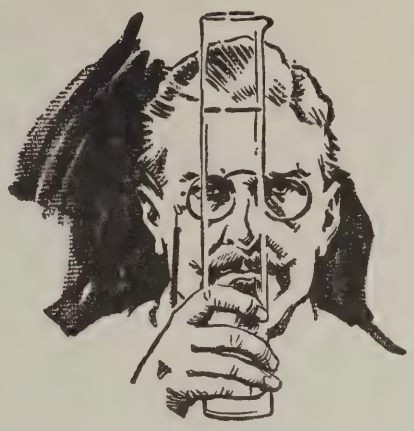
NEW JERSEY "SHORT" SHORT-COURSE IN MILK TESTING AND ICE CREAM MANUFACTURING.

By A. I. Goehrig.

Although short courses in agriculture have been conducted at the New Jersey Experiment Station, New Brunswick, N. J., for the past 18 years, this is the first year that special one-week and two-week schedules have been tried out. That such innovations are appreciated is evidenced by the fact that 116 students took advantage of these special short courses. Besides the classes in milk testing, dairy cattle feeding and ice cream manufacturing, courses were also conducted in poultry feeding, flower gardening and tractor operation.



The courses in milk testing and ice cream manufacture were under the supervision of Prof. Forrest C. Button, assisted by Elmer G. Maier and George I. Ball. Lectures were given each morning in the following subjects: composition of milk, milk secretion, food value, legal standards, adulterations practised, creamery inspection and the details of making correct Babcock tests for milk and cream. In the afternoons, actual testing was done in the laboratory under the supervision of the instructors. In addition to correct methods of sampling milk and the technique of testing for fat, instructions were also given in the use of the lactometer, acidity test and the modified Babcock methods for testing ice cream.

The New Jersey law requires that every person who tests milk and cream, where such products are purchased on the basis of the amount of butterfat contained therein, shall have a state tester's license. Examinations are held every month at the experiment station for those desiring to obtain such permits. At the close of the week's intensive training in milk testing, each of the students had the privilege of taking an examination. This included a written test on the subjects studied as well as practical laboratory work. Persons who were somewhat unskilled in the technique of testing or knew little of the many problems connected with milk control at the beginning of the week's work, were able, at the end, to pass a satisfactory examination in every case where close attention was paid to the course.

The ice cream manufacturing course also pleased all those availing themselves of its advantages. Two weeks were consumed in this course. As in the milk testing schedule, the mornings were devoted to lectures on composition of ingredients, ice cream mix, viscosity, flavors, freezing temperatures, refrigeration, etc. The afternoons were devoted to correct testing for butterfat in ice cream, preparation of the mix, pasteurization, homogenization and cooling the mix, freezing, operation of refrigerating machinery, etc. There is splendid equipment in the school for ice cream manufacturing.

That courses of this character fill a long-felt need for those who can spare but little time away from their regular work is shown by the ready response of students in various walks of life from all over the state. As Prof. Helyer, director of the short courses, says, "It is such work as this that makes the students interested in their course and sends them home ready to do better work and get a greater enjoyment out of life through the satisfaction that comes from the knowledge of being able to do a job in the right way."

Prof. Button, in charge of the dairy products courses, has this to say: "The work went across very well and from the enthusiasm on the part of the students, we believe we have made a good beginning and that the work will increase in popularity in the future."

It costs less to use Atlantic—

Atlantic Super-Clarified Gelatine is made by a painstaking highly specialized method that costs more than the usual methods of manufacture, yet in your actual production it costs less to use than gelatine of so-called corresponding grades.

We do these two things for a specific purpose. First to give you a dependable, high quality gelatine that goes farther and that you know is absolutely uniform and reliable, and secondly to bring about economies in your production that will bind you to us as a permanent customer. We, too, make a fair profit because our volume is large.

Standardize on Atlantic Super-Clarified Gelatine. Its high viscosity, super-clarity, purity and dependability together with its marked savings in your production, help you make a product that is at once better and more economical to produce.

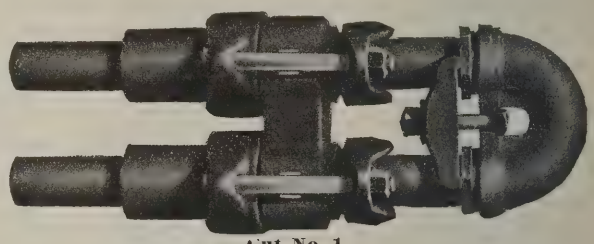
Dairy Refrigeration

The Condenser.

By F. B. FULMER

AS THE compressed gas leaves the compressor on its way to the condenser, it passes through the separator, which extracts the oil from the refrigerating media. The act of compression generates a high degree of heat, depending on several conditions, and this hot gas, in a dense form, enters the condenser to have the heat of compression removed and the media changed to its original liquid form, when it is in a condition to repeat the refrigerating cycle.

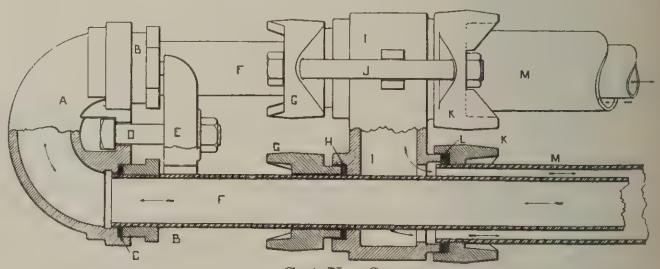


F. B. FULMER.

The condenser may be one of two types, the submerged or the non-submerged. These are divided into several classes, such as the atmospheric, shell, tubular and the double pipe. The latter form of condenser is in extensive use and is the one that will be considered at this time.

As a general rule in any plant the machinery that is not in motion during the period of operation, does not receive the attention that the moving units do. While the condenser is an immovable part of the equipment, refrigerating engineers have long recognized the vital part that it plays in the economical operation of the plant.

The ammonia condenser is an apparatus designed for the exchange of heat and should be as simple and compact as possible. The double pipe condenser has proved to be very efficient, as it embodies the "counter flow" principle; the hot gas entering at the top and flows downward, while the cold water enters at the bottom and flows upward. This brings the hot gas in contact with the warmest water, which absorbs the first shock of heat, and as the ammonia is leaving the condenser it comes in contact with the coldest water, which cools the liquid to the lowest possible temperature.



The double pipe condenser is usually constructed with an inch and a quarter pipe inside a two-inch pipe, the water circulating in the smaller pipe, while the ammonia gas is discharged into the annular space between the two pipes. The condensers are usually about ten pipes high, though this is a matter of detail for each installation, and the arrangement at the ends is shown by reference to cut No. 1.

Cut No. 1.

The double pipe condenser has long been recognized as an efficient one, and its success was for a considerable period attributed to the counter flow principle embodied, but now the opinion prevails that the rapid movement of the water inside the inner pipe is instrumental in a quick transfer of heat, which materially aids in the efficiency obtained.

It would appear that any condenser used should be easy of access for cleaning and offer the minimum of resistance to the flow of water through the pipes. The following illustration shows in detail the construction of the return bends for both the ammonia and the water:

Cut No. 2.

Descriptive part number:
A—Water return bend

As most water used for condensing purposes contains some impurities that will form a coating on the inside of the water pipes, the condenser should be located so that the water return bends can be removed and a wire tube scraper used in cleaning the deposit from the inside. In cases where the deposit is apt to be of a loose and muddy nature, there should be a by-pass connection made from the water supply pipe, so that the flow of water can be reversed occasionally, which action will tend to keep the water tubes cleaner. When a double

A Magic Transformation

Gowing-Dietrich

Equipment and Supplies

CARRYING an enormous stock of supplies always on hand at Syracuse is expensive for us—but often means dollars for you; for it enables us to make prompt, same-day shipments of goods out of Syracuse stock, just when you need them.

For years we have been selling high grade dairy, ice cream, and creamery supplies and equipment of every description. Consequently G-D goods are backed by the character and experience of an old, established house. We guarantee our supplies absolutely.

It is well worth your while to deal with such a concern—better let us serve you.

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS — READ THEM.

pipe condenser is located, sufficient space should be provided, preferably at the opposite end from which the water enters, that a handle to the cleaning device, long enough to reach the whole length of the water tube, can conveniently be used.

From a practical operating standpoint the lowest possible condenser pressure produces the minimum of expense for power to operate the ammonia compressor. With a given set of operating conditions, the condenser pressure is governed by the temperature and volume of water used and the influence of foreign gases. The amount of effective work that can be accomplished when using different temperatures of water is illustrated by the following table, the amount of water used is assumed to be 60 gallons per minute with a condensing pressure of 165 pounds:

Water temperature	Refrigerated effect in tons
55	47.7
60	42.1
65	36.1
70	29.9
75	23.4
80	16.1

The amount of water required will depend largely on the average temperature, and while it is not practical to lay down a hard and fast rule, it can be stated that good practice allows an increase of about 10 degrees in the discharge water above the admission temperature. This may require anywhere from one to four gallons per minute per ton of refrigeration.

The foreign gases are of two classes; those which are heavier than the ammonia gas and those which are lighter. Air is heavier than the ammonia gas and causes considerable operating difficulty if present in any amount. It carries a certain amount of moisture with it and as it is non-condensible under ordinary refrigeration pressures, it causes considerable increase in the condensing pressure and dilutes the ammonia gas, which reduces the efficiency.

The gases lighter than the ammonia are usually caused by the breaking down of the ammonia used by its contact with impurities, and by the volatilization of the oil used for lubrication.

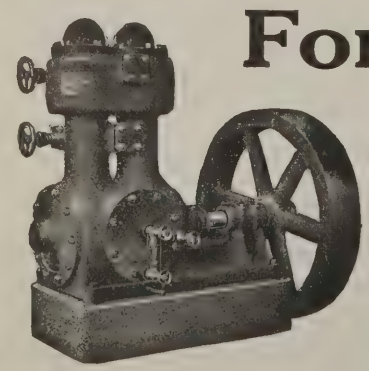
BETTER UNDERSTANDING IS ICE CREAM INDUSTRY'S NEED.



Has it ever occurred to you that business is the greatest thing in the world today? That business is the oldest trade? King Soloman was the greatest business man of his time. He built a magnificent temple and took seven and a half years to complete it. That was nearly 3,000 years ago and our engineers marvel at its size and beauty of architecture.

I believe that my business is my opportunity to serve my fellowmen, and in that service I will put the best that is in my nature and brains and character to produce. What we need today is a better understanding between competitors, an understanding that will bear confidence and bring about co-operation. What we need is less suspicion, more honesty, and less hypocrisy, and this understanding can be brought about if we are ready and willing to develop friendship, if we will but meet our competitors half way.

Many the price-cutting war has been avoided, many the business saved from bankruptcy, many the sleepless night buried into one of sweet repose simply because competitors became better acquainted and were willing to discuss their differences and settle their disputes without resort to bitter words and unscrupulous underhand methods.—From Southern convention address by Ben C. Brown.

I think a man who agrees with his fellow man on a certain thing and he violates his word without giving notice, I think he is a dishonest merchant. I do not care who he is. A man who violates his word, when he does it once, he should be through.—From California-Pacific joint convention address by Carl Plaut.

If you want to buy or sell anything, or want help, or desire a situation use The Ice Cream Review Want Ad Department. A sure result getter. Only 2c per word.

For Lasting Satisfaction

York
Refrigerating Equipment
One reason why there are so many installations of York Refrigerating Equipment is that its satisfactory working condition does not pass with the seasons. York Equipment does not mean satisfaction until the first signs of wear show up, but a year in year out dependable service that stands the strain of rush seasons without injury to its long life.
Let us show you just why York Equipment lasts longer.

You'll find pure cork—*nothing else*—in every Jamison Door

I WANT everybody to take a real good look at this picture because it shows you a part of our doors that you have to take for granted—the insulation. It's there, but you don't see it—except when you step inside our plant like you're doing now.

Here the camera catches us in the act of assembling a Jamison Sharp FREEZER Door. Look closely and you'll note that one layer of cork is placed vertically and the other horizontally. The corkboard is laid up in hot asphalt or is encased in waterproofed insulating paper, as the purchaser specifies.

Our own specifications for Standard COOLER Doors call for granulated cork hammered in and encased in waterproofed insulating paper; but corkboard can be substituted if desired. Or even with the Sharp Freezer Doors, other insulating materials than cork can be used if the purchaser has a preference.

The point is that whatever the material, we know how to install it — **right** — so that it won't shake loose or settle and so that it will give best results for the thickness used. Our job is to build doors that last — **and outlast.** The kind of doors you'd expect from best grade materials, strong, heavy, specially designed hardware, and good, conscientious, sober workmen (like the ones in the picture).

Incidentally, there's something else in this particular picture worth observing. Note the 2" x 4" running diagonally through the door. That's a brace which adds several years to the life of every door we make. It absolutely prevents sagging. It's the cause of less door trouble in more than 15,000 plants, big and little, both here and abroad.

JAMISON COLD STORAGE DOOR COMPANY

HAGERSTOWN, MARYLAND, U. S. A.

How Dealers' Prejudice Against Sherbet Can Be Overcome

Why Sherbet Without Combined Solids Breaks Down More Quickly Than Ice Cream

By E. E. LOVE

THROUGHOUT the life of the sherbet industry, from 15 to 25 per cent more sugar has been used in manufacturing any given amount of sherbet mix than in the same amount of ice cream mix, partly to balance the acids found in the fruit used in the flavoring, and partly with the idea of adding solids and body to the mass. Both of these points were well taken, but during all this period of time, manufacturers, dealers, and the consuming public have found that sherbet kept very poorly, i. e., breaks down or settles from the top of the container, the color, flavor and sweetness disappearing and leaving a snowy, unpalatable, unsalable mass, which extends from two to four inches into the sherbet from the top. At the bottom will be found two to three inches of very heavy syrup, highly flavored and colored, which is likewise unsalable. (For this reason, the dealer does not like to handle sherbet, but if this trouble can be eliminated, and it can be, the dealer will be delighted to use more sherbet.)

The reason the above conditions have existed, and still exist to a considerable degree, is as follows: It is a well known fact that sugar syrup is hard to freeze and still harder to keep frozen and the higher the percentage of sugar in the syrup, the harder the freezing process becomes, though sherbet is only 2½ degrees to 3 degrees F. colder, when frozen, than ice cream. Many thousand B. T. U. of latent heat must be removed from your sherbet mix to gain this two or three degrees of sensible lower temperature.

Possibly, the greatest mistake in the sherbet end of the ice cream industry was made a number of years ago, when the ice cream manufacturers began to prove by science and figures the why's and wherefore's of the business. They devoted nearly their whole attention to ice cream instead of giving some consideration to sherbet, taking for granted that the large amount of solids added to the mix in the form of sugar would or should take care of the texture and holding qualities. Sugar is good, but standing alone, could not accomplish the desired end. In other words, a boy was sent to the mill.

Now, the facts are that originally sugar was added to the ice cream mix solely to sweeten. In recent years, it has been found that sugar added largely to the solid content improves the texture and body. Therefore, the chief function of sugar has been to sweeten, though I grant it does more than sweeten. Now we know that sugar and gelatine do not contain the right kind of solids to make the products viscos enough to hold the incorporated air under changing temperatures, for any considerable length of time. We should put in milk solids, both S. N. F. and B. F. Right here, one of the big mistakes has been made. Some have added S. N. F. and some B. F. but very few have added both, and rarely ever the right amount or the right proportions of S. N. F. and B. F., nor was it properly prepared. Now, if the right kind of solids are added to sherbet, at the right time, they combine with the sugar and gelatine solids, producing a product of fine texture which will stand up equal to fruit ice cream.

The solids found in condensed milk are S. N. F., therefore, not complete. Those found in sweetened unskimmed condensed milk are S. N. F., sugar solids, and B. F., but are not in the right proportion and if added to the sherbet mix like the former case, cannot give a high degree of satisfaction. The use of either one will improve a sherbet over the old skimmed milk base product, but to get real satisfactory results, the proportions of milk solids both B. F. and S. N. F. must be controlled and the whole mass must be thoroughly emulsified by recent homogenization. If not, the S. N. F. come into contact with the acid in the sherbet and instantly form hard coarse particles, and though the sherbet may be improved in taste, the texture and standing up qualities are not obtained.

NOW, it so happens that in every plant where the whole vanilla mix is homogenized, you have right at hand the very product best adapted for use in your sherbet mix. On the average, vanilla mix contains approximately 10 per cent B. F., 11 per cent to 13 per cent S. N. F. and 15 per cent sugar and ½ per cent gelatine. Here you have the right solids properly com-

bined and recently homogenized, which insures a proper emulsion, all ready to add to your sherbet. You will note by the formula that we now have in our sherbet mix, a definite amount of sugar, gelatine, S. N. F. and B. F. solids and a small amount of fruit and acid solids. These solids are all needed, each solid performing its own function and secondly, they act collectively to make a finished sherbet that is very near perfect. A mix that if cold packed or properly treated fresh fruit is used to flavor, will give you a product with fine body and texture that will stand up in the container or brick, or even in individual molds as well as strawberry cream, also a mix figuring your total volume that will give you 100 per cent overrun. Always where it is possible use cold packed or fresh fruit for flavoring.

SHERBET FORMULA.

Material	Lbs.	% B.F.	% S.N.F.	% T.S.	Lbs. B.F.	Lbs. S.N.F.	Lbs. T.S.	Cost

3¾ gal. water	31.250	0	0	0	0	0	0.000	.00
7 oz. acid	.437	0	0	44	0	0	.190	.131
½ gal. fresh fruit or cold pack fruit	5.250	0	0	sugar 90 fruit 3	0	0	2.940 .069	.85
1 gal. mix	9.17	10	13	14	.917	1.192	1.283	1.00
Color to suit								
Total	61.544				.917	1.192	18.358	3.74

Total weight	61.544	12 gal. finished product	846% overrun
Total wgt. of S.	20.467	Cost per gallon	31c
% sugar solids	287%	12½ gal. finished product	923% overrun
S. N. F. sclids	0193%	Cost per gallon	30c
B. F. solids	0148%	13 gal. finished product	100% overrun
Total	332%	Cost per gallon	28c

Sugar figured at ten cents per pound, gelatine at 60 cents per pound and acid at 60 cents per pound. Of course, with present prices the final cost per gallon of finished product would be considerable less than the above figures.

Put the 7 ounces of gelatine into two gallons of the water, heat to 180 degrees. Don't boil but be sure gelatine is all in solution.

Put the 15 pounds sugar in the remaining water, stir well and add the hot gelatine solution, stirring all the time. Pour into freezer, start the machine, add the acid, your ½ gallon of fruit, turn on brine, then add your vanilla. Mix, and color to suit. Freeze stiff with zero brine, then shut off the brine and let swell to the desired per cent.

WHAT DOES THE CONSUMER WANT?

What does the consumer want and expect in ice cream? If we had the answer to that question, operating of business in the ice cream industry would be more nearly a primrose path of perpetual delight. One prominent ice cream manufacturer, F. J. Bridges of the Hydrox Company of Chicago, believes that the public wants ice cream of good body and texture, not too heavy and certainly not grainy, "of good flavor, and in a condition that brings out all of its deliciousness."

Mr. Bridges expressed this thought in an address before the Illinois convention last year on the subject of "Bulk Ice Cream versus Packaged."

Declaring that the ice cream manufacturers' first motive is to try to sell as much ice cream as is possible, "with a reasonable profit," Mr. Bridges insisted that the effort should be to give the public what the public wants, and not what "we as manufacturers think that they ought to have for one reason or another."

Anyone who studies the advertisements in this paper does not have to be told that it is a profitable habit. He collects the profits daily.

Hudson's

Always in the Lead

For thirty-seven years **Hudson's Ice Cream Flavor No. 52 Special** has been a favorite—and it has never failed to win in the race for public approval and preference.

HUDSON'S Ice Cream Flavor No. 52 Special, and **HUDSON'S Ice Cream Flavor No. 52 Concentrated** are made for a specific, specialized purpose. The smooth, clear body, the teasingly delightful flavor, the strength and the 100% solubility make them dependable, economical and sales-building flavors to buy.

By laboratory test they go farther—and by the palate test they **"please all."**

Let us ship you a sample gallon of Hudson's Ice Cream Flavor No. 52 Concentrated, or a sample keg of Hudson's Ice Cream Flavor No. 52 Special — express or freight prepaid to your city. You may return same to us at our expense if not entirely satisfactory.

After History of a Century Ice Cream Still Called a Confection

Educational Work Stressing Products Food Value Has Only Recently Approached Stage of Effectiveness, Though Future Headway in this Direction Promises to be Rapid

ALTHOUGH more than a century has passed since the development of ice cream, the public all this time has regarded ice cream as purely a confection, although not so much now as formerly, it was pointed out in an address before the recent New York state convention by C. H. Kimberly, Dairy Products Laboratories, Philadelphia. He deplored the fact that all advertising and trade development have until recently been put up on the one quality of high fat content.

It is for this reason, according to the speaker, that the public has come to believe that the only criterion by which ice cream is to be judged is its butterfat content. This error has been disproved by indisputable evidence that a low fat ice cream with proper composition of raw materials, carefully selected, and with fine flavors, is "surely equal in palatability and far superior in food value," to quote from Mr. Kimberly.

A large number of dietitians and food experts with whom Mr. Kimberly conferred as late as last summer, almost without exception were decidedly in favor of a low fat ice cream, this for the reason that fat is more difficult to digest than the other heat producing foods, "contains four times as many calories than carbohydrates, and hence, is not as desirable as more digestible products."

ROBERT P. KEHOE
7 East 42nd Street New York, N. Y.
Telephones: Vanderbilt 9594-9595

THIS speech is of particular interest in view of the fact that the ice cream industry is doing more today to convey the idea of health food in connection with its product than ever has been done in the past.

The efforts of the national association toward establishing not only a uniform butterfat standard but to establish one that will not be so high as to reduce the food quality, are leading in that direction. The national advertising campaign likewise is moving toward that purpose.

With regard to the slogan, the speaker said:

"We may, therefore, back up our slogan and go before the public with our advertising with a confidence born of knowledge that our product is right. The consumer once educated to the facts, will desire and be able to consume and enjoy larger amounts of ice cream, and hence by honestly serving the public, the manufacturer will profitably serve himself."

THE position of flavors used in ice cream with regard to food value is cleared up with the statement that the flavors may or may not have definite direct food value, "but if tasty and wholesome, will in all cases indirectly act as a food because of the increased palatability and hence digestion." He continued:

"The relative food merit of the milk products used in ice cream need not be discussed, except to impress upon you that whatever is used must be pure and wholesome, produced under clean and sanitary conditions, of fine quality and flavor, and come to the ice cream manufacturing stage in as natural or normal a condition and as fresh as possible. High grade ice cream cannot be made from old raw materials or any that are not most carefully selected. Investigation of the source with complete technical control throughout, will produce a fine quality food product, the commercial popularity of which will pay all effort and expense incurred. Too little attention has been given to these factors heretofore, but as our development goes on, more will be required, and moreover, this will be found necessary and above all advantageous.

"Numerous instances prove the value of ice cream as a food. Most authorities on nutrition endorse it, and no less an authority than Dr. Luther P. Howell of Columbus, O., says that in homogenized ice cream we have a safe substitute for the butterfat of mothers' milk, and that it has proven a safety first food for infant feeding. It is true, a special ice cream is utilized and it is administered in a warm instead of a frozen condition, but all the same its value is demonstrated.

"In the Cumberland, Md., schools, Dr. H. W. Weiss recently carried on an experiment with twenty-five boys and twenty-one girls, ranging in age from six to eight years, with each child eating one-fifth of a quart of ice cream daily, during nine weeks. The average normal increase in weight per child at these ages and time, is three-fourths pound, but the results here, when the test was completed, were twice the normal weights increase in all cases but one. Every normal child craves ice cream, and this craving should be humored within proper limits, for it is clearly the outward indication of an

Save $.10 to $.25 per Can Every Day on Hauling Expense ≈ Use the Glass Lined Truck Tank

$.25 Per CAN ON 100 CANS SHIPPED DAILY = $7500.00 ANNUALLY

Don't be satisfied to carry on your business in the same old way! True, you can buy milk cans year after year, have them repaired, and get along. Many milk men still operate that way, but not the progressive companies. They have already adopted or are seriously considering for adoption, the bulk method.

$10,000 Saved in One Year

Let's look at it another way:—Here is the Hanford Produce Company at Sioux City, Iowa, who used to pay $42.00 a day to ship 120 cans of milk by train from Merrill and LeMars, Iowa, to Sioux City. Then they bought a truck tank, and at the present time the actual expense of operation, hauling the same amount of milk, is only $7.00. This makes a saving of $35.00 daily on 120 cans or more than $10,000 a year. That money would pay twice for the initial expense of the complete unit—truck and tank! If greater distances are involved and more milk is handled the savings are still greater. Some dairies have saved as much as $65,000 the first year through eliminated can-handling, washing, etc.

Free Survey

Let us make a survey of your requirements and show you in dollars and cents what this method can do for you. No obligation of course. Mail the coupon below.

3 out of more than 200 satisfied users express themselves

"We have installed two of your tanks for use at two of our stations and find them quite satisfactory. By using these we are able to save the use and washing of 200 10-gallon cans. Furthermore, the milk is received in a much better condition with a lower percentage of waste incidental to the handling of milk in cans."

Co-Operative Dairy Association, Kansas City, Mo.

"We have observed many favorable instances in which we have gained customers due to the use of the Glass Lined Truck Tank. It appeals to them as being a great step towards Sanitation, eliminating the unsightly dented milk can which in a good many cases are practically impossible to clean. We certainly are well satisfied with the Glass Lined Truck Tank transportation and hope that we shall soon be in a position to transport all our milk requirements in that way."

Bartholomay Company, Inc., Rochester, N.Y.

"Formerly, we drew this milk in 40 quart cans, with three trucks, making two trips with 3½ ton truck, two with 2½ ton, and one trip with 1 ton truck, requiring 250 cans to haul the milk. With this equipment it eliminates the washing of the cans, eliminates spillage of the milk, which we estimate would amount to about $5.00 per day, also two drivers and two helpers, one man doing the entire work with our present equipment."

F. X. Baumert & Company, Inc., Antwerp, N.Y.

actual physical demand and children will thrive on a daily portion of ice cream.

"We may, therefore, conclude that ice cream is a food and a most valuable one, but as has been said, much depends on the individual product, as to whether it is the best possible ice cream food. Its composition is all important. Since milk is our standard food, we should have our ice cream as near it in nutritive ratio, digestibility, etc., as possible. A few approximate figures will explain what I mean. Thus, a 3.6 per cent milk is composed of about 87.5 per cent water, 12.5 per cent solids, of which 3.6 per cent is fat, 3.3 per cent protein (casein, albumin, etc.), 4.8 per cent milk sugar, 0.8 per cent minerals and the nutritive ratio is correct at 1 part of muscle builders to 3.7 parts of heat and energy producers. A 20 per cent cream has a ratio of 1-16, because the fat is 20 per cent and milk solids not fat only 7.6 per cent. This is not a suitable food as such.

"A high fat ice cream with total solids of over 36 per cent with fat 14.5 per cent, milk solids not fat 7.50 per cent, cane sugar 14 per cent, has a ratio of about 1-17 still farther away from standard, due to the increase in heat producers by the 14 per cent of sugar.

"A low fat ice cream, 35 per cent total solids, 9 per cent fat, 14 per cent sugar, 12 per cent milk solids not fat, has a ratio of about 1 to 6. This is coming closer to what we want, but to get the correct balance we still must lower the fat with the same solids, or increase the solids with the same fat.

"In my opinion, we should do both, lower the fat percentage and increase the (Milk Solids Not Fat) M. S. N. F. A formula somewhat like this allows chance for variations to meet conditions, and while obtaining a proper ratio will still meet manufacturing and trade demands. Fat 8-10 per cent, milk solids not fat 11-14 per cent, cane sugar or equivalent 13-15 per cent, gelatine 0.5 per cent."

WITH regard to objections that may be raised that sandiness will occur if the milk solids not fat are under 10.5 per cent, which seems to be generally accepted, the speaker assured his hearers that sandiness need not occur with very much higher milk solids not fat, declaring that actual tests made in different ice cream plants in the last two years have "amply demonstrated this truth." Care must be used in the selection of raw material, also in storage of ice cream.

Where the consumer really does demand a rich fat ice cream, Mr. Kimberly believes this can be readily overcome to the benefit of both manufacturer and consumer.

NATIONAL ADVERTISING.

The subject of national advertising of ice cream is one that has been discussed in all meetings of this kind, more or less, in recent years. I recall the meeting of our association at Spokane two years ago and after a rather thorough examination of the subject there the National Association of Ice Cream Manufacturers was petitioned to take up seriously the subject of nation-wide advertising of ice cream. We are not conceited enough to think that we were instrumental in activities in that regard, but it was a like thought that was going on all over the industry in the United States, and the national association has now evolved, and is getting under way, a comprehensive plan that has been worked out as the result of a great deal of study on the part of the national association's national advertising committee.—From remarks before California-Pacific joint convention by W. V. S. Robbs.

Neutralization and Homogenization as Related to Viscosity and Overrun

Results of Experimental Work by a Leading Western Expert

RESULTS of an interesting investigation were outlined by H. A. Bendixen, associate professor of dairy manufacture, University of Idaho, in an address delivered before the Western Canada Dairy Convention at Vancouver, B. C., in February. By neutralization in this connection the professor meant the reduction of acidity in the mix. He pointed out that in the ice cream industry, as we all know, neutralization is entirely out of place, it has happened that creameries selling sweet cream to ice cream factories have neutralized cream which was slightly sour and sold it as sweet. He said "fraudelant practices" of this kind if detected should be dealt with severely.

He continued:

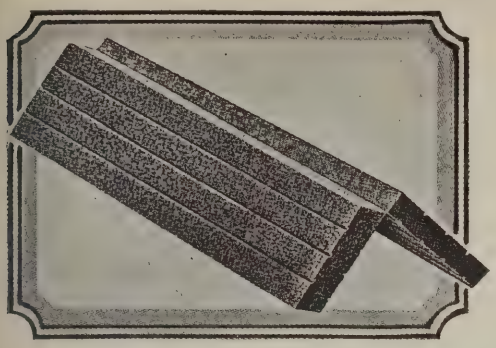
"Last year we did a little work along that line at our station. We studied especially the effect of neutralization on the overrun that may be obtained. In our experiments which were conducted mostly by Mr. Kieth, a post graduate student in our department, we used both milk of lime and normal sodium hydroxide as neutralizing agents. These neutralizers were used to neutralize sour mix, and also to neutralize sour cream, sour condensed skim milk or both before adding to the rest of the mix. Acidity and viscosity tests were also made in order to find some correlation between acidity, viscosity of mix, and overrun."

Results of the experimental work were summarized in the following table:

Kind of Mix	No. of Batches	Ave. per cent Overrun	Ave. per cent Loss in Overrun as Compared with Normal Sweet Mixtures	Ave. per cent Acidity	Ave. Viscosity Value
Normal sweet mixes...	9	89.95	0	.217	275
Untreated high acid mixes	7	85.29	5.18	.371	394
NaOH used as a neutralizer in mix or mix ingredients	8	81.99	8.85	.179	419
Lime used as neutralizer in mix or in mix ingredients	12	74.75	16.90	.169	490
Neutralized condensed skim milk added to mix before pasteurizing	4	86.13	4.24	.136	552
Both neutralized cream and neutralized condensed skim milk added to milk before pasteurizing	4	79.98	11.08	(2-.140) (2-.180) .166	(2-153) (2-490) 321
Complete pasteurized mix (naturally soured) neutralized 1 hour before freezing	6	74.12	17.60	.223	439
Neutralized cream added to mix before pasteurizing	6	72.92	18.93	.156	514

These experiments, Professor Bendixen explained, although not conclusive, seem to "point out first of all that with an increase in acidity from an average of .217 to .371 per cent the overrun suffered on the average to the extent of 5.18 per cent and the viscosity increased from 275 to 394." He saw no regular close relationship existing between acidity and overrun, although the general trend is "toward a reduction in overrun with an increase in naturally developed acidity." However, there is no relation whatsoever between viscosity of mix and overrun and between viscosity and acidity in untreated mixes, he declared.

These facts he brought out in the following tabulation of all 16 of these mixes in the order of their overrun and viscosity:



Unneutralized Mixes.

% Overrun	% Acid	Viscosity
78.21	.320	378
82.71	.355	366
84.75	.375	532
85.30	(High) .545	323
85.87	(Low) .21 (x)	152

89.87 (x)	.345	621
84.75	.375	532
86.02	.225 (x)	453
94.36	.210	446
87.34	225	432
93.36	.210	402
78.21	.320	378
82.71	.355	366
85.30	.545	323
88.63	.320	292
87.54	.340	243
90.06	.205	199
85.87	.210	152
92.88	.205	148
88.21	.235	129
91.14 (x)	.225 (x)	111

"From a further examination of the summary table," the professor reminded the delegates, "it may be seen that sodium hydroxide when used for neutralizing a sour mix or sour mix ingredients in eight batches reduced the overrun on an average of 8.85 per cent while lime water used in the same way in twelve batches reduced the overrun 16.9 per cent. Sodium hydroxide seems to be preferable, therefore, to calcium hydroxide as a neutralizer in the ice cream mix."

He went on:

"It is possible that the free acid contained in the mix is more destructive to the overrun than the acid combined with the casein and since, according to Professor Hunziker, sodium neutralizer attacks the free acid before attacking the combined acid it may be preferable for that reason. The neutralizer, however, has some other effect upon the mix besides just reducing its acidity because a neutralized mix with a certain acidity always gives a lower overrun than an unneutralized mix of the same acidity. There may be a slight saponifying action of the alkali on the fat globules during pasteurization. This might explain the increase in viscosity. However, there are no scientific data on this point. Again in the batches where either lime or sodium hydroxide was used as a neutralizer there was no apparent relationship whatsoever between acidity, viscosity, and overrun as may

No "Green Centers" possible. Slowly and carefully baked in double width molds, Split and finished full standard 12"x36". Center of every sheet visible.

The sixth of a series: read it and watch for the next!

No "Miles per Hour" With NOVOID!

Among the things that affect the quality of corkboard adversely is "speed-up" methods applied to the baking of the raw compressed cork in the molds. High speed of travel, to get "production," requires a high temperature oven which tends to bake the surface too quickly and not fry out the natural cork resin sufficiently to everlastingly bind the entire mass into a **good, strong sheet of insulation.**

In a word, high quality corkboard should be baked by a **slow and careful** process, such as can best be carried out in the world's greatest cork producing and manufacturing district abroad, where both oven fuel and labor are relatively a small item of cost.

Novoid Corkboard, made in conformity with this slow-and-careful principle—one of six basic principles followed by Manufacturas de Corcho, S. A., at their modern plants in Spain, home of cork—is justly entitled to be known as a **uniform high quality insulation.** Manufactured 25"x37", split and finished full standard 12"x36"—no odd widths or lengths—in 1", 1½", 2", 3" and 4" thicknesses. **No other corkboard is made in this way.**

Uniformly and thoroughly baked, processed to eliminate all voids between particles, every sheet crated, no hard-back, no green-centers—**Novoid Corkboard** is worthy of the universal acceptance it has gained.

Ice Cream Manufacturers

You Can Have Perfect Control of Your Mix With the Jensen Revolving Vertical Coil Batch Mixer

UNIFORM FLAVOR is obtained only when the mix contains smallest amount of air during pasteurization, homogenizing and aging.

AIR which causes **FOAM** produces **oxidized, metallic** or bitter flavor.

REVOLVING VERTICAL COIL BATCH MIXER furnishes the ice cream manufacturer a process by which he is able to overcome these most objectionable evils.

REVOLVING VERTICAL COIL EXPELS AIR AND GASES.

BLADES—located at extreme bottom of coil furnish maximum agitating and mixing at bottom of vat where sugar and heavy materials tend to settle.

POSITIVE FORCED CIRCULATION of heating medium assures the greatest efficiency in heating and eliminates any possibility of burning the mix and producing a cooked flavor.

STUFFING BOXES ARE ENTIRELY ELIMINATED, therefore no grease or other contaminating verdigris can seep into the mix during pasteurizing and aging periods.

SQUARE CONSTRUCTION requires one half usual floor space.

OPERATING POWER reduced one-half.

Neutralizing the whole mix just before freezing always increased viscosity, he found, the same amount of neutralizer being used each time. "Nevertheless," he said, "the acidity was not always reduced an equal amount. This probably needs to be re-checked. However, the greater the acid reduction the greater was the increase in viscosity, although the per cent overrun showed no relationship to the viscosity or acid reduction as seen from the following tabulation of complete mixes neutralized just before freezing:

Limewater Used.

No. of c.c. Neutralizer Used	Per cent Acidity Before Neutralization	Per cent Acidity After Neutralization	Per cent Acidity Reduction	Viscosity	Per cent Overrun

500	.360	.215	.145	307	75.24

Finally, in comparing the different types of neutralization, they noted that neutralization of the condensed skim milk affected the overrun the least, giving a loss of 4.24 per cent on the average; next was the neutralization of both condensed skim milk and cream with a reduction in overrun of 11.08 per cent. Neutralizing the complete mix reduced the overrun 17.6 per cent while the neutralization of the cream was the most harmful to the overrun, showing a reduction of 18.93 in the overrun ob-

Performance of six on trial brings order for 200

In answer to a query from a Newark ice cream manufacturer, the Kirk-Maher Company, of Malone, N.Y., writes: "Hope to eventually do away with cabinets we were formerly using."

"Last summer," writes G. H. Frechette, secretary-treasurer of the Kirk-Maher Company, in answer to a query from the Puritan Ice Cream Company, of Newark, N. J., "we bought six A-B Ice Cream Cabinets and had them sent to our various plants. They have proven entirely satisfactory with one icing in 48 hours.

"As a result, we have placed an order for approximately 200 of the various sizes, and hope to eventually do away with the cabinets we were formerly using.

"We highly recommend A-B Ice Cream Cabinets to those desiring a money-saving proposition."

Like Kirk-Maher, ice cream manufacturers all over America are finding A-B Ice Cream Cabinets save more ice, more salt and more money than any pack cabinet they can buy. And no wonder!

Surrounding the ice and salt chamber of the A-B Ice Cream Cabinet is an unusually effective insulating material which keeps cold air inside the cabinet and warm air out. Even the lid is fully insulated, and fits tight.

Cream compartments are square and perfectly dry. All sizes of bulk ice cream can be inserted with greatest ease—square pockets permit all package cream to be carried in compact facility.

Our new booklet, just off the press, explains why the A-B Ice Cream Cabinet will cut your ice and salt bills to the lowest possible level. Sent free. Write for it.

THE MOST PROMINENT IN THE COUNTRY

KIST Flavored

EVERY NOTABLE SUCCESS IN THIS COUNTRY

Here Are Just a Few of the Larger Manufacturers Who Are Putting Out the Kist Flavored Frozen Sucker

Rieck-McJunkin Dairy Company, Pittsburgh, Pennsylvania with their plants throughout Pennsylvania including—Butler, Charleroi, McKeesport, New Castle, Oil City. The Hoffman plants at Altoona, Barnesboro, Philipsburg and Tyrone.

Telling-Belle Vernon Company, Tabor Ice Cream Company, Peerless Ice Cream Company, Baker-Evans Ice Cream Company, Cleveland Ice Cream Company of Cleveland, Ohio.

Hydrox Corporation, Chicago, Illinois.

Imperial Ice Cream Company of Parkerburg, West Virginia and their various plants.

Castle's Ice Cream Company, Newark, N. J.

Carry Ice Cream Company, Washington, D. C.

French Bros. Bauer Co., Cincinnati, Ohio.

Horn Ice Cream Company, Baltimore, Md. also Norfolk and Richmond, Virginia.

H. L. Neuman, York, Pa., together with the York Ice Cream Company.

Williams Ice Cream Company, Scranton, Pa.

Kennedy Dairy Company, American Ice Cream Company and Mansfield-Caughey Company. These are the big three in Madison, Wis.

Gate City Ice Cream and Dairy Company, Atlanta, Georgia.

National Ice Cream Company, San Francisco, California.

Benham Ice Cream Company, Fresno, California.

Gloria Ice Cream Company, Inc., Stockton, California.

Carpenter Ice Cream Company, St. Louis, Mo.

Peerless Ice Cream Company, Kansas City, Mo.

Houston Ice Cream Co., of Houston, Texas.

Peoples Ice & Ice Cream Co., Springfield, Mo.

M. B. Ise Kream Company, Waco and Dallas, Texas.

New Orleans Ice Cream Company, New Orleans, La.

Terry Dairy Company, Little Rock, Ark.

Ft. Smith Ice Cream Company, Ft. Smith, Ark.

Space precludes listing of scores of others.

A New Source of Added Revenue for the Ice Cream Manufacturer

The most prominent Ice Cream Manufacturers in the ccuntry have decided for the Kist Flavored Frozen Sucker. The exceptional interest displayed by the manufacturers and their eagerness to get started on this profit-making proposition, have justified our efforts in offering Kist Flavored Frozen Suckers to the industry.

We have made the Frozen Sucker a National Item.

Manufacturers who have gone into this proposition are reaping exceptional profits every day and the best part of all, they are making this extra profit without tying up any of their Freezer Equipment.

The Frozen Suckers are easily and quickly frozen in inexpensive mold units. Each mold consists of 72 tubes, allowing the production of six dozen suckers in one simple operation. Freezing is done in simply constructed brine tanks or in the regular hardening room.

The Frozen Sucker is purely and simply a flavored ice, five and one-half inches long by one inch in diameter. It is easily and cheaply manufactured.

The cost of making Frozen Suckers, including all materials, supplies and wrappers is less than 7 cents per dozen. The selling price to the dealer is 40 cents per dozen. The retail price is 5 cents each. Truly an exceptional profit, you will admit.

With practically no initial investment you can add this new source of income to your 1925 business.

ICE CREAM MANUFACTURERS ARE PUTTING OUT

Frozen Suckers

TO DATE, HAS BEEN MADE WITH KIST FLAVORS

Frozen Sucker Equipment

We have gone into the Frozen Sucker proposition, thoroughly and coordinated all the details, enabling the Ice Cream Manufacturer to start production quickly and with practically no initial expense.

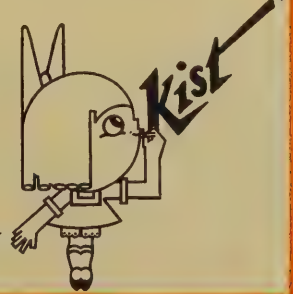
After careful investigation we have made arrangements with the Valentine Machinery and Supply Company of Chicago to supply our customers with their Frozen Sucker mold units at $29.50 each, F. O. B. Chicago. They are sold to responsible Ice Cream Manufacturers in regular open acount, terms 2% cash, ten days, net 30 days. In addition to the mold unit, it is necessary to have a Valentine Spill-drain costing $8.50. However, only one Spill-drain is needed for the average size plant and only two or three for the larger plants, using 50 or more molds.

We have found the Valentine method to be by far the most satisfactory and sanitary way of making Frozen Suckers.

We have secured a source of supply for the necessary vegetable parchment wrappers and supplies at exceedingly low prices for our customers' benefit.

How You Can Secure the Exclusive Rights to Manufacture Kist Flavored Frozen Suckers

To help the manufacturer put the Frozen Sucker proposition over quickly and effectively in his town we have prepared a forceful advertising campaign, consisting of a series of five exceptional newspaper advertisements and a series of powerful colored dealer window posterettes, all featuring the manufacturer's name prominently.



All the advertising material and other aids are only a part of our large and comprehensive advertising and merchandising service, which we furnish **FREE** to one Ice Cream Manufacturer in a town under a Friendly Agreement plan by which he enjoys the exclusive rights on "Kist" Flavors and "Kist" Flavored Frozen Suckers.

Just as "Kist" Flavors have been the outstanding flavors used in week-end bricks and bulk ice cream, ices, sherbets, ice cream cups and other specialties, so they have become the only accepted flavors for making Frozen Suckers.

Ice Cream and the Dairy Council

National Advertising Balances Itself After a Time, According to M. D. Munn, President of the National Dairy Council

HARDLY had the proposed national advertising ice cream campaign been outlined at the national convention last year when suggestions were made by different ice cream manufacturers that this campaign could be made much more effective if conducted in a manner similar to the methods followed by the National Dairy Council. Since that time many manufacturers have expressed themselves as favoring having this campaign placed largely in the hands of the dairy council. These thoughts have been expressed in view of the extremely good work the dairy council has done toward boosting the consumption of other dairy products.

M. D. MUNN.

It is for this reason that members of the industry will be much interested in some of the views of M. D. Munn, president of the the National Dairy Council, upon the matter of boosting ice cream consumption. Before the national convention was held, Mr. Munn expressed some interesting ideas on ice cream advertising at the annual convention of the Illinois Association of Ice Cream Manufacturers. The remarks he made at that convention are more interesting now than they were at that time, though Mr. Munn by no means attempted to outline at the Illinois convention any definite program for advertising ice cream, merely confining his remarks to the value of co-operative advertising. However, he did—

"...Wish that this industry could wake up to the opportunity that lies ahead of it in building this building. How can this be done?"

He then told of the council's activity toward getting more milk consumed not only as milk, but also in connection with other products.

With regards to the question of how this can be done with ice cream, he said:

"We have our demonstrators, we have our lecturers, nutritional lecturers we call them, we have our play-workers; but all the time and whatever they do, they are talking about the food value of dairy products but primarily milk.

"You can't give a cooking demonstration with ice cream, but do you realize what you can do? Supposing you had a lecturer that was meeting with mothers' clubs, with community organizations (and there are millions of women in those organizations who are seeking knowledge as to how they can have something attractive and not expensive for a little party, a little gathering, a family reunion) and those people know but little about ice cream excepting perhaps one or two varieties, they don't know how they can get ice cream in different forms or how they can have it put up so as to make it something attractive and new. They don't know anything about baked Alaska any more than I did.

"How easy it would be for this lecturer—and we appeared last year before 960,000 mothers in giving these demonstration talks by the nutritional lecturers alone—to get some idea of the opportunities for reaching these women! What can this lecturer do?

"She could take one of these groups of women and explain to them what it means to use ice cream in a home. Explain to them how, by buying a quart or two quarts of ice cream, they are buying more concentrated food in the form of vitamines, energy, mineral matter and protein than they could get in any other way. And tell them what it means to give their children a dish of that ice cream, let alone what it means to the satisfaction and pleasure of the people who might happen to drop in, to get some of that ice cream. And to tell them how to fix up their meal so that ice cream fits in. Do you think that would do any good?"

SINCE this is a partial outline of the procedure the council has followed in building up the consumption of milk, it is interesting to give thought to what the same method would do toward boosting ice cream consumption. But to go farther into the practice of the dairy council, quoting Mr. Munn at the Illinois convention—

"We take funds and divide them into proper relationship so far as budget is concerned. I'd use a certain portion of them in national advertising for psychological reasons, good supporting advertising, but I'd use the majority of it in this actual demonstration work, supported by the literature, pictures and material that is necessary to scatter this knowledge.

"We don't get this increased consumption of milk and

NEUTRALIZATION AND HOMOGENIZATION AS RELATED TO VISCOSITY AND OVERRUN.

(Continued from page 102)

tained. The alkali, therefore, proved most harmful in the material which was highest in fat. Whether this fact is significant needs further investigation, he believed. In no instance, however, could a relationship be found between acidity, viscosity, and overrun, and

It appears then that acidity itself and viscosity itself has no direct influence on the overrun. High acidities, above .3 per cent, or conditions accompanying them, usually result in reduced overrun, but the reduction is generally less than if neutralization is resorted to. Neutralizing the cream or the whole mix is more destructive to the overrun than neutralizing condensed skim milk used in the mix although the same amount of neutralizer was used in each case.

"In other experiments in commercial plants such as the Crane Ice Cream Company at Philadelphia and Russ Brothers of Harrisburg, as well as at several experiment stations, the relationship of acidity and viscosity to overrun have been studied. But there seems to be much disagreement in the results. Of course, pasteurizing a high acid mix, containing above .3 per cent acid, is likely to cook onto the coils in pasteurizing.

"High acidity in the mix also detracts somewhat from the smoothness of the ice cream and neutralizing may improve the texture slightly."

He took up homogenization:

"Of course, homogenization is the process in which we break up the fat globules of the mix and cause a more thorough emulsion of all the ingredients of the mix by forcing it, by means of a heavy pump, through very small openings controlled by finely adjustable valves. The value of homogenization has been recognized so generally that no factory of any considerable size can afford to do without it at the present time."

He summed up the main advantages of homogenization as follows:

1. It produces a very smooth, velvety body in the ice cream because of the complete emulsion of all ingredients.

(a) A coarse body is prevented because the water globules are finely divided and emulsed with the remaining ingredients so that if ice crystals form at all they are so small as not to be detected in the mouth.

(b) A buttery body is avoided because the fat globules are so small and so well emulsed that they cannot be gathered into butter granules in the freezer.

2. No butterfat is lost by separating and churning out.

3. The ice cream is uniform in fat content in all packages and within one package.

4. Less time is required for aging.

5. A larger overrun may safely be incorporated into a homogenized mix without danger of shrinkage because the air cells are smaller and small air cells are more stable than the larger air cells found in unhomogenized ice cream. However, the purpose of the homogenizer is not to raise the overrun, but to improve the quality of the ice cream.

6. Homogenized ice cream seems to improve the flavor of the ice cream although this impression is probably obtained because of the touch of smoothness on the palate.

7. Homogenized ice cream is more digestible because of the smaller fat globules.

8. Homogenization gives the manufacturer a choice of dairy products that he may use in order to obtain the best flavor and body in his ice cream and the greatest economy of production.

"QUALITY, of course," he added, "should be the deciding factor in selecting the ingredients to be used in the mix although some ingredients have the advantage of being less bulky and of keeping better than others. Then, also, there may be a considerable difference in the cost per pound of solids in different dairy products. For instance, thin cream contains a higher per cent of solids not fat than thick cream and since the ice cream maker values the solids not fat as well as the fat although he pays for the fat only, there may be quite a difference in economy between using thin cream, thick cream, or sweet butter."

Returning to consideration of viscosity and overrun as affected by homogenization—

"In experiments conducted at Storrs, Conn., there seemed to be a direct relationship between acidity, viscosity, and homogenization pressure. They found that an increase in either acidity or homogenizing pressure was always accompanied by increased viscosity. What they considered the correct viscosity was obtained—

With 4,000 pounds pressure on a .16 per cent acidity mix
With 3,500 pounds pressure on a .2 per cent acidity mix
With 3,000 pounds pressure on a .24 per cent acidity mix
With 2,500 pounds pressure on a .28 per cent acidity mix
With 1,900 pounds pressure on a .32 per cent acidity mix.

"It would be interesting to know how the overrun was affected by the variation in viscosity, acidity, and pressure. The lowest acidities, together with correspondingly higher homogenizing pressures are commonly recommended for best results.

The old theory that viscosity increases overrun, therefore, does no longer seem to hold water, he concluded, adding that there seem to be different types of viscosity.

ICE CREAM IS A RICH RELATIVE OF NATURE'S MOST COMPLETE FOOD.

(Continued from page 12)

We can only speak as a layman, but we know three people who are fond of drinking a cool glass of pure whole milk to one who has any appetite for cream. You have a sense of health and benefit out of a glass of milk.

There should be some way for the candid ice cream man to capitalize upon the ever-increasing fondness of the public for milk. (See page 12, March, 1925, issue of The Ice Cream Review.)

ONE of the most effective means of propaganda which the Metropolitan uses to convince its policyholders of the importance of milk in the diet is a thirty-two page pamphlet called "All About Milk" written especially for the purpose by Dr. Milton J. Rosenau, professor of preventive medicine and hygiene at Harvard Medical School, formerly director of the Hygienic Laboratory of the U. S. Public Health Service and probably the country's foremost authority on milk. In this book he says regarding milk—which would apply just as well to ice cream:

"Milk is the best food we have. Save on other things if you must, but not on milk. You cannot afford to do without it—growing children especially need plenty. Buy at least a pint of milk a day for each person in the household. No other food can take its place. Use it all; do not waste a drop.

"Milk looks like a simple fluid but really it is very complex. A glass of milk contains a mixture of all the important things that make up a mixed diet. One can get the same nourishment from milk as from a meal made up of meat and eggs, sugar and cereals, oils and fats with salt and water.

"Milk is a good fuel because it contains fat and sugar. But food is more than fuel—it repairs waste, helps growth, builds flesh and bone. Milk does all this. Milk is rich in vitamines, which are the 'life' of the diet. Vitamines promote growth and favor utilization of food. It is not possible to live without vitamines though full quantities of food are eaten. Vitamines are not stored in the body and it is therefore necessary for us to eat food containing some of them most every day.

"Milk contains a great deal of lime. Children need lime and plenty of it, especially for their growing bones and teeth.

"Milk also contains plenty of phosphates in the form of phosphate of lime. In order to utilize this salt especially for growing bones it is important to have a certain amount of sunlight otherwise the child is likely to develop rickets. Common-sense long ago showed the value of sunlight and fresh air. Science has now proved their vital importance, especially for growing children."

Mapleine

Costs Less in the End

Mapleine should appeal just as strongly to manufacturers who buy on price as those who buy on quality.

The only true way to figure the cost of a flavor is its **cost per gallon of finished ice cream,** and here Mapleine wins. It has such great strength that 2 ounces are all that is required to flavor and color 10 gallons of finished ice cream. The cost is only **1½c a gallon**—a figure that is hard to beat.

Mapleine reduces flavor costs to the minimum, and at the same time develops a quality of flavor that is not surpassed. Mapleine Ice Cream "tastes like more." Each year brings increased demand for it. Manufacturers who began buying Mapleine in quart bottles a few seasons ago now need many kegs a season to satisfy their requirements. Mapleine stands in the front row of leading flavors, along with chocolate and strawberry.

Mapleine a Proven Flavor

There is no experimenting. You take no chances. Mapleine has made good as an ice cream flavoring and you can depend upon it for flavor that sells the goods.

Convince yourself. Order of your jobber but accept no substitute. Mapleine is always identified by the Crescent Trade Mark. Look for it.

APPRAISAL—ITS RELATION TO COSTS AND INSURANCE.

(Continued from page 84)

are not as complete or accurate, nor in any way dependable as is a standardized appraisal. Of course the architect-contractor can set a valuation and it may be accepted on the basis of his personal high standing in the community, but that does not necessarily make the figures correct.

"The fact of the matter is that the training and experience of the average architect or contractor is entirely the reverse of appraisal. You might as well say that you can skate backwards because you can skate frontwards. No, it must be learned. Both architects and contractors are occupied with the putting up of buildings, whereas appraisers are solely concerned with the materials and workmanshop in buildings already up under certain regularity of description.

"Undoubtedly the factory management understands the operation of a machine, or the entire plant, better than anyone else, but, when it comes to descriptions and values, the owner is usually untrained as to standardized method. Compared with appraisal almost any owner's inventory is more or less crude and unsatisfactory."

APPRAISAL work is naturally very confidential. It would be "easier to get the bank to tell you your competitor's balance or your auditor to disclose business secrets than to secure any information from an appraisal company concerning any plant except your own."

The speaker added:

"One of the great differences between an owner's inventory and an appraisal may be designated as 'classification,' which deserves some explanation. The equipment man does not go from a machine to a bench, then to the light that hangs over it. He takes each item under its proper heading. Thus, by going over and over each building it is especially certain that everything is properly classified, and included.

"Some factory owners having appraisal are of the mistaken opinion that they should keep from the appraisers every scrap of information and make them do the work entirely alone. It should be stated that it does not interfere with the disinterestedness of the work for the management frankly to be of whatever assistance possible on the job and not make it any more difficult for the men than is absolutely necessary.

"In a factory of any size the manager's time and attention is, or should be, more necessary to other matters, such as purchasing, production and sales, rather than in the details of a plant inventory. It is a fact that the same work done by the owners, if their time is figured on the basis of their income, would cost as much on the average as the price paid to an appraisal company. To say, therefore, that an inventory doesn't cost anything because done in overtime, is dodging the issue."

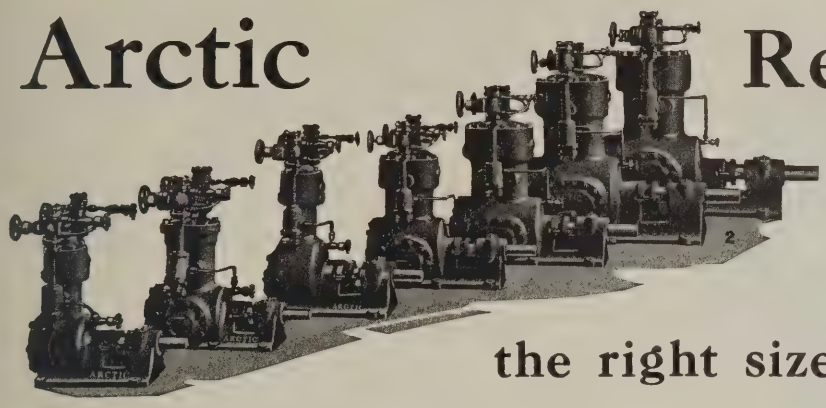
ICE CREAM FOR BREAKFAST IS REALITY—IN ENGLAND.

(Continued from page 26)

Are we not following along in the same beaten path and allowing our potential ice cream customers to go ahead and eat pretty much the same food they and their fathers and their fathers' fathers have been eating for these many years. True, we have induced many to eat ice cream for dessert at lunch and dinner. But what about breakfast?



Somebody smiles and says, "It just isn't done, that's all—can't be done."

The only thing unexplained now is, how long will it be before somebody comes along and puts over another one of those things that "can't be done"—how long? For it will be, you know.

ing become an expression of the ice cream industry. It is in a sense the measure of our progress as a group. Publicly, the ice cream industry will be judged by the size, quality and accomplishments of its convention and show. Every manufacturer or supplyman who participated will be a factor in raising the industry in the public estimation and helping to make the industry greater. What a convention and show it would be if all the people interested in the ice cream industry got together in Detroit and what a force they would be if they all could be made to see the magnitude of the ice cream industry and its future possibilities and if they could only fully grasp that they are engaged in the manufacture and distribution of the most delicious and most highly health giving of all human foods.

"Until the people in the industry fully grasp this thought and give it united expression the rest of the world will never know. There is an appeal in 'Let's meet in Detroit in October.' Let's go prepared to give of our experience and knowledge for the benefit of the industry and take away with us renewed faith in the ice cream business and a desire and determination to establish new records in quality and in quantity production and sales."

This is probably the first time on record that the national association has issued a convention bulletin so far in advance of the convention. There are many other signs indicating that the association is making the most earnest preparations for a gigantic convention that will be fitting observance of its 25 years of useful service in the upbuilding of the ice cream industry.

* * *

DETROIT OFFICIALS ISSUE EARLY NOTES OF WELCOME.

The governor of Michigan and the mayor of Detroit have taken occasion to assure the ice cream industry of a royal welcome at the national exposition-convention to be held in Detroit next October.

Governor Alex J. Groesbeck has written to The Association of Ice Cream Supplymen, from his executive offices at Lansing, under a dating late in March:

"Gentlmen:

"I have been advised that The Association of Ice Cream Supply Men has selected the city of Detroit as its 1925 exposition center, and as governor of the state of Michigan, I wish to extend my good wishes to this association which means much in the life of American industry.

"The great industry covered by your association, through the National Association of Ice Cream Manufacturers and other bodies and through the individual interest in ice cream manufacturers throughout the continent will bring, I understand, several thousand visitors to Detroit, the metropolis of our great state of Michigan.

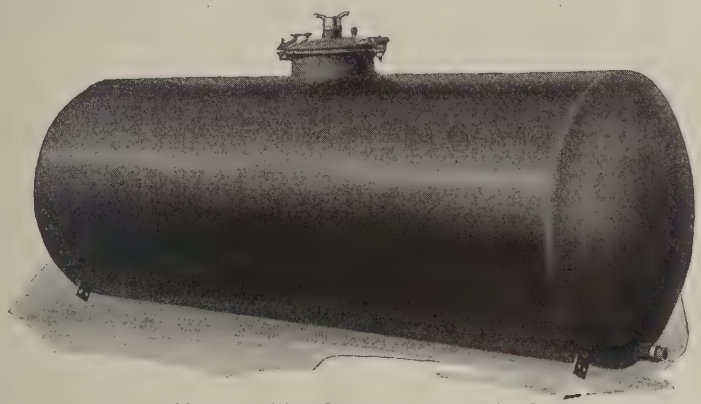
"Much may be obtained through the mutual exchange of ideas through the association's exposition which I am informed is among the leaders of the nation for its particular type.

"It is my sincere wish that the coming visit to Detroit will be pleasant and profitable, and that your efforts will be successful to the highest degree, and that you will return to us at an early date."

Several days earlier, immediately upon the conclusion of arrangements to hold the third national exposition in Detroit, the city's mayor, John W. Smith, communicated with the association as follows:

"With much satisfaction and pleasure I learn of the coming of The Association of Ice Cream Supply Men to Detroit next October, and I wish to extend my congratulations to your honorable body in choosing this city as its national exposition center.

"It is my belief that the members of your association will find a genuine spirit of friendliness awaiting them, and when each departs for his own city, he will feel that he is leaving his second home.



"Detroit is in reality a huge exposition of industrial activity and it will be of considerable interest and importance to our leaders to witness the exposition of The Association of Ice Cream Supply Men which I have been informed is third or fourth in size in the United States among expositions of a specific industrial character.

"Ice cream is distinctly an American creation and during its course of development has become one of the many in-

GLASCOTE

GLASCOTE Truck or Trailer Tanks have the approval of many of the largest and most experienced authorities on hauling milk.

The design of these tanks lowers the center of gravity, also decreases the weight; this is most essential for milk transportation.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

stitutions of our domestic life. As a food it has been found highly nutritious.

"It is with pleasure that I await the coming of The Association of Ice Cream Supply Men to our city, and it will be gratifying to me, as mayor of Detroit, cordially to welcome your members.

"Permit me to extend my sincere wishes for the success of your undertaking."

Further details of Detroit exposition facilities have been made known by the association. Nearly 100,000 square feet of ground floor area, under one roof, has been leased to accommodate the machinery, supply, equipment and special services displays.

The exposition committee, composed of K. W. Schantz, chairman, L. B. Esmond, Albert McDougal, Thomas J. Stewart and Robert Everett, has virtually completed steps preliminary to leasing the display area to members. Several features, conservative but novel in detail, this committee reports, will distinguish the third national exposition from the two earlier national shows.

⚜

ICE CREAM SHOULD HAVE BEAUTIFUL ENVIRONMENT.

The tendency to have ice cream served from butcher shops, meat markets, and other such places should be curbed, it was brought out in a speech before the California-Pacific joint convention by Carl Plaut. The industry cannot continue to make progress unless we keep this condition from materializing, declared Mr. Plaut, and he continued:

"I think ice cream is a food that represents everything lovely and nice, a food that everyone should surround with the thought that it is beautiful—it is sweet and lovely—but when you see it in a butcher shop, and when you see it scattered with vegetables and soft drinks, it loses that charm, in my opinion, and yet we insist on giving a cabinet and signs and all that sort of thing. The company which I represent had in years past a lot of gallonage which after very carefully figuring we found a great deal of it to be absolutely unprofitable. We found that one customer used 148 pounds of ice per gallon, and I figured out, although I am in the ice business, that that is in the end unprofitable on a gallonage of all the way from 10 to 20 gallons a month. We discontinued service to these people as nicely as we could. We told them that the sale of so little ice cream was not profitable to them, and if they desired to continue to sell ice cream it would be necessary for us to put on an icing charge. We put on an icing charge, which we still maintain. We put on the icing scale that our friend Weatherley put on in Portland. It works fine in some instances and in others we found it still unprofitable and had to discontinue service entirely. I might say, however, that all of this trade which we discontinued was absorbed by our competitors. We discontinue service and the next day they get somebody else to serve them, and I maintain this, that no customer that is not satisfactory or profitable to our company can be satisfactory and profitable to the other company, because we would not intentionally discontinue service to any man unless we could make some money out of him and so that he could sell our goods profitably."

EXPERTS DIFFER ON MATTER OF COLOR.

(Continued from page 32)

There is little likelihood of a color standard being established, according to a prominent ice cream supplyman. He points out that in some localities "the trade has been educated to prefer a pure white vanilla, while in others the color of the product has a very definite place in creating a demand."

A leading Middle Western ice cream authority believes in the natural color that is imparted by the use of milk and cream, and thinks this should be taken as a standard, for—

"This would be a very light color, which would be suggestive of the milk and cream from which it is made. During the winter months, if no color is added, the ice cream will be extremely light and the trade might demand a small amount of color, but the amount should be very small, as white ice cream would surely meet with better satisfaction on the average market than one which was too highly colored. I feel that the closer we can hold to the natural colors in case of vanilla ice cream, the better it will be for the industry."

Many manufacturers in the country are not helping sales any by having color in their product, it is pointed out by a leading instructor in New England, who added:

"There seems to be no standard at all and many shades and degrees of orange and yellow colors are found. Many of these are not in any way typical of normal cream color. Some of this promiscuous high coloring has come about, I believe, through the sale of so-called French ice cream, much of which is no more or less than the ordinary plain ice cream with extra added color. Then small dealers try to imitate this in their regular make.

"Personally, I believe that the most desirable color for plain vanilla ice cream is that obtained by the use of sufficient cream produced on grass to give the ice cream a fat content of 12-14 per cent. Ice cream made from the same kind of cream but containing only 8-10 per cent fat would perhaps be a little too low in color. Such a standard of color could be easily maintained throughout the year by the addition of the necessary amount of artificial coloring. In our laboratories here we use cheese color for this purpose and feel that it gives a more desirable and more natural color than anything else we have used. We find that 6-10 c.c.'s of cheese color are usually required per 100 pounds of mix in the winter time to give the desired shade or color.

"In scoring ice cream a perfect score should be given to the natural cream color. Deduction should be made for either higher or lower shades of color."

AN ICE cream manufacturer in a Southwestern state, who has personally supervised the scoring of about 500 lots of ice cream during the past five or six years, "and has noted considerable variation in the color of vanilla ice cream," believes that this color should approach a natural color which is obtained during the spring of the year, when cows have considerable green forage. This man says he always scored off perfectly white ice cream and especially, "if the color was gray or of a greenish tinge, which was found very freqently."

The matter of coloring depends altogether on what the trade wants, we are told by a prominent dairy educator in an Eastern university, who adds:

"The association of a rich creamy flavor of vanilla ice cream with the color of rich fresh cream made from milk produced from cows in pasture is probably responsible for many manufacturers adding enough color to their vanilla ice cream to produce this particular shade of color. It is generally conceded that the cream must have an appetizing appearance and a color which should be characteristic of the ingredients which are supposed to be present in the ideal ice cream.

"The ice cream manufacturer must please his trade. The judge is supposed to reflect the demand of the trade. The cheese judge who persists in selecting highly colored cheddar cheese for the Boston market will not find a ready market for the product when it gets to Boston. That trade demands a different color in its cheese. At present the demand of the ice cream trade has not settled on a single color in all sections of the country. The judge, therefore, can

BUSINESS IS BUSINESS

The desire of all business today is for more business. And more business can best be realized by using those methods and those supplies which produce quality products.

But the production of a quality product requires skill — a skillful workman assisted by skillful supplies. And the test of such skill is the service each renders.

Wyandotte
Sanitary
Cleaner and Cleanser

is nothing more to you than a mere name until it has performed some real service for you, or for some one whose decision you value.

In the absence of either of these tests you ask what knowledge do the makers of this product possess that leads them to believe they can render me a skilled service.

Indian in Circle

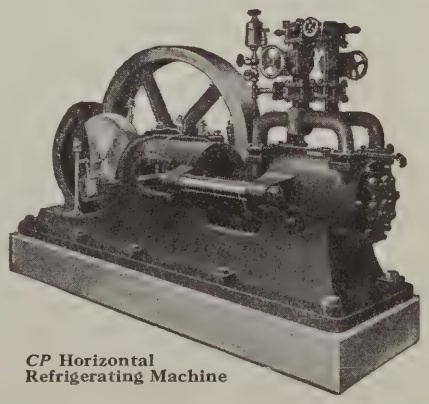
In Every Package

Inquiry shows the originator and maker of Wyandotte Sanitary Cleaner and Cleanser to also be the originator and maker of other successful cleaners. In fact, Wyandotte is the family name of a group of special cleaners Nationally known, some even of International reputation with records possible, only to products which show unusual ability or skill in doing the work for which they are recommended.

If Wyandotte Cleaner and Cleanser is not performing a profitable service for you who is the greater loser, you or we?

Why not ask your Supply Man to ship you Wyandotte Cleaner and Cleanser?

The J. B. Ford Company *Sole Manufacturers* Wyandotte, Michigan



NO DOUBT ABOUT IT

The Dairy Product Plant equipped with *CP* Refrigeration has the advantage.

Temperature, the most important factor in making first quality product, can be controlled. You, who are still using ice, just consider how much easier your work would be, how much more certain and uniform your product if you could obtain low temperature at will.

If you have not investigated we suggest you do it now. Talk to the *CP* Salesman or write the address below for Refrigeration Catalog.

We build both Horizontal and Vertical Types. Capacities range from ¼ ton upward. There are over 5000 in use. We can serve you well.

only comment perhaps for educational purposes only on the amount and shade of the color and cut the score only when the stretch of the imagination refuses to include canary yellow or strawberry red as characteristic of a well made vanilla ice cream.

"When the manufacture of ice cream becomes a more standardized process, and the trade has been educated to demand a more uniform color in ice cream then the color of ice cream will have ceased to be the problem which it is at present to the manufacturer and the judge of the product."

THE color of ice cream has its importance "in suggesting to the prospective consumer a desirable product," according to a leading dairy educator in a Middle Western university, who has had considerable experience in manufacturing ice cream for commercial purposes. In making ice cream, he points out, he always tried "to give the trade an ice cream with a delicate cream color obtained by the use of a standard ice cream or cheese color," but he does not recommend the addition of any coloring matter to ice cream "to the extent of making it appear too artificial." He would prefer to have ice cream with a Guernsey cream color in preference to a Jersey cream color, "as the Guernsey cream appears nearer to that of a delicate cream color." It has been his observation that the demand for a very light, medium light or a medium heavy color ice cream varies in each locality. He believes it is important for the plant manager to learn the demands of his trade and color his ice cream accordingly.

This matter has not been given sufficient thought during the past years to warrant a definite color standard at present, though the time will never come when ice cream will be all uniformly colored or a universial attempt made to obtain a definite color, it is declared by a well known ice cream authority in New York. It is his thought that—

"Pure white and real cream yellow with all gradations between, should be considered proper colored ice cream. White slightly tinted with yellow is the normal natural color of vanilla ice cream. The artificial yellow color should never be added in such quantity that the ice cream has a higher color than cream. Various objectionable tints of color often appear in ice cream. Gray and brown shades are not uncommon and are objectionable. The use of dark syrup during the war gave an objectionable gray, and certain condensed milks give a brown that is also undesirable. In scoring ice cream, it is my opinion that in justice to the manufacturer all ice cream that is not too highly colored or off-color should be scored perfect.

"The ice cream manufacturer must make the ice cream he can sell best whether it be white or colored. Some consumers prefer white ice cream; some state laws prohibit the use of any color so that the ice cream ingredients, especially condensed milk must be watched to get them as white as possible, or objectionable brownish tints will appear in the ice cream. In other localities white ice cream could not be sold. The manufacturer must cater to his own trade."

NEW COMPANY TO MAKE ICE CREAM.

Walter W. Grewe, formerly secretary of the Farmers' Dairy Co., Evansville, Ind., has resigned his position with the company and has organized the Walter W. Grewe Co. Fancy ices, ice cream and sherbets will be manufactured by the new company.

Mr. Grewe advises that he contemplates entering the butter and milk business later on. The company's plant, 25 by 60 feet, of brick construction, is equipped with modern machinery and was put into operation during the middle of April.

Don't be without a position, when at a small cost you can locate one through the Want Department in "The Ice Cream Review."

GRANTING that the practical, efficient mechanical fountains have arrived and that retailers are willing to put up their own money to buy them, why should the ice cream manufacturer be eager to invest large sums of his own money in cabinets? You are interested in seeing the salt and ice method of keeping ice cream discarded as soon as possible. So are we. But Rome was not built in a day and no matter how liberal you may be in the loaning or giving of cabinets, you cannot revolutionize an industry over night.

Is it not more important that the change in equipment, when it does take place, be a permanent rather than a temporary or makeshift one?

Is it not to the interest of every one concerned to have the retailer install such equipment as will be able to handle his business—enable him to give the kind of service that will build up his and your business?

Is it not better to let him put his own money in equipment rather than for you to carry the load?

If the only motive you have in pushing the mechanical cabinet is to get away from the unnecessary servicing expenses, should you not co-operate with us in our efforts to sell the dealer mechanical soda fountains, instead of discouraging the dealer who is favorably inclined toward a fountain?

I DO not believe that the majority of progressive ice cream manufacturers approve of cabinets being used to get business away from competitors, yet they are being used for this purpose in several localities. To a man up a tree this looks like business suicide. As one man expressed it, it is the same as giving a nigger a bottle of gin and a razor.

As I said before, I do not believe the majority of you men—no, not even a small minority—are in favor of cut-throat competition, and this being the case, is it not possible for us to work in close harmony instead of at cross purposes?

We come to you with a fair, square proposition. We are bending every effort to sell mechanical fountains, the installation of which will benefit you. We have nothing to sell you, we ask for none of your money, but we are asking for your co-operation and support.

It has been stated that there is a saving of from ten to fifteen cents a gallon in servicing mechanical fountains or cabinets. The offering of a rebate and your recommendation that fountains be bought will encourage their purchase. It is easy to convince a retailer that he can pay for a mechanical fountain out of the savings in the elimination of shrinkage and the lower price he can get on his ice cream.

When ice cream manufacturers refuse to give a lower price to users of mechanical fountains they are standing in their own light and postponing the day when salt and ice service can be discontinued. They are fighting against the inevitable, as without doubt the efficient fountain is the equipment all progressive retailers will ultimately have.

Bear in mind that our policy has been and will continue to be that of permitting each manufacturer to name his own figure without attempting to force his hand by suggesting to the retailer what would be a fair rebate. Our salesmen have positive instructions to let the matter of rebate be the subject of negotiations between the manufacturer whose ice cream he is using and the retailer. What we are proposing is that each of you decide on as liberal an allowance as you can afford, and encourage the reatiler to spend his money for a mechanically refrigerated soda fountain.

With a large capacity fountain such as are now available the average retailer has ample room for all the ice cream he needs for dispensing purposes. If, in addition to this fountain, you should install a cabinet in the back room or basement or possibly in the back bar, you could give the reserve stock that would enable you to cut your stops to once or twice a week except in the very busiest places. When you do this you have really accomplished something and those who want to use the cabinets to tie up accounts could still have the opportunity.

MEAT AND ICE CREAM MIX IN $50,000 RELIGIOUS SUIT.

Because the Castles Ice Cream Company of Irvington, N. J., delivered ice cream instead of plain ices for the wedding of Morris and Jenny Heyman, 82 Schuyler Ave., Newark, N. J., the company has been sued for $50,000 in Essex county court.

Heyman, a clothing merchant, charged that the company's mistake resulted in a serious violation of Jewish orthodoxy, which prohibits eating meat and milk or cream at the same time.

The wedding guests, after realizing the breach of the old religious tenet, were so offended that they left the celebration, Heyman charges, adding that his reputation has been damaged and that as a result his business has been impaired.

CERELOSE

CERELOSE is a pure white refined corn sugar which has been found to be of advantage to ice cream manufacturers for use in conjunction with cane sugar in the proportion of 25 to 50% Cerelose instead of 100% cane sugar, for the following reasons:

1.—Cerelose emphasizes the richness of the butter fat with the result that Cerelose develops the natural flavor of ice cream.

2.—Cerelose produces a smoother cream.

3.—Cerelose is the new solid builder for ice cream because it improves the body and texture. It will not crystallize nor form sandy cream.

4.—Ice cream made with Cerelose is more digestible than when made entirely with cane sugar because Cerelose is a dextrose sugar being directly assimilated by the blood, therefore, more ice cream may be consumed, particularly by infants and invalids.

5.—Cerelose is approximately 25% cheaper in price than cane sugar.

Cerelose should be used in the same manner as cane sugar, the amount depending upon the type of cream desired. 25 to 50% is recommended.

Sanitary Ice Cream Truck

The Sanitary Ice Cream Truck facilitates handling cream from freezers to hardening room.

Will handle any size can in common usage. Avoids accidents in handling, as the operator does not touch the cans until he reaches the hardening rooms.

One man with truck will handle the cream from the freezers as fast as it will flow, no helper being necessary.

Substantially built to stand usage, nothing to get out of order. Can container revolves on a thrust roller bearing and is easily turned.

Style	Diameter	Capacity	Freezer Opening	F.O.B. Price
A	28½ in.	6 cans	30 in.	$50.00
B	23 in.	4 cans	24 in.	45.00
C	34 in.	8 cans	36 in.	62.50
D	40 in.	10 cans	42 in.	75.00

Two or three can containers, placed so that two or three freezers can discharge at one time, can be mounted on one truck, increasing capacity, making less trips to the hardening room necessary. Prices for these special trucks made on application, specifications required.

One regular size truck will be shipped, acceptance on approval.

pends on the use of a suitable cleanser, so, too, does th success of washing painted surfaces depend on the ma terial used. Certain modern cleaners will thoroughl clean painted surfaces of all dirt and stain, and resto them to their original brightness and luster witho marring, dulling, or scratching. Such results are onl possible when the cleaning element is free and eas rinsing, and where its abrasive is so constructed that will not mar or scratch, but will break down und pressure.

It is possible to increase your business by trying eac of the many new stunts that are weekly referred to th ice cream industry. But it is less effort and far mo profitable to adhere to tested and tried methods—pu ting out a quality product at a reasonable price and o that is guaranteed thorough sanitary protection by th use of reliable cleaning materials.

WHY SO MANY DELIVERY ACCIDENTS?

(Continued from page 34)

quite high, until men were schooled, weeded out a replaced with careful men. An official of the compa remarked: "We now have good bumpers on our buss front and rear, and good drivers, but in spite of th and stop lights on the rear, we are still getting rear e collisions which cannot be helped, but over the pa year accidents in which our drivers have been at fa have been reduced to a very low figure. This has be due to picking the right men, and training them prop ly. We hire no men under 25 years of age, and pref them at 30 to 35 years, married and settled."

CAROLINA ASSOCIATION INCORPORATED.

The North Carolina Ice Cream Manufacturers' As ciation has received its certificate of incorporation. S retary A. E. Dixon has announced the objects of the corporation, which follow:

The objects for which this corporation are formed as follows:

(a) To promote and safe-guard the common intere of its members.

(b) To establish, foster and maintain friendly relati among those engaged in the manufacture of ice cream in state of North Carolina.

(c) To take united action upon all matters affect the welfare of the trade at large.

And in order to properly prosecute the objects and p poses above set forth, the corporation shall have full pow to purchase, lease and otherwise acquire, hold, mortga convey and otherwise dispose of all kinds of property, b real and personal, both in this state and in all other stat territories and dependencies of the United States, and g erally to perform all acts which may be deemed necessa for the proper and successful prosecution of the objects a purposes for which this corporation is created.

ICE CREAM PRODUCTION WAS 152,277,000 GA LONS IN FIRST 9 MONTHS OF '24.

The amount of ice cream produced in the first months of 1924 was 152,277,000 gallons instead of 14 277,000 gallons, as stated through an error in the Ap issue of The Ice Cream Review. The production figu for the first 9 months of 1923 were correct as given that article—156,305,000 gallons.

Complete figures on the production of ice cream the United States for the twelve months of 1924 states will not be available until June.

Honeymoon Ice Cream

our Special today

THE new Honeymoon window strip pictured above, will soon be teasing the eyes and appetites of people in 42 states where Honeymoon Ice cream is now being made.

If you do not know about "Honeymoon Special," here is the story in a nut-shell. It is a fruit blend made exclusively by The Cleveland Fruit Juice Company. Two quarts are sufficient for a 5-gallon mix. No color is needed.

Honeymoon Ice Cream outsells other Specials because it has all three points that make a winning cream.

—a color that coaxes a trial. Pink with bright fruit pieces flashing throughout.

—a flavor that teases the taste. One of those rare blends that appeal to all classes of trade.

—a catchy name.

Let us send you quotations on Honeymoon Special. We'll also tell you about the success of other ice cream manufacturers in your own state with this great Special.

of butter by just talking alone. We scattered 6,400,000 pieces of material last year that told about these things. That is what you will have to do with ice cream."

Mr. Munn expressed himself as having little patience with those ads "that try to picture ice cream as just an attractive delicacy, or as being a confection without reference to food value." He stressed the importance of balance in ice cream advertising, saying:

"Now you may ask me, why should Chicago contribute a fund to nationally advertise ice cream as a food and help New York to sell more ice cream on that basis? No, unless New York comes along with its proportionate share of that expense. I'd say not. But you can't see that when you advertise ice cream in New York, which advertisement reaches Chicago, or you advertise ice cream in Chicago at the same time, which advertising reaches New York, that you are balancing up all the while.

"This advertising nationally is a curious thing; it balances itself after a time, because increased consumption (brought about by educational means in one place when the same kind of work is going on in another place) brings about equal results all the while, providing you have those essential thing present that are necessary—your quality."

"Build Your Industry on a Solid Rock."

You are not in business for your health, you're in business because you want to succeed and want to make money. That's a justifiable part of it. But, men, you are engaged in a business that has something in it beyond dollars. Just get these facts in your mind—that your industry means something to child life in this country, that your industry means something to national health in this country. Build your foundation solid as a rock, on which you can meet anybody at any time and then go out and cultivate a habit of eating this product not only because you want to sell it to the people but because it's better for everybody if they will eat more of it, and realize that while you're doing that, while you're serving your own business, you're serving humanity and remember the better you serve your own business, the better you serve humanity—From Illinois convention address by M. D. Munn.

Clopton Tells School Kiddies About Ice Cream

A news exchange informs The Ice Cream Review that J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers, was one of the speakers at a high school ceremony at Albany, Ala., recently. Mr. Clopton's address was part of an educational program that is being put on by the Kiwanis Club of Albany-Decatur, Ala. Since making that speech Mr. Clopton has had classes in physics and chemistry to visit his plant, the Decatur Creamery and Ice Cream Co. of Decatur, Ala., which is one of the best equipped dairy plants in the South. The school children had explained to them each part of the plant's operation, and the function of each piece of machinery.

Mr. Clopton, in addition to performing valuable work for the ice cream industry in the South as secretary of the Southern Association of Ice Cream Manufacturers, takes a leading part in civic activities in his city, having served as president of his local chamber of commerce, president of the Kiwanis Club, and as a leader in various other civic movements.

YORK TRUCK

Ice Cream Can and Cover

Large Capacity—Easy Rolling
Durable—Built for Long Life

A REASONABLY priced, heavy, durable, strong, well built truck of large capacity, yet easy to handle. A truck that will stand up under hard usage and actually help reduce can handling costs.

Designed and built by engineers who are thoroughly experienced in the manufacture of trucks for the dairy industry.

Every detail of construction is carried through "to a point of perfection," both as to material and workmanship.

A better, more durable and efficient truck for the ice cream manufacturer.

CAPACITY
106—2 gal. cans; 96—3 gal. cans; 78—5 gal. cans.

Direct Method of Cost Accounting Approved For The Ice Cream Industry

Uniform System of Accounting and Cost Finding Will Correlate With That of Milk Dealers' Association

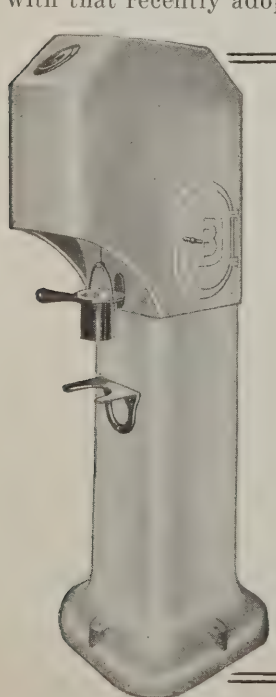
STEPS have been taken for the adoption of the direct method of cost accounting in the ice cream industry. This developed at a meeting of 47 members of the advisory committee of the cost accounting committee of the National Association of Ice Cream Manufacturers, following a four-day discussion in Chicago, it has been announced by Fred Rasmussen, executive secretary of the National Association of Ice Cream Manufacturers, Harrisburg, Pa.

S. T. NIVLING.

The advisory committee represented accountants and administration officials of ice cream companies from all parts of the country, there being representatives from as far south as Shreveport, La., as far west as Portland, Ore., and as far northeast as Burlington, Vt., in addition to representatives from St. Paul, Dallas and other distant cities.

The action of the committee means that a uniform and complete system of cost accounting and cost findings will be put in operation in the ice cream industry, after certain other steps are carried out.

The ice cream manufacturers' system will correlate with that recently adopted by the International Association of Milk Dealers, thus working toward standardization of the dairy industry. This is absolutely imperative in view of the fact that many ice cream manufacturers also handle market milk and make butter.



THE plan of co-operation between the ice cream manufacturers' association and the milk dealers' organization was approved at the annual convention at New Orleans, when recommended by S. T. Nivling, chairman of the cost accounting committee, and T. J. Bolitho, director of the cost accounting work of the milk dealers' association. After the convention, Mr. Bolitho made a survey of the representative ice cream plants in different parts of the country, collecting data from which he prepared preliminary drafts for the basis of discussion at the meeting of the advisory committee.

Mr. Bolitho is given much credit for the work which made it possible for the advisory committee to arrive at the unanimous conclusion of recommending the direct system of cost finding for the ice cream industry, according to Mr. Rasmussen, who in commenting upon this step, said:

"Only those present who participated in the discussion at these meetings can fully appreciate the importance of this conference. It means that the ice cream industry eventually will have a uniform and complete system of cost accounting and cost findings. Uniform terms will be adopted and the accounts of different companies can be compared on a similar basis; but what is more important, the system will be built so that it will give operating cost by departments and unit cost of the different products which will enable owners and managers to eliminate waste if it exists and reduce manufacturing and distributing costs to a minimum.

"Another very important feature in deciding upon the direct method of cost finding is that it makes possible the preparation of a uniform cost accounting system for the ice cream industry which will correlate with the uniform system of accounting adopted by the International Association of Milk Dealers and which is now in use in the fresh milk industry."

FOLLOWING the conference of the advisory committee in Chicago, four subsidiary working committees were appointed by the advisory committee, these committees being designated as: the standard, the classification, the engineering, and the manual committees.

Mr. Rasmussen explained the function of these committees as being "to prepare certain parts of the system of accounting, later to be reviewed and approved by the advisory committee." In fact, according to Mr. Rasmussen, what is taking place is—

"* * * leading accountants now in the industry are building the cost accounting system. This assures that when completed it will be simple, practical and applicable to the industry. In the working out of a uniform system of accounting, it is easy to understand that the system for the plant making 100,000 gallons annually must be simpler than the system for the plant making 5,000,000 gallons annually. This fact was kept clearly in mind by the conference and manuals will be prepared which will be applicable to the smaller as well as the larger manufacturers.

"It was a conference long to be remembered by those present because of the interest and earnestness of the participants, the freedom of discussion and the friendly spirit of give and take which existed. Everyone seemed to realize it was a big job, that no one knew it all, but that it was up to each man to give freely of his experience and knowledge and to keep an open mind."

This action places the ice cream industry in the ranks of the progressive industries of the day, as the failure to keep up with costs has meant a good deal of leakage in ice cream profits in the last several years.

⚜

FAITH AND GOOD WORKS.

The American habit of coining slogans might be very commendable, but it is the opinion of Richard F. Grant, president of the Chamber of Commerce of the United States, that slogans without good deeds to back them up are nothing more than pretty pearls of wisdom.

"I am very much interested," he said at a recent convention, "in the keynote, 'better selling,' but any keynote or any slogan that you may adopt remains a slogan or a keynote unless you do something about it. We have a great habit in this country of passing resolutions and having slogans and deciding that some new pearl of wisdom has descended upon us and that everything will be all right. Better selling—you might just as well say behave yourself, and then go away and forget about it, unless you do something about it.

"Better selling, as I conceive it, does not mean selling more, not trying to crowd a market beyond the ability of a market to absorb, not indulging in unfair practices in competition with those who are in business with you, but does comprehend a realization of responsibility which a man in business owes to his fellowman and his community."

These extracts are not reproduced to operate against the purpose of the National Association of Ice Cream Manufacturers recently adopted slogan, but to emphasize the importance of clean, ethical selling tactics in this industry. In making his statement Mr. Grant is saying nothing but what is expressed in different words in our national association's code of ethics.

⚜

ICE CREAM FOR THE IRISH.

Ice cream in Ireland is in prospect, according to the Ice Cream & Soda Fountain Journal, a supplement to the Confectioners' Union, London. A recent issue of that publication gives information that the Bri Chulaan Urban Council has accepted offers for the right to sell ice cream on the esplanade at Bray.

THAT DRUGGIST AND HIS "SPECIALS."

Birmingham, Ala., April 15, 1925.

Editor The Ice Cream Review:

Ever since I read the editorial in the April issue of The Ice Cream Review, I have had the "feeling," that something ought to be said about that druggist and his "specials." Thought perhaps it would evaporate—have tried to avoid seeing the editorial, but had The Ice Cream Review placed so I could see it. No, it can't be did. It's in my system so I'll have to let it out. That editorial is a "knockout." Of course, all editorials in The Olsen Publishing Company's publications are not only interesting and entertaining, but are instructive and constructive. If these editorials keep on keeping on being so good, I have a "feeling," that brother "E. K." will go preaching. That editorial, though no name mentioned, is worth $5,000 because folks will be watching the editor—find out where his "special D. S." is and that "fellow" will get a hunch—and will specialize in ice cream and do good for his town's people.

But while I am at it, let me point out that the drug store is **not** the place to handle nor sell dairy products. When "H. P." comes back from Denmark, he'll tell us about the selling of butter by the yard and eggs by the pound, the only right, honest way to sell eggs, and that when over there, in beautiful little Denmark, if he would go into a drug store (Apothek) and ask for a glass of buttermilk, an ice cream cone, a sandwich (without butter), nothing but the holes left of Swiss cheese and dried up slice of meat the thickness of paper, (as in big, rich America), or ask for a cigar (of course, he doesn't smoke), or looking for a pocket knife or doll, or hundreds of other junk articles sold in drug stores in these great United States, they would look at him, think he had just come out of an asylum or a fit subject to go in one. They sell nothing but drugs and the best of them.

A short time ago the writer went into a "big" drug store and asked for a vanilla ice cream. A young jelly-bean, with a cigarette in his mouth, stuck his hand into a can and I noticed he dropped some ashes in the cream. I said, "Excuse me, I have changed my mind," and walked out without cream. Will never buy there again.

A long time ago in the Butter, Cheese & Egg Journal, there was something said about sandwiches with butter. When "H. P." comes back he'll be elected to congress and will have a law enacted, a good one, that every sandwich offered for sale in the United States must have good butter on it. In Denmark, when asking for a sandwich, one starts with butter, spread with "lay on." Take the butter and lay it on, smoked herring, smoked eel, Swiss cheese, Danish cream chese, pork or ham, etc., used as filling in the sandwich, weighing more than the bread, makes a delicious sandwich. When traveling by air is better established, we'll take a run over and get some real sandwiches over there.

Sometime ago we read about a new slogan for ice cream. This will have to be done over again. There must be something else than "serve it." Like the dairymen have long since learned, there is more to it than to make butter. The bible says: "Sow sparingly, you reap sparingly, sow abundantly, you reap, etc." Dairying and ice cream products must be advertised. Look at soft drinks—often stale colored water—soft but expensive. "Let's advertise!"

Yours truly,
J. P. HOLM.

CAN-PRO CO. CANVAS SHIPPING BAG

Note the webs in the four corners. Adds strength and completely encloses top when it is buckled.

Leather washers hold outside leather and cap firmly.

Strictly waterproof inner lining. Can be washed out with hose and brush.

Handle is heavy canvas, riveted and sewed continuously DOWN LENGTH OF BAG, clinching inside double bottom.

Smooth surface makes cleaning and painting the bag easy. There is no QUILTING ON THE CAN-PRO-CO BAG — THUS NO connections between inner and outer canvas, affecting insulation.

The even semi-rigid surface takes paint and stencil readily, MAKING A FINE APPEARING SHIPPING PACKAGE.

Double heavy canvas bottom. Makes the bag wear longer.

Heavy rope. Proof against wear on bottom. Flexible and durable.

"Patent Applied For"

The CAN-PRO CO. BAG—packed with a 5 gallon can weighs approximately 30 pounds. Size closed, diameter 12½ inches — height 26 inches.

Compare this with the heavy iced packers you are now using. With the Can-Pro Co. Bag you load 4 times as much, with no more gross weight. One man handles packers with ease. Freight rates are cut. Wear and tear on equipment reduced. Time saved.

Used wherever ice cream is shipped.
Get your orders in early and save.

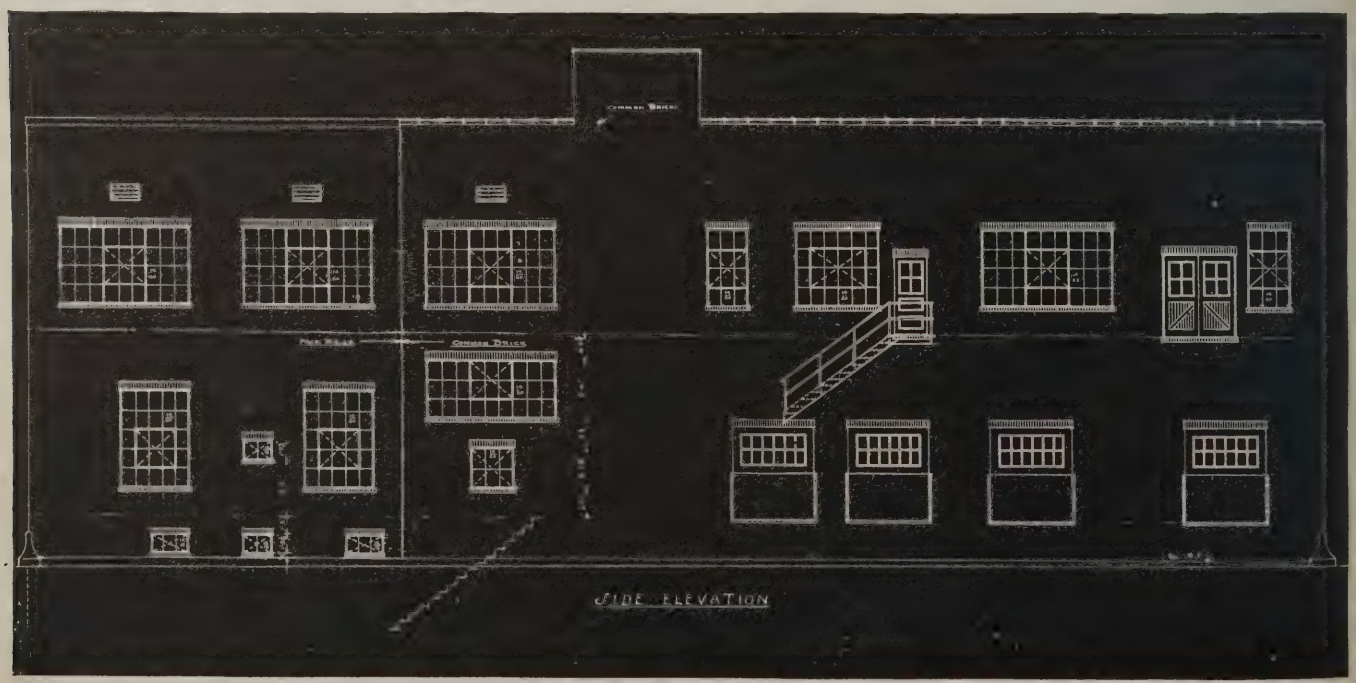
Model Plant for Telling-Belle Vernon Co.

IN THE city of Dayton, on one of the busy downtown streets, there is rapidly nearing completion an ice cream plant that in many original ways will attract much attention.

This plant is being constructed by The Telling-Belle Vernon Co., under the supervision of the Dayton manager, C. F. Robinson, who is seeing to it that "nothing will be lacking to make this plant a model in a scientific age."

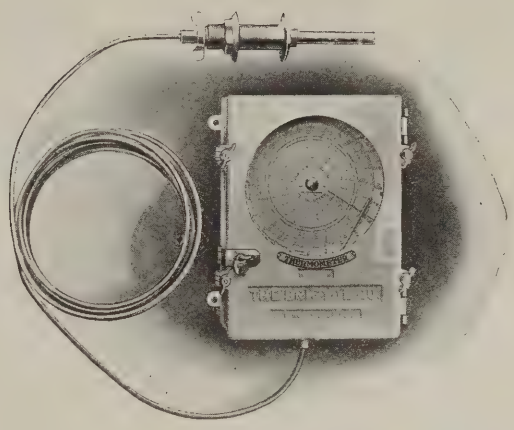
All power will go into the building electrically. Refrigeration and steam for heat and cleaning are produced in other buildings and brought into the plant from the outside.

As will be seen by the accompanying illustrations, the new Telling-Belle Vernon plant, located between St. Clair and Kenton Streets in Dayton, will be both ornate and practical. It will be two stories high with a handsome frontage of brick and stone. Capacity has already been arranged for the daily production of at least 12,000 gallons. Mixing vats and equipment will be on the second floor. Freezers, package machines, brick cutting apparatus, are arranged on the first floor.



The company expects to be completely installed into the new building and have the large quantity of new ice cream machinery it has purchased in actual operation by the first of May.

"Manufacturers who are familiar with the scope of the Telling-Belle Vernon Co. and with the success of their various enterprises, according to officials of that concern "will appreciate the amount of time and investigation given to the project before the erection of this plant and without any doubt other plants of the same type will follow in the various cities in which this company is represented."



ICE CREAM AND MARS.

And it should not be forgotten that ice cream has an almost universal appeal. It is sold to the rich, the poor, the sick and the strong. It graces the finest homes and the poorest tables. It is the working man's treat to his girl just as it is the refreshment of the upper class. It is the most aristocratic food on the market and yet it is the cheapest. It feeds princes, prize fighters and paupers. It is served in Florida, Texas, Maine, Missouri and even at Hollywood's quiet evening parties. It knows no limitations of age, sex or purse. It is worthy of the highest type of advertising, and frequently has the worst. It has more news stories to be told that are worth telling and worth hearing than any other product on the market.

It pays to advertise a product that is worth advertising. Wonderful is advertising and great its power. It can help even stars, planets, moons, nebulae and the milky way itself to attract attention. Sixteen hundred million people on this earth haven't paid any attention to the planet Mars for years. Yet, only a few weeks ago, several hundred million were looking around the sky for that planet simply because it had beeen advertised in the papers.—From California-Pacific address by A. A. Comey.

Stop Your Guesswork!

When something has gone wrong with the mix—inquiry among the help only brings out a lot of guess work on what or where the trouble may be.

If the cause is due to temperature variation—

BRISTOL
RECORDING INSTRUMENTS

along the line of mix will have charted the fault.

Bristol instruments not only help locate sources of trouble due to temperature variations, but tell exactly WHAT that variation was and WHEN it occurred. No human individual can do that. You need Bristol Recording Thermometers along your line of mix for checking at critical points.

BRISTOL'S

The most extensive line of recording instruments in the world, including—Pressure, Liquid Level, Temperature, Electricity, Motion, Speed, Humidity, etc. Ask for our catalogs.

The Ice and Salt Cabinet Still Has a Place Under The Sun

Dual Service is in Prospect for Many Years, as the "Little Fellow" Cannot Be Ignored

*By J. V. JAMISON, JR.**

FEW products have been launched into the established channels of an industry and secured almost universal acceptance in so short a time as the iceless ice cream cabinet. And yet, strangely enough, its advantages are too highly advantageous, and therefore, so radically different from the existing tools designed to serve the same purpose, that it has brought with it an entirely new set of problems, the answers to which few if any can confidently ascertain.

Consequently a discussion having to do with the future of the ice-and-salt cabinet is not altogether simple for the reason that no one seems sure as yet just what will be the ultimate place and importance of the iceless cabinet.

The ideal way to replace ice and salt cabinets with the new iceless containers would, of course, be a complete and decisive change. Doubtless if every manufacturer who reads this publication could wake up some morning to find all of his routes mechanically refrigerated he would quite willingly accept the suggestion that the millennium has come.

But unfortunately, big and lasting changes are usually less sudden and far more painful. And even those who are most impatient to put an end to the inconveniences so long associated with ice and salt are inclined to admit the folly of attempting to jump out of a situation which should rather be out-grown.

MY PERSONAL feeling, based largely upon conversations with a great many manufacturers, is that the problem can only be solved by years, probably many of them, because it goes so much deeper than the mere decision to buy certain equipment of a new and improved type. Like most distinct improvements, a distinct amount of cash is involved—and that as usual lets out the little fellow. So it is really the little fellow who presents the big problem.

Let him out—and the chances are the loss of volume will be felt. Count him in and you face the necessity of operating a system of dual service. Give him an iceless cabinet whether he justifies it or not and your bookkeeper may have opportunity to exhibit his talent in the use of red ink.

The puzzle is certainly not an easy one, particularly when aggravated by such considerations as heavy investment, depreciation, service charges, losses on old equipment, and proper distribution of earnings, if any, on the new. I have not the answer, but I believe along with the majority of others with whom I have conversed, that it lies, for the present at least, and probably for many years to come, in dual service. Few manufacturers are in position to depend entirely on the big fellow for volume.

While some are of the opinion that the iceless cabinet will automatically provide its own solution either by increasing the little fellow's business to a point where he is no longer "little" or by attracting to the bigger dealer the business which now makes the little fellow such a big worry, it is more generally believed that the little fellow, like the iceless cabinet, is here to stay.

And with him, must stay the ice and salt cabinet. The little man can't buy his own iceless cabinet—and the manufacturer can't buy it for him—not profitably. So the inevitable seems to be the operation of both types of cabinets. To retain the patronage of the large dealer,

Increase Your Business in 1925

By Judicious Advertising

Resolve now to go after business aggressively during 1925. You can use the magical power of advertising to build your business just as successfully as Wrigley of chewing gum fame, Gillette of the safety razor or Ingersoll of the dollar watch. Let the public know early and often that you can serve them well and that you want their business and your reward is certain.

Send today for a copy of "The Sale and Advertising of Dairy Products." It will tell you how to plan an advertising campaign that is within your means and it will show you how to conduct it every step of the way.

PRICE $2.00

This book contains hundreds of sales creating ideas that are carefully explained—any of which are worth several times the cost of the book. In addition it has scores of charts and illustrations which explain the subject matter with crystal clearness.

"The Sale and Advertising of Dairy Products" consists of over 100 pages, is abundantly illustrated with reproductions of actual ads and is well bound in blue cloth, lettered in gold.

It contains chapters on Milk, Ice Cream, Butter, Cheese and Dairy Farm advertising. It has become by far the best seller among dairy books. Send for your copy today.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN — MEMBER

iceless cabinets are bound to be almost a necessity, though a very desirable one. To nourish the little dealer and derive the volume which in the aggregate he provides, ice and salt cabinets have as yet no suitable substitute.

CONSEQUENTLY, there still seems to be a place in the sun for the ice-and-salt cabinet manufacturer, and while he may find the demand leaning heavily toward his smaller sizes, and his total volume somewhat under par, that doesn't mean that the local sheriff will find occasion to order a new supply of placards.

Indeed, I might go so far as to predict that the present upheaval will not be without its beneficial effects on the ice-and-salt cabinet business itself. The advent of iceless refrigeration has brought the cabinet question and particularly the question of the costs involved in the operation of the old ice and salt cabinets very much to the foreground. Undoubtedly the resulting investigation will disclose to many manufacturers, as no amount of sales effort and advertising could, that ice and salt cabinet manufacturers have not been idle all these years and that present day ice-and-salt cabinets are far superior, both in construction and in operation, to those which were on the market even as recently as a year or two ago.

After all the consensus of opinion seems to be that the ice cream manufacturers, as well as their dealers, must keep on making a little money now and then. That being the case, the ice-and-salt-cabinet man whose product contributes to the basic idea of paying dividends will still get a hearing with many, and probably the vast majority of operators.

HANDLING CONVENTIONS.

Handling a convention of a trade, profession or other type of organization is given the aspect of a science in a pamphlet on the subject prepared by John N. Van der Vries and issued by the Chamber of Commerce of the United States.

To the lay mind conventions might appear to be agglomerations of delegates wearing badges of many hues, but to the manager, who is rapidly developing into a professional expert, like the efficiency engineer and the publicity adviser, they are a serious business. Mr. Van der Vries under 13 headings lists 161 items which must be taken into account in preparing for, holding and summing up the results of conventions. He points out the particular wheels in the involved mechanism upon which a successful convention depends. His outline, "The Handling of Conventions," may be obtained from the Organization Service Bureau of the National Chamber at Washington.

In the ice cream industry we have some splendidly aggressive and studious association secretaries. If the industry as a whole could appreciate the great amount of work our secretaries must handle, we would be more grateful for the services of our secretaries, more responsive to their requests for co-operation, and more mindful of the sacrifices they make to serve our common industry.

We want to remind you that if you do not find advertised in this issue what you are seeking, it will cost you only 2c a word to let the world know through "The Ice Cream Review" what you want. Get busy before the other fellow gets ahead of you.

OUR MAIL BAG

Montgomery, Ala., April 8, 1925

Editor The Ice Cream Review:

Just a few lines of praise for that nice double page you have devoted to the "ladies" in the April issue. I always look forward to receiving The Ice Cream Review each month, and imagine my pleasant surprise to find myself right there "amongst 'em" with a clever little notice. You must know how much we ladies enjoy that pretty flattery and you can make us feel like we are really essential to the ice cream business.

I think we are going to have a splendid ice cream season down in "Alabamy." The season is much earlier than last year and our March business shows quite an increase over last.

With a happy wish for all my ice cream friends and the ever popular Ice Cream Review, I am,

Sincerely yours,
MARY KATE CARR,
Carr's Creamery.

"WHEN YOUR SHIP COMES IN."

General conditions and public sentiment indicate that 1925 will be the most prosperous year we have ever known. It will be a year of financial stability, in which the capitalist and layman will work hand in hand, and will benefit mutually. But remember, bigger returns will go only to those who have given in return an increased measure of service. If you can convince yourself that your opportunity lies right in your present position, and if you determine to make the **most** of that opportunity, **you'll** be a happy man when YOUR ship comes in laden with plenty.

NORBERT J. RODER,

C. A. Berry.

BIG MERGER PLANNED IN ILLINOIS.

It was recently announced by Henry G. Hawkinson and Sons, owners of the College City Ice Cream Co., Galesburg, Ill., that plans were under way for the merger of two big ice cream and dairy products plants at Beardstown and Jacksonville with the Galesburg company. If present plans materialize, the company will deal in dairy products on a large scale and will manufacture ice cream on a wholesale basis.

It is reported that the purpose of the merger is to make the industry stronger in line with the tendency which is prevailing throughout the country with regard to the manufacture of dairy products.

DOES QUALITY ALONE SELL ICE CREAM?

The United States as a whole consumed 78 dishes per capita in 1923, where cities like Chicago, Detroit, Cleveland, Baltimore, Washington and Philadelphia, show a per capita consumption for 1923 from 90 to 176 dishes consumed per person.

Exception would be taken that these cities make the best ice cream in the country. It is reasonable to suppose that manufacturers at other points produce a product of equally high quality. Therefore, we face the fact that it cannot be quality alone which influences the consumption of ice cream. Is it not more reasonable to suppose that the people in cities where this high per capita consumption prevails are more ice cream conscious than are the people of other points where the per capita consumption is low? And is it not more reasonable, therefore, to assume that national advertising and intensive selling will assist in bringing about an increase in the per capita consumption of ice cream at such points and at the same time deepen the consciousness of consumers in those cities where the per capita consumption is high? —From Illinions convention remarks by Will A. Schwindeler.

CHOCOLATE-COATED ICE CREAM CAUSES ECUADOR'S ECONOMIC RECOVERY.

The popularity of the chocolate covered ice cream confection is having much to do with the economic recovery of the country of Ecuador, in South America, according to foreign trade council reports. Almost over night chocolate produced in Ecuador was placed at a new premium by the widespread habit in this country of eating ice cream prepared in chocolate jackets. Bringing about increased demand for Ecuador's staple agricultural product, cocoa, from which the highest grade butter chocolate comes, this country has been lifted completely out of financial depression, according to trade reports.

This boom at the same time has worked to the advantage of the United States, according to government commerce officials, who pointed out that this is sought to bring back to Uncle Sam in Ecuador a customer that drifted away from us five years ago. The money that Ecuador has made from its chocolate is being spent freely in this country, and through round-a-bout channels much of it no doubt will return to the ice cream manufacturer.

The Congo is Ecuador's principal competitor in the production of cocoa, but the African product is called milder. Ecuador's advantage in this market developed with the end of the world war, when the transportation from the Congo was blockaded.

ICE CREAM MEN ENTERTAIN KIWANIANS.

East Manchester, N. H.—Members of the Kiwanis Club were entertained recently at the ice cream factory of C F. Fearon. After luncheon, the guests were afforded the opportunity to inspect the plant and a guide gave details regarding the manufacture of ice cream in a modern plant.

Later on the Kiwanians adjourned to a nearby theater, where a moving picture on the manufacture of ice cream was shown. Prof. W. P. B. Lockwood, secretary of the New England Association of Ice Cream Manufacturers, addressed the gathering.

PROMINENT ICE CREAM MANUFACTURER'S SON IS FOOTBALL STAR.

Benjamin C. Brown, head of the New Orleans Ice Cream Co., past president of the Southern Association of Ice Cream Manufacturers, prominent in national association activities, and one of the leading ice cream manufacturers of the South, is not the only member of the Brown family that has distinguished himself. Herewith is shown the likeness of "Brother" Brown, son of Benjamin C. Brown.

"BROTHER" BROWN

"Brother" Brown is one of the first sons of an ice cream family to distinguish himself in football. He was one of the star halfbacks last year on the Tulane University eleven. Tulane, located at New Orleans, away down in the extreme end of the country, has been counted out of football scrambles for a number of years, but last year, due to 'Brother" Brown's excellent work, Tulane stepped to the fore of Southern elevens by winning over Vanderbilt University, Vanderbilt being the team that later on journeyed up to Minnesota and defeated the strong University of Minnesota team.

"Brother" Brown was selected by the Southern sport writers for the all-Southern football team. He played four years with the Tulane eleven and last year was elected captain of the team. His engagement was announced in a recent issue of a New Orleans newspaper, and after he settles down to married life, he will join his father and brother in conducting the affairs of the New Orleans Ice Cream Co.

CO-OPERATIVE ADVERTISING AND ICE CREAM.

Co-operative advertising is rapidly becoming general. Out in Chicago during the first week in March, the florists, laundrymen and glove manufacturers discussed general advertising campaigns. They are all doing it. Maybe the confectionery trade will begin to think about it after the ice cream men have made inroads into our business. In an all-important matter of this kind the first in the field will have a decided advantage over the other.—International Confectioner.

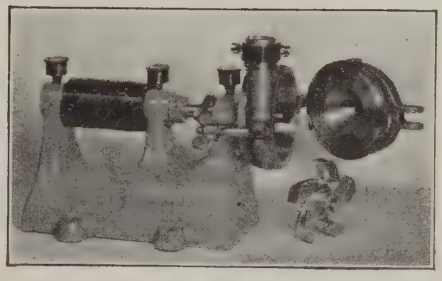
GIRL NAMES ICE CREAM BRAND.

An award of $50 was won by Katherine M. Krebs for the name she suggested for the special brand of ice cream to be manufactured by the Purity Ice Cream Co. of Tulsa, Okla. The product will be distributed under the trade name of "Purbest."

A total of 6,158 names were suggested during the week the contest lasted.

You'll make better ice cream if you get "The Ice Cream Review."

Wall Super Service Steel Cylinders



Made to last longer. From one piece of 16 gauge galvanized steel, with only one seam, securely riveted. Other gauges to specification. Top and bottom have smooth one inch bands formed by rolling the metal tight back upon itself.

Made to specifications for replacements or for new cabinets. And both first cost and yearly cost are less than that of inferior cylinders made in local tinshops or in your own plant.

FRANK STUART WEDS.

Announcement has been made of the marriage of Frank B. Stuart of Knoxville, prominent Southern ice cream manufacturer, to Mrs. Louise S. Finger, the marriage being solemnized Tuesday, March 10, at Knoxville.

F. B. STUART

Mr. Stuart is widely known in the Southern ice cream industry. He is a prominent figure in the South's convention activities each year, and just a few weeks prior to his marriage, he was elected vice-president of the ice cream division of the newly formed Tennessee Dairy Products Association. Mr. Stuart is with the Sani-Seal Company at Knoxville.

WHEN DID CONES START?

Whatever the date of the first continental wafers and cornets, the cone was not known in America until the St. Louis Exhibition, which preceded the Chicago show, in the 'nineties. The legend is that a young chap was selling ice cream to the visitors next to the stand where his sister was baking thin batter-cakes, and noticed many twisting these batters round the portions of ice cream and eating both together. The idea caught on, the batters were made in the shape of a cone, and that started the sale which has now reached four billion per annum in the states and, roughly, 10,000,000 in Britain last summer.—The Ice Cream and Soda Fountain Journal, London.

At last! Trouble-proof ice cream service

Nizer Cabinet with Monel Metal top and covers in store of Frank B. Calkins, Detroit, Mich. Manufactured by THE NIZER CORPORATION OF DETROIT

The Industry's most progressive development— Automatic Ice Cream Cabinet with Monel Metal Top

THE SALT-AND-ICE METHOD of keeping ice cream had to go. It was unsanitary and wasteful. But it required four years of intensive study and experiment to perfect an iceless cabinet that would take the place of ice and salt, and do it economically.

In the study of the problem, Nizer engineers found it necessary to discard many mechanical and construction features which until then had been generally used. They strove for simplicity, reliability and efficiency. These features you will find incorporated in the NIZER Iceless Ice Cream Cabinet.

The top and covers of all NIZER cabinets are Monel Metal. They will always look new and attractive because Monel Metal:

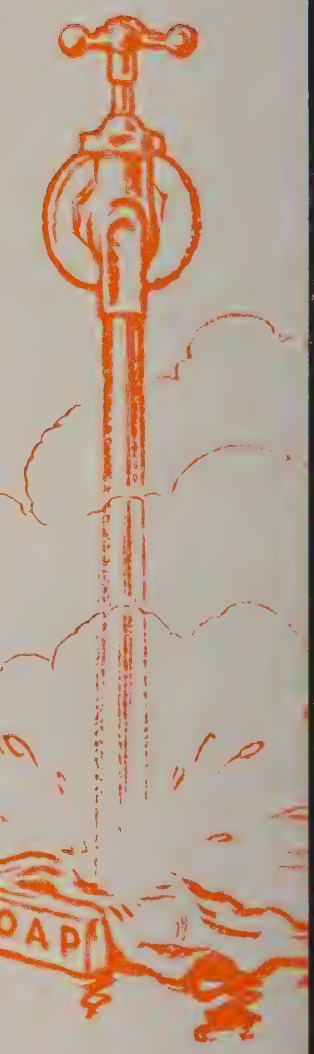
is so easy to clean
—will not rust or corrode
—has the strength of steel
—withstands hard service.

The Nizer Corporation's adoption of Monel Metal for cabinet top and covers is further proof that it is the ideal metal for soda fountain equipment. Let us tell you more about Monel Metal and its application to your problem.

SEND FOR "LIST B" OF MONEL METAL & NICKEL LITERATURE

THE INTERNATIONAL NICKEL COMPANY
67 WALL STREET NEW YORK CITY

INCo Monel metal



A little soap *and* water

THAT'S ALL! Just a little soap and water to keep Monel Metal spotlessly clean.

Have you ever noticed how noticeably Monel Metal improves a kitchen's appearance? Even when exposed to spattering grease and dimming smoke, it retains a bright, attractive finish through years of service.

Because Monel Metal equipped kitchens are so easily kept clean with little cost and effort, Monel Metal is now accepted as standard for food service equipment.

Are you overlooking places where Monel Metal might be used to advantage? Why not discuss present and future equipment plans with a manufacturer of Monel Metal equipment or your supply man. Find out for yourself how easily a kitchen can be improved with Monel Metal.

Monel Metal is the ideal metal for food service equipment

1. Monel Metal will not contaminate food.
2. Monel Metal with its steel-like strength withstands indefinitely the shuffling grind of heavy dish traffic. Monel Metal endures abuse as well as use. Years of "rough-and-tumble" service leave Monel Metal surfaces still bright and unscarred.
3. Monel Metal retains its silvery surface. Under any ordinary condition of kitchen service it will not lose its natural silver color.
4. Monel Metal will not rust or corrode.
5. Monel Metal is economical. Over a period of years, the savings in cleaning, labor, and the need for fewer replacements make the purchase of Monel Metal equipment a genuine economy.
6. Monel Metal is suitable for many forms of restaurant equipment. Leading manufacturers have standardized on Monel Metal.

SEND FOR "LIST B" OF AVAILABLE LITERATURE

Gives a Creamy Tint to Ice Cream and Cones

Hansen's June Cream Color imparts a most natural pale June Cream or a rich egg shade to ice cream, ice cream cones and other bakery goods, depending upon the quantity used.

It is fine for giving a creamy tint to cultured milk. It blends perfectly for all these purposes.

Hansen's June Cream Color is strictly vegetable—it contains no aniline dyes—it's simply made from the pollen of the seed of the annatto tree.

Not only this, but

Don't Make An ICE MAN Of Your DRIVER!

Delivering more ice than ice cream to your dealers is poor business, especially when the cause is with the cabinet and not the dealer's inability to sell more ice cream.

Brooks Drypak Cabinets

CONSERVE ICE

The Brooks Drypak is entirely new and different in construction. The ice, salt or brine never touches the ice cream can. This preserves your cans, keeps the dealers' floors and cabinets free from drip stains and eliminates complaints of salt in your cream. Cans cannot float or whirl in the Brooks Drypak.

The Drypak construction drains the brine free from the ice—keeps a uniform temperature top and bottom and permits a free circulation of cold air around all parts of the can.

Smith & Mann One-piece valves eliminate leaks around the drains. The outside construction is one-inch, number one Gulf Cypress. The vertical construction prevents warping and splitting so prevalent in glued up panels.

The Brooks Drypak is a 48 hour cabinet. Puts suburban stops on a profitable basis and cuts delivery costs 50%.

Get the full details of Drypak construction and how you can make a first hand inspection.—Write

FROM PACKING TUBS TO 48-HOUR CABINETS.

By J. N. Taylor.

All of the older ice cream men remember when it was customary to dispense ice cream direct from the packing tubs. Then, somebody thought of building a box and packing sawdust around the tubs to make the ice cream last longer. This improvement suggested a more efficient insulating material and granulated cork came into use for this purpose. Then you had the original tub cabinet that has been the old standby of ice cream manufacturers for many years.

It has only been the in last three years that the efficiency of the tub cabinet has been increased by using corkboard, sealed with asphaltum, and backed by insulating felt, in addition to the usual granulated cork used to fill in the insulating space around the tubs. This style of cabinet has the advantage of separate compartments that may be used independently for one or more cans of cream to meet the varying conditions due to seasonal changes in the volume of sales throughout the year, and is for that reason largely used in smaller communities.

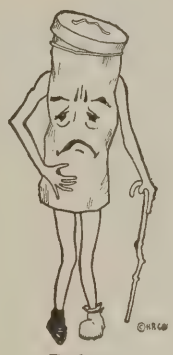
The development of the metal-lined cabinet has taken place very rapidly in recent years and the ice cream manufacturer is now able to supply his customers with cabinets that will keep cream in perfect condition for serving when iced every other day. Exhaustive tests have proven that this new cabinet will keep cream for 48 hours and in exceptional cases longer, depending on weather conditions and the location of the cabinet.

The 48-hour cabinet offers the ice cream manufacturer an opportunity to serve a larger number of stops with the same equipment and labor by every other day icing service, and they will enable him to save from 33⅓ to 50 per cent of his delivery costs when he has equipped all of his stops with the new cabinets.

This improvement in ice-and-salt refrigeration at the point of of distribution means more to the ice cream manufacturer than is apparent at first glance. They not only mean that he can materially reduce his icing and delivery costs but also that it will not be necessary for him to invest huge sums in mechanically refrigerated cabinets, which in many cases would mean that he would be compelled to borrow additional working capital and shoulder the burden of heavy interest and depreciation that naturally follows an investment in complicated mechanical devices.

It is further to the interest of every ice cream manufacturer to use the best ice and salt cabinets and avoid the waste resultant from poor cabinets, and on the other hand, the danger of tying up his working capital in mechanically refrigerated cabinets.

⚜



ICE CREAM LEAFLETS.

The New England Association of Ice Cream Manufacturers is furnishing copies of an interesting leaflet entitled, "Ice Cream—The Health Food," in which are given some interesting facts about ice cream. These leaflets have been distributed among members of the New England association, and Secretary W. P. B. Lockwood announces that copies will be furnished to ice cream manufacturers in other parts of the country at "a very slight additional charge over cost." The first "run" of these leafllets in New England was about 100,000 copies, according to Secretary Lockwood.

Century 16" Portable, 5 speed Oscillating Fan.

For Greatest Air Movement

Every ice cream parlor patron, to be comfortable, must actually feel the movement of the air. To assure such a comfortable condition, this Century 16-inch Portable, 5-speed Oscillating Fan is designed to include a unique and exclusive Century feature:—when it is tilted downward, as generally used on a side wall installation, it will blow on all of the guests seated within its entire sweep of oscillation. It always blows air to the same level or height to which it is tilted, from one end of its swing to the other—instead of blowing only on some of the guests and over the heads of others.

Combined with this is an ability to move a large volume of air, making this fan particularly useful in ice cream parlors.

Century Fans are built for either alternating or direct current service in these types:—9 in., 12 in. Portable, 3-speed Oscillating—16 in. Portable, 5-speed Oscillating—9 in. and 12 in. Portable, Single Speed—58 in., 3-speed Ceiling Fans and 16 in., 3-speed Ventilating Fans.

Send for complete folders and sales data on all types.

$30,000,000 Ice Cream Merger Reported for New York State.

New York City.—Steps toward a $30,000,000 merger of ice cream plants in New York State were reported by the Journal of Commerce on April 11, as follows:

A merger of ice cream companies in New York State, representing total assets of around $30,000,000, is under consideration. It would be the largest ice cream company ever organized. Seven up-state companies have the merger under discussion and an effort is being made to interest a large New York City organization. The latter is said to be the Horton Ice Cream Company. One man who is in close touch with the ice cream business here says the Horton concern approves the merger while another man who apparently speaks with equal authority, gives testimony to the contrary.

The principal figure in the proposed merger is said to be Vernon Hovey, who has extensive interests in the ice cream business. The companies which are most prominently mentioned in this connection are: The Albany Ice Cream Company, The International Ice Cream Company of Schenectady, The Syracuse Ice Cream Company, the Rochester Ice Cream Company, Wheat's and Hoffler's Ice Cream Companies of Buffalo and The Tonawanda Ice Cream Company.

A tentative plan of capitalization was drafted on March 27 at a meeting of representatives of the companies interested in the merger. Bankers in Wall Street were requested to take the matter under consideration and give their advice as to the feasibility of the proposed merger, and as to an interchange of stock and a possible public offering of stock.

It was stated today that the bankers might not be able to make their report before another week or two. The accounts of the interested companies are being examined by auditors representing the bankers, as well as the different concerns. A report will be made on assets, actual earning power of the individual concerns, opportunities for expansion and advantages which would result from the proposed merger.

By means of the merger it is stated, a concerted advertising and sales campaign could be carried on, production costs could be reduced and the price of the product could be lowered.

The plan is to have a holding company which would coordinate the operations of the different concerns in the merger and direct the operating units.

It is stated that assets of from $15,000,000 to $20,000,000 are represented in the companies which already have given their approval to the plan for the merger.

Ice Cream Measures Standardized in Jersey.

Trenton, N. J.—Announcement has been made by the New Jersey State Department of Weights and Measures that regulations have been adopted to put an end to the practice of using odd-size containers for the sale of ice cream and similar commodities generally sold by liquid measure. J. Harry Foley of the department announces that although regulations became effective April 15, jobbers will be given a reasonable opportunity to dispose of the odd sizes of containers now on hand.

It is reported that the purpose of the new regulations is to insure the sale of ice cream and similar products on the gallon basis. The standard sizes below a gallon will be two and a half quarts, two quarts, one and a half quarts, one quart, one pint, one-half pint and a gill. The regulations demand that each container have the capacity conspicuously stamped or printed thereon.

* * *

Big Ice Cream Mergers in East.

New York City, N. Y.—Some of the largest ice cream and dairy plants of the East have been absorbed by recent mergers. The Colonial Ice Cream Co., which recently was absorbed by the United States Dairy Products Corp., Philadelphia, is but one of several other plants thus far taken over by that corporation, including the Burdan Bros. Ice Cream Co. of Pottstown, Pa.; Sanitary Milk Co., Gloucester, N. J., and others. This corporation now serves a score of cities from its centrally located plants, including Harrisburg, Reading, Lebanon, Pottstown, Allentown, Lancaster and Wilmington.

A few weeks ago it was announced that the corporation's holdings now put its sales at the rate of $10,000,000 a year. This involves 36,500,000 quarts of milk a year and annual sales of ice cream in excess of 15,000,000 quarts.

Another large corporation, the National Dairy Products Corp., is rapidly extending its properties, now having big plants in New York, Perth Amboy and Chicago. Through the Hydrox Co., a subsidiary, it recently secured control of factories in Waukegan, Aurora and Hammond. These places are near the city of Chicago.

* * *

Penn State Seniors Visit Dairy Plants.

State College, Pa.—Eleven seniors in dairy husbandry at the Pennsylvania State College made an annual inspection trip to milk and ice cream plants of Harrisburg and Philadelphia, April 6 to 9. The group was in charge of Prof. W. H. Martin, head of dairy manufacturing work at the college.

On April 6 they visited Russ Brothers' ice cream plant, the Hershey ice cream plant, and the Pennsylvania Milk Products Company plant in Harrisburg, and then went on to Philadelphia.

April 7, 8 and 9 were spent in the Quaker City. The party there visited the milk and ice cream plants of the Supplee-Wills-Jones Milk Company, the Philadelphia Dairy Council, the market milk plant of the Scott-Powell Dairies, the market milk and ice cream plants of the Breyer Company, the Colonial Ice Cream Company, two milk and ice cream plants of the Abbot Company, and the butter market.

Injunctions Sought by Paper Container Manufacturer.

Brooklyn, N. Y.—Hearing has been held in the suit by the manufacturers of Lily drinking cups against the Tulip Container Corp. in the United States District Court for the Eastern District of New York. The Lily company alleges in its complaint that it has made and sold billions of drinking cups of the familiar Lily design, for which it holds a patent, and that the Tulip cup is so nearly identical in appearance with the Lily cup as to infringe the patented Lily cup. This is denied by the Tulip corporation.

The suit also alleged infringement of other patent rights, and charges that the name "Tulip" is a mere variation and an infringement of the registered trade mark on the Lily cup.

Both companies manufacture in Bush Terminal, Brooklyn.

Suit was also filed by the Dixie Drinking Cup Co. of New York against the Tulip company, under the patent of L. W. Luellen, who claims to be the originator of the present-day paper drinking cup. This patent is asserted to be the pioneer patent for the commercial one-piece paper drinking cups.

Both plaintiffs ask for injunctions and damages.

* * *

Business Anniversary Observed.

Philadelphia, Pa.—The week of April 6 marked the sixth anniversary of the entrance of Abbott's Alderney Dairies in the ice cream business in Philadelphia, Camden, Atlantic City and Bridgeton. The occasion was observed by the company with a celebration at its large Philadelphia plant. Ice cream dealers from Philadelphia, Camden, and various other cities for miles around Philadelphia attended the celebration. They inspected the making of Abbott's ice cream and the plant.

Since its modest start six years ago, the Abbott's ice cream business has grown till today it ranks as one of the leading ice cream manufacturing concerns of the industry.

Imperial Co. Treats Newsies.

Parkersburg, W. Va.—The Imperial Ice Cream Co. was host to local newsboys when they were treated to their fill of the company's product. The company had extended an invitation to every newsie in the city and it is reported that

LUICK BUYS TWO-STAGE GAULINS!

The above is a picture of recent installation of two 800 gallon, 2-Stage Valve, Gaulin Homogenizers, in the well known, up-to-date plant of the Luick Ice Cream Company of Milwaukee, Wisconsin. These two machines represent an investment of over TEN THOUSAND DOLLARS.

Following are some of the reasons why this investment was justified:

The Gaulin 2-Stage Valve is guaranteed to produce better ice cream than any similar device known.

The Gaulin 2-Stage Valve is guaranteed to increase homogenizing efficiency over 100%.

The Gaulin 2-Stage Valve is the only mechanical device by which viscosity or body of the mix, may be controlled by the operator.

The Gaulin 2-Stage Valve is the original and only genuine up-to-date homogenizer on the market; these are strong statements backed by strong companies. We stand ready to prove them at any time. Write us for new catalogue on our line of Gaulin Homogenizers and Blenders.

not one failed to respond. According to reports, 275 were present, and it is needless to say that it was a jolly crowd of youngsters that filed in, each being served with a large ice cream sandwich. The sandwich table was in charge of E. S. Ruble. The sandwich was followed by dishes of vanilla and chocolate ice cream, each boy or girl being given as much as he or she could eat—and some of them ate plenty, according to officials.

The big free-for-all ice cream feed was pronounced by the newsies as about the most joyful occasion in modern Parkersburg newspaperdom. The affair lasted about an hour during which time about 25 gallons of ice cream and several hundred sandwiches were consumed.

The affair was in charge of C. B. Hyatt, manager; C. F. Jackson, foreman of the packing department; E. S. Ruble, R. V. Chilvers, M. Elliott, and H. A. Spencer. J. H. Freese, representative of the J. B. Ford Co., also co-operated in making the event a real success.

* * *

Co-operate with Food Officials.

Jersey City, N. J.—Secretary Siemsen of the Hudson County Ice Cream and Confectionery Manufacturers' Association, has pledged the support of that body to city health authorities in a campaign to keep all food stocks in that community free of contagious disease. Going before the health officials recently, Mr. Siemsen stated that at a recent meeting of the association, which numbers 250 members, this matter was taken up and unanimously approved. He stated that the ice cream manufacturers have agreed not to employ any man or woman who is not in possession of a food handler's card. This card can be secured only after an examination.

* * *

Druggists Form Ice Cream Co.

Washington, D. C.—An exchange to manufacture ice cream for 50 Washington druggists has been organized in the Capital City under the style of the "Washington Druggists' Co-operative Group." This group will sell ice cream exclusively to members of the Washington Wholesale Drug Exchange.

This body has offered a prize of $250 for a name to describe the ice cream it produces. It will produce a product containing 18 per cent butterfat, according to announcement.

* * *

SOUTH.

Union Colors for Union Ice Cream.

Nashville, Tenn.—The Nashville public will grow familiar with the Union colors of red, white and blue in another connection besides that of the flag of the Union. For the colors of red, white and blue will be used in various ways by the Union Ice Cream Co. of this city.

The "Union colors" are to be used extensively, not only in display material of all kinds, but on all packages of cream sent out from this company. All of the dealers in Union ice cream will be supplied with these red, white and blue packages, both in pint pails and in the quart tubes with which most people are already familiar. The trademark of the company generally appears in white on a blue ground, with a red background. The packages are so bright and festive looking that they suggest an attractive gift, and will be very welcome to their recipients when used in this way during the warm months just ahead.

In addition to the packages, the Union colors will be carried out by the Union company on its cone boxes and on its sidewalk signs, and in every possible way. The whole idea is to make the public think of Union ice cream when they see the vivid splashes of red, white and blue denoting the Union colors. Both packages and sidewalk signs will be ready within the next few weeks.

* * *

Ben Brown Gets Set for Active Season.

New Orleans, La.—The New Orleans Ice Cream Co., at 1322 Baronne St., this city, while not a pioneer in the industry, is one of the outstanding establishments, locally, engaged in that line of business. Its activities date back about a couple of decades ago — in 1905, to be exact — when first founded by its present executive head, Benjamin C. Brown. The product of the New Orleans Ice Cream Co. has made great strides in popular favor since its foundation, the plant now covering a frontage of 164 feet of ground on one side and about 200 feet on the other, with 64 feet on the north side reserved for future expansion.

In anticipation of a big summer business, the company is engaged in installing a new refrigerating machine of fifty tons capacity, directly connected to a synchronous motor, together with other needed equipment for the manufacture of the frozen sucker. This is to be a brand new product of the plant to be featured this summer.

The company proposes making special window displays in the very near future and to this end is now giving active consideration to this method of drawing attention of the consumer and distributors to the excellence of the New Orleans Ice Cream Co.'s products.

Two sons of Mr. Brown assist him in the management of the plant. One of these, known among his college friends and intimates as "Buster" Brown—the younger of the two—won distinction as all-Southern "half-back" and captain of the Tulane University's football team last year, while the other, B. C. Brown, Jr., is manager of the plant.

Charles F. Hoppe Dies.

Louisville, Ky.—Following an illness of pneumonia, Charles Ferdinand Hoppe, 63 years of age, one of the founders and treasurer and general manager of the Frozn-Pure Ice Cream Co., Louisville, died at his home, 1124 South First street, Louisville, March 30, after but three days' sickness. He had been in poor health for five years.

CHARLES FERDINAND HOPPE

He was born Nov. 2, 1862, in Richmond, Va., and was a member of the prominent Boedeker family of that city. He attended the University of Virginia and later moved to Owensboro, Ky., where he married Miss Carrie C. Wilhoyte, who died seven years ago. He remained in Owensboro eighteen years, and was manager of the Owensboro Gas Company there for a number of years.

Mr. Hoppe moved to Louisville eighteen years ago and had been in the ice cream business here ever since. He was a member of the State Dairymen's and Ice Cream Manufacturers' Association of Kentucky, and also the Southern Association of Ice Cream Manufacturers. Seven years ago he assisted in organizing the Frozn-Pure company and has been an official of the organization since that time. He was a member of the Broadway Methodist Episcopal Church.

Mr. Hoppe is survived by three sons, Carl and Rutherford Hoppe of Louisville, and Wilhoyte Hoppe of Wheeling, W. Va.; three daughters, Mrs. F. S. Redfield and Miss Maude Hoppe of Louisville, and Mrs. G. N. Parrish of Owensboro, and five grandchildren.

increased manufacture of ice cream, butter, condensed milk and prepared ice cream mix.

This company does a large shipping business in whole milk and sweet cream.

V. L. King, president and manager, established this business in the spring of 1915. Since the advent of his company dairying has been considerably built up in this community. There formerly was not enough milk and cream produced in this territory to make the small amount of ice cream consumed there at that time. The sales now are in excess of a half a million dollars annually.

* * *

Fuerst & Kraemer, manufacturers and retail confectioners of New Orleans, have gone into the manufacture of ice cream for public sale and distribution, and for the purpose have constructed a modern and up-to-date ice cream plant at Canal and North Claiborne Sts., adjoining their other plants.

During the twenty-five years of its existence, the firm has manufactured ice cream exclusively for its own chain of retail confectionery stores, extending from one end to the other of the Orleans parish lines, which includes the entire city of New Orleans, but the new venture is intended to reach the public generally by supplying the demand for the best ice cream that can be made. The new plant will cost approximately $50,000, and will have a daily capacity of about 1,000 gallons of ice cream.

The plant is equipped with the most modern of ice cream machinery, every precaution having been taken to assure safety and excellence of the product.

* * *

Much Ice Cream Eaten in South Texas.

Houston, Tex.—The operation of the Houston Ice Cream Co. indicates that South Texas is a section of ice cream eaters. This company has an annual output of more than 400,000 gallons of ice cream, using 15,000 gallons of milk and cream every day.

The Houston company was the first wholesale ice cream concern to establish in this city. It was established by J. M. Jones and at present J. J. Sullivan is president and manager. W. J. Ijams is vice-president, and C. H. Rousse is secretary.

* * *

Window Display Contest to be Staged by Nashville Manufacturer.

Nashville, Tenn.—Announcement has been made by the Union Ice Cream Co., Nashville, Tenn., that a window display contest will be held this season. It is reported that the Union company furnishes its product to 90 per cent of the druggists of Nashville, all of whom are eligible as contestants. Prizes ranging from $5 to $100 will be awarded by the company to those dealers making the most attractive Union ice cream displays in their windows during the months to come. According to reports, the proprietor or head fountain man of nearly every drug store in Nashville has signified his intention of entering the contest.

W. E. DRAKE.

The Union Ice Cream Co. furnishes the display material, but the arrangement is left to the individuality and taste of the competing druggists. Attractive and handsome lithographing material will be furnished to the contestants, who are privileged to call at the company's plant and make their choice from a large selection of advertising matter available.

W. E. Drake, general manager of the company, is one of the South's leading ice cream men, being prominent in Southern and national convention activities.

Laura Norvell Elliott, advertising manager of the Union

Ice Cream Co., claims that "the only persons in Nashville who will not know the deliciousness of Union cream this summer will be those who are deaf, blind and devoid of any sense of taste."

* * *

MIDDLE WEST.

Kansas City, Mo.—By establishing a group insurance program at its plant, the Franklin Ice Cream Co. has provided protection for 160 employees, who are covered for a total of approximately $330,000. Underwritten by the Metropolitan Life Insurance Co., the insurance features of the plan are supplemented by service advantages, such as a free visiting nurse service and a department for the distribution of booklets on health subjects and sanitation.

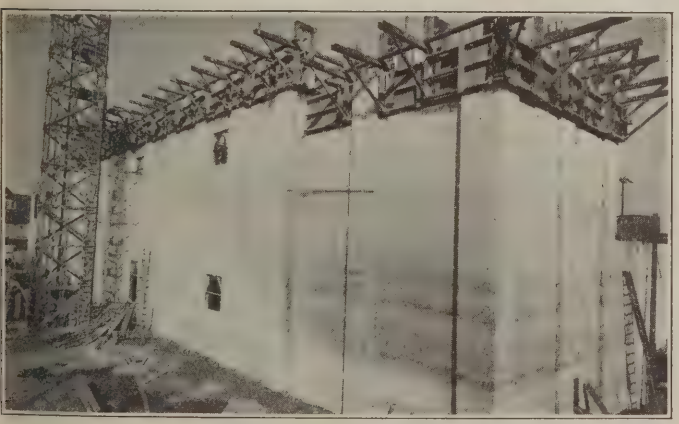
The plan is co-operative, as the employees and employer jointly pay the premiums.

Assistance in case of total and permanent disability is provided by a clause in the master policy, which covers exactly such a condition. This guarantees full payment of the insurance to any employee who becomes totally and permanently disabled before the age of 60. The payment will be made in equal monthly installments for a stipulated period and during the time of disability no premium payments will be required from the disabled employee.

Coverage for individuals is $1,500 for rank and file employees and $3,000 for members of the supervisory and clerical staffs.

* * *

Cox is Ohio District Chairman.



Columbus, O.—W. E. Cox of Portsmouth has been chosen chairman of District No. 6 of the Ohio Association of Ice Cream Manufacturers. He succeeds J. J. Smith of Athens, who resigned. For vice-president of the district, A. A. Brust of Chillicothe has been named. Included in this district are the counties of Athens, Ross, Scioto, Fairfield, Meigs, Pike, Pickaway, Gallia, Lawrence, Perry, Hocking, Victor and Jackson.

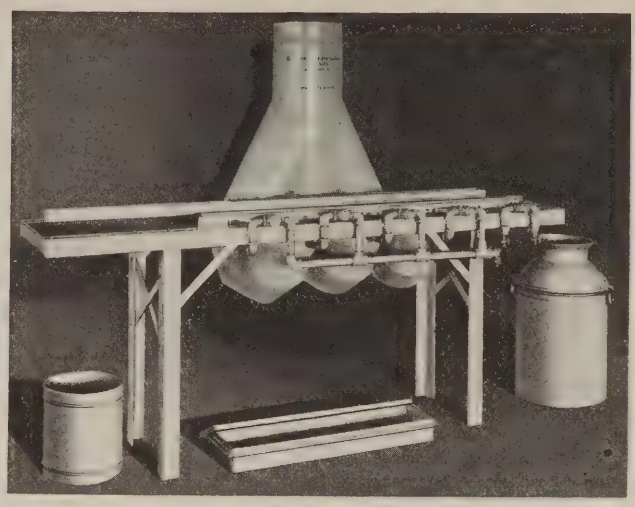
Globe Co. Erects $250,000 Annex.

Los Angeles, Cal.—A short time ago announcement was made by A. A. Comey, vice-president and general manager of the Globe Ice Cream Co., that the Globe Ice Cream Co. was erecting another $250,000 addition to its already monumental



Showing completion of two stories of 6-story annex building by Globe Ice Cream Co., Los Angeles, Cal. It will be ten stories high.

plant which now occupies over one-third of a city block.

All buildings of the Globe Ice Cream Co. are built of re-inforced concrete and steel, being Class A-1 construction. The new form of construction as originated by the Globe Ice Cream Co., and which is still being used, was invented by Will E. Keller of Los Angeles. This new form of construction is known as the "Keller slip-form concrete construction system." The moment the foundation is laid and the walls are started, a complete set of slip-forms are built and placed in position, thoroughly braced with eye bolts.

On top of the slip-forms a platform is erected for the purpose of pouring concrete, and controlling the slip-forms are screw jacks. As fast as the concrete is poured into the slip-forms the workmen then operate the screw jacks, which

Rinses—Sterilizes —Dries

ICE CREAM CANS
MILK CANS—MOLDS

The Economy Sterilizer injects live steam into every corner of the can—effectively controls bacteria—and draws off the steam so that the condensation is not perceptible in the room. This elimination of condensation in the room protects the equipment, preserves the building and makes the atmosphere more comfortable to work in.

The Economy Sterilizer and Drier

After steaming, The Economy Sterilizer DRIES the can, leaving no medium in which bacteria can develop. The Economy Sterilizer is but 6' long, handles all kinds of cans and is very reasonable in price.

"The Economy machine for rinsing, sterilizing and drying which we purchased is giving entire satisfaction. It is easily operated, does its work well and meets all requirements for which it is designed. We made no mistake in our decision." Yours truly,

immediately start to raise the forms, leaving the concrete in perfect shape, the walls being very exact and true. When the building is completed it forms one solid piece of concrete from top to bottom. This concrete, when it is poured, contains one inch round steel lacing bars to secure and tie together the walls as they rise. This class of concrete construction has revolutionized concrete building.

Short Course Students Organized.

Davis, Calif.—The California Dairy Industries' Association is composed of short course students for the past several years, having been organized under the direction of the University of Caliornia. C. A. Phillips is secretary-treasurer. He is located at Davis, and endeavors to keep the short course people in touch with the university and with each other by getting out monthly letters to the members.

* * *

Notes From Far and Near

Blytheville, Ark.—The Blytheville Ice Cream Co. has increased its capital from $12,000 to $30,000 so that the business may expand. The firm name will be changed to the Barnes Ice Cream Co., which new company has purchased the Caruthersville ice cream factory. Modern machinery will be added by Mr. Barnes to meet present demand for the company's product.

Fayetteville, Ark.—Joe Wood of Fort Smith has secured a permit for the erection of an ice cream plant at Spring and Block Sts.

Searcy, Ark.—The Grisham Ice Cream Co. has installed two coil pasteurizers with a capacity of 400 gallons each. A hardening room has been added with a capacity of 1,000 gallons.

Ontario, Calif.—The Ontario Upland Dairy Co. plans to establish a creamery and ice cream factory in the building at 110 North Euclid Ave., according to Ira B. Benson, head of the firm. A re-enforced concrete and brick addition will be built at the rear of the present building at a cost of $4,000, which will double the capacity of the ice cream factory.

Petaluma, Cal.—W. A. Helton is now sole owner of the ice cream factory at 8th and F. Sts., having purchased the interest of his partner, Seth Jones. Mr. Helton announced that improvements will be made to the plant.

Jacksonville, Fla.—Phillips Ice Cream Co. has been incorporated with Phillip B. Vaisilion and George H. Caramoment. The firm is capitalized at $75,000.

Chicago, Ill.—The National Dairy Products Corp. has acquired the business of the Chapelle-Thompson Ice Cream Co,. which company operates four plants and did a business of approximately 1,500,000 gallons of ice cream in 1924. The National Dairy Products Corp. recently absorbed the Hydrox Corp. of Chicago.

Cedar Falls, Ia.—The J. & H. Dairy Co. will begin operations soon, specializing in the manufacture of ice cream. The company was organized by George Jensen and W. A. Harvey.

Clay Center, Kans.—The Concordia Creamery and Ice Cream Co. of Concordia, Kans., will establish an ice cream factory at Clay Center. Paul Edquist is an officer of the company.

Portland, Me.—The Coon Ice Cream Co., Inc., operating plants in New England and northern New York points, is completing an ice cream manufacturing plant at Portland. Ward White, formerly manager at Biddeford, will be in charge of the Portland plant.

Faribault, Minn.—H. E. Voegel, Voegel Creamery, estmates that 600 gallons of Voegel's ice cream is eaten each day by the people in the Faribault territory. This represents the amount of ice cream turned out daily during the summer months.

Shakopee, Minn.—Articles of incorporation were filed by W. E. Redman, F. L. Koelzer, and K. Koelzer, for the organization of the Redman Ice Cream Co. The company is capitalized at $50,000 and will manufacture ice cream and butter and will pasteurize milk.

Kennett, Mo.—Operations were recently begun by the Kennett Ice Cream Co. In addition to manufacturing ice cream, the company handles all kinds of milk products.

St. Louis, Mo.—The Standard Ice Cream Co., 1301 Ohio St., was incorporated with a capital of $30,000. Incorporators are Peter Marchiony, John Marchiony and Edward Bueche.

THE KAY MACHINERY COMPANY, Elyria, Ohio

Sales Office: 946 Hanna Bldg., Cleveland, Ohio.

Hornell, N. Y.—The newly organized Hornell Ice Cream Co. will take over the business of the bankrupt Purity Ice Cream Co. The men interested are Everett Copeland, Benj. C. DeWitt, James T. Foody, and others.

Palmer, N. Y.—The Bridgeman Co. has been incorporated to deal in ice cream, milk products, etc. The company is capitalized at $100,000.

Fargo, N. D.—Work has been begun on the new Advance Ice Cream Co. plant here. George Christian is president of the organization.

Childress, Okla.—John R. Gates, formerly of Durham, Okla., will establish an ice cream and butter manufacturing plant here. The chamber of commerce is co-operating with Mr. Gates. Mr. Gates reports that the latest and most modern equipment will be purchased.

Dayton, O.—The Gem City Ice Cream Co. will enlarge its plant on West Third St., according to George D. Antrim and Lewis E. Ellis, owners.

Jackson, O.—Abraham Isaac has purchased property on Main and Railroad Sts., and will construct a modern ice cream factory on the site.

Frederick, Okla.—The new Cochran ice cream plant being erected here is nearing completion rapidly.

Everett, Pa.—J. H. Laher has completed an up-to-date ice cream plant here. An ice house, with a capacity of 275 tons, was also erected.

Hanover, Pa.—The Folmer Ice Cream Co. recently made improvements in its plant, which included the installation of a York refrigerating system.

Pittsburgh, Pa.—The officers of the Rieck-McJunkin Dairy Co., one of the East's largest ice cream manufacturing institutions, were elected at the annual stockholders' meeting of the company, and are as follows: E. E. Rieck, president; E. M. Bailey, vice-president; James G. Lewis, secretary and treasurer, and C. S. Nettrour, Q. C. Daniels, W. J. Burnap, C. J. Dauphinot, J. M. Hoyt, T. H. McInerney, L. G. Runk, G. E. Miller, H. R. Burnham and C. E. Rieck, directors.

Punxsutawney, Pa.—The Mahoning Ice Cream Co. conducted a contest to secure a suitable brand name for its product. "Mahoning Maid" was submitted by Catherine O'Connor and was the name adopted.

York, Pa.—Clarence E. Jacobs, who began the manufacture of ice cream in a small way last year, is now erecting a new modern factory building on East High St. New equipment and machinery will be installed.

Huron, S. D.—Additions being made to the Gagnon Ice Cream Co. will greatly increase the plant's capacity, and, according to Mr. Gagnon, considerable new machinery will be installed.

$75 IN CASH PRIZES FOR BEST IDEAS ON MERCHANDISING ICE CREAM.

(Continued from page 8)

writing. Just sit down and dictate your letter just as though you were talking to a group of good friends between convention sessions—which is just what you are doing, as it is six months off before another convention.

Let us hear from you right away. The contest closes June 15, but the earlier we get your contribution, the more time there will be for the judges to give the contribution a careful reading—and their vote for first place.

We shall publish the photo of the winner of the first prize, his article, a personal sketch of his business career, and also announce the other winners, in the August issue of The Ice Cream Review. We also shall publish the photos of the other four prize-winners, their articles and the articles of other contestants in subsequent issues.

Let us hear from you.

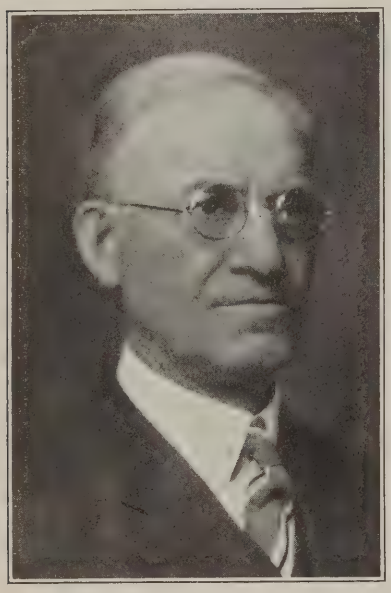
We also have several forty-quart machines of different makes which have been completely rebuilt. Prices very reasonable for quick sale.

UNIVERSAL SHOPS



BINGHAMTON, N. Y.

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

EVOLUTION OF THE CABINET INDUSTRY.

The "Tray-Pack" ice cream cabinet has been introduced to give the industry "a cabinet that would be sanitary and would be iced in the street at the truck instead of in the store," it is explained by Philip Fritz, president of the Grand Rapids Cabinet Co., Grand Rapids, Mich. The company also is manufacturing a cabinet called "Dry Tank," which is proving to be "very efficient," Mr. Fritz says. He adds that these cabinets are being built so "they will not deteriorate in efficiency from age and use."

PHILIP FRITZ.

Mr. Fritz, who began in the cabinet manufacturing business 27 years ago, says he has procured figures from concerns who have more than 100 mechanically refrigerated cabinets in use, and does not see "how the majority of ice cream manufacturers have been "forced or scared" into buying refrigerated cabinets, declaring that his firm was "forced" to build mechanical cabinets.

Regarding the evolution of the cabinet business Mr. Fritz, in a statement to The Ice Cream Review, said:

"The first ten years in the ice cream cabinet business I built nearly everything under the sun in the shape of an ice cream cabinet, as at that time, like now, the ice cream manufacturers hardly knew what they wanted and everybody had an idea of their own. We made cabinets to order, according to specifications, some of them being good and some bad. Some of the types of cabinets on the market today I built some 20 years ago, but in those days they cost too much money and the manufacturer did not want to pay the price. Furthermore, the majority did not believe in the dry pack system. They even complained of having cylinders around the tank, stating the brine should come up to the ice cream can to keep the cream in proper condition. This question had finally leveled itself out and everything was running smoothly when the iceless cabinet made its appearance and upset the whole country, and it is still far from being ironed out."

FOR THE BENEFIT OF THE INDUSTRY.

This department is for the benefit of our readers. Its purpose is to furnish news and helpful information about products used in the manufacture and distribution of ice cream.

We are pleased to receive news concerning activities among firms manufacturing and distributing ice cream supplies, machinery and equipment, so long as the matter is news and not "puffs." We like to keep up with the issuing of new catalogs, bulletins, pamphlets, etc., and are glad to make note of them. We like to receive information about changes in organizations, appointments of new salesmen, changes in territory of salesmen, promotion of salesmen and officials, removal of offices, erection of new plants, introduction of new lines of supplies, new types of machinery, etc.

We must decline to take part in controversies.

We must decline to express any opinion on the merits or functions of any product described in this department, as our position permits us to state only what the manufacturers or distributors of the product claim.

NATIONAL ICE CREAM CONE WEEK WINDOW-STRIPS FURNISHED FREE BY HAVACONE.

The Cone Company of America, Long Island City, N. Y., and Chicago, Ill., manufacturers of the Havacone, advise that it will supply the ice cream trade free of charge with National Cone Week window strips. A supply of these may be had by writing the Cone Company of America, 6001 S. Western Avenue, Chicago, or the Long Island City office.

* * *

GALLAGHER AGAIN HEADS CHOCOLATE MANUFACTURERS.

The annual meeting of the Association of Cocoa and Chocolate Manufacturers of the United States was held on Wednesday, March 25, at the Hotel Pennsylvania, New York City. In the absence of the president, Mr. Gallagher, the vice-president, Mr. Murrie, presided.

Aside from the usual routine report of officers, there was a lengthy discussion regarding the efforts of the traffic committee during the past year to secure lower rating on cocoa beans and chocolate products. It was pointed out that the existing freight ratings were established many years ago when the value was higher and the volume vastly smaller, and that today cocoa beans and cocoa and chocolate products are paying much higher rates than justified by the present value and volume, especially in comparison with other commodities of like nature for classification purposes. The efforts to secure just rates from the railroads will be continued. Following is a list of officers:

President, H. C. Gallagher, Walter Baker & Co., Ltd., Dorchester, Mass.; vice-president, Wm. F. R. Murrie, Hershey Chocolate Co., Hershey, Pa.; treasurer, Wm. H. Watt, Hooton Cocoa Co., Newark, N. J.; secretary, Wm. K. Wallbridge, Peter Cailler Kohler Swiss Chocolates Co., Inc., New York.

The following were named members of the executive committee:

H. C. Gallagher, Walter Baker & Co., Ltd., Dorchester, Mass.; Wm. F. R. Murrie, Hershey Chocolate Co., Hershey, Pa.; B. K. Wilbur, H. O. Wilbur & Sons, Philadelphia, Pa.; S P. Goble, Rockwood & Co., Brooklyn, N. Y.; Louis Runkel, Runkel Bros., Inc., New York, N. Y.; Wm. K. Wallbridge, Peter Cailler Kohler Swiss Chocolates Co., New York, N. Y., and J. A. Boyle, Stollwerck Chocolate Co., Stamford, Conn.

* * *

ICE CREAM FOR THE GERMANS.

The ice cream industry seems to be becoming established in Germany. The firm of W. Zinnert A. G. Holzmarkstr 2, Potsdam, Germany, has ordered flavoring extracts from a well known American ice cream supply house. This order was placed by Wilhelm F. Petrelli, buyer for the German ice cream factory, and was handled through Miss Sally H. Mahoney, Hudson Mfg. Co., Chicago.

The Hudson Mfg. Co. has handled considerable export business within the last few weeks, it is reported by members of the organization. This company reports having shipped vanilla to Sydney, Australia; Hongkong, China, and Havana, Cuba.

* * *

PURITY PAPER VESSELS CO. ACQUIRES NEW HOME.

A group of two and three-story manufacturing buildings has been acquired by the Purity Paper Vessels Company of Baltimore, Md., for its new factory, according to announcement. The plant spreads out for nine hundred feet along the banks of Jones' Falls at the base of the sloping hills of Druid Hill Park. It is situated along the northern central division of the Pennsylvania Railroad in what is known as the Woodberry section of Baltimore. Entrance to the plant is obtained over a private road connecting Falls Road with Union Avenue. Approximately five acres of ground surround the plant.

Minor alterations in the plant are already taking place

and by the first of May, officials announced in April, installation of the machines for making Purity paper cans and Pavesco paper bottles will begin.

Increasing demand for these its products compelled the company to seek new and larger quarters, officials explain, as the old plant acquired in 1917 was no longer large enough to house the company's machinery. By the installation of additional equipment, the Purity Paper Vessels Company will be operating without any cessation of production and in its new plant will be in a position better to supply the demand for its products, the company's announcement says.

* * *

FROZEN SUCKERS INTRODUCED IN THE NORTH.

Frozen suckers, which are said to have won widespread popularity in the South, are being introduced in the North by Fred K. Higbie, head of the Fred H. Higbie Supply Co., and the Higbie Salt Co., 360 N. Michigan St., Chicago. Mr. Higbie is taking care of the trade in frozen suckers at all points north of St. Louis, and reports that this product promises to be at least as popular in the North as in the South, particularly since per capita consumption is so much higher in Northern states.

H. A. Benners, head of Southern Selling Service, 702 United Fruit Building, New Orleans, is national agent for Radford's frozen sucker units, made by E. H. Radford Sheet Metal Works, Los Angeles.

The frozen sucker is made at a cost of 8 cents to 10 cents a dozen, retailing for a nickel, and it is further claimed that in the South this product has proved to have been valuable in combating competition from soft drinks.

* * *

New Corporate Name Announced.

It has been announced that the G. R. Ryan Mfg. Co., Inc., has changed its name to Vanilla Laboratories, Inc. Officials of the company advise there will be no change in the personnel and policy of the company.

The officials are Charles R. Phillips, president; F. J. Minges, first vice-president; J. G. Brown, second vice-president, and L. W. Chapin, secretary and treasurer. The business is established at Rochester, N. Y.

* * *

Increased Capitalization.

Anheuser-Busch, Inc., formed 50 years ago by two St. Louis families, with a capitalization of $240,000, will be re-incorporated for $18,000,000 June 9 when the original Missouri charter expires. Augustus Busch, president, states the increase would bring the capitalization to a parity with the actual worth of the properties.

Trade Literature

CREASEY CATALOG.

In the new 1925 catalog of the Creasey ice breaker line, which has just come in, a complete series of motor-driven ice breakers for capacities ranging from one ton an hour up to 50 tons an hour are shown. The motor is mounted directly on the ice-breaker frame, resulting in a neat, compact unit, which can be located wherever most convenient for handling ice cakes, broken ice and without regard to the location of shafting or belting. Low speed motors are used and power is transmitted by means of a roller chain and sprocket in the smallest machines; belt and idler in the intermediate sizes; and silent chain belt in the largest sizes. In all cases the belt, according to the catalog, chain and pulleys or sprockets are completely enclosed, so that they are protected from contact with the moving parts. The driving motor, although mounted out in the open so that it will not run hot, is adequately guarded against water or flying pieces of ice by a heavy baffle plate. Various other improvements, such as socket-held steel picks, split babbitted bearings, heavily ribbed, movable front plates, interchangeable combs for regulating the size of the broken ice, etc., are retained. Everyone having anything to do with the freezing, packing and shipping of ice cream, fish, game and other perishable food products will find this publication of interest, officials of the Cochrane Corp. believe. A number of drawings have been introduced, showing convenient portable rigs and layouts of elevators and other means of handling ice.

* * *

CORK BOOKLET.

The Armstrong Cork & Insulation Co., Pittsburgh, Pa., has issued a new publication entitled, "Nonpareil Cork Covering," copy of which has been received in the editorial offices of The Ice Cream Review. The booklet deals with cork covering for brine, ammonia, carbon dioxide, ice water and other cold lines, tanks, coolers, etc. There are 48 pages, and the publication is interestingly illustrated. Among the subjects discussed are: "Why Cold Lines Need Insulation," "Hot and Cold Line Insulation Compared," "Essential Qualities," "Insulation of Fittings," "Sundries Used in Applying," "Coolers, Tanks, etc.," and other subjects.

In the appendix are given "Heat Loss Tables," and an explanation of how to use the tables, "Tests of Nonpareil Cork Covering," "Calculation of Test Results," and miscellaneous tables.

* * *

SIDEWALK ADVERTISING.

The efficiency of sidewalk signs is emphasized in a booklet issued by the Standard Pressed Steel Co., Jenkintown, Penn., who manufacture "Hallowell Steel Signs." According to claims put forward for their product "Sidewalk advertising is the most powerful of dealer helps. The sign sits out in front of the store where it is visible for some distance to people approaching from both ways. Passersby can't help but see it, for their eyes are watching the sidewalk for obstructions. Your dealers and distributors naturally appreciate your co-operation when it takes the form of sidewalk signs. They realize the power of sidewalk advertising more than any one else."

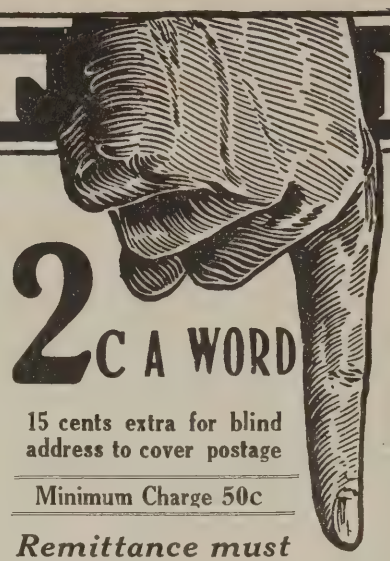
* * *

ANOTHER "KIST" BULLETIN.

Volume 2, No. 5, of the Business Builder, published by the Citrus Products Company, Chicago, has reached our desk. This issue is largely devoted to emphasizing the "frozen sucker" and ice cream manufacturers are advised that now is the time to push this profit making delicacy. At an average cost of 7 cents a dozen for which the dealer pays 40 cents and gets 60 cents there is a nice profit for both manufacturer and dealer. It is a product which can be put out without disturbing the regular run of business inasmuch as ice cream freezers are not necessary. The company also emphasizes the advertising service with which they back up the efforts of their customers to promote sales, not only of this delicacy but all other products in which "Kist" items enter. Eric Scudder, president, is an enthusiastic exponent of intensive advertising in developing sales in the ice cream business.

* * *

SECRETARY MAUGHAN UNDERGOES OPERATION.



M. O. Maughan, secretary of the National Dairy Council, underwent a serious operation in a Chicago hospital on April 15. Pneumonia set in following the operation and for several days his recovery was in doubt. However, latest reports are to the effect that he is recovering nicely, and this will be pleasing news to his many friends in the industry.

OHIO EATS 15 PER CENT MORE ICE CREAM.

Ohioans ate 15 per cent more ice cream during January and February, 1925, than they did during the corresponding period last year, it was recently announced by the Ohio Association of Ice Cream Manufacturers. The increase is attributed to the warm weather and to generally better business conditions. Consumption of ice cream in Ohio during the year 1923 totalled 11,900,000 gallons, it was announced.

Send your personals and news items to "The Review" and see how well they look in print.

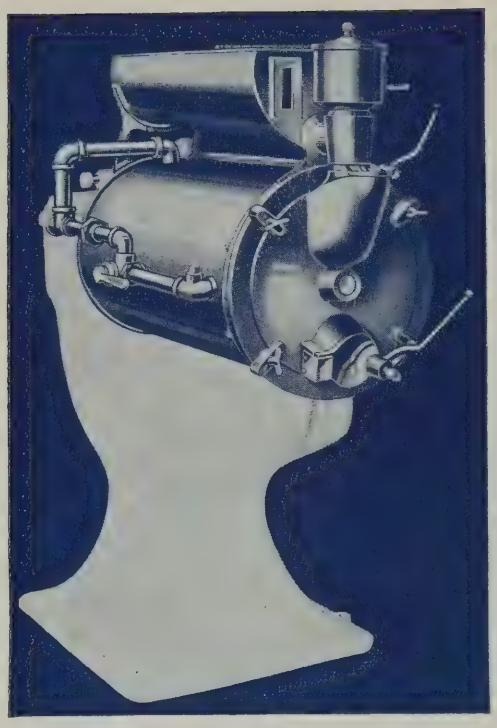
All 20 quart size. Will sell at a bargain. Write us for prices. Address Arctic Dairy Products Co., 415 West 16th St., Kansas City, Mo. 6-25

FOR SALE—One De Laval centrifugal emulsor No. 2, capacity 25 gal. per hour, for $50.00. One steam jacket kettle $40.00. One Rogers Junior ice cream brick maker $200.00. All good as new, and shipped on approval to anyone furnishing good references. Address Brown County Creamery, Hiawatha, Kan. 5-25

FOR SALE—New and second hand ice cream freezers, homogenizers, glass lined tanks, coil vats, etc., at low prices. Address H. G. Davis, Lakeside and Stanley Sts., North Chicago, Ill., Telephone Waukegan 3151. 6-25



FOR SALE—A 900-lb. Simplex cooler, slightly used, two sections, 24 1-in. tubes, 3 ft. wide, $60.00, guaranteed. Address Asselin Creamery Co., Norway, Mich. 5-25

The ICE CREAM REVIEW

June 1925

THE CHERRY 40 QT. FREEZER

The World's Finest Low Priced Freezer

Here at last is a Cherry Brine Freezer for any size plant at a popular price. It is patterned exactly after the larger Cherry units and has practically all of those many exclusive features which always make Cherry Freezers so desirable.

This new model makes it possible to now freeze ice cream without investing too much money.

Experienced ice cream manufacturers and mechanical engineers who have viewed this unit call it "The World's Finest Low Priced Freezer". You, too, will be astounded at the great value incorporated in this freezer.

Ask for Bulletin No. 2060—it tells the story of the "World's Finest Low Priced Freezer".

"Twenty-five years ago there was no ice cream *industry*. There was no *ice cream* supply industry. A single quarter of a century, a mere twenty-five years, sees both established, both among the major, if not the very largest, industrial units in the country. Each created the combined industry—that of manufacture and supply—the Quarter Centennial Celebration of which marks 1925. . . . In Convention, in Exposition, they celebrate it in Detroit in October."

JUNE 1925

CHANGING conditions give rise to new words, and the term "red" as a political designation is well known to all. The man who sees "red" in contemplating the functions of government may be sincere, but often he is playing to the galleries. He hopes to profit by appealing to the discontented.

Business circles are not free of "reds." There are always those who strive to upset the existing order of things. Some of them think they are progressive. They forget that true progress is usually accomplished by evolution, not revolution.

The ice cream industry is not free of "red" influence, but it is very much submerged. Appeals for support of destructive propaganda do not attract much attention. Condemning everybody else in the same line of effort, and assuming a "holier than thou" attitude doesn't appeal to hard headed business men.

WHEN a newspaper editor starts out to fill up space by writing on some subject with which he is unfamiliar he usually makes a sorry mess of it. Here is a clipping from the Brodhead (Wis.) Independent:

Certainly in Need of Improvement.

There is something the matter with much of the commercial ice cream. The manufacturers of most ice cream are not anxious that knowledge of the content of ice cream be made public. It is known however that very little fresh milk or cream enters into the product, but that evaporated milk forms the bulk of the milk content. It is charged that gelatine is also used, and a move is being made to pass a law in this state limiting the amount of such product in the manufacture of ice cream. The bill limits to one-half of one per cent as the legal amount of gelatine that can be used. Brick ice cream, many assert, contains a much larger amount of gelatine. Why not give the people of the state the same protection in ice cream that is demanded of foods and drugs? Every container of ice cream should bear a label or printed formula stating just what is used in its manufacture.

While this display of ignorance is amusing to men who know trade practices in the ice cream industry, it has a serious side as well. Most of the readers of that careless editor's paper don't know that he doesn't know what he is writing about. They assume that he does know.

"It is charged that gelatine is also used." How scandalous!

"A move is being made to pass a law in this state limiting the amount of such product in the manufacture of ice cream." Someone should tell him that the law he craves has been on the statute books in Wisconsin for several years and has been strictly enforced.

"Why not give the people of the state the same protection, etc." Yea, why not? No state in the Union has more stringent food laws, and in no state in the Union are they more rigidly enforced. Yet this self-appointed guardian of the health of the people of the leading dairy state in the Union raises his voice in protest against one of the state's dairy products. Yes, why not? Why not declare an open season on country editors who don't take the trouble to look up a little information before tackling such a subject as the manufacture of commercial ice cream?

Instead of shooting such specimens, however, it will probably be more constructive to remove the cause. In his ignorance of the manufacture of commercial ice cream that country editor unwittingly points out the need for an educational campaign that shall tell the people about the pure food qualities of ice cream. He seems to think that manufacturers should be compelled to label each package of ice cream so that the consumer might know exactly what ingredients enter into its manufacture. He would compel manufacturers to advertise the goodness of ice cream. If that were practical no ice cream manufacturer would object to such a law. On the other hand he could well afford to help pay for the enforcement of such a law.

There are many consumers of ice cream who are just as uninformed regarding ice cream as this country editor. They think that ice cream manufacturers are holding back something because they don't tell how they make ice cream. They don't realize that a manufacturer may dislike to tell the world—including his competitors—

exactly how he makes his product and still be honest. They conclude that his silence is a confession of guilt.

We believe that the right sort of an advertising campaign, put on and supported by ice cream manufacturers the country over, can do much to eliminate the prejudice that many people hold against commercial ice cream. Instead of eating ice cream under protest, or with a feeling of distrust, these people should be educated to the fact that good commercial ice cream is a pure food product and that absolutely nothing of a questionable nature enters into its manufacture.

This country editor above quoted is a product of a policy which has too long guided the men in this industry. Our people have been too busy building fine plants and improving their product. Their advertising campaigns have had for their purpose the exploitation of a particular brand of ice cream, often at the expense of some other brand.

We have taken too much for granted. We have assumed that the consumer knows how pure and how good "commercial ice cream" really is. We have assumed that as he registered his approval of it by buying it in large quantities he was convinced of its purity and wholesomeness.

We believe it is one of the reasons why the manufacture and sale of ice cream is such a "seasonable" business. Too many consumers eat it during hot weather for the same reason that they drink a bottle of pop. They want to cool off and are willing to "take a chance" in order to do it.

Consumers must be "sold" on ice cream for different reasons than these before we will get the per capita consumption of ice cream in this country that is possible. In order to "sell" them on ice cream as they might be sold it will be necessary to forget brands and talk about ice cream. That is what can be done under a national advertising plan such as has been proposed.

SECRETARY RASMUSSEN has asked his members for certain information relative to canvas bags and the shipping of ice cream mix. A brief questionnaire has gone out to all members. The results of this questionnaire should be valuable and the more replies received the more valuable it will be. It should bring a 100 per cent response. If you are invited to discuss these important questions be sure your factory is represented in the final compilation.

PLANS are shaping up for the Detroit exposition. The demand for space exceeds that of any previous year, and, of course, that makes the "men behind" very happy. It means just this: Detroit will play host to the greatest gathering of ice cream manufacturers and their friends ever held in the world. Don't say "I hope to be there," just say, "I will be there," and then plan accordingly. All right, that's better; we will meet you there.

IN SPITE of the good work being done by our various associations of ice cream manufacturers, there is a great deal of constructive work that might be done that gets little or no attention. We are not blaming anybody, either. Our industry will have to grow more and get older before the men in it will adequately support the sort of program that the industry should adopt.

The National Association of Ice Cream Manufacturers, for instance, should have thousands of dollars to spend where hundreds are now available. Instead of depending on big hearted men to give of their time and ability in order to do the things that are being accomplished, the association should have a staff of trained, salaried men who would devote their entire efforts to trade association work. Then the program could be enlarged and some of these things that are left undone might be taken up.

Some people make the mistake of thinking that the chief purpose of a trade association is to hold conventions. We believe in the trade convention, but it should be used as a means of obtaining an object, not the object itself. It should be used as a sort of annual stockholders' meeting at which time full and complete reports of the year's activities should be made. It should be the time for men who have been given certain jobs to do to give an account of their stewardships. It should be used as a source of inspiration and good fellowship. That is plenty to expect of the annual convention.

Then in between conventions the heavy work should be done. Some of it is being done, more in fact than might reasonably be expected with the money available, but there is a lot remaining undone.

With the right sort of a program, and sufficient funds, the ice cream industry could be organized as successful individual business enterprises are organized. It would then be in shape to sell its goods.

STATISTICS compiled by the Pennsylvania Department of Internal Affairs indicate that in 1920 there were 223 ice cream factories in the state, employing 4,393 people. Four years later, in 1924, there were 255 factories, employing 6,887 people. Capital invested increased from $20,273,700 in 1920 to $33,661,038 in 1924; 26,338,100 gallons of ice cream were produced in 1920 and 32,378,002 gallons in 1924.

According to these figures the ice cream manufacturers of Pennsylvania produced 1.3 gallons of ice cream in 1920 for every dollar invested. In 1924 they produced .96 of a gallon for every dollar invested. That perhaps is a natural trend, but if it is not checked it will explain to the ice cream manufacturer of the not distant future why he can't do business on the same margin as the manufacturer who operated in 1920.

Fine, modern plants, expensively equipped, are a good investment for the men who own them, and for the industry, but the man who tries to do business in one

of them without considering the added investment is storing up trouble for himself.

The way to "offset" the added expense of doing business in these more expensive institutions is to do more business. According to the statistics above quoted the ice cream manufacturers of Pennsylvania have not increased the volume of business done in the same proportion that they have increased their investment. What is true in Pennsylvania is undoubtedly true in other states.

We see no element of danger in this general trend in the industry. This increased investment, tremendous though it may be, is good for the industry. What we need to do is, not to halt increased investment, but keep it up and then go out and sell more ice cream—not Jones' ice cream or Smith's ice cream, but just plain ice cream. That is exactly what the industry can do when properly organized and energized.

⚜

ONE of the most fertile fields for the propagation of knowledge concerning ice cream is the hotel field. There are too many inn keepers in this country who are foisting poor ice cream on the public. Ask these men why they make their own ice cream, instead of buying it, and they will tell you that they can make it better.

Some of them honestly think so. The great majority, if they were to frankly state their reasons, would confess that they do it to save money. They think they can make ice cream cheaper than they can buy it.

Some of them do. We know one who does. We tasted some of his ice cream the other day. He surely saves money by making his ice cream, but the next time we visit his city someone else will get our room rent and ice cream money.

Oh, ice cream, what crimes are committeed in thy name! What an awful concoction that was. It was not only low in fat content, but it was low in everything that goes to make good ice cream. It was coarse and sandy, and to make the disguise complete, it was made from sour milk. After that we hunted up a drug store and revelled in a dish of good ice cream made by a local ice cream manufacturer.

The proprietor of that hotel owns the leading hotel in a city of about 25,000 inhabitants. The food served his guests is good, all except his ice cream—and butter.

There should be some way of reaching this hotel man and the many others like him. The salesmanship of the local ice cream manufacturers has failed. They must have outside help. They are entitled to his business, and surely his guests are entitled to good ice cream.

Probably the way to reach such hotel men is through their trade associations. We understand that the hotel keepers of the country are well organized. Why can't our trade associations work with their associations and build up more business for everybody? Poor ice cream sold in hotels hurts the hotel business and the ice cream business. It's all due to ignorance, that's all, and the right sort of a campaign of education would go a long way toward setting matters right.

⚜

SELLING milk and selling ice cream are two entirely different propositions. The milk man gets repeat orders day after day and week after week without asking for them. The most of his orders are standing orders, while the only repeat orders that the ice cream manufacturer gets are the ones he goes out after. True, he has his regular "stops," but the amount of ice cream he leaves at a stop depends on repeat orders from a third party—the consumer. Selling that third party is the real sales problem for the ice cream manufacturer. It can never be solved by spending money and energy taking "stops" away from competitors.

Some of these days the men in this industry are going to take hold of this problem of selling ice cream and solve it. They are going to solve it by teaching the consumers of this country to eat more ice cream. They are going to quit spending so much money and effort in taking business away from each other. They are going to work together in a big effort to make more business for everybody.

⚜

THE "sucker" season is on in full blast in many communities. Not the kind that buys fake oil stocks and gold bricks, but the kind made up of flavorings, water and profits. Many ice cream manufacturers are finding this frozen dainty a welcome addition to their sales and the margin of profit helps them to forget last year with its cold weather and losses.

BULLETIN OF EVENTS.

National Dairy Exposition—Indiana State Fair Grounds, Indianapolis, Ind., October 12 to 18, 1925. Secretary, W. E. Skinner, 910 South Michigan Ave., Chicago.

National Association of Ice Cream Manufacturers—Twenty-fifth annual convention to be held at Detroit, Mich., the week of October 19, 1925. Convention headquarters, Hotel Statler. Secretary, Fred Rasmussen, Telegraph Bldg., Harrisburg, Pa.

Pacific Slope Dairy Show—Oakland, Calif., November 14-21. Manager, Frank T. Murphy, 216 Pine St., San Francisco.

Texas Ice Cream Manufacturers' Association—Annual convention, Houston, November 18, 19 and 20. Secretary, A. J. White, care Mistletoe Creameries, San Antonio.

Oklahoma Association of Ice Cream Manufacturers—Annual convention, November 23 and 24, 1925. Hotel headquarters will be announced later. Secretary, W. M. Hawk, Tulsa.

Southern Association of Ice Cream Manufacturers—Annual convention at Lexington, Ky., December 1, 2, 3 and 4, 1925. Convention headquarters, Phoenix Hotel. Secretary, J. W. Clopton, Decatur, Ala.

Kansas Association of Ice Cream Manufacturers—Annual convention, Kansas City, December 8, 9 and 10. Convention headquarters to be announced later. Secretary, B. T. Perkins, Pittsburg.

Pacific Ice Cream Manufacturers' Association—Second joint convention with the California and Southwestern States Ice Cream Manufacturers' Association, Portland, Ore., January 12, 13, 14 and 15, 1926. Secretary, Bert H. Walker, Royal Ice Cream Co., Tacoma, Wash.

California and Southwestern States Ice Cream Manufacturers' Association—Annual convention to be held jointly with the Pacific Ice Cream Manufacturers' convention at Portland, Ore., January 12, 13, 14 and 15, 1926. Secretary, Jay H. Kugler, 57 Post St., San Francisco, Cal.

Ohio Association of Ice Cream Manufacturers—Annual convention, during last week in January, 1926, at Columbus. Convention headquarters not yet named. Secretary, W. A. Wentworth, 509 Outlook Bldg., Columbus.

How to Train Salesmen to Prepare Ice Cream Window Displays

Some Important Hints From a Man Who is Doing Noteworthy Ice Cream Merchandising Work in the East

By KARL B. MORY*

IT HAS only been recently that ice cream manufacturers have realized the tremendous value of window displays to assist in merchandising their product. If this medium of advertising has been successful in increasing sales of other lines of merchandise, which can also be prominently displayed on dealers' shelves and counters, surely it must be of great importance in increasing the consumption of so intangible a product as ice cream.

Our industry must realize that it is manufacturing an intangible commodity insofar as the possibilities of actually displaying it are concerned. Candy, and virtually all other commodities competing for the nickels and dimes of the public, may be prominently and attractively displayed within easy reach of the customers' hands. But not so with ice cream. You and I have time and again watched the youngster gazing longingly into the candy case, trying to decide which of the brightly colored candies would get the nickel so tightly clutched in his little fist.

KARL. B. MORY.

And where was ice cream all this time? Buried—completely out of sight and, furthermore, out of mind of the young purchaser.

So the inevitable answer is, that due to the nature of the product, the only bid it may make for public favor is by means of very attractive reproductions or cut-outs as they are called.

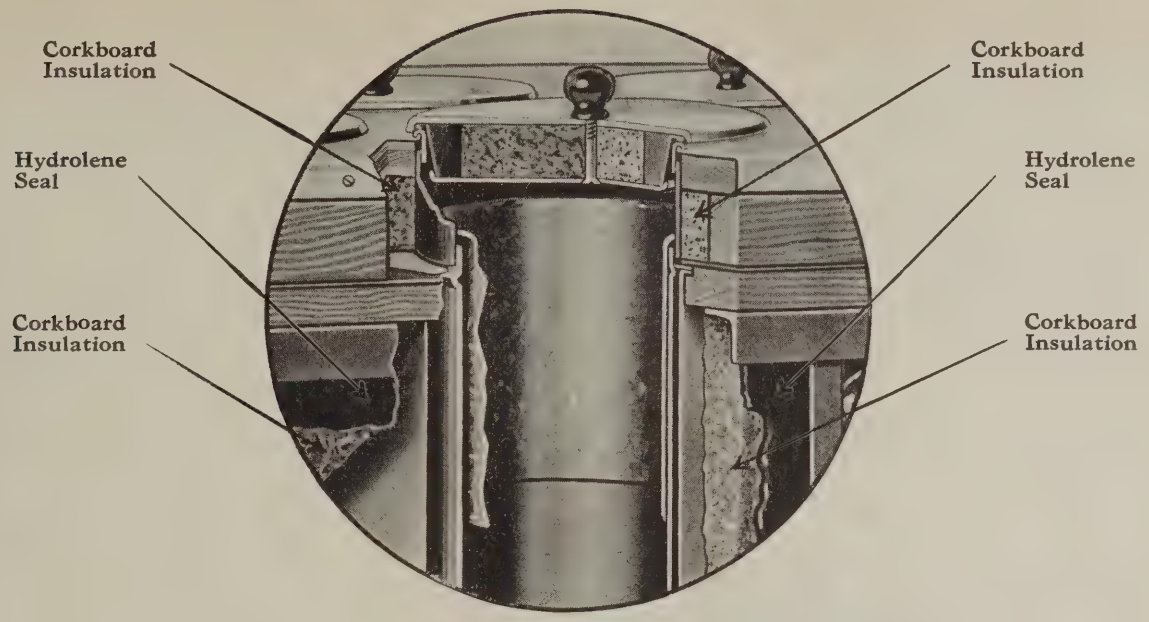
These cut-outs arranged in attractive displays should act as the connecting link between all the other advertising and the actual point of sale. Or, in other words, should be the actual tie-up between your different mediums of advertising and the dealer's store.

Therefore, the utmost care must be exacted in the selection of this material, with the thought in mind that it must be so attractive that it will appeal to the eye, excite the appetite, which in turn should create the desire to buy.

Too often this department of the advertising budget receives little or no attention, resulting in slipshod, ineffective methods, and a tremendous loss of money to ice cream manufacturers every year. If there is any doubt as to the truth of this assertion, a trip to the stock room might prove a startling revelation. With the value of window displays recognized, and a careful selection made, the next step is to see that they are properly installed in the windows of the dealers. And herein lies the greatest difficulty with ice cream displays.

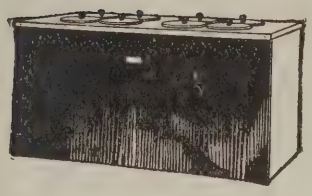
THE average salesman knows little or nothing about properly decorating windows, and though his material may be of the best, the results will be disappointing. Two avenues are open to the manufacturer to remedy this trouble. First, he may do the same as the large mercantile concerns—keep an expert window decorator and his corps of assistants on the pay roll at all times, which is very expensive and out of reach of the average manufacturer. Or, second, pay experts to come and instruct the salesmen in the proper method of installing attractive window trims.

The latter has been the policy adopted by this concern. At intervals we have these men come to our factory, talk to the salesmen, use our material to make up "dummy" windows, and give them general ideas on color schemes, arrangement and so forth. The salesmen then copy these windows and go out and install them very well, indeed.



We are particularly indebted to the Dennison Manufacturing Co., who very kindly sent us a representative who explained the many attractive ways in which its crepe paper might be introduced into window displays. This company also maintains a studio at its factory in Framingham, Mass., to which any manufacturer may send samples of his advertising material, and which they in turn will make up into attractive window displays, photograph them and return the pictures.

PROCEEDING on a sound basis such as this, has done much to eliminate the reluctance of the large dealer in offering his windows for ice cream displays, and the dealer is not to be entirely blamed for his hesitancy in this matter. Because, with the ice cream industry spending in the neighborhood of twelve million dollars for advertising every year, some of the window displays which we see around the country are not anything of which one may be proud.



But under this new system the salesman approaches the dealer, shows him photographs of what

*Director of sales and advertising, Rochester Ice Cream Co., Rochester, N. Y. Submitted for The Ice Cream Review's exclusive use.

No Other Electric Cabinet Is Insulated Like Frigidaire

Frigidaire Cabinets are made in four and six-hole single row models, and in four, six and eight hole double row models. All double row models are 30 inches wide and 30 inches high to conform with standard fountain interiors.

NO OTHER cabinet incorporates *all* the good insulating features of the Frigidaire Electric Ice Cream Cabinet. In the making of Frigidaire Cabinets thick slabs of corkboard are placed in the steel framework and *permanently sealed* with hydrolene, an asphalt preparation. The corkboard varies from two to four inches in thickness, depending upon its location and the size of the cabinet.

Framework, tank and insulation become *one piece*. There are no air spaces to permit the formation of moisture and the consequent breaking down of the insulation.

This "corkboard and hydrolene" construction is the same as that used in the best hardening rooms. It assures *permanent* heat insulation, longer life for the whole cabinet, lower cost in the long run.

Better construction is just one reason why manufacturers and retailers everywhere are turning to the Frigidaire Cabinet. But there are other reasons, too. Frigidaire cabinets are quiet, efficient and dependable in operation—they are approved by the Underwriter Laboratories—they are equipped with either air-cooled or water-cooled compressors which make them adaptable to all service conditions—and they are backed by a nation-wide organization of over 3,500 trained sales and service representatives.

Write today for complete information about the Frigidaire Ice Cream Cabinet. Use the coupon below.

Ice Cream Campaigns Link Up Dairy Cow

"Mookow" Sales Plan, Now Being Conducted by Manufacturers in Leading Cities, Establishes the Identity of The Dairy Cow with Ice Cream

THE dairy cow is coming into its own in the ice cream industry. Manufacturers in many parts of the country are showing unmistakable evidence of greater appreciation of dairy health as a foundation upon which ice cream, the rose of the dairy industry, should make out its case as a wholesome, nutritious, palatable food product.

The Ice Cream Review at different times has called attention to the importance of keeping this industry linked up with the dairy cow. An article pointing out how the ice cream industry can cash in on the popularity

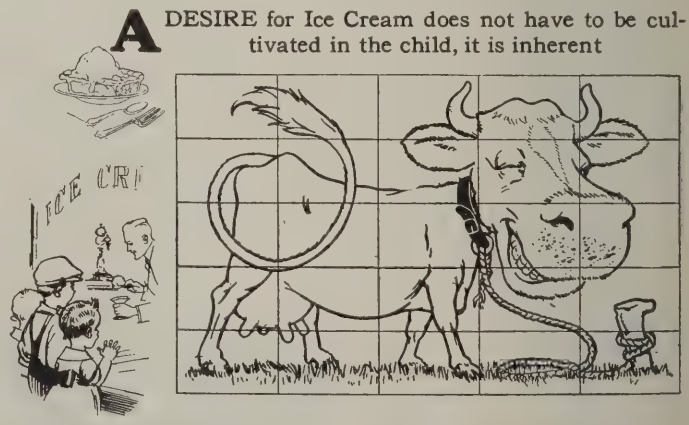
Distribution of "Mookow" booklets at Scruggs Public School, St. Louis.

that has been won by the dairy cow appeared in the March issue of The Ice Cream Review.

Since that time a number of ice cream manufacturers have expressed great interest in campaigns to keep their product associated with the dairy cow. At this writing such campaigns either are under way, have just been carried out, or are being planned in a number of the largest cities in the country, including Chicago, Pittsburgh, St. Louis, New Orleans, and some of the smaller towns, such as Centralia, Ill.; Cairo, Ill.; Johnston City, Ill., and Flora, Ill.

Most of these manufacturers, with the exception of those in Chicago, are promoting a syndicate campaign, known as the "Mookow" sales plan, which seems to be winning much popularity.

The "Mookow" campaign concerns the distributing of syndicated literature in which "Mookow" prizes are offered to boys and girls who eat ice cream. The front cover of the booklet, which is printed on a wholesale basis by a large concern in St. Louis, shows the picture of a good-natured cow, and throughout the book are interesting and humorous illustrations connecting the cow with ice cream.



The Chicago manufacturers have linked up a campaign with the National Dairy Council, about which more will be related in a subsequent issue.

The purpose of the "Mookow" sales campaign is best explained by quoting from page ten of the syndicate booklet describing this movement:

"Somewhere in your neighborhood you will find a drug store, confectionery or soft drink parlor where the 'Mookow' sign is displayed in the window (a small picture of this sign is shown on opposite page). Wherever you see the 'Mookow' sign you can get the 'Mookow' sections with each five-cent purchase of ice cream. When you receive your first section, paste it in its proper place on the outline picture opposite the colored 'Mookow.' Continue to paste in all sections received until the picture is complete and is identical with the colored picture facing it. When the four cows are completed you may fill out the blank in the back of the book and send it in for a prize, or you may keep it until more books are completed and secure a much nicer prize. As there are four identical 'Mookows,' you will be able to use four duplicate sections in each book. If more duplicates are received, you may either start new books with them or trade with other boys and girls for the sections needed.

A REPORT from St. Louis stated that one week after the campaign had been opened by the Carpenter Ice Cream Co., children had so flocked around the retail ice cream parlor that consumption was doubled. The Anheuser-Busch Ice Cream & Beverage Co., directed by E. B. Geisel, inaugurated a campaign about the same time, and, after the first twenty-five thousand booklets had been distributed among school children and mothers, a second lot of 20,000 copies was prepared.

What is the purpose of the campaign? Ice cream manufacturers who have gone into it say the purpose is to reach a child with a language that will appeal to the child, and at the same time in a language that will convince the mother. The booklets are distributed in the homes, as well as to children on street corners, most of them ultimately reaching the homes anyhow.

Nature has endowed children with a taste for the only food containing every property essential to health and growth.

(A page from a "Mookow" booklet.)

The usual plan is to have distributors stand on the outside of school buildings and circulate the books among school children when they come out.

Through "Mookow" sales plan booklets, the manufacturers are enabled, we are told, to impress the fact that ice cream is a wholesome, nutritious, palatable product, because its principal ingredient is milk, because it is produced in sanitary manner. In other words, ice cream is good, to quote from the booklet of the "Mookow" sales plan, because —

The Russ Manufacturing Co.
W. 58th & Walworth Ave.
Cleveland, Ohio

Gentlemen:

We wish to express our appreciation of the prompt and careful installation of the thirty-five-foot Russ "Bilt-Rite" fountain just made at our Meridian & Washington Store. Not only was the work well done but the installation is one of the most beautiful we have ever seen.

The first installation, the 20-foot job, was made the early part of March, 1924, and except for a few minor adjustments to regulate the temperature has given us no trouble whatever. We have been able to maintain a temperature that would keep soda and drinking water as cold as we desired and a zero temperature on ice cream, if we wish it.

There is a great economy in the dipping of the ice cream due to the fact that it is always hard - besides the many other advantages that the fountain offers.

Sincerely yours,
President

JAH/ts

WHATEVER a manufacturer may say for his product, or his competitors may say against it, counts for little in the final analysis. The important thing is what the buyer or user has to say, based on actual experience.

The Russ WALKER-NIZER PATENTS **Bilt-Rite** *Fountain*
3 temperatures without icing

has proved its true worth to many users throughout the country. It is saving them money, labor, time, bother, mess. It is increasing their business and profits by enabling them to serve perfectly conditioned ice cream, refreshingly cold fountain drinks and bottled goods, and stopping all shrinkage losses.

BILT-RITE Fountains MORE than earn their way. Catalog on request

THE RUSS MANUFACTURING CO.

PHONE LINCOLN 9147

BERT A. SMYSER
PHARMACIST
14TH STREET AND PENNSYLVANIA AVENUE, N. W.

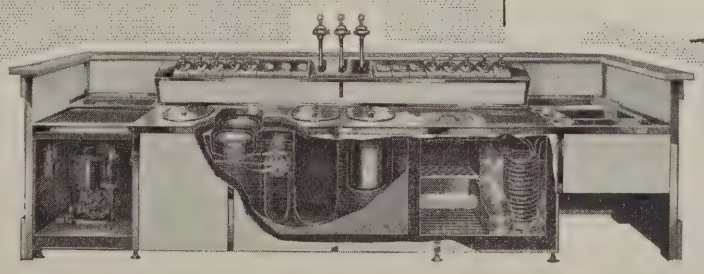
WASHINGTON, D. C., Feb. 14th, 1925

The Russ Manufacturing Company,
5700 Walworth Avenue,
Cleveland, Ohio.

Gentlemen:

I am glad to answer your inquiry as to the service rendered by the new Walker Type mechanically refrigerated fountain which you installed for me.

At the outset let me say that the appearance of my store alone would justify the expenditure. The muss of ice and salt packing is gone and my store is always clean. The ice cream is in perfect condition day and night. The bottle goods are very cold and the labels are always on the bottles, as the bottle compartment is perfectly dry.



Now comes the important part; the soda and drinking water is colder than I have ever been able to draw from any other type of fountain and I have eliminated entirely the use of chipped ice in drinks. My customers comment daily of the coldness of the drinks and tell me that my sodas have improved greatly.

The ice cream manufacturer has made me a better price by ten cents per gallon on the ice cream and this, together with the saving in shrinkage and ice purchases will soon pay for the fountain.

It will be a pleasure to answer any inquiries from prospective purchasers and I will recommend that they purchase the Walker Type fountain which does the work one hundred percent.

With best wishes for your success, I am,

Respectfully yours,
Bert A Smyser

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

State Secretaries May Be Organized at Detroit

Steps Expected to be Taken by National Officials at 1925 Convention, When Program May Be Shaped to Allow Secretaries to Talk Over Their Problems

AN IMPORTANT matter that is expected to develop at the 1925 convention of the National Association of Ice Cream Manufacturers at Detroit in October is the organizing of the state and regional secretaries of the ice cream industry. It is understood that consideration of this proposition has been taken up by officials of the National Association of Ice Cream Manufacturers, though an official announcement in this connection has not been made yet.

For some time there has been an obvious need for an association of this kind. It is not likely that this will be a strictly formal, ironclad organization, but rather a secretarial body that will function, say, once a year, at the national conventions, when the different secretaries can get together and talk over common problems. In this way the National Association of Ice Cream Manufacturers could be made the clearing house for all problems in connection with the industry, and in carrying out this plan, the association would make much closer relation between the national, state and regional associations.

BERT H. WALKER,
Secretary,
Pacific Association of Ice Cream Manufacturers.

JAMES W. NEUMAN,
Secretary,
Association of Ice Cream Manufacturers of Pennsylvania and New Jersey.

W. P. B. LOCKWOOD,
Secretary,
New England Association of Ice Cream Manufacturers.

It would be possible for the national convention to take some forenoon or afternoon for a meeting of all state secretaries and there would be a regular program of interest to the secretaries, this program based principally upon the idea of exchanging of information in regard to work done in different localities with a view of closer co-operation and mutual benefit.

IN THIS way different secretaries would be enabled to pass along to each other problems that they encountered and overcome, ideas that they had worked out for building up interest in their association, increasing membership, correcting trade abuses, etc., and—most important of all—ideas on how the state and regional associations can best work for the upbuilding of the national association.

Some of the leading secretaries of the industry would be quick to give their co-operation to this proposition, it seems assured.

Among the leading state secretaries are W. P. B. Lockwood, secretary of the New England Association of Ice Cream Manufacturers; J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers; Bert Walker, secretary of the Pacific Ice Cream Manufacturers' Association; Jay Kugler, secretary of the California and Southwestern States Ice Cream Manufacturers' Association; J. W. Neuman, secretary of the Association of Ice Cream Manufacturers of Pennsylvania and New Jersey; W. A. Wentworth, secretary of the Ohio Association of Ice Cream Manufacturers; N. Loewenstein, secretary of the Illinois Association of Ice Cream Manufacturers; A. M. LeMessurier, secretary of the Association of Ice Cream Manufacturers of New York State; R. L. Hammond, general secretary of the Indiana Dairy Products Association; Carlton Ball, general secretary of the Dairy Products Association of Kentucky; A. J. White, secretary of the Texas Ice Cream Manufacturers' Association.

ALL of these gentlemen, no doubt, would be quick to give their assistance to this plan, and it is very likely that many other state and regional secretaries of the industry would quickly rally to the support of the idea. They have made no announcement in this connection, however.

Secretary Fred Rasmussen had no official announcement to make in this connection in May, but it is understood that the matter has been taken up by a number of

SALES PLAN

The new sensational Selling Plan that Pays it's Own Way and Furnishes it's Own Advertising

EXCLUSIVE RIGHTS GIVEN TO ONE COMPANY IN EACH CITY

Here's what it does~

1st It appeals directly to those who are the largest consumers of ice cream—the children.

2nd It furnishes them a strong incentive to eat more ice cream. It appeals to the child whether he is rich or poor for in primary instincts all children are much alike.

3rd It insures the interest and co-operation of the parents. It insures the help of the mother in completing the series of pictures, and through the message conveyed to her, she is sold on ice cream as a necessary part of the child's diet.

4th It eliminates all waste of printed matter as it is a selling campaign going directly and exclusively to interested prospects.

5th It limits the benefits derived exclusively to the manufacturer who issues the books, his dealers, and their customers, and no part of the cost goes to help build up some other manufacturer's business.

6th It gives the manufacturer, practically without cost, the active help and co-operation of an army of children and their mothers—the greatest buying power in the world.

7th It affords a complete and perfect tie-up between manufacturer, dealer, and consumer, which is not possible with any form of *general* publicity known at this time.

Educational Publicity and the Ice Cream Industry

How Long Will it Take to Double the Consumption of Ice Cream?

By FRED RASMUSSEN*

A PROMINENT ice cream manufacturer, G. W. Kenison of the Jersey Ice Cream Company, Lawrence, Mass., sometime ago was approached by a leading business man in his home city about as follows:

"As you know, we have a small boy. He is continually asking for money to buy ice cream and his mother is worried each time she gives him a nickel for fear that commercial ice cream is not a wholesome food for children, and I have promised her to find out just what ice cream is made of.

FRED RASMUSSEN

The writer, shortly after beginning work for the national association, accidentally met three newspaper men, one a representative of the Associated Press, the other two representatives of two of the largest newspapers in the state of Pennsylvania. In conversation two of the newspaper representatives expressed a dislike for commercial ice cream. When asked what was particularly wrong with it, the reply was "It has too much cornstarch and gelatine in it." They were very much surprised to learn that gelatine generally represented less than one-half of one per cent of the constituents of ice cream, that recent investigational work conducted at the Mellon Institute, Pittsburgh, had proven that a small quantity of gelatine in ice cream and milk increased its digestibility and that gelatine, upon advice of physicians, was added to the milk of infants when unable to digest the milk in original form; in fact, they were surprised to know that gelatine was a wholesome food product given freely to patients, especially in case of fevers. These newspaper men were quite surprised to know that corn starch, although sometimes used in home-made ice cream, was not a constituent of commercial ice cream and that practically every state in the Union had laws governing the ingredients of ice cream which, in nearly all cases, are limited to dairy products, fruits and flavoring substances and a maximum of one-half per cent of gelatine.

The above illustrations shows that a representative business man and his wife had no knowledge of ice cream as a food and that two of the newspaper men (the third did not express an opinion), considerably above the average, not only were ignorant of what ice cream contained but had a hostile attitude towards the product based upon conception. The ignorance and misconception, in both cases, resulted in a lack of confidence in ice cream. There are probably few ice cream manufacturers who have not been asked questions by their personal friends, indicating a lack of confidence in ice cream as a food.

BECAUSE ice cream is cool, refreshing and tastes good, we have been able to sell 270,000,000 gallons annually. Is it not a fair question then to ask: if we can sell 270 millions of gallons annually because of the physical qualities of ice cream, how much can we sell if we can establish in the minds of all the people universal confidence in commercial ice cream as a safe, healthful, hygienic food, essential to life and growth—the very best food that money can buy? The answer is: Public confidence in ice cream as a food, and a knowledge of its dietetic and health giving qualities, will double the consumption. To some, this may be nothing but a statement, yet we challenge anyone to produce any sound argument why it cannot be done.

The above statement is based upon the following facts:

1. Ice cream is milk in concentrated form, and the time is ripe for the ice cream industry to cash in on ten years of educational publicity and advertising of milk as the nation's health food.
2. There never was a time in the history of the country when people were as willing to listen to the story of food product in relation to public health, or when they were as interested in knowing about the constituents and the method of manufacture of foods as they are today.
3. There is no other product which, like ice cream, contains every desirable and essential quality as a food. It contains all elements of nutrition and can be eaten by itself by old and young, the convalescent and the sick. It has desirable physical characteristics, and it contains the necessary constituents for sustaining life and growth, including vitamins. In this connection, let us not forget that because ice cream is palatable and delicious, it is a great deal easier to convince the public that it is a health food and increase its consumption. In other words, "It is not hard to take."
4. Because of the many physical, hygienic and health-giving qualities of ice cream, there is probably no other products which offer so many avenues for advertising and publicity as ice cream does, and in which so many agencies can be enlisted to promote its consumption.

If you will agree that the four statements given above contain all necessary potential factors for doubling the consumption of ice cream, the question is—How can it be done and how long will it take?

THE writer, at different times, has asked ice cream manufacturers about the amount of money spent in local advertising. The amount varied from 3 to 7 cents per gallon, but let us be conservative and allow 2 cents per gallon of ice cream for local advertising. Based upon an advertising expenditure of two cents per gallon, this industry during the last six years has spent approximately 30 millions of dollars or over five millions of dollars annually, in fact, probably a great deal more. Yet, during this period according to government statistics, there has been no perceptible increase in consumption

HOW TO TRAIN SALESMEN TO PREPARE ICE CREAM WINDOW DISPLAYS.

(Continued from page 8)

the finished window will look like, tells him that if the dealer will have the window washed and empty that he will call and put in a trim, causing no disturbance or confusion in the store, and not only that, but he will return in a week or ten days, take out the trim and leave everything as he found it. The latter being also a mercenary reason, because it makes possible the use of the same material again and again.

One of the windows prepared by trained ice cream salesmen for the Rochester Ice Cream Co.

We also adopt the policy of getting our first run of displays in the large down-town stores. The other dealers see them and we immediately have offers of windows throughout the city. In fact, many more than we can possibly take care of. So, we pick the better stores first and the others await their turn.

This in a general way covers our operations along this line. Tests have been made in the stores while the displays were in, and without exception the results have been more than gratifying.

One question frequently asked by the manufacturer is, "Where will I get an expert to instruct my men?" And the answer is, "The display man of your leading department sore will more than fill the bill."

⚜

OUTPUT GROWS IN PACIFIC NORTHWEST.

Different sections of the territory show an increased output for the first half of 1925 over the first six months of 1924 in the Pacific Northwest region, according to a bulletin issued in May by E. A. Burt, president of the Pacific Ice Cream Manufacturers' Association, through Bert H. Walker, secretary-treasurer of that association.

"With good weather conditions, the total for the year should be quite satisfactory to the ice cream manfacturers," it is stated in this report.

The Pacific association embraces the upper half of the Pacific Coast, and the Rocky Mountain section.

⚜

WASHINGTON PLANT CHANGES HANDS.

Ernest Okeson and G. E. Hilen, proprietors of the Honeydew Ice Cream Co., South Tacoma, Wash., purchased the Perfection Ice Cream Co., with plant located at 5626-28 South Union Ave., South Tacoma. Mr. Okeson claims "the need for expansion to care for the company's growing business" is responsible for the purchase. Messrs. Okeson and Hilen began operations less than two years ago, and have enjoyed a steady increase in business.

What Ice Cream Men Think of DIXIES

"The Dixies are surely going fast here. We are working day and night on them. Now for heaven's sake do not slip up on any of our orders and please wire acknowledgments for each of our wire orders, stating when shipment will be made."

Velvet Ice Cream Co.,
El Paso, Texas, April 6, 1925.

"It is the most popular ice cream specialty ever created."

H. P. Hood & Sons,
Boston, Mass.

(From their newspaper advertisement April 15, 1925.)

"You may be interested to know of our experience with 5c Dixies--We are pleased to state that results have been most satisfactory. Your unremitting system of co-operation is much appreciated."

Tech Food Products Co.,
Pittsburgh, Pa.

"You will undoubtedly be interested to know that our Dixie sales are holding up quite well."
March 16, 1925.

"We are working day and night trying to keep up with our Dixie orders and brick orders."
April 22, 1925.

Jersey Ice Cream Co.
Lawrence, Mass.

5¢ DIXIES are Primarily Winter Sales Boosters

This fact has been proven beyond reasonable doubt by the many manufacturers who are now completing a profitable winter season.

Most of them let up during the hot busy summer months and start up again September first.

Some of them have considered dixies so successful that they will continue thru the summer months for the purpose of strengthening certain weak spots in their distribution.

If you are interested in this Summer business we believe we can show you how to do it without affecting your delivery problem in handling normal bulk sales.

THE SPIRIT OF OUR INDUSTRY.

By W. W. Campbell.*

The foundation of any business is confidence which springs from integrity, fair dealing, efficient service and mutual benefit.

The love for the industry, the close co-operation, the exchange of ideas have formed habits of right thinking and right acting, which in the last analysis are economically sound habits.

The progress our industry has made in the last few years, the high standard on which the business has been conducted is reflected in the growth and development of the enlightened civilization which to a large extent we have contributed toward producing. These standards are not experiments, they are not new, but they will serve a useful purpose to interpret and to reduce to a code or digest the habits and rules and standards which already exist in the minds of those engaged in the ice cream industry and to construct therefrom a business conduct, in a practical, ethical business platform.

W. W. CAMPBELL.

The principles of resolution passed at a recent meeting of the Chamber of Commerce of the United States, I think, is very applicable to our industry:

"The function of business is to provide for the material needs of mankind, and to increase the wealth of the world and the value and happiness of life. In order to perform its function it must offer a sufficient opportunity for gain to compensate individuals who assume its risks, but the motives which lead individuals to engage in business are not to be confused with the function of business itself. When business enterprise is successfully carried on with constant and efficient endeavor to reduce the cost of production, to improve the quality of its products, and to give fair treatment to customers, capital, management and labor, it renders public service of the highest value."

These expressions of principles and fundamental truths will furnish a practical guide for the conduct of our industry, and for each individual.

The constructive work as outlined at the New Orleans convention which is now being worked out by the committees with the co-operation of the manufacturers throughout the United States, such as national advertising, the advent of the refrigerated cabinet, a national standard and a uniform cost accounting system, these things show progress and the great possibilities of our industry.

A good standard product, good salesmanship, good advertising and good merchandising policies which fundamentals are so vividly expressed in the atmosphere of the manufacturers of this state, they reflect the true **Spirit of our Industry!**

Adverse Conditions Caused Other Motors To Fail— But Not Red Bands

"We tried nearly every make of motor on the market, but not until we had tried the Howell Red Band Motors were we satisfied that this particular motor was the one that could stand up under the most adverse conditions encountered in the operation of a milk plant" says Harold I. Nordby, President of the Franklin Co-operative Creamery Association, Minneapolis, Minn.

"We have found that these Red Band Motors would readily carry an overload and have also found them very satisfactory under very moist conditions which is frequently the case in a milk plant.

"When we built our second plant at 2108 Washington Avenue North, we practically standardized on Howell Red Band Motors, having at the present approximately 300 horsepower of this type of motor installed. We have never regretted our decision, and are very glad indeed to highly recommend this type of motors for use under similar conditions to ours."

Howell Red Band Motors are made in all types and sizes from ½ H. P. to 100 H. P. Sales and Service blankets the nation. Catalog on request.

WISCONSIN CHILDREN GAIN ON ICE CREAM.

Facts showing how ice cream can build up the weight of youngsters of school age were revealed in an interesting test conducted recently by the Carter Ice Cream Co., Richland Center, Wis., with the aid of the teachers and pupils of one of the public schools of that city.

The tests began with the weighing of all the children of the school, and then again at the end of a period of eight weeks. Then began the serving of ice cream, one-tenth of a quart to each individual. One serving of ice cream was given to about 75 pupils in the forenoon and the fifteen who were under normal weight, an additional serving was given in the afternoon.

Complete records were impossible because of sickness and absencies. Records were obtained from 65 of those who received the one serving and from 14 who received the two servings.

When weighed at the end of eight weeks period, some of the children showed gains in weight. The 14 pupils who received two servings a day—that is, per school day—made an average gain of 1.3 pounds each during the eight weeks.

There was an average gain of 1.0 pound for the 65 pupils receiving one serving a day, and for the balance of the school that received no ice cream, approximately 75 pupils, showed an average gain of .7 pound during the same period.

It was shown in the test that pupils receiving one serving of ice cream a day made an average of .3 pound, or nearly one-half more than the pupils not receiving ice cream. Those receiving two servings a day made an average gain of .6 pound each, or nearly double the gain over those not receiving any ice cream at all.

KANSANS TO MEET IN DECEMBER.

The 1925 convention of the Kansas Association of Ice Cream Manufacturers will be held at Kansas City December 8, 9 and 10, according to announcement by B. T. Perkins, secretary of the association. This was decided upon by the executive committee recently, but the matter of convention headquarters was deferred till a later date. Kansas City was selected for the 1925 convention last year at the convention at Topeka. J. F. Crum, Junction City, is president of the association, C. A. Radley, Windfield, is vice-president and is chairman of the executive committee. The personnel of the executive committee follows:

One year: J. H. Bennett, Ottawa; J. R. Fenner, St. Joseph, Mo.; F. H. Meyer, Kansas City. Two years: L. R. Manley, Topeka; R. E. Ambrose, Norton; W. H. Chappell, Manhattan. Three years: W. H. Hammond, Great Bend; P. F. Edquist, Concordia; P. H. Chism, Wichita.

OKLAHOMA CONVENTION SET FOR NOVEMBER 23 AND 24.

The Oklahoma Association of Ice Cream Manufacturers will hold its 1925 convention on November 23 and 24, it was recently announced by Secretary W. M. Hawk. The convention will come just three days after the close of the Texas convention at Houston.

The Southern convention will open just a week later at Lexington. C. A. Burns of Ponca City is vice-president.

You'll make better ice cream if you subscribe for "The Ice Cream Review." It is a standard authority.

RICUT

The **orange** flavored pulp absolutely uniform—no seeds, etc. Makes the finest Ice Cream, Sherbet and Ices.

Ice Cream Week Set for Wisconsin

GEO. D. MANSFIELD,
Chairman, Ice Cream Division,
Wisconsin Dairy Club.

Badger Manufacturers Will Co-operate to Feature Ice Cream During Dairy Week, Which Will be Staged by The Wisconsin Dairy Club During the First Week in August

TOM CAMPION,
Secretary,
Wisconsin Dairy Club.

ICE cream will be staged on a state-wide scale in Wisconsin in August. The movement has been launched by the Wisconsin Dairy Club to feature ice cream among other dairy products in emphasizing the importance of Wisconsin's dairy industry and dairy production. Wisconsin ice cream will be exploited among consumers throughout the state, and there will be many visitors to hear the story of Wisconsin dairying.

The first week of August has been set for dairy week. Every branch of the industry will be represented in the festivities to be held over the state.

week literature will go into the homes of consumers, with the brick featured.

Plans for dairy week have been shaping up for several months. The movement was proposed in the Wisconsin Dairy Club by Mrs. C. E. Hatch, chairman of the consumers' division.

The club was formed a year ago to make ready for the National Dairy Exposition held in Milwaukee last fall. It represents every branch of the industry. Meetings are held on the second Thursday of every month. An intensive membership campaign will be launched as

ICE CREAM WEEK OBSERVED IN INDIANA.

Ice cream manufacturers of Indiana were just putting the finishing touches to a state-wide ice cream week as this issue of The Ice Cream Review was going to press. All leading ice cream manufacturers of the state joined hands to help the Indiana Manufacturers of Dairy Products in an intensive drive to focus the minds of the public on ice cream. The campaign will be held the week of May 23.

Sixty manufacturers used uniform advertising material, including posters, window strips and ice cream booklets, as also news items and mats that were used in newspaper advertising. This material was furnished by the association at cost.

Retailers' stores throughout the state carried appropriate banners, strips and window displays during ice cream week. Ice cream manufacturers exploited the occasion with decorated trucks, streamers proclaiming the fact that it was ice cream week all over the state.

A particular feature of the occasion was an essay contest conducted by the association in which prizes were offered for the best essay on "Why I Should Eat Ice Cream Every Day." In all the association distributed 175,000 pieces of advertising material.

George C. Mansfield, head of the Mansfield Ice Cream Co., Milwaukee, is chairman of the ice cream division of the Wisconsin Dairy Club and is in charge of the ice cream manufacturers' end of the matter. He has called upon manufacturers throughout the state to join hands and help feature ice cream during dairy week. They will have their chance at an important meeeting of the Wisconsin Dairy Club at the Republican House, Milwaukee, at noon on June 11, when officials of different organizations of dairy manufacturers will meet to give their support.

A SPECIAL "dairy week ice cream brick" will be made by Milwaukee manufacturers, and manufacturers out in the state are expected to follow suit. Dairy

one of the initial steps toward dairy week. This campaign will be to strengthen the club so dairy week will be observed in every city and hamlet in the state. A goal of 1,000 members has been set. The membership fee is one dollar a year.

Wisconsin hotels and restaurants will be asked to prepare special dairy week menus for the occasion, featuring milk, cheese, butter, ice cream, etc.

GROCERS will be asked to have special dairy week window displays, and the ice cream manufacturers will co-operate getting dealers to have special ice cream displays during the week, featuring the dairy week brick.

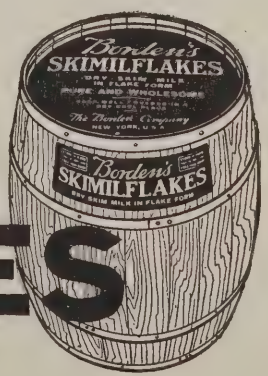
3 reasons WHY
you should use Skimilflakes for your ice cream—



1—It's better
2—It's cheaper
3—It's easier

SKIMILFLAKES, the new dry milk in flake form, makes better ice cream than any other milk—fluid or dry. It is a perfect body-builder—gives you a rich product that stays absolutely smooth and creamy when bricked and frozen hard. Never becomes grainy or sandy when cut. Skimilflakes is always perfectly uniform—very essential in making good ice cream.

SKIMILFLAKES prevents waste and delay. Immediately and entirely soluble in cold water. This means *it does not clog the homogenizer with lumps.* The machine can be operated continuously. Once in solution it will not separate or precipitate. Can be prepared at your convenience and used when you're ready. Always available for extra batches.

SKIMILFLAKES reduces manufacturing costs to the lowest possible figure. It eliminates all waste—cuts freight charges—saves time.

If you're not already using Skimilflakes for your ice cream, send at once for free folder of formulas and information. Samples and prices also free on request. Write us. The Borden Company, 770 Borden Building, 350 Madison Avenue, New York, N. Y.

Southern Manufacturers Will See Famous Kentucky Horses

By CARLTON BALL, General Secretary, Dairy Products Association of Kentucky

"Where The Ponies Run"

A Lexington Race Track Scene That Will Interest Delegates to The Southern Convention In December

IN REPLY to the many inquiries as to the reasons for the late date approved for the 1925 convention of the Southern Association of Ice Cream Manufacturers at Lexington on December 1-4, we may state that the National Association of Ice Cream Manufacturers and the National Dairy Exposition were among the contributing causes. Of more consequential concern was the fall racing meets of the Kentucky Jockey Club and the Kentucky Trotting Horse Breeders' Association, which had to precede because of their many years seniority and because of their popularity and the inborn, familiar life routine of horse racing in Lexington.

The year 1787 witnessed one of the principal streets of early Lexington being used for a straight away race course. Stimulated indulgence in this street racing necessitated the laying out of the course of the Kentucky Jockey Club, the oldest and most historical racing grounds in America today.

The property of the Kentucky Trotting Horse Breeders' Association is the scene of the trots which have been for many years the outstanding social event of the season. In addition to these commercial tracks, there are many private tracks of considerable significance, well-known as the training places of renowned purse winners.

Analysis of the soil and water now substantiate a fact long established by practical experience, that the Blue Grass region encompassing Lexington is one of the few locations in the United States where horse flesh will not deteriorate in physical qualities under natural feeding and grazing conditions.

These fundamental advantages will enable visitors to the Southern convention to view the superior representatives of thoroughbred runners, standard-bred trotters, as well as champion three and five-gait saddle horses and what is still more rare, prize-winning plantation riding horses.

Mark the date for the Southern convention on your calendar—December 1 to 4.

Ice Cream

Facts and figures on advertising and sales problems in the ice cream industry

Advertising

Conducted for readers of The Ice Cream Review
by MILES D. ALLEN

The Question Mark in Ice Cream Advertising

WHAT is the maximum burden that ice cream advertising can carry? How long is advertising profitable? Should it pay for itself? Can ice cream be over advertised? These and many other questions confront every ice cream manufacturer, and because some still look upon advertising as a sort of necessary evil, they do not, or will not, take the time to sit down and figure out what advertising is all about.

There are several basic things that must be decided before any sort of advertising campaign can be intelligently undertaken. The first and most important question to answer is, do you really and truly believe in the power of advertising or do you look upon it superficially and without thought as to what constitutes good and bad advertising and its proper application to your business? Do you still believe that advertising may possibly help your salesmen if Lady Luck is with you or that it is a constructive building force which will tear down resistance and build up good will and prestige for your concern?

A man's business is but a lengthened shadow of himself, and he takes out of it in pleasure and financial remuneration in exactly the same ratio to the amount of energy and enthusiasm he puts into it. If he is of the old school, or is short-sighted and narrow-minded, the shadow he casts will never shade a great amount of business. To the manufacturer who is but luke-warm toward advertising this article will not appeal, for it is given over to advertising subjects which will only interest those who believe in it as a real constructive building force.

ICE cream advertising is unlike almost any other kind of endeavor. It has no successful counterpart from which successful examples may be drawn for comparison. It is a field all its own and should be handled as such.

In ice cream advertising you cannot advertise a **specific retail outlet.** Your distribution falls among a few hundred or a few thousand dealers, widely separated, and each unmindful of the other. Whereas, the department store, clothing store, gift shop, furniture store, etc., has but one or possibly two outlets, the ice cream advertiser usually has that many hundred retail outlets. Therefore his advertising problem is not one of drawing crowds to a particular location, but rather one of going into the highways and by-ways and telling everyone that his ice cream has certain fundamental superiorities which recommend it to every user. A retail store can advertise a certain article and trace directly whether the advertising pulled results. It is preposterous for an ice cream advertiser to undertake to carry out such tactics.

You must be content to maintain an aggregate volume throughout your territory. But, you ask, what is the best way to advertise to get volume? My answer to this question is, do three things in all your advertising:

1. "Sell" the dealer.
2. Sell quality and service.
3. Always mention flavor combinations.

You can talk superfluities about your ice cream till the cows come home, but if you keep hammering home these three points you will get the most satisfactory volume. In your advertising play up the point that your dealers are proud to sell your ice cream because, after a thorough investigation, they are willing to stake their reputation and the reputation of their store on the quality of your ice cream.

The more intimately you tie up with your dealer, the more he will sell your ice cream. This fact merely carries out the law of reciprocity. And if you continually play up flavor combinations you tend to get the public away from the idea of just buying ice cream, but rather buying such and such a flavor combination, your brand, even though they do have to go a few steps farther to get it.

If price appeal could be played up in ice cream advertising what an easy time we would have. Our copy

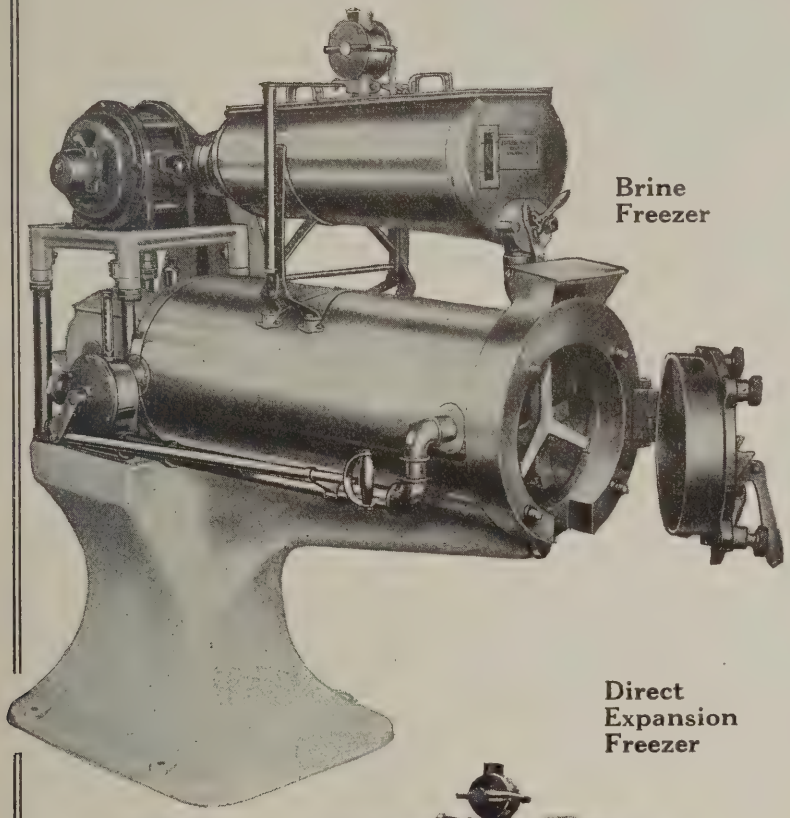
(Continued on page 68)

A New Department

A new department has been added to The Ice Cream Review which should prove of real benefit and value to the many ice cream manufacturers throughout the United States who are readers of The Ice Cream Review.

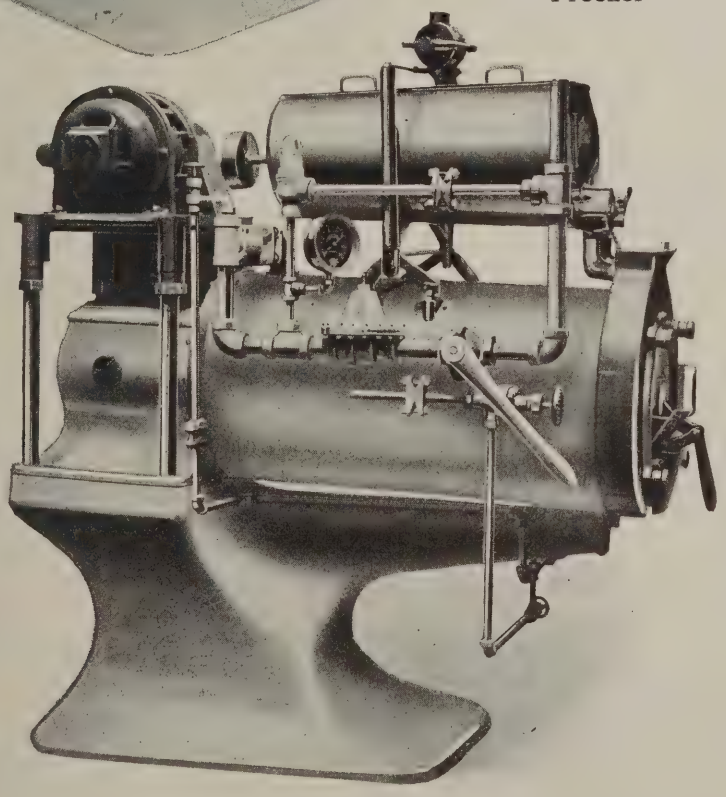
Mr. Allen, who has been prominent in the ranks of ice cream advertisers for several years, will conduct a regular questions and answers department in The Ice Cream Review, starting with the next issue.

No matter what your advertising or sales problem may be, just mail in your questions to The Ice Cream Review and Mr. Allen will answer them for you.



He is keenly alive to the latest developments in the ice cream industry—call upon him for constructive ideas along the lines of advertising and sales promotion.

Our biggest problem is increasing the sales outlet for ice cream. This department is created in line with our policy to serve this industry in every way possible. Make the most of this department; bring Mr. Allen your advertising and merchandising problems.



U. S. HEAVY DUTY ICE CREAM FREEZERS

BRINE — DIRECT EXPANSION

Universally Appreciated---because of the following exclusive features:

Brine Freezer

Direct Expansion Freezer

POWER SAVING:—Effected through the exclusive use of the famous Hyatt Roller Bearings in the U. S. Heavy Duty Freezers.

SMALL UPKEEP:—Effected through the use of finest materials obtainable.

REDUCES LABOR COST:—Effected through the exclusive use of the U. S. Automatic Batch Weigher.

MODERN CONSTRUCTION:—Effected through the exclusive use of the Patented Whipping Device, which is another exclusive U. S. feature.

VERTICAL DISCHARGE:—Another exclusive U. S. feature.

SANITARY:—No soldered or braised joints on the inside; all Nickel Silver. No brass coming in contact with the cream in any shape, manner or form.

LEAK-PROOF BRINE CYLINDER:—The brine coils are very ample and have nothing to obstruct the free flow of the brine.

PRESSURE CONTROL:—Effected through the use of the exclusive U. S. Pressure Regulator.

OVERRUN CONTROL:—Exclusive U. S. feature.

SAVES REFRIGERATION:—Effective through the exclusive use of U. S. features.

SPEED OF OPERATION:—The U. S. Heavy Duty Direct Expansion Ammonia Freezer can be started up the same instant that the compressors are started.

ADAPTABILITY:—There is no special equipment necessary in the installation of U. S. Heavy Duty Direct Expansion Ammonia Freezers.

Regarding Shrinkage When Ice Cream Is Dipped in Quart Containers

Report of Committee at the 1924 Annual Convention of the New England Association of Ice Cream Manufacturers, at Hartford, Connecticut

By R. C. FISHER and H. F. JUDKINS*

YOUR committee in making this report wishes to acknowledge and express an appreciation of the fact that its work was made possible, largely through the courtesy and co-operation of our president, who placed at the committee's disposal not only the firm's equipment and supplies, but liberally gave of his own time and counsel in studying this problem.

Shrinkage an Important Problem.

Everyone who has ever dipped or scooped bulk ice cream has come to realize that there is a certain unavoidable shrinkage. This shrinkage is caused by pressing out part of the air cells at the time of dipping the ice cream from the can to the quart or pint container.

However, the amount of shrinkage may vary from ½ gallon to 1½ gallons per 5 gallons of ice cream. To illustrate: Assume two dealers both buy 5 gallons of ice cream. The one may dip 4½ gallons, while the other may dip only 3½ gallons from the 5 gallons of ice cream. At 60 cents per quart this means a difference in returns of $2.40 for every 5 gallons of ice cream handled. What causes this difference in shrinkage? How may shrinkage be kept at a minimum? These are the questions which are of importance to the industry and which your committee has been attempting to solve.

Experimental Work.

To compare and study the influence of overrun and temperature on shrinkage, an experimental mix was prepared containing:

Butterfat	10.0%
Serum Solids	11.0%
Sugar	15.0%
Gelatine	.5%

The above mix we believe to be a representative commercial mix. As previously mentioned, this experimental mix was prepared, pasteurized at 145 degrees F. for 30 minutes, homogenized at 2,500 pounds pressure and subsequently frozen in a commercial ice cream plant so as to have results comparable to actual conditions in the industry.

After proper ageing the mix was frozen into four batches of ice cream containing, respectively, 80, 90, 100 and 110 per cent overrun in the freezer, as determined with an overrun tester.

Four three-gallon cans of ice cream were filled from each batch, thus giving four cans of 80 per cent, four cans of 90 per cent and four cans of 110 per cent overrun ice cream. One can each of the 80, 90, 100 and 110 per cent overrun ice cream was then taken to make four groups containing one can of 80 per cent, one can of 90 per cent, one can of 100 per cent and one can of 110 per cent. For the sake of clearness, and for future references, we will call these groups A, B, C and D, respectively. Group A was then stored at —2 degrees F., group B at +2 per cent F., group C at +4 degrees F. and group D at +12 degrees F.

All four groups were held at their respective temperatures for about 48 hours, so as to thoroughly temper the entire contents of each can at each respective temperature.

After weighing each can of ice cream to determine the actual per cent of overrun, the ice cream in each can was dipped into quart pails by four operators. Each quart of ice cream was weighed and the number of quarts dipped from each can recorded. Several quarts from each operator were examined to determine the nature of the package as to fullness, freeness of holes, etc.

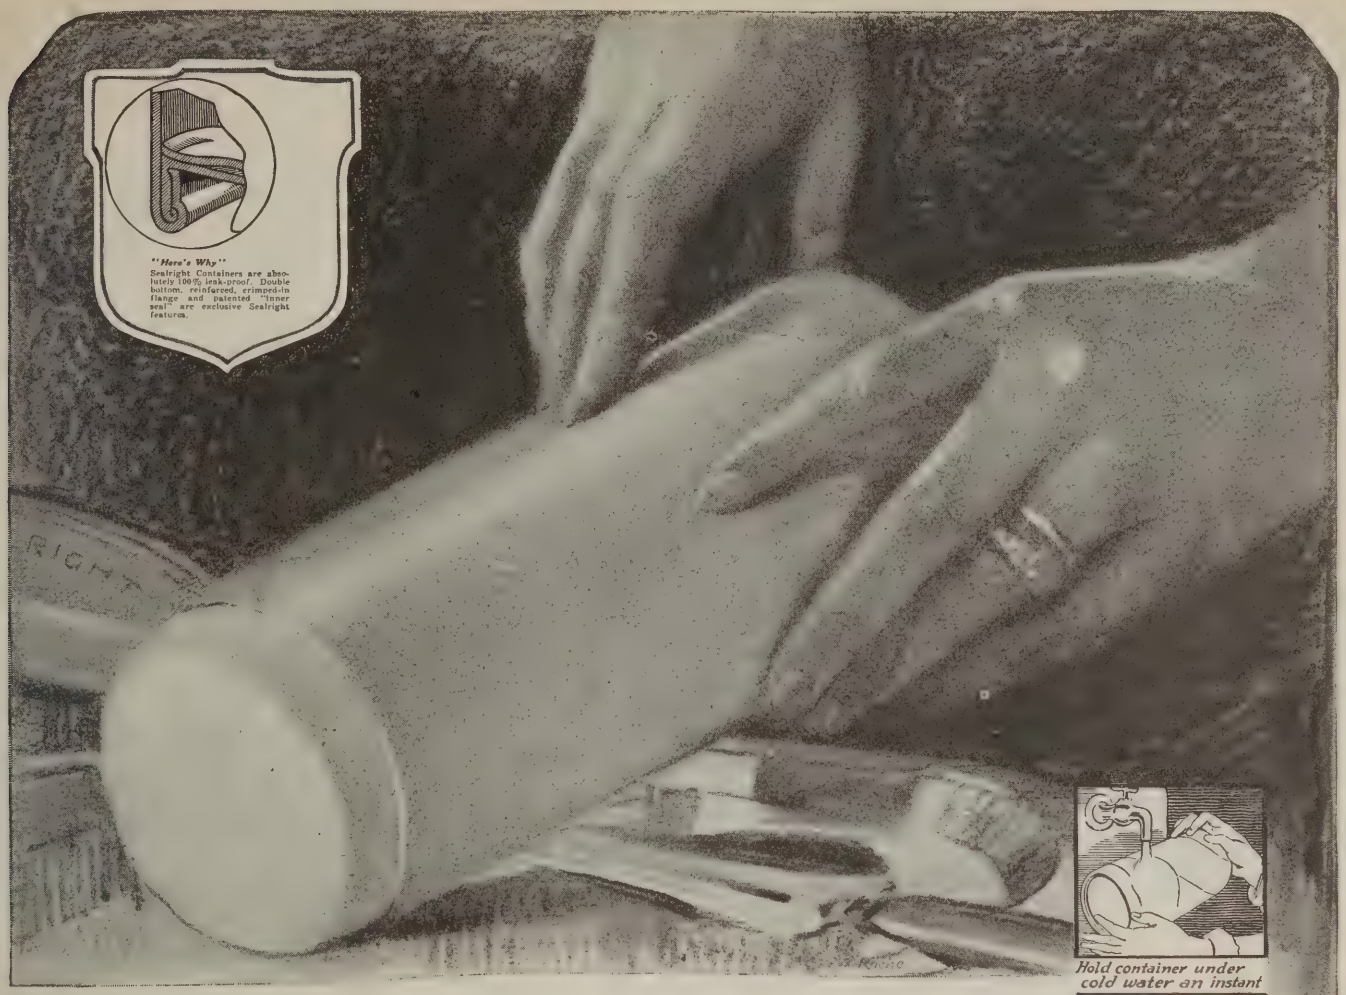
RESULTS as to weight per quart of ice cream and number of quarts dipped from the ice cream containing the various percentages of overrun and at different temperatures is reported in tables 1 to 4. As previously mentioned, the actual per cent of ice cream in each can was determined. This was found to be quite different from the overrun as determined in the freezer with an overrun tester. Especially in the higher percentages of overrun there was a shrinkage of practically 10 per cent from the freezer to the can.

The actual overrun in the can is reported in tables 1 to 4, rather than the overrun in the freezer, while table 8 reports the overrun in the freezer and in the can, thus making possible a comparative study. A study of tables 1 to 4, inclusive, seems to indicate:

1. That while quart packages dipped by the same, or by different operators, from the same can may vary as much as 6 to 8 ounces, in the majority of instances, the variation is about 2 to 3 ounces.

2. That when an average of ten quart packages or more per operator is taken, the average weight per quart, when dipped by different operators, checks within one ounce.

3. That the average net weight per quart of dipped ice cream, containing between 80 and 90 per cent overrun and of medium firmness, weighs about 23 or 24 ounces.



4. That, as the per cent of overrun increases, the percentage of shrinkage also increases in almost direct proportion. An increase in overrun from 80 to 100 per cent lowered the number of quarts dipped from 3-gallon can from 10½ to 9 quarts, or 20 per cent higher overrun increased the shrinkage in overrun from 20 to 45 per cent.

5. That as the dipping temperature increases above +2 per cent F. there is a corresponding increase in shrinkage, as shown by the greater weight per quart package.

Dairy Health—and Ice Cream

Dairy Cow is Foundation of Highly Successful Business Operated by Terry Dairy Co., Little Rock

By W. E. BEESON

Terry's Model Dairy Plant

Will Terry believes in the dairy industry. He believes dairy health is the foundation of our dairy manufacturing structure. He ties up the ice cream industry with dairy health. He is one of his section's most prominent dairy manufacturers. He operates one of the best equipped dairy plants for its size in the country — that of the Terry Dairy Co., Little Rock, Ark.

WILL TERRY.

Mr. Terry, who is an association leader, and is one of the dairy pioneers of the South, believes in the dairy development of the South. It was at a convention of the Southern Association of Ice Cream Manufacturers in Little Rock two years ago, that the question of dairy development in that part of the country was taken up. Leading ice cream manufacturers of that section took the stand that there was nothing the ice cream industry could do to aid the development of dairying. Called upon for a statement, Mr. Terry told how some years previously he had spent considerable money toward getting better dairy cows on the farms surrounding Little Rock, and added that every cent of that money had been paid back and that the dairy herds in his community had been so materially built up that he was quite pleased.

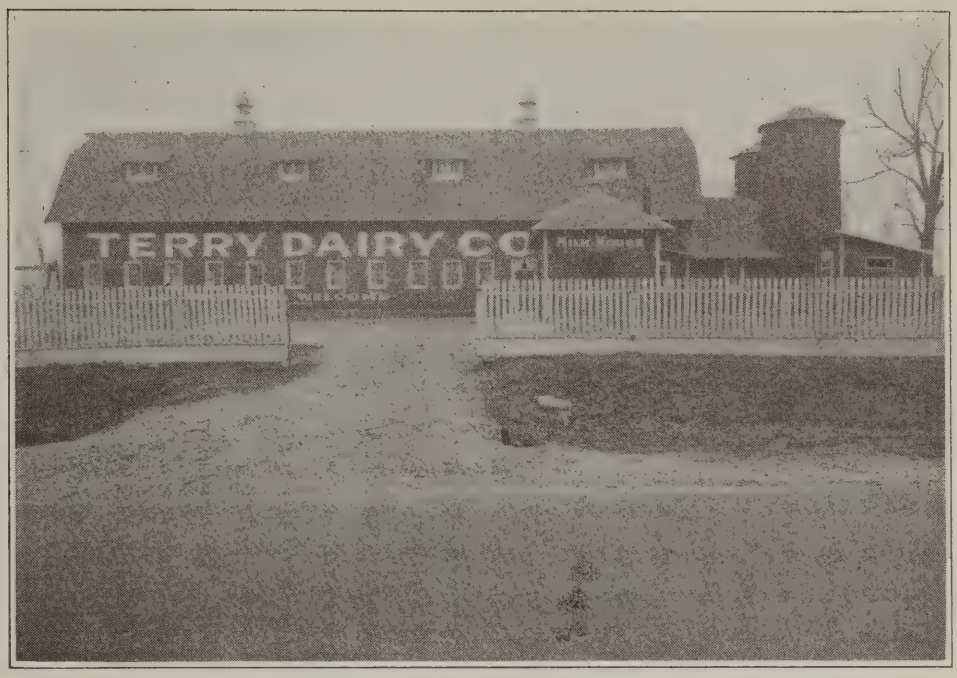
THE Terry Dairy Co. had its inception 20 years ago. The physical property of the infant industry consisted of one horse and one wagon. The executive department, the sales force, and the accounting department consisted of Will Terry.

From this inauspicious beginning there has grown a large, modern manufacturing and distributing business, the largest and most up-to-date enterprise of its kind in that section of the South, employing approximately 100 people, and doing an annual business of more than a million dollars.

Every modern appliance known to science for the sanitary and efficient handling of dairy products is in use at the Terry dairy plant.

A model dairy farm, modernly equipped and stocked with thoroughbred Holstein cattle, located on the 19th Street Pike, is a part of Terry Dairy Co. Milk receiving and pasteurizing stations at Hazen, Carlisle, Screeton, Conway, Mesa and Cabot receive the milk from hundreds of dairy herds, and from these stations the milk is transported to the central plant at Little Rock by a fleet of rapid auto trucks.

Twenty modern milk wagons leave the plant in the early hours of the morning, serving the people of Little Rock with pure, fresh pasteurized milk daily. A number of cream receiving stations, and more than 600 individual farmers daily ship cream to the Little Rock plant for buttermaking.



A fleet of modern ice cream route trucks take care of the demand for Terry's ice cream in the city, while the early morning trains carry shipments of Terry's ice cream to every part of the state.

(Continued on next page)

THE Terry Dairy Company was incorporated in 1912, with Will Terry, the founder of the business, as president, which position he still holds. The steady, healthy growth of the business has required an increase in capital several times to take care of the rapid expansion.

In 1918 the capital stock was increased to $100,000, additional new buildings were added, and, during the strenuous years of the World War and the two years following, the plant of the Terry Dairy Co. functioned perfectly, taking care of the unprecedented business in a capable and efficient manner.

Today the Terry Dairy Co. stands out as one of the important industries of the state, and is still growing. Two carloads of ice cream cabinets were installed by the Terry Dairy Co. last spring, time and labor saving machinery for the manufacture of brick ice cream has been installed, and the officers of the company confidently look forward to the best year in their history.

This is the Terry Model Dairy Barn, located at Terrytowne, out from Little Rock.

In 1923 the Terry Dairy Co. of El Dorado was organized and began operations in El Dorado, the metropolis of the Arkansas oil field. The El Dorado plant, like the one in Little Rock, is modern and up-to-date in every way, and has enjoyed a steady, healthy growth from the day it began business.

* * *

IN THE February issue of The Ice Cream Review there appeared a story in which were set forth some interesting plans by Mr. Terry in the use of iceless cabinets in a merchandising campaign. Mr. Terry bought a whole carload of iceless cabinets, and so tied up his dealers with these cabinets that it was made to their interest to make every effort to sell all the ice cream possible. For instance, the dealer that was not selling enough ice cream to justify the installation of a cabinet was told that if he increased his sales output he would be furnished with a cabinet.

The company at the same time put on an advertising campaign which tied up the dealers in a way that made it absolutely sure that a standard price would be charged the consumers for ice cream; that is, made it sure that the consumers would not have to pay **more** than a certain price, which was less than the price that dealers themselves would have charged ordinarily.

IN ADDITION to being one of the most progressive dairy manufacturers of his section, Mr. Terry also sets a good example for this industry by taking an active interest in civic affairs, being a prominent figure in activities in Little Rock centering around his chamber of commerce and different other civic organizations, including the Lion's Club, and others. It is easy to see how highly he is regarded by business leaders of his community when one "sits in" at a meeting of the Little Rock Lion's Club, or some other organization, and hears his name mentioned in virtually everything that arises.

This small section of the inside of Terry's Model Dairy Barn shows the careful attention paid to cleanliness.

In connection with the Southern convention at Little Rock in 1923 there are two things that linger in the minds of the delegates — Will Terry and Earl Hodges. Earl Hodges not only is one of the South's greatest orators, but has a reputation that spreads from ocean to ocean when it comes to putting "pep" into any kind of gathering, movement or enterprise. He believes in Will Terry and Little Rock.

The Terry Dairy Co. manufactures ice cream, Red Rose cream-

Lightening the Delivery Burden

How a San Francisco Manufacturer Cut Down the Length of Time Required to Serve Stops Through the Use of a Map of His Distribution Area

MORE attention is being given in this industry to what has come to be recognized as a big factor in the delivery system—the maintenance department. Speaking particularly in reference to the maintenance of the motor truck, F. L. Sargent in an address before the California and Pacific joint convention, pointed out many abuses that the motor truck often receives, including over-speeding, over-loading, lack of proper consideration in selecting a truck for particular service, etc.

For instance, quoting Mr. Sargent:

"If you are going to haul a one-ton load you naturally would buy a one-ton truck, but generally, people buy one-ton trucks and put three or four tons on them and run them several times faster than they should be run. When this is done, naturally, the trucks are going to depreciate very rapidly and are not going to be satisfactory, and unless you have a man on the job who understands the situation you are not going to know the reason why. A condition of that kind would naturally make it very hard for the maintenance department. In the maintenance department — and the purpose of a maintenance department is to keep the equipment rolling, or on the streeet, in the most economical manner and for the longest period of time possible.

"If the truck is regularly inspected, properly taken care of, it will run economically a great deal longer that the most of us can imagine. For instance, you can take a truck, a truck of most any kind, put it on the street, and ruin it inside of two years—maybe a shorter time than that. You can take the same truck, maintain it properly, that is to grease it regularly, and keep it as near as possible in the shape it was when you first bought it, and if you do this, the life of that truck will be anywhere from four to six years—that is, the gasoline truck—regardless of whether it is in the ice cream business, hauling flour, or whatever it might be doing."

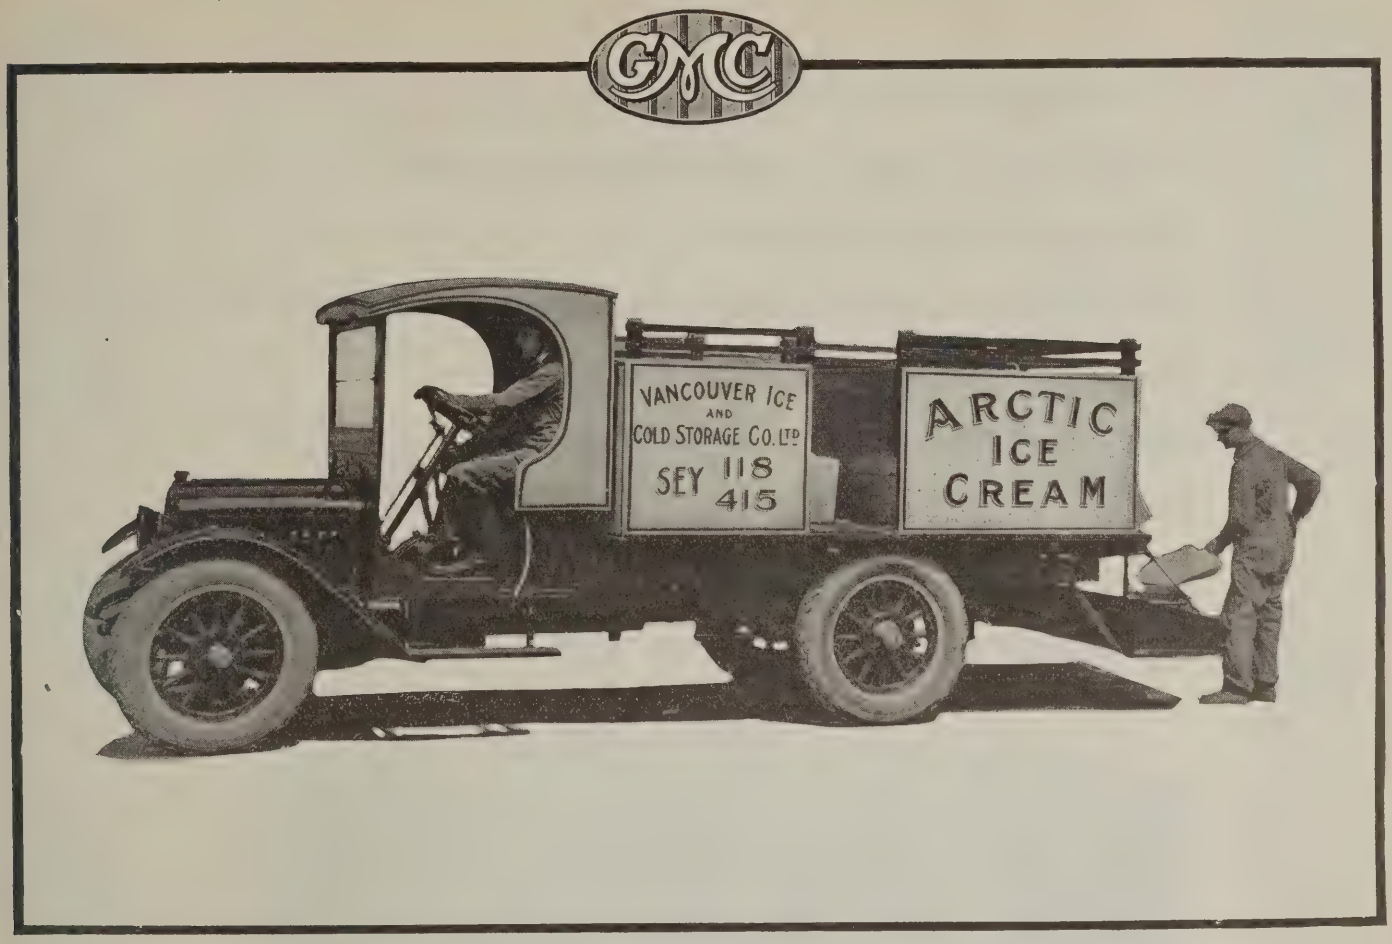
The speaker then went on to show how in the ice cream business we have much trouble with bodies. Regarding refrigerated bodies and leaking on the chassis, he said:

"If we build these bodies properly, give them the right consideration, and figure just what we are going to do with them, and build them rugged, and light and accessible, with proper drains, we are going to eliminate about 90 per cent of the leaks on the chassis, and then we are going to cut our maintenance cost and lengthen the life of our equipment, and furthermore, it is going to be safer on the street because an ice cream truck being driven with a leaky body rusts up the brakes and brake rods and the pins and sometime or another when the driver wants to stop he is not going to be able to do it, which was the case the other day in San Francisco where I saw an ice cream truck go into a Knight car and the reason he went into it was that his brakes did not work and the reason his brakes did not work was because he had brine on them, which made all of the parts, you might say, slippery. I find this comparatively easy to overcome, this leaky condition of the body, by building them so we can get at them in case they do leak and repair them quickly and economically.

"In the maintenance shop of a motor truck department it is very important that we have the proper maintenance men who have been well trained, know how a motor truck is built and assembled in the first place, so when they are called upon to take it down and rebuild it they are able to do it and know when it is in proper shape to turn loose or to put back to work. Now, it is also necessary to have your shop properly equipped with special tools and things of that kind that enable these men that you have to do the right kind of work."

SARGENT went on to tell how the National Ice Cream Co., the year before, operated about 900,000 truck miles, during which time the company did not have more than 10 or 12 street failures. This keeping down of street failures was due to the vigilance of the repair men in the repair department, he declared, adding:

"The delivery cost can be cut probably in several ways. We take our route trucks, for instance, they are properly routed, and naturally we are going to cut down the length of time it will take to serve a certain number of customers. The way I went about this was to get a map of the area affected. We placed upon this map colored tacks showing the exact location of every customer—different routes had different colored tacks. After we had the map filled out we could see just exactly where our trucks went, how they cris-crossed one another, ran around, ran uphill where they could have gone around and come back; we then changed the routing, and within a short length of time we changed it again, and in one case we were able to take off a truck."



There is another place where delivery costs can be cut, and that is—

"The dispatching of the special delivery truck. The special delivery usually runs very high. In special delivery the city is zoned, and the shipping clerk, when he receives the orders, marks the tag that goes to the man who packs the goods with the numbers on them representing the zones and the man who packs the cream will file it in some files that he keeps. When the truck comes in it will back up to the platform and while the man is checking in to the cashier the truck can be loaded, and when he comes out he is ready to go. That is not always the way it is done—there are many different ways—but I find by actual practice that you can speed up delivery that way and cut down on the number of trucks that you might need to deliver a large amount of orders."

(Continued on page 46)

A peep into the garage of the National Ice Cream Co., San Francisco, showing how batteries are recharged over night.

In the Inventory

GMC Delivery Trucks are a protected investment. Protected by their own excellence, their high value at normal cost, and by the responsibility of their builder.

GMC's are rugged—they resist wear. Overstrength materials and parts have been developed by GMC engineers and in General Motors great research laboratories.

GMC shares in the purchasing power of General Motors. That means superior materials at the same cost as materials of ordinary quality purchased in smaller quantities.

And GMC's are backed by a permanent manufacturer, a division of General Motors, a bulwark against the rapid loss of resale value that comes to trucks when their manufacturer quits.

In the inventory of your assets, or out on the job, GMC Trucks make a better showing. Ask for a new booklet on motor truck transportation and care.

The remarkably great refrigerating capacity of the Nizer Compressor [either water-cooled or air-cooled style] is ample assurance that the ice cream in even our 60-gallon iceless cabinets will be kept always in perfect condition. Specify Nizer and be safe this summer.

Nizer 12-hole Iceless Cabinet—with a separately installed Compressor operated by a one-quarter H. P. Motor, the largest motor that can be used on most lighting circuits.

NIZER

Reg. U. S. Patent Office

Automatic Electric Ice Cream Cabinets

Made in 4, 6, 8, 10 and 12-hole sizes—water or air-cooled—single or double-row—self-contained or remote.

Nizer Corp.: Detroit, New York, Atlanta, Chicago, St. Louis, San Francisco
A. P. McLendon, Waco, Texas. Linde Canadian Refrigeration Co., Montreal

Copyright, 1925, Nizer Corporation

You can depend upon
at least 10 years of use
from a Nizer Iceless Ice Cream Cabinet
—because: the compressor runs at
only half the usual compressor speed;
and its large capacity practically cuts
the operating time per day in half;
the lubrication is positive and
automatic, not manual;
the cans rest on a reinforced floor
not on part of the "brine" tank;
the cabinet top is durable Monel metal
not the customary "German Silver";
the "brine" tank uses a
non-corrosive, stable, safe
mixture of alcohol and water [as in motor
car radiators] not a salt solution;
in brief, a Nizer is built for permanency
—to protect your investment
and our reputation.

Try this Simple Experiment

"Ask a man what time it was just after he looked at his watch and tucked it back into his vest pocket."

Ninety-nine out of a hundred can't tell you what the "correct" time was. Their eyes just "approximated" the time. The proof lies in the fact that the 99 will look again to give you a correct answer.

With the human mind naturally working thus, how do you know whether the readings of your thermometers were "correct" and regulations made accordingly or just "approximately."

BRISTOL
Recording Thermometers

leave nothing to doubt. Their indelible record of correct temperatures is a positive check on the failings of the human individual. Use them liberally at critical temperature points for protection.

ery butter, Bulgarian buttermilk, Eskimo pies, and other dairy products. The company has cream stations at six different points in the state.

Officers of the company are: Will Terry, president; A. Terry, vice-president; S. S. Summerfield, secretary-treasurer, and G. W. Kumpe, treasurer.

TWENTY PER CENT OF NEW ENGLAND'S ICE CREAM MADE IN JULY.

Twenty per cent of the ice cream manufactured in New England is made in the month of July, if figures worked out by Prof. Lockwood, from an average of twelve manufacturers, handling a total of 3,000,000 gallons of ice cream in that section, are accurate. Prof. Lockwood's figures show August to be the second highest month for New England ice cream manufacturers, 17 per cent of the ice cream being made in that month, with June coming third, with 15 per cent, May fourth, with 10 per cent, while September falls in fifth place, with 9 per cent. December, January and February are the months of low production, each of these months showing the production of 3 per cent, with March a little better, with production of 4 per cent, the same as November. Five per cent of the ice cream is made in October and 7 per cent in April.

ICE CREAM FELLOWSHIP ESTABLISHED IN CALIFORNIA.

Announcement has been made that research work will begin at the University of California at Davis, in connection with the fellowship in the dairy division of the university voted at the annual convention of the California and Southwestern States Ice Cream Manufacturers' Association. Jay H. Kugler, secretary of the association, states that after numerous conferences between officials of the dairy division of the University Farm and officers of the association, a check for $500 was forwarded to the dean of the college of agriculture.

Prof. Roadhouse at the university plans to have this research work started this summer, it is announced. Through this fellowship, the university will probe the problems of ice cream manufacturers.

PLANT REMODELED.

The Paris Ice Cream Co., Paris, Tex., has remodeled its plant and machinery of the latest design has been installed. In keeping with the company's stringent sanitary policy, the new plant has been finished in white on the inside as well as the outside, and the factory has the name of "The All-White Plant."

The three units, pasteurizer, viscolizer and double packer, are enclosed by a screened partition to eliminate flies and dust. No one is allowed to enter this section except the men in actual supervision of the work.

B. B. Harlan is manager of the plant.

ICE CREAM SLOGAN OFFERED.

Miss Vera R. Wolff, 541 W. 150th St., New York City, announces that she wishes to dispose of what she considers to be a good slogan for an ice cream concern, and any manufacturer interested may communicate with her.

Performance of six on trial brings order for 200

In answer to a query from a Newark ice cream manufacturer, the Kirk-Maher Company, of Malone, N.Y., writes: "Hope to eventually do away with cabinets we were formerly using."

"Last summer," writes G. H. Frechette, secretary-treasurer of the Kirk-Maher Company, in answer to a query from the Puritan Ice Cream Company, of Newark, N. J., "we bought six A-B Ice Cream Cabinets and had them sent to our various plants. They have proven entirely satisfactory with one icing in 48 hours.

"As a result, we have placed an order for approximately 200 of the various sizes, and hope to eventually do away with the cabinets we were formerly using.

"We highly recommend A-B Ice Cream Cabinets to those desiring a money-saving proposition."

Like Kirk-Maher, ice cream manufacturers all over America are finding A-B Ice Cream Cabinets save more ice, more salt and more money than any pack cabinet they can buy. And no wonder!

Surrounding the ice and salt chamber of the A-B Ice Cream Cabinet is an unusually effective insulating material which keeps cold air inside the cabinet and warm air out. Even the lid is fully insulated, and fits tight.

Cream compartments are square and perfectly dry. All sizes of bulk ice cream can be inserted with greatest ease—square pockets permit all package cream to be carried in compact facility.

Our new booklet, just off the press, explains why the A-B Ice Cream Cabinet will cut your ice and salt bills to the lowest possible level. Sent free. Write for it.

The "C-GAL" [Pfaudler Glass Lined] Is the Greatest Equipment Value in the History of Dairying

THIS TANK CAN BE USED AS A PASTEURIZER, STARTER CAN, STORAGE TANK, ICE CREAM MIXER, AGING TANK, BUTTER-MILK TANK, ETC.

Bearing out our claim that the "C-GAL" is the greatest equipment value ever offered to the trade, note carefully the following specifications:

- Interior of tank lined with Standard Pfaudler Glass Enamel.
- Inner shell and jacket of tank made of $\frac{3}{16}$" steel.
- Insulated with 1" corkboard, which is covered with a 20 gauge copper-steel (Keystone Metal.)
- Furnished with semi-flush, side outlet, angle valve. This is a very sanitary construction and the plug can be removed for cleaning the valve.
- Fitted with special agitating nozzle for entrance of heating or cooling medium.
- Has special dished bottom to permit of side outlet.
- Has angle stem thermometer with regular diaphragm connection.
- Is equipped with Pfaudler Impeller Agitator and tight-and-loose, floating-type, pulley drive. This has a belt shifter which can be shifted to any angle for convenience. Standard diaphragm connection is used for entrance of agitator shaft.
- Has safety valve which is set for 3 pounds. Valve is fitted with a latch for opening jacket when draining brine or other jacket contents.
- 3" steam gauge, pressed steel enameled casing.
- Equipped with one-piece pressed copper cover.
- Has standard 1½" pipe legs, which are furnished with adjustable leg bases so as to take care of floor slope.

Price Only $325

F. O. B. Elyria, Ohio

NOTE: Motor bracket with gears and two-speed drive substituted for pulley drive, $60. additional (motor extra.) Recording Thermometer substituted for angle stem $70. additional.

Kist

REG. U. S. PAT. OFF.

KIST Flavored Frozen Suckers are being manufactured by the most prominent Ice Cream Manufacturers in the country.

To show the national acceptance of this remarkable product we have selected a few names from the hundreds of manufacturers who are now putting out "Kist" Flavored Frozen Suckers.

Rieck-McJunkin Dairy Company, Pittsburgh, Pennsylvania, and their allied plants. Telling-Belle Vernon Company, Tabor Ice Cream Company, Peerless Ice Cream Company, Baker-Evans Ice Cream Company, Cleveland Ice Cream Company, all of Cleveland, Ohio. Hydrox Corporation, Chicago, Illinois. Crystal Ice & Storage Company, Portland, Oregon. Imperial Ice Cream Company of Parkersburg, West Virginia, and their various plants. Castle's Ice Cream Company, Newark, N. J. Carry Ice Cream Company, Washington, D. C. French Bros. Bauer Co., Cincinnati, Ohio. Horn Ice Cream Company, Baltimore, Maryland, also Norfolk and Richmond, Virginia. H. L. Neuman, York, Pa., together with the York Ice Cream Company. Williams Ice Cream Company, Scranton, Pa. Gate City Ice Cream & Dairy Company, Atlanta, Georgia. National Ice Cream Company, San Francisco, California. Benham Ice Cream Company, Fresno, California. Houston Ice Cream Co., of Houston, Texas. New Orleans Ice Cream Company, New Orleans, La. Terry Dairy Company, Little Rock, Ark. J. D. Roszelle, Peoria, Ill.

Exceptional Profits

Manufacturers who have gone into this proposition are reaping exceptional profits every day and the best part of all, they are making this extra profit without tying up any of their Freezer Equipment.

The Frozen Sucker is simply a flavored ice, five and one-half inches long by one inch in diameter. It is easily and cheaply manufactured.

The cost of making Frozen Suckers, including all materials, supplies, and wrappers is less than 7 cents per dozen. The selling price to the dealer is 40 cents per dozen. The retail price is 5 cents each. Truly an exceptional profit, you will admit.

With practically no initial investment you can add this new source of income to your 1925 business.

A miniature reproduction of one of the "Kist" Frozen Sucker dealer window posterettes supplied in the Free "Kist" advertising and merchandising campaign described on the next page.

FROZEN SUCKERS

Every notable success with Frozen Suckers in this country, to date, has been with "Kist" Flavors.

Just as "Kist" Flavors have been the outstanding flavors used in week-end brick and bulk Ice Creams, Ices, Sherbets, Ice Cream Cups and other specialties, so they have become the ONLY accepted flavors for making Frozen Suckers.

We have gone into the Frozen Sucker proposition thoroughly and coordinated all the details. Through our efforts the "Kist" Flavored Frozen Sucker is now being manufactured in practically all the large centers of this country. We have made Frozen Suckers a National Item.

Frozen Sucker Equipment

After careful investigation we made arrangements with the Valentine Machinery and Supply Company of Chicago, to supply our customers with their Frozen Sucker mold units at $29.50 each. We have found the Valentine Method to be by far the most satisfactory and sanitary way of making Frozen Suckers.

We have also secured a source of supply for the necessary sticks and vegetable parchment wrappers at exceedingly low prices for our customers' benefit.

The "Kist" Free Advertising Campaign will assist you to the same success that it has to hundreds of other Ice Cream Manufacturers.

To help you put the Frozen Sucker proposition over quickly and effectively in your city, we have prepared a forceful advertising campaign, consisting of a series of ten exceptional newspaper advertisements, four of which are shown in miniature on this page, and a series of powerful colored dealer window posterettes, all which will feature your name prominently.

All this advertising material is only a part of the large and comprehensive advertising and merchandising service, which we furnish FREE to one Ice Cream Manufacturer in a town under our Friendly Agreement Plan, by which he enjoys the exclusive rights on "Kist" Flavors and "Kist" Flavored Frozen Suckers.

Clip the coupon and mail it today for complete information on "Kist" Flavors and "Kist" Flavored Frozen Suckers and our exclusive plan for increasing your 1925 sales and profits.

LIGHTENING THE DELIVERY BURDEN

(Continued from page 36)

MANUFACTURERS can make many improvements in operating and repair practices—particularly those smaller manufacturers using from one to ten trucks—resulting in reduced cost of operation, according to C. H. Snow of Bloomington, Ill., who has given this matter much thought. Mr. Snow prepared a paper on this subject for the Illinois convention last year, and in this paper it was brought out that reduced costs of operation can be effected by proper attention. His thoughts on the subject were based upon experiences covering a period of 14 years of truck operations.

Mr. Snow set forth that his company had discovered that it is necessary to have trucks suited for the particular work they are supposed to do, care being taken not to underload or overload. He recommended the policy of "diligent, constant maintenance" as being "less costly than a policy of deterioration, a periodically overhaul and trade-in," adding:

"In our operation each truck is assigned to a certain man who is responsible for proper attention to gas, air and water supplies. This same man must regularly lubricate the chassis and properly watch the motor oil replenishment and changes. We have a mechanic who does the repair work on all eight trucks, but this occupies not more than half his time so that he does other things as well. We have a painter who does all wagon, truck and building painting, and other duties in addition. Our superintendent of delivery has charge of trucks and wagons and directs their operation and repair.

"I will now take up practices in operation.

"1. We have found that consideration given to proper coordination of loads and tire sizes was a good way to reduce tire costs. We found that a 2,500-pound load limit and a five-inch tire on the Fords practically cut in two the tire costs as compared with a 3,000-pound load limit and a 4½-inch tire. Yet I have seen several hundreds of Ford ton-trucks carrying such a load on the standard 4½-inch tire. As a general policy, I believe that a load limit of 25 per cent higher than the truck's rated capacity and the first oversize in tires, especially on rear wheels, will be found most economical. The larger tire sizes permit lower air pressures with a corresponding increased resiliency and saving of shocks on the chassis."

The value of keeping gasoline mileage records was stressed in Mr. Snow's paper. This is easily done, he insisted, if manufacturers—

"2. Will equip the trucks with mileage recorders and the result of a monthly gasoline mileage computation will show you many things. By means of this check we have located such faults as dragging brakes, improperly adjusted carburetors, retarded ignition and similar minor troubles that might have gone on for some time if not indicated by some more definite means than an occasional driver's remark about 'lack of pep.' As a direct result of this gasoline check we removed all dash carburetor adjustments from the Fords. We found that invariably the driver would open up the needle valve to faciliate starting and then forget to restore the leaner mixture. This change increased gas mileage one to two miles per gallon."

A REGULAR changing and careful checking up of the crank case oil was another operating practice that this company found to save considerable expense, as "without question, proper motor lubrication will pay bigger dividends than any other truck operating item." He figures that there are three things to keep in mind—"first, the oil must not be allowed to become diluted with unburnt fuel to an extent which destroys its lubricating ability," which in winter time can occur in less than 100 miles of truck operation with a poor grade of fuel; "second, to remember that motor lubrication means that the oil must be of such a character that it will "properly lubricate the main and rod bearings," and third, to bear in mind that this oil "lubricating the shaft bearings must also lubricate the cylinder walls and pistons."

He set down some repair practices that he thought would be helpful, speaking as follows:

"First, we find that it pays to remove a cylinder head quite frequently, clean the carbon and grind the valves. With the help of the driver this is often done in four hours time and increases materially the life and efficiency of the motor.

"Next, we have found that in the case of the Fords it pays to take out the motor and completely re-fit the bearings instead of doing the usual take-up job. Ford bearing lubrication is by splash system and the result is that the crank shaft becomes egg-shaped or flattened more quickly than is the case in pressure lubricated motors. Consequently, we usually 'take-up' the rods once, but the second time replace the flattened crank shaft with a new one and re-fit all the bearings. This is done quickly with bearing grinding compound and such jobs stand up for a year or more without further attention. If the work is done on a flattened shaft it is usually but a short time until the bearings are again loose. The fact that we carry an extra motor makes it easy for us to keep the truck at work while such repairs are in progress."

The value of frequent painting was stressed by the speaker in conclusion, Mr. Snow insisting that paint protects the chassis to a great extent, "especially in work as severe as our industry demands." His company protects the chassis from salt water as much as possible in body construction, but he recommended an additional protection in the nature of brine resisting paint.

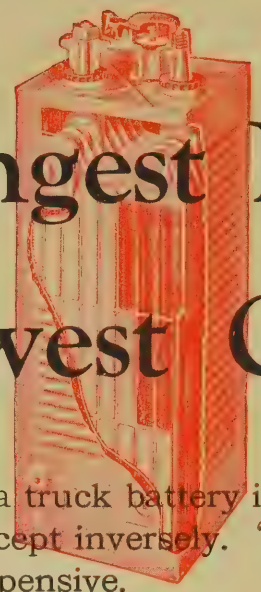
Moderate price

THE fact that so many users have re-ordered Baird Refrigerator Bodies year after year proves beyond question their complete and lasting satisfaction.



It is the enthusiastic recommendation of Baird users which has enabled us to place such a large number of Baird Refrigerator Bodies in service all over the country. Upon request we will be glad to give you the names of Baird users in your locality.

We can ship a Baird Refrigerator Body in the lead within from three to five days after receiving the order, depending on the size.

William F. Baird Co.

1118 LITTLE BUILDING BOSTON, MASS.

Longest Life
Lowest Cost

THE cost of a truck battery is not indicated by its price, except inversely. "Cheap" batteries are invariably expensive.

Maintenance, labor and time lost for battery repairs and rebuilding must all be added to the price. This total, divided by the number of years of useful battery life, will give the actual cost.

The steel-alkaline Edison Battery, free from the self-destroying diseases of the lead acid type, will outlive two or three lead acid batteries. Over this long life, its cost per year and—more important—your delivery costs, are greatly decreased.

Our nearest District Office will gladly give you FACTS on the problem of electric delivery.

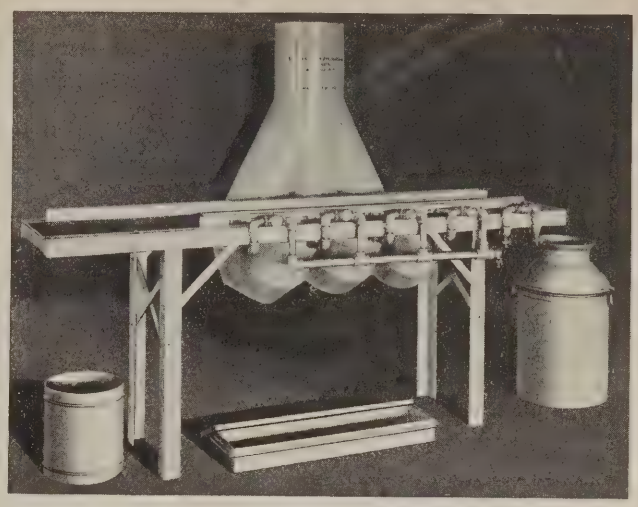
THE SUGAR SITUATION
World Supplies and Prices

Facts About Sugar.

THE fact that the prices of raw and refined sugar are now down to the level they occupied in May, 1922, invites a comparison of general market conditions in these two years. In many respects they are much alike, especially as regards the situation in the United States and Cuba, but in some particulars there are decided differences.



At the beginning of 1922 Cuba had on hand some 1,200,000 tons of the previous year's crop. Its production in 1921-22 was nearly 4,000,000 tons, so that the total Cuba supply for 1922 was above 5,100,000 tons or somewhat more than is promised for the current year. Of supplies produced within the United States the total quantity available in 1922 was 2,175,000 tons, while in 1925 the amount from these sources, so far as can be determined at this stage of the season, will be 2,775,000 tons or about 600,000 tons more. Thus the total quantity of sugar available from sources which ordinarily supply the markets of the United States is 400,000 to 500,000 tons more this year than in 1922.

During 1922, however, Cuba's shipments to countries other than the United States exceeded those of any other year, before or since, amounting to over 1,100,000 tons. During the same year the export of refined sugar from the United States, practically all of which was produced from raw sugar imported from Cuba, was 820,000 tons, representing nearly 900,000 tons of raws. Thus 2,000,000 tons of the 5,100,000-ton Cuba supply of 1922 found markets outside of the United States, leaving 3,150,000 tons as the quantity entering the United States for consumption.

THIS year direct shipments of raw sugar from Cuba to countries other than the United States may equal or exceed the record of 1922. Various estimates place the quantity already sold at such markets at 800,000 to 1,000,000 tons. As Cuba, at present prices, is underbidding every other exporting nation, it appears reasonable to anticipate that further sales of considerable volume will be made to Europe and elsewhere.

In the matter of refined exports from the United States, however, there is no likelihood that the 1922 record will be reached or even nearly approached. For the first three months of the year such exports have totalled 47,700 tons, equal to about 51,000 tons raw value, or at the rate of 190,000 to 200,000 tons for the year. While this movement may expand during the next few months it will hardly exceed 250,000 to 300,000 tons, raw value. The total supply from Cuba and domestic sources amounts this year to 7,500,000 tons as compared with 7,275,000 in 1922. Deducting actual shipments to other countries of 2,100,000 tons, raw value, in 1922, and estimated shipments of 1,400,000 in 1925 leaves about 6,100,000 tons to seek a market in the United States during 1925 as compared with 5,100,000 tons in 1922. There is thus an apparent excess of roundly 1,000,000 tons in the total supply seeking an outlet in the markets of the United States during the current year as compared with 1922. This is one rather important difference between these two years.

(Continued on next page)

The Economy Sterilizer and Drier

"Dries" the Cans as it Rinses and Sterilizes

The Economy Sterilizer after thoroly rinsing and sterilizing all types of cans and moulds, *dries* them so that new bacteria will find no medium for growth.

Furthermore, with the Economy Sterilizer there is no condensation in the room. This is all drawn off to the outside. This eliminates the ruination of valuable equipment and building interiors.

A wonderfully efficient piece of equipment at a very reasonable price. Investigate it.

"The Economy machine for rinsing, sterilizing and drying which we purchased is giving entire satisfaction. It is easily operated, does its work well and meets all requirements for which it is designed. We made no mistake in our decision." Yours truly,
Glen & Mohawk Milk Assn., Inc.

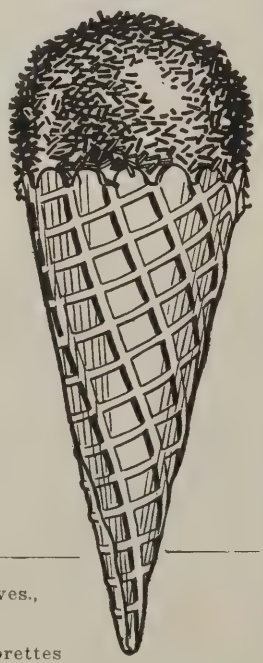
The Economy Products Company, Auburn, N. Y.

DISTRIBUTION in the United States during 1922 reached a total slightly over 5,000,000 tons, refined value, or over 100 pounds per capita. For 1925 it has been estimated that distribution may amount to 5,300,000 tons refined or 5,700,000 tons raw value. This would still leave an undisturbed balance of 400,000 tons at the end of the season. To dispose of this quantity, or even the greater part of it, outside the United States it will be necessary for Cuba to undersell other producing nations for some time to come. The alternative will be to carry this amount over into next year. In 1922 the huge Cuba output and carry-over was nearly all distributed by November, a condition that seems hardly possible of attainment by the corresponding date this year unless, as previously mentioned, sales to outside markets are conducted on a very much larger scale than now seems likely.

For one thing, Europe's production of sugar has increased from 4,000,000 tons in 1921-22 to over 7,000,000 tons for the current crop year, and while European consumption has also greatly increased the gain has hardly been sufficient to permit the absorption of much more than 1,000,000 tons of Cuban sugar in addition to the other supplies that naturally seek European markets. South America and the Orient have taken moderate amounts of Cuban sugar, but their own crops are now about ready and appear to be ample for their further demands.

Thus the parallel which some trade observers have attempted to draw between the course of the market in 1922 and its probable action during the remainder of the year hardly holds good, so far as it relates to the extent of available supplies and probable demand for Cuban sugar during the balance of the current year. As future prospects have more influence than present conditions in affecting prices, however, developments in connection with next season's crops, should they indicate a very serious falling off in production, may bring about a marked improvement later in the year.

DECORETTES



Will Help Your Dealers Double Their Cone Business

STORING ICE CREAM FOR PERIOD OF FOUR MONTHS.

Storing ice cream for a period of four and one-half months is a feat that most manufacturers off hand would regard with great incredulity. Yet that is what is done with the ice cream sold by the Horton Ice Cream Co., New York, through the Cunard Steamship Co. for vessels on world cruises.

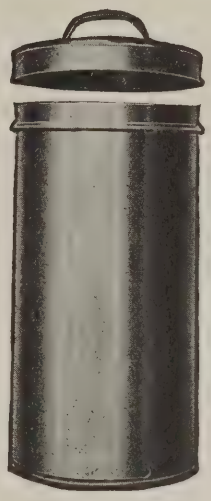
In an article in the March-April issue of The Glass Lining, we are told that the Horton ice cream is put up in quart boxes and placed in the cold storage room on board the ship. This room is kept at a temperature of 18 degrees, and in addition to the natural refrigeration, ice cream is packed with broken ice and salt about three times a week.

View of the cold storage room on the S. S. Berengaria.

Thus it is that ice cream is kept in perfect condition for four and one-half months. This is the length of time it takes for a world cruise. Passengers on the last day are eating from the same box that the ice cream came from when the trip began.

This ice cream keeps in perfect condition, we are told.

TRENCH BECOMES MANAGER OF CLINE ICE CREAM CO.



H. A. Trench, for some time manager of the Imperial Ice Cream Co., Clarksburg, W. Va., has left that organization to take charge of the management of the Cline Ice Cream Co., Athens, O.

Employees of the Imperial Ice Cream Co. honored Mr. Trench with a farewell party on April 22 in the storeroom of the company's plant, at which time he was presented with a handsome Gruen watch. Dancing was the chief pastime of the evening. A buffet supper was served, after which Charles R. Griffin addressed Mr. Trench in behalf of all the employees, expressing keen regret at his departure.

Mr. Trench has been connected with the ice cream business for 18 years. Prior to coming to Clarksburg five years ago, he was connected with a Pittsburgh firm. Mr. Trench was a member of the Kiwanis Club and the Masonic Lodge and was quite active in civic work.

K-W TYPE A ICE CREAM CANS

Tinned on all surfaces — inside and out.

Soldered in just one essential place — where the bottom is set in.

(Patented)

Are You Satisfied?

Are you satisfied that you have on hand a sufficient number of K-W Type A Cans to take care of your requirements for the coming hot weather?

The demand on us for this type of Can this season has so far exceeded our expectations that we want to bring to the attention of the trade the necessity of anticipating their requirements.

At the present time we are still in position to make prompt shipments. If this demand continues, however, which we believe will, we do not know how long we will be able to do this.

Send your orders for K-W Type A Cans in NOW.

WE ALSO MANUFACTURE
MILK CANS AND SODA WATER TANKS

Dairy Refrigeration Erecting

By F. B. FULMER

ALL machinery with moving parts should have a solid foundation to set upon in order that the vibration will be reduced to a minimum, thereby preventing undue wear and also that the machine will always maintain the exact position in which it is placed. Settling of machinery, though it be slight and gradual, may produce serious results. This applies with special force when dealing with mechanical apparatus which is designed to perform refrigeration duty.

F. B. FULMER

Foundations have several functions to perform, hence it is necessary that they have ample size, the proper proportions and be made from first class materials. The first function of the foundation is to support the weight of the machine by distributing the weight over a sufficient area so that no settling will occur. In order to meet this vital requirement the foundation must have considerable weight and extend a considerable distance below the surface of the ground where it is located. The depth of the foundation depends largely upon the character of the soil, the depth of the frost line, subterraneous seepage and other local conditions.

The second function of the foundation is to absorb the forces which are produced by the rotating and reciprocating parts of the machine itself. The forces produced by the reciprocating parts of the machine act along the center line of the piston rod, while those produced by the rotating parts act radially in all directions from the center of the crank. These forces are governed by the speed of the machine and the weight of the moving parts. In well designed ammonia compressors the frame or bed plate has considerable weight, which helps to absorb the forces caused by the operation of the machine, but it is good practice to build a foundation that will have at least double the weight of the machine it is called upon to support.

Another function of the foundation is to hold the machine rigid against the unbalanced forces which may be present. These unbalanced forces may be caused by the pull of the belt in a belt driven machine or from other sources. If the foundation rests upon solid rock the weight can be reduced to a minimum, but if it is to rest upon damp and porous soil the depth and the bottom area must be greater. Each local condition can in a general way be governed by well established rules of construction based on experience from similar locations.

WITHOUT question the most satisfactory material for constructing the foundations for machinery is concrete. This is composed of various proportions of Portland cement, sand and crushed rock or coarse gravel. The cement used should be of very best quality; the sand must be free from dirt and should be what is known as sharp, which means that it is coarse and gritty. The pieces of stone should not have a diameter of more than two inches. For heavy duty a satisfactory concrete can be made by mixing one part of Portland cement, two parts of good sand and four parts of crushed rock. Foundations constructed similar to the formula given will have a weight of approximately 150 pounds per cubic foot. A large part of the efficiency of concrete work depends upon the proper mixing of the various ingredients, as strength and durability increase with mixing up to a certain point. Foundations should be allowed to dry out very slowly and after the surface has set, it is good practice to keep a two-inch layer of sand in a moistened state on the top for a week or more. Under ordinary conditions the foundation should be allowed two weeks time to properly set and dry before any weight be placed upon it.

The manufacturers of machines usually supply blue prints showing the exact dimension for the wooden frames which are designed to support the foundation bolts in their proper location during the construction of the concrete foundation. These frames are called templets and are supported in position above the foundation so that the bolts will be in the correct location when the bed plate is placed upon the foundation. The holes in the templets should not be much larger than the foundation bolts and special care should be taken to have the bolts set at the proper height so there will be ample space for the nuts to fit on the threaded end of the bolt after

For Lasting Satisfaction

York Refrigerating Equipment

One reason why there are so many installations of York Refrigerating Equipment is that its satisfactory working condition does not pass with the seasons. York Equipment does not mean satisfaction until the first signs of wear show up, but a year in year out dependable service that stands the strain of rush seasons without injury to its long life.

Let us show you just why York Equipment lasts longer.

A TRIP through the JAMISON PLANT

Scene No. 6

DOUBLE SEALS of CONTACT

Two More Reasons for Less Door Trouble After You Put Jamisons on the Job

A COOLER door that isn't air tight—might as well be a screen to keep out the flies. That's the reason you find **two** seals of contact in every Jamison door, **instead of one.**

When you buy a cooler door you pay for a big, strong, heavy door that is five or six inches thick—**and well insulated.**

What folly then to skimp on the seals of contact. What good is the finest insulation inside the door, if the air circulates all around it?

Understand, it costs US more money to give you two seals—because in addition to the extra seal itself, there must be a heavier frame; beveled jams, which necessitates beveling the edge of the door to correspond; and the rabbit strip must be extra heavy and very securely put on.

BUT—that all adds to the life of the door, just as the two seals of contact add to its efficiency.

And the nice part of it is that on the strength of longer life and better service, we've been selling more doors than anyone else in the business. **So many more** that the increased volume actually enables us to absorb nearly all of the extra cost of manufacturing—**ourselves.**

In other words, you get two seals of contact in a Jamison Door at just about the cost of **one** in other doors.

Our list of 15,000 customers—repeaters a lot of them—includes the big users of cold storage all over the world. Recently, we got out a book showing photos of installations that are really impressive. Write me and I'll see that you get a copy.

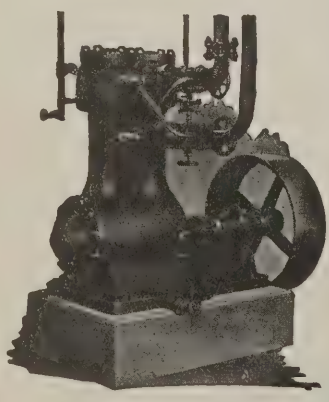
Jamison Doors



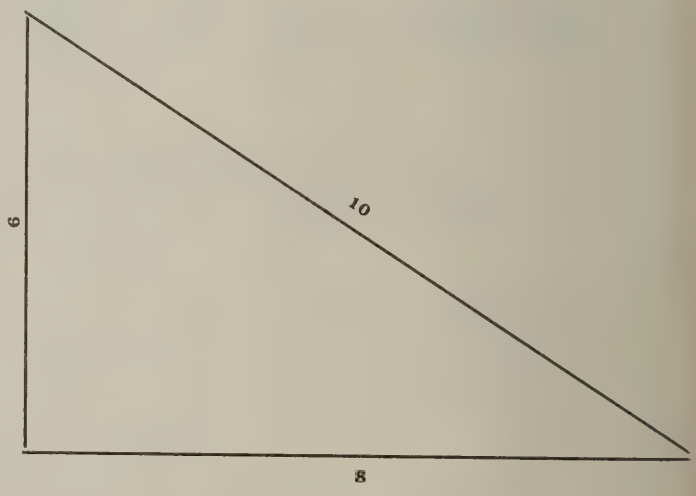
JAMISON COLD STORAGE DOOR COMPANY
HAGERSTOWN, MARYLAND, U. S. A.

the bed plate has been placed in position.. Mistakes have been made by those responsible for the height of the templets and as a result when the foundation was set and the machine placed upon it, the bolts did not come up through the bed plate far enough to put the nuts on. A safe rule to follow is to put a washer and nut on the foundation bolt and have them rest on top of the templet and locate the top of the templet at the same height that the top of the bed plate of the machine will occupy when set in position.

Another matter of importance is to place some sort of a sleeve around each foundation bolt so as to keep the concrete from coming in contact with it for a space of about an inch on each side for about three-fourths of the length of the bolt from the top downwards. These sleeves are usually made from galvanized iron and are placed just below the templet and centered equidistant from the foundation bolts. After the templet is removed and the machine set in position, the free space on the sides of the bolt will allow any slight horizontal adjustment which may be required.

THERE are different methods of providing an anchorage for the bottom end of the foundation bolt to hold it in position so that a large part of the weight of the foundation rests above it. Perhaps one of the best methods is to have a form made so there will be a pocket in the concrete at the proper distance from the top, which will be large enough for a steel plate four by six inches in diameter, depending on the size of the machine which is to be held in position, and have the plate rest upon the top of the bottom nut. Many of the manufacturers of compressors and other machinery supply the foundation bolts with the plates for anchoring and send full instructions for their use.

Vilter
Enclosed Type
Ammonia Compressor



An ideal ice machine for the moderate size plant. Modern in design, made of high grade materials and thoroughly inspected and tested. Let us send a copy of our Bulletin No. 29R to you. It tells of the force feed lubrication to the piston pins, the easily operated Vilter plate valves, the oil sealed stuffing box and gives other information of value.

Let us Submit quotations on your requirements —no obligations to you.

The
Vilter Manufacturing Company
ESTABLISHED 1867
830 Clinton Street Milwaukee, Wis.

The templet must have a center line marked upon it which will correspond with the center of the compressor. With the horizontal machines the crank shaft will be at right angles to the center line of the cylinder. When the center line of the cylinder has been located by the principles of the old engineering rule of "six, eight and ten." To apply this rule two lines are drawn tight and fastened at right angles to each other, the point where they cross being the estimated center of intersection of the compressor center and crank shaft center. It will be assumed that the longer line coincides with the center line of the compressor and both ends of it are securely fastened. One end of the other line is given a permanent fastening and the other a temporary one. On the compressor center line, a distance of eight feet is measured from the point of crossing, and from this six feet are measured on the other line.

Then a diagonal measurement is made from the eight foot mark on the one line to the six foot mark to the other line, and when these two points are exactly ten feet distant from each other, the two line present a perfect right angle to each other. The one end with the temporary fastening is moved so as to meet the required distance of ten feet. The figures presented by these lines represent a right angle triangle, as shown by the illustration:

IF SPACE permits probably more accurate measurements may be made by using 12, 16 and 20 feet for the distances on the lines. In fact any set of distances can be used, when the squares of the two short lines added together equal the square of the longest line. To illustrate: the square of 6 is 36 and the square of 8 is 64 and 36 plus 64 equals 100, and the square of 10 is 100. After the exact center lines of the crank shaft and the cylinder have been determined, they may be transferred in locating the templet by means of plumb bobs. Should it ever occur that a machine has to be set to line up with a shaft already in position, plumb bobs can be dropped from the shaft at points as far distant from the place where the machine (engine, compressor or motor) will be belted to it, and a line drawn to parallel the center of the crank shaft and the "six, eight and ten" rule applied to locate the center of the cylinder.

After the templet has been securely fastened in its exact location and the form completed for the concrete work the pouring of the concrete is accomplished and when it is thoroughly set, the machine bed plate is placed in position and leveled by means of wedges driven between it and the top of the foundation. It is good practice to allow about one-half inch space for this, which

time—

the Great Revealer!

"TIME will tell" the difference between fads, fancies, frills, and those things that are basically good. Time adds fame and value to all things worthy. Music, Art, and Literature are hallowed by its hand whilst shams are shoved aside. Time has dealt kindly with SCOTCH BOB, proving—if proof were needed—that Butter Scotch Ice Cream is a permanent addition to those goodies and delicacies that gladden the hearts of kiddies and touch the tender chords of reminiscent middle age, bringing to memory's mind the good old-fashioned butterscotch candy of long ago. CHOCO FORCE!

A KAY-WHITE PRODUCT

as different as balloon tires

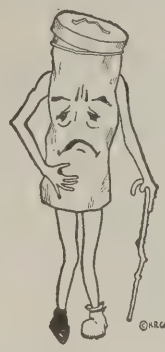
Like Balloon Tires, Choco Force works on an entirely new principle. It gives to Chocolate Ice Cream that same velvety smoothness that Balloon Tires give to riding.

CHOCO FORCE *does three things—*

1- Makes CHOCOLATE FUDGE ICE CREAM of ultra-richness and unrivaled flavor.

2- It brings supreme smoothness of texture, as free from roughness as a balmy summer's breeze.

3- It immediately increases sales by placing your Chocolate Ice Cream miles ahead of your competitors.



An introductory container is offered at only Two Dollars, to enable you to try it at practically no expense. If *all* the Chocolate Ice Cream you have ever eaten doesn't seem weak and flat after tasting some made with Choco Force, we will gladly refund your money.

is later filled with a suitable grouting material. This usually consists of making a mixture of equal parts of clean sand and Portland cement with enough water so that it will pour easily. The grout should fill all of the space around the machine base on top of the foundation and should set three days, when the nuts of the foundation bolts may be tightened up.

ICE CREAM CAMPAIGNS LINK UP DAIRY COW.

(Continued from page 10)

"All doctors agree that milk is a necessary part of the growing child's diet. This is very definitely proven by the fact that infants exist and thrive for many months on milk exclusively, and that no other food, possessing in itself all the properties necessary to the child's health and growth, has ever been found. Pure rich milk is indispensable to a well balanced diet for children, but the difficulty lies in the average child's distaste for whole milk. Due to some idiosyncrasy in the human make-up, those who require a milk diet most, relish it least, and it is necessary therefore to prepare the milk in a more palatable and pleasing form that will be readily acceptable to all children. Ice cream is the logical and easy solution of the milk diet problem.

"* * Our ice cream contains all the food properties of the whole milk with pure cream added. Nothing is taken out and no substitutes are used. It is a pure, wholesome, highly nutritious food, and a delicious confection that all children relish, need, and should be encouraged to eat."

A FEW weeks ago the Rieck-McJunkin Co. of Pittsburgh, which controls eleven or twelve ice cream plants, was planning to put on this campaign at its Butler, Pa., plant with the intention of staging it later on at all of their plants this fall when an appropriation will be available.

Announcement has been made that the Purity Ice Cream Co. of Galveston, Tex., also intends to try out this campaign, and likewise the Campbell Ice Cream Factory, Shreveport, La.; the Boedeker Manufacturing Co., Dallas, and the Franklin Ice Cream Co., Kansas City.

THE "Mookow" books each contains a section of seven pages of outlined cows. A booklet is given at the soda fount with each 5-cent purchase of ice cream. The idea is for the children to fill in the outlines of the cow pictures with colors. Then the finished books may be turned in to the dealers in exchange for prizes—one completely colored book for either a platinoid bracelet, a Waldemar knife, or abaseball; and so on up to eight complete books, which entitle the holder to an Ansco camera, a "Bingler" bat, or an official league baseball.

According to one manufacturer:

"So far as we can see up to this time, the 'Mookow' plan is the most sensational success ever known in the ice cream industry, and may be the means of not only enormously increasing sales in the summer season, but of stimulating them in the winter to a point where the usual loss will be greatly lessened and possibly overcome."

E. B. Geisel of New Orleans, with reference to the "Mookow" sales plan, has this to say:

"We have your letter of the 24th instant, and are glad to know that you are very much interested in the novel ice cream sales plan that we have inaugurated.

"We are pleased to advise that this 'Mookow' sales plan has gone over very successfully, and has inspired the mothers on the food quality of ice cream."

AMONG the most striking arguments favoring ice cream for the child, particularly stressing the point of dairy health, are given as follows, on the first page of the booklet:

"All of the elements necessary to the maintenance of life and growth, namely: proteins, fats, carbohydrates and min-

eral salts, are contained in ice cream. It is perhaps the only food that can be taken without reserve both in health and in all forms of disease. Indeed, in early life, up to the age of eighteen or twenty, when the ends of the long bones fuse, a diet rich in milk is important on account of its high calcium content. In the very young it is absolutely necessary for the proper development of the bones and dentition and for the prevention of rickets, a disease of the young which causes softening of the bones and deformities.

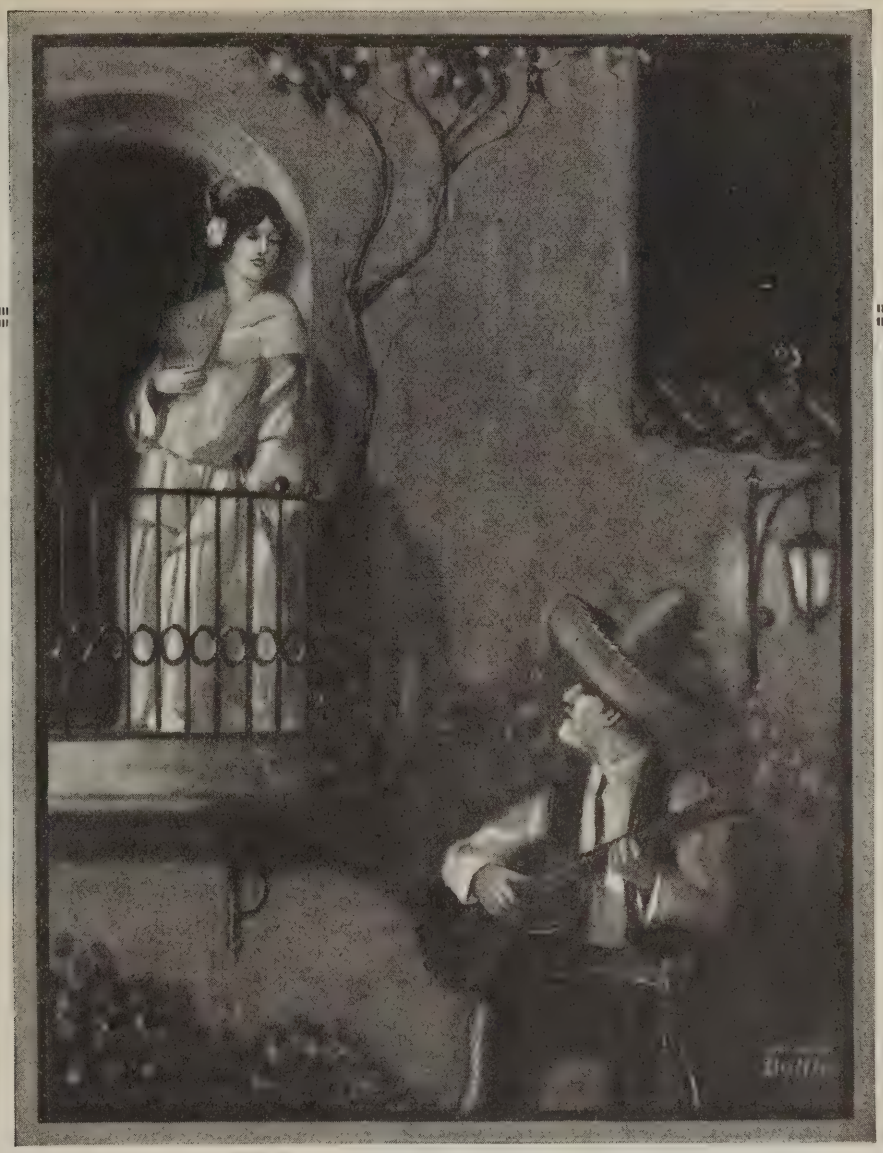
"Notwithstanding the invaluable importance of milk as a food, in fact as a necessary one, it is surprising to find how many children either refuse it altogether or take very little because of its lack of palatability. Children have a great predilection for ices and sweet things. With few exceptions all children are fond of ice cream, which is nothing more than frozen milk and cream sweetened and flavored, and which provides a perfect and delectable way to administer the most important and valuable food known."

NEW DAIRY PLANT.

The I. N. Hagan Ice Cream Co., Connellsville, Pa., has opened a new and entirely modern dairy plant on West Crawford Ave., and will operate it under the firm style of The Hagan Dairy Co. Milk, cream and buttermilk will be sold to both the retail and wholesale trade, and all products will be pasteurized before being offered to the consumer.

All the equipment is reported to be of the latest design, and includes a pasteurizer, filter, coooler, bottling machine, bottle washer and sterilizer, and adequate machinery for keeping milk and cream in fresh and sanitary condition after bottling.

A laboratory has been equipped by the company, where a chemist will test all milk and cream for butterfat content and bacteria count. Officials of the Hagan Dairy Co. report that it is their intention to put out the highest grade of milk and cream possible. Albert Rose, who has taken up special work in dairy management at the State College, will be manager of the plant.



TO DOUBLE CAPACITY.

The capacity of the South Utilities Company ice cream division at Miami, Fla., will be virtually doubled, when this company makes improvements throughout its entire plant on N. Miami Ave. at Sixth St., improvements to cost in the neighborhood of $150,000, according to announcement by C. F. Rhodes, manager of the Miami plant. He further states that the increased capacity is made necessary by the increase in business, which is keeping pace with the progress of the city. The ice cream department will increase its capacity from 500 gallons to 1,000 gallons daily, and the present ice making equipment capacity will be increased from 200 tons to 350 tons a day.

KANSAS PLANT OPENED.

Announcement has reached us of the opening of the new building recently constructed for the Osage Ice and Ice Cream Co. of Osage Kans. The building is 42 by 75 feet and is constructed of inter-locking tile. The capacity of the plant is 12 tons of ice, 1,000 pounds of butter and 200 gallons of ice cream daily. Refrigerating equipment has been installed and Cherry and Creamery Package equipment is in operation, including a viscolizer.

The building is fireproof, having a six-inch concrete floor throughout and steel sash. Frank M. Angus, manager, and Mr. Henny, who is also connected with the plant, were formerly with the York Mfg. Co.

Charming!

June-- the month of flowers and romance-- is also when the deliciousness of HUDSON'S Ice Cream Flavors are as charming as the Senor's seranade.

This delightful flavor appeal will make your ice cream outstanding among consumers, and they never fail to attract business to your dealer stations.

Aside from their sales promoting qualities, HUDSON'S flavors are most economical because they go farther and do not freeze out. These claims are based on 37 years of specialized experience.

Proper Care of Battery Charging Adds to Electric Truck Efficiency

Charging Equipment Has Been Standardized, Thus Eliminating the Need for a Trained Electrical Engineer

By C. H. KAENTJI*

MUCH has been said of the value of electric trucks for certain classes of work—the best applications being in connection with city delivery. In traffic tie-ups, when unloading or picking up at many points, the electric truck shows the advantage. There is no inclination to continue to let the engine run—when the stop is made the current is shut off and yet the driver is not called on to do any manual work to start up again. When the controller handle is thrown to the "off" position the electric motor simply stops running and remains idle, using up no current until a start is made.

Aside from the proper lubrication and general maintenance of electric trucks there is no other part that influences so greatly the operating efficiency on the batteries. They are the source of power—the power generating plant.

Naturally this plant must be kept in condition to supply power to the motor on demand, and to do this, proper care must be exercised not only in the regularity of charging but in the method of charging as well.

Part of the credit for the satisfactory service of electric trucks in many kinds of delivery service is due to the development of automatic battery charging equipment—which eliminates the need for a trained electrical engineer to supervise the charging.

Today, it is possible to run the ice cream truck into the garage, attach it by plug to the charging outlet (like attaching a vacuum cleaner in the home) and return the next morning to find the battery with full charge ready for work. Automatic means are provided to cut off the battery when its voltage has reached the full value—and if the power supply is cut off at any time unintentionally, the batttery will again be connected when the power is "on" without need for an attendant to reconnect it.

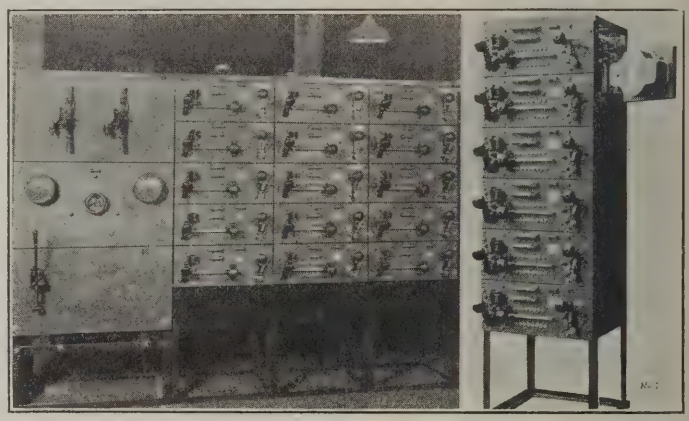

Fig. No. 1 Fig. No. 2

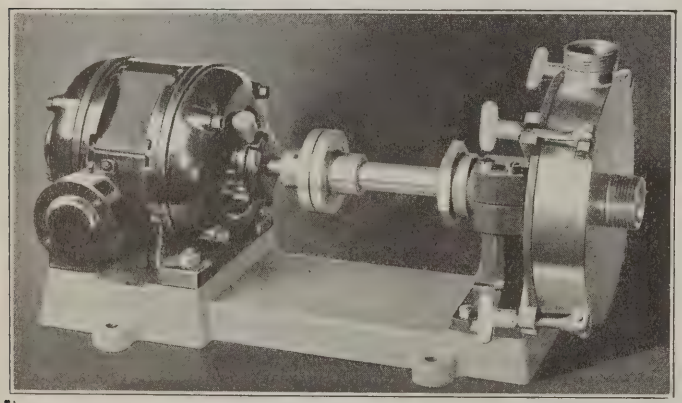
Charging equipment such as is used in hundreds of electric garages all over the country has been standardized so that units for any number of trucks can be assembled and augmented as more trucks are added to the plant.



The panel shown in figure No. 1 shows a group of six standard charging rheostats, one for each of the six charging circuits. If only three are required the lower three sections or rheostats are not supplied—but are added one at a time or otherwise when the number of charging circuits required increases. Likewise, additional panels can be installed side by side.

Each sectional rheostat is complete in itself, the meter on the bracket, however, serving to show the volts or amperes for any circuit desired. When a truck is plugged in on any circuit the bull's eye lamp on the rheostat in circuit is illuminated.

Where alternating current only is available a motor-generator set is used, on alternating current motor driving a direct current generator and in this case it is customary to mount the motor-generator control on a panel alongside the charging rheostat as in illustration 2. This panel, shown at the left, carries a starter operated from the front of the panel (see handle at lower left hand corner), circuit breakers, voltmeter, ammeter and field regulator, the round handle of which is shown in the center and which is used to adjust the voltage of the generator to the proper value—usually 110 volts.

The illustration shown accompanying this article are typical of modern apparatus designed for electric truck charging.

The GAULIN and the ROLLS-ROYCE

"They Never Wear Out"

THE Rolls-Royce Automobile and the Gaulin Homogenizer are similar with respect to their individuality and durability. Each is so sturdily built, and the material and mechanical workmanship entering into their construction is of such character, that "they never wear out."

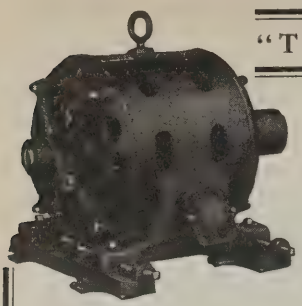
The Rolls-Royce is never found in the used market, ***and just so with the Gaulin.***

You will find, however, some makes of used homogenizers on the market which can be bought at very low prices — discarded by the user because they have not ***stood the test.*** Instead of making a poor investment in one of these machines, buy a Gaulin, which is guaranteed to stand the ***"test of years"***— it will save you many times the difference in cost and you will never have to discard it.

Gaulin Homogenizer
Type 400, Motor Driven
Equipped with
2-Stage Valve
Patent applied for

The Gaulin is the only homogenizer on the market today equipped with a 2-Stage Valve, which guarantees you a more uniform and superior quality product than any other homogenizing device manufactured.

"Only Gaulin can build a Gaulin"



For 15 years Manton-Gaulin Manufacturing Co. have specialized exclusively in the manufacture of emulsifying machinery, and unquestionably, today, the GAULIN leads the field.

"They Keep a-Running"

7½ H.P. Century Repulsion-Start Induction Single Phase Motor.

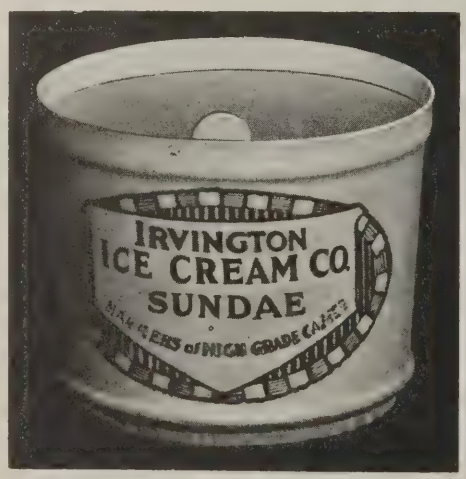
They Develop Heavy Starting Torque

The heavy starting torque developed by Century Repulsion-Start Induction Single Phase Motors renders them especially desirable for the operation of refrigerating machines, crushers, mixers, pumps, heat regulators, sewerage disposal equipment, garage air compressors and also other similar apparatus usually employing automatic or remote control.

The low starting current requirements of this motor—not in excess of 245% of full load current—permits the use of any standard single throw switch for starting. A fuse which will protect the motor while running and carrying its load, is usually of ample capacity for starting due to the low starting current and quick acceleration.

The new Century Wool-Yarn System of Lubrication can now be furnished in all Century RS Motors of fractional horse power sizes.

Built in all standard sizes from ⅛ to 40 horse power---temperature rise not more than 40 deg. Centigrade.



Send For Bulletin No. 29.

Bulletin No. 29 describes all superior features of Century Repulsion-Start Induction Single Phase Motors---a copy will be mailed to you on request.

EDUCATIONAL PUBLICITY AND THE ICE CREAM INDUSTRY.

(Continued from page 14)

of ice cream; in fact, last year there was a decrease of over nine millions of gallons in spite of an increase in population of two and one-half millions.

Has our advertising been effective or has our product lost its appeal? May not the answer be that we have reached the saturation point of selling ice cream on its cool, refreshing, palatable qualities?

The fact, as evidenced in the press and daily conversations, that people in general have little, if any, knowledge of the scope of the ice cream industry or of the constituents of ice cream and its value as a food proves that ice cream has not been sold on its value as a food.

We will all agree, I believe, that we will not get maximum consumption of ice cream until we can overcome the prejudice and ignorance regarding the manufacture and consumption of ice cream and get firmly fixed in the public mind the truth about ice cream as a health food.

The two facts, which we desire to get the people to accept, are:

1. That the commercial manufacture of ice cream has long since been lifted out of the cellar, that the manufacture of ice cream has passed the stage of the home industry, that today commercial ice cream is made in well equipped sanitary factories, that commercial ice cream is made according to standard practices based upon scientific facts, and that practically every state in the Union has laws governing the products from which ice cream is made.
2. That ice cream is milk in concentrated form and that it is a health food.

There are two general ideas that lend themselves admirably to co-operative national publicity and advertising. Co-operative national advertising is not new; the American public today is quite familiar with this type of advertising and, consciously or unconsciously, places the industry which advertises nationally on a higher plane.

WE HAVE a real story to tell about the ice cream industry and ice cream as a health food which will not only lift the ice cream industry to a higher plane in the public estimation but it will raise the standards of the men in the industry as each manufacturer will be impressed by the magnitude and importance of the industry in which he is engaged and try to live up to his responsibilities and the things the industry says of itself.

Over 200 ice cream manufacturers appreciate the advantage to the industry of co-operative national publicity and advertising and have signed pledges for the advertising campaign of one-half cent per gallon. In view of the fact that every manufacturer spends several times that amount for local competitive advertising, one-half cent per gallon is a mighty small price to pay if by such expenditure we can raise the industry in the public estimation, dispel the misconceptions which exist regarding ice cream, acquaint the public with its health-giving qualities as a food, increase the confidence of the public in our industry and its product thereby increasing its sales.

During the last few years, nearly 70 associations have successfully carried on co-operative national advertising. Probably not one of them had in their product the appeal and so many splendid qualities to bring to the attention of the public as is found in ice cream. In every instance, where individual members tied up their local

SALES OFFICES
487 ORANGE STREET NEWARK, N. J.

advertising with the national campaign, the results were especially favorable.

A manufacturer, who expects to spend a certain amount of money on local advertising, can increase the value of his local advertising by tying it up with the co-operative national advertising campaign and in this way not only make for the effectiveness of his local advertising but he can help to lift the industry to a place in the estimation of the public where it properly belongs.

KEEP in mind this thought, the additional gallonage which will come from co-operative activities of this kind comes from the same stops you are serving today and, therefore, will be more profitable than additional gallonage from new stops.

The question still is unanswered, "How long will it take to double consumption of ice cream?" That is entirely up to you. We can go along as we have for several years and double the consumption when the population is twice what it is today or we can, by working together, do it in approximately five years.

ICE CREAM WEEK SET FOR WISCONSIN.

(Continued from page 26)

"This will be one of the best years for dairying of many years," Prof. C. E. Lee, head of the butter division, told the club at the May meeting, when the dairy week movement was launched. "Good cows, good dairymen and good dairy products will keep he tdairy industries on the map."

"We shall make every effort to have appropriate ice cream window displays in Wisconsin retailers' windows," stated George Mansfield, head of the ice cream division.

Plans for the membership campaign were outlined at a meeting of the divisional chairmen at the City Club on May 14, with Mrs. C. E. Hatch presiding.

Important developments are expected at the June 11 meeting. Wisconsin ice cream men are expected to attend and take steps to keep ice cream in the limelight during dairy week.

HOVEY DENIES MERGER REPORT.

Absolute denial was issued by Vernon F. Hovey concerning the reputed merger of some eight New York ice cream companies to form the largest ice cream corporation ever organized. Mr. Hovey, president of the National Association of Ice Cream Manufacturers, and head of the Albany Ice Cream Co. and the International Ice Cream Co., was reported as the principal figure in the plan.

Mr. Hovey states that such a deal had not even been contemplated by his companies.

A. M. LeMessurier, secretary-manager of the Syracuse Ice Cream Co., Syracuse, N. Y., also issued a denial to the statement that his company was involved in the merger. Stephen F. Dennis, president of the company, stated that while there had been some talk of the project last year, he had heard nothing of it since.

STUDENTS VISIT PLANT.

Students of the home economics department of the high school at Chillicothe, Mo., visited the local plant of the Brownfield & Bird Co. The students were escorted through the different departments of the company and special attention was given to the making of ice cream. The students were deeply impressed by the sanitary conditions prevailing.

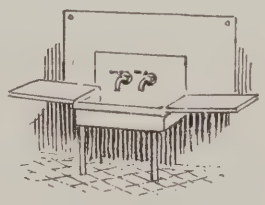
for that sheet metal job

Use Monel Metal and your telephone

A CALL on the telephone will settle the question of how you can best protect the bottom of a swinging door, the wall back of the sink, or the top of a table.

For your sheet metal worker knows how to protect such places. He knows too, that Monel Metal is the ideal metal for such uses.

He knows that Monel Metal:

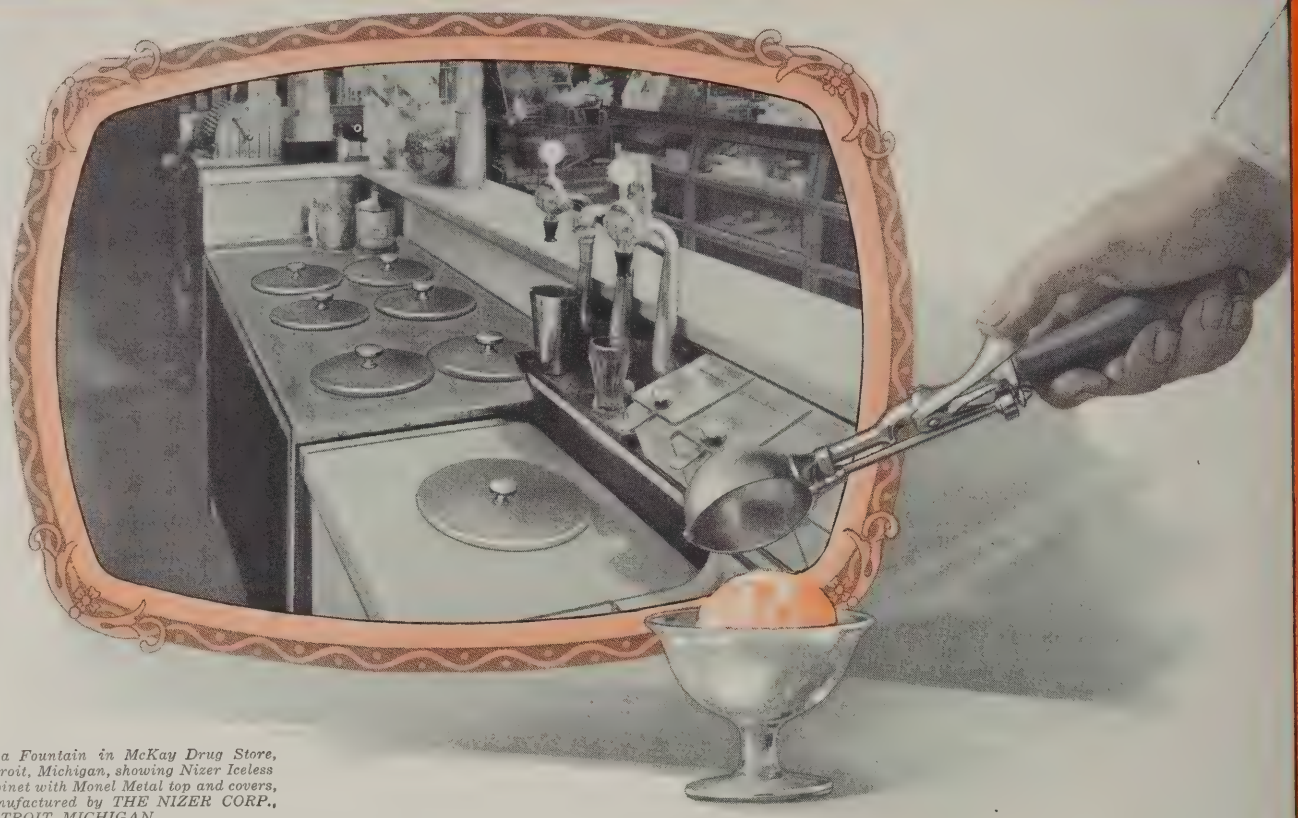


—won't rust
—resists corrosion
—is strong as steel
—is easily kept bright and spotless
—is long-wearing and economical.

Monel Metal is available in the form of rods, sheets, wire, strip, etc., and can be fabricated into any desired form—it can be cast, forged, drawn, machined, welded, etc.

Monel Metal has such a wide variety of uses that there is not space here to list them all. But below we have mentioned a few of the common uses—many of which you will recognize as fitting in with your immediate needs.

Why not get in touch with your local sheet metal worker now and let him tell you how inexpensive—in the long run—it will be to use Monel Metal where you need it most. Or let us send you booklets and folders which will give you full information about this all-around metal.



Some typical uses of Monel Metal

Drain board tops	Flashings	Hoods	Strainers	Splash plates
Sink linings	Skylights	Trim	Troughs	Table tops
Refrigerator linings	Shelving	Roofs	Gutters	Kick plates
Cutting tables				Ventilators
Exhaust ducts				Counter tops

Soda Fountain in McKay Drug Store, Detroit, Michigan, showing Nizer Iceless Cabinet with Monel Metal top and covers, manufactured by THE NIZER CORP., DETROIT, MICHIGAN.

Good-bye salt and ice!

The Nizer cabinet with Monel Metal top has arrived

THERE'S a new slogan of service in the ice cream business—"Iceless Cabinets for Economy." The new automatic ice cream cabinets, produced by The Nizer Corporation, set a new standard in equipment construction.

Simple, reliable, efficient—these modern-day cabinets eliminate the bother and mussiness of old style equipment, and at the same time provide a way of keeping ice cream at just the proper temperature.

All Nizer Iceless Ice Cream cabinets are provided with Monel Metal tops and covers. Before choosing Monel Metal for this use, Nizer engineers spent years experimenting and testing different materials. Their adoption of Monel Metal for these important parts followed their finding that it always looks clean and attractive—it is easy to clean—it resists corrosion and will not rust—it has the strength of steel and endures rough usage.

Monel Metal has long been recognized as ideal for food service equipment. Its adoption by The Nizer Corporation is just one more step towards its universal adoption for soda fountain equipment.

Get all the facts about Monel Metal—and how YOU can use it. *Write today.*

MANY PEOPLE, BECAUSE OF HARMFUL ADVERTISING, DO NOT KNOW WHAT ICE CREAM IS, DECLARES WESTERNER.

THERE are two kinds of educative advertising. One kind is extremely harmful and should not be allowed a place in the ice cream industry. The advertising which influences the public against dairy products of a certain kind, simply to win the public's approval of an individual ice cream manufacturer's own product—this propaganda, in the long run, works great injury to the ice cream industry.

These thoughts were brought out in an address before the California and Southwestern States' and the Pacific Ice Cream Manufacturers' Associations' joint convention by Sam Greene, secretary of the California Dairy Council. Mr. Greene believes that a large amount of regular commercial advertising is harmful. He said:

"I saw advertisements in our papers right here in Oakland within the last four days saying, 'Don't drink milk, three more dairies were refused admittance to Oakland because the milk was so bad,' and then went on to say, 'But go ahead and drink our milk.' That is the worst kind of that sort of commercial advertising. The less harmful kind but a kind which returns the least amount of benefit for money and energy expended is the kind which attempts to center the attention of the consumer upon the product of that individual person or concern that is putting that product out, and that lays certain claims for the merits of his goods that he will not concede to others. You all have seen these advertisements: 'If you are searching for the best, try ours,' 'We originate, others profit,' and various advertisements of that kind. Another one is 'Our brand ends the quest for the best.' There is mighty little return for that, mighty little return for the money expended in that direction, because everybody knows that that is a partisan claim. We all know that industries that employ scientists to do research work for them to ascertain truth or part truth, do not get the reception from the public for the findings of these scientists. They are not received by the public with the confidence and with the full, whole-hearted belief with which the public accepts the findings of scientists that are not beholden to the particular industry whose goods they may be working upon."

Very few people really know what ice cream is, Mr. Greene asserted. He pointed out that even yet ice cream is regarded as a soda fountain confection, much in the same manner as people look upon ginger ale. He pointed out that very few women ever serve ice cream at noon, and added that if they knew what ice cream is a lot of them would serve it in the middle of the day.

But what are the ice cream manufacturers going to do to correct this situation? Mr. Greene continued:

"Maybe some of you are attempting to carry on the work of teaching the people what ice cream really is. I have an idea that a few ice cream manufacturers could stand up before a group of housewives and mothers and discuss the components of their product and keep within the limits of scientific facts and tell them just exactly what that ice cream was made of and what these different components were, why the human system needs them and what benefit they are; I suppose a few ice cream manufacturers could do that but I will gamble that far less than fifty per cent of you can do that. You do not know yourselves what your stuff is, and that is no discredit to you because you have been engaged with the other phases of the work, but the fact is you have not informed yourselves. How many of you can tell what the protein of ice cream is and why it is a better protein than the protein of beefsteak? How many of you can tell me what advice you should give when urging people to use more ice cream? How many of you know that? Not very many."

CUBA WANTS DAIRY MACHINERY.

On a letterhead of the Cuba Railway Company comes a request for information on American machinery and supplies for the manufacture of ice cream. Our correspondent states that Wallace Ward, Admor. Hoteles y C.D., Camaguey, Cuba, is contemplating establishing an ice cream factory in connection with one of his hotels.

two ways to learn

1. By making Your Own Mistakes — this costs money and wastes time.
2. By profiting from the Experience of Others.

The second way is easier, quicker, costs you nothing. We ask you to profit by our 35 years experience in the manufacture and use of Vanillas, Flavors, Compounds and Synthetics. While anybody can *sell* you these things, very few can offer you at any price the knowledge we offer you free! It pays to deal with people who know their business. If it's a flavoring problem, ask us.

THE QUESTION MARK IN ICE CREAM ADVERTISING.

(Continued from page 30)

would take on a new role, our appeal would be entirely different. But ice cream sells at one price, or rather it should, and usually does. Therefore, the price can never be mentioned, and we must seek for some form of interpretation that will sell the product in preference to all competitors. This is a real job, but if intelligently worked out will bring results.

The hackneyed expressions, "superior quality," "richer flavor," "velvety smoothness," etc., will not do it because such copy is just as good for your competitor as it is for you. The best way to demonstrate these qualities is to give little personal glimpses into the inside of your business and if you have some talking point which your competitor does not have, tell the public about it. If, for instance, you use fresh fruit in your fruit flavored ice cream instead of the preserved variety, that is a strong talking point. If your chocolate flavoring is of better grade, talk it up. Don't slam a competitor. Tell what goes to make up your ingredients, let him tell his story. The public will be the judge. **Abusive tactics are not to be thought of. Constructive tactics alone will bring results.**

I WOULD rather spend four times as much and tell my story in color than spend less and talk in black and white. How do the Swifts sell sugar-cured hams? By showing pictures of a ham that makes your mouth water. The Swifts wouldn't spend large amounts of money on displaying true-to-life likenesses of their product unless it paid. And the same thing can be applied to ice cream advertising as well. If you are using newspaper copy you are limited to black and white, but that is no reason why you cannot illustrate a tempting dish of ice cream and show your carton. In your display material you can show with exact likeness your ice cream in natural color.

Always think in terms of eye-minded appeal and make every piece of copy or literature, every poster and display card carry out that idea. Color can be employed as a resourceful aid in all your advertising. Use it plentifully. Fewer words and more color is an axiom that could well be used by every resourceful ice cream advertiser, for color will tell your story where copy fails.

This question has been asked of the writer so repeatedly that it bears some genuine consideration. Every advertiser has a little different idea, but each finally ends up by saying that ice cream advertising cannot bear too much of the burden of the business. This is true, for, like all highly perishable commodities, ice cream depends more upon large volume for profits than a large margin of profit on each individual sale. An appropriation for ice cream advertising based on one or one and one-half per cent of the gross revenue is about right. The percentage of an appropriation varies with the age of the company, a younger concern being compelled to spend a larger amount to put its name on the market than an old established business which is well known.

THERE is a limit above which ice cream advertising becomes unprofitable, in the sense of the word that it no longer pays its own way. No advertising campaign can long be a success if it does not prove self-supporting. Therefore, you must figure your appropriation percentage high enough and low enough to fall within the profitable limits of your business.

Some concerns spend much more than one and one-half per cent for advertising, but their margin of profit on each sale is higher and they do not deal in a highly perishable commodity. If you want any comparative appropriation figures go to food products manufacturers, not to manufacturers of non-perishable goods.

If advertising won't pay for itself then what other department wants the extra burden of paying its way? An unprofitable advertising campaign usually ends up by being bolstered to the sales department. Yes, advertising should pay for itself and make a profit for the business as well.

But can a new advertising campaign prove profitable right from the outset, or must you limp along for awhile until it gets under way? My answer to this would be, that if the campaign is carried out persistently it should begin paying dividends within four to six months.

I am speaking now of the concern just starting to advertise, for many people get the idea that advertising will bring immediate results. Such cases are few and far between. Usually immediate results end up with a weak finish which is worse than no advertising at all. Get the idea firmly fixed in your mind that you will stick to a constructive program and then make small deviations in your schedule to meet unforseen conditions.

GIVE your advertising man a chance. A manufacturer will not think of trying to approve every detail of his business yet, in many cases, the advertising man is continually harassed by interference from those higher in authority. An advertising man is supposed to know advertising, and if allowed to proceed without interference will produce the best results. If an advertising man is compelled to have every piece of copy or every idea picked to pieces before he is allowed to pro-

ceed, it soon stunts his creative ability and makes him fearful of results.

Put your advertising man on the same basis as a doctor or lawyer, a man who specializes on one subject only and is supposed to know which is the best way to proceed. If you have any confidence in his ability, give him a free rein and tell him that he is responsible for results, no matter how attained, so long as they fall within the bounds of the general policy of the concern. A man working under such conditions is placed on his own resources, and if he is any good at all will produce maximum results.

The best piece of copy can always be improved. So can the best processing method, or the best bookkeeping system. If you lend your co-operation to the advertising man by telling him to go ahead and then give a constructive suggestion here and there, you will get the best results.

If there is one thing above all others that will take the enthusiasm out of an advertising man's job it is to have his pet campaign shelved until all the directors of the concern have had an opportunity to pull it to pieces. After such a procedure the campaign, much delayed, will usually run pretty much as originally outlined.

I AM a great believer in analyzing an advertising problem until you are sure it is sound and then going fast. The best campaigns are the ones which move rapidly when once started. No general ever won a decisive battle by starting his army forward and then halting it in the face of fire, while his contemporaries deliberated as to whether he was following out the best battle formation.

Give your advertising man a chance; don't put a straight-jacket on his ability and hand-cuff his enthusiasm. For if you do there will always be a question mark in your advertising and you will vacillate from hot to cold, with the result that your advertising effort will not bring the maximum results with a minimum amount of labor and cost.

INTERNATIONAL DAIRY FEDERATION.

Word is received from the secretary of the International Dairy Federation, Brussels, Belgium, that plans for the International Dairy Congress, which have been announced for Paris in September, 1925, have been delayed because the French Government has as yet not acted on its budget. The program, it is suggested, will "discuss milk, subdivided into two sections, raw milk and homogenized and sterilized." They suggest other subjects may be offered.

The secretary of the international federation also reports that a delegation of the "English committee" and of the English Ministry of Agriculture have asked the co-operation of the International Dairy Federation for an International Dairy Congress to be held in London and Reading during July, 1928. Reading is the location of the principal dairy research laboratories, the director and the chemist of which were in attendance at the World's Dairy Congress in this country in 1923. During July, 1928, the great annual show of the Royal Society of Agriculture of England will be held in Reading. This should prove to be an attractive date for those interested in dairy progress to visit Europe.

The time is far enough ahead so that plans may be made which should result in a large attendance.

Make This Test at Our Expense

Place a trial order. Use all you can to give it a full, fair trial. If MICHAEL'S Mexican Vanilla Bean, Vanillin and Sugar Pulverized does not produce the finest vanilla ice-cream you ever tasted, return the remainder at our expense, and we will cancel the charge. DO this, by all means.

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

Selling Both Ice Cream and Service

California Manufacturers' Cost Sheet Shows That the Total Delivery and Service Charge Necessary to Distribute Ice Cream Amounts to 60 Per Cent of Manufacturers' Cost

THE question has been asked from time to time, "Are we selling ice cream or service?" This problem has become more acute in late years. There was an interesting discussion on this by J. M. Bonner at the first California and Pacific joint convention. As for the first part of the matter, there is no question but that we are selling ice cream to the dealers for a fixed price, and Mr. Bonner also thinks it is obvious that we are selling service.

Profiting from past experience, Mr. Bonner's company, more than a year ago, established a service charge of $1.00 a cabinet per week for all customers selling between 20 and 30 gallons a month, this to spur dealers on to sell a gallon a day to escape the service charge. The result was the company reduced its ice consumption from 48 pounds to 38 pounds a gallon.

BONNER has concluded that ice cream manufacturers can sell both ice cream and service if they make a survey of the type of customers that are being served and ascertain the percentage of unprofitable stops on the books, and after this survey reduce the number of stops, truck and driver expense, which will result in greater profit to the manufacturer's business.

He pointed out that with dealers purchasing large gallonage, where requirements average as low as 12, 15 or 20 pounds of ice per gallon of cream, there is no great problem involved, but—

"* * * There are various classes of small dealers who do require our utmost consideration before extending service to them, and there is a problem involved in such cases. On the first warm day in spring, prospective customers will phone in from every direction, due to the neighbor's boy coming into the store and making inquiry for a cone or two, and the dealer concludes that he should put in ice cream to meet the requirements of his neighborhood, and an experienced ice cream salesman should then be able to make an intelligent survey of the field and determine if there is a chance for a stop to operate profitably in that neighborhood. Often times, this is not easy to determine, and every ice cream salesman will, at times, make a mistake in this matter of a stop that might look unprofitable, which might later on be found to be purchasing large gallonage from the other fellow.

"It would appear from an analysis of the usual cost sheet, that the total 'Delivery' and 'Service Charge' necessary in the distribution of our product amounts to at least 60 per cent of the manufactured cost of the product sold, a very large item and one that must be included in the total selling price.

"It is a very common occurrence to find a customer who sells 18 to 20 gallons a month, asking for four, five and six flavors in addition to a brick cabinet. In such cases one will find cream on hand for ten, twelve, fifteen and even twenty days in the cabinet of the customer before being sold; and in such cases, the manufacturer cannot possibly be given credit for a good article, nor get desired advertising value out of the sale of such a stale product when it fails to satisfy or please the ultimate consumer."

The speaker was sure it would be cheaper for such a man to come to the ice cream manufacturer's plant and get his ice cream free of charge, for—

"All small dealers are not in this class, and many realize that in the winter they cannot sell sufficient to make it profitable to the manufacturer, and this type will call up and ask to discontinue service, and they do us a favor when they do so. In this connection it is pertinent to state that in some districts other than the central congested districts of the city, there are too many ice cream stops, and the trucks of every manufacturer go to the same block four or five miles distant from the plant, when a single delivery in such districts would be sufficient to take care of the total ice cream requirements of those living in the immediate vicinity, and duplicate delivery expense would be avoided."

AND it is not always the dealer to blame for this condition, it was pointed out by the speaker, who believes the ice cream manufacturers have brought about such conditions through earlier competition, which led

They *Must* be Right

With over 350 users now operating the Northwestern Cutting and Dipping Machines together with the Northwestern Bar Cabinet they must be right or the users wouldn't reorder and increase in numbers.

The reorders prove that this combination is right and its use and product profitable. The increased number of users proves the growing interest in the product it makes.

Full details on how these users make a profit on the 5c pie is yours for the asking.

NORTHWESTERN CORPORATION
MORRIS - ILLINOIS

the dealers to look for much more service than that to which they are entitled.

He thinks it would do every manufacturer good to look into this situation, saying:

"If the manufacturer will provide an extra column on the sales sheet for the amount of ice delivered to each stop, some amazing bits of information will be obtained by the office, and you will ascertain how many stops you have, to whom you are giving ice cream for nothing, when you consider the service, ice and salt that goes with small gallonage. Ordinarily under general practice, the driver takes 10, 12 and 14 blocks of crushed ice, and seven or eight hundred pounds of salt every morning, and he returns and is reloaded in a similar way for the next day, without any record whatever being made of the disposition of his 10, 12 or 14 blocks of ice; but if you will itemize the amount of ice delivered to each stop, you will be astonished at the amount of ice necessary to take care of the smaller, unprofitable customers.

"Last year, upon checking up our customers' gallonage and the amount of ice used by each, we found certain customers using as high as 144 pounds of ice for each gallon of ice cream purchased from us. Probably much of this ice was used for milk boxes, ice boxes or root beer barrels; in some cases our ice was keeping cool all the soft drinks kept by the customer, the soft drink manufacturer furnishing no ice whatever. On November 1, 1923, after careful investigation, we arranged to discontinue service to seventy-one customers whom we considered to be wholly unprofitable to our company as they were ice customers to a large degree. In this connection I might state that in our experience, it is the most difficult thing a salesman is called upon to do, to eliminate, in a friendly way, unprofitable customers at the close of the season, so that in case it is desired, the salesman can go back to this customer in the spring and renew his relations. Many times the driver, when sales run low, can suggest to the customer that 'as many other customers are deciding to discontinue for the winter, we presume you will be doing so very soon,' and by the time this propaganda is broadcasted three or four times, the customer often suggests to the driver that we send out and pick up the cabinet. If the company can succeed in getting the customer to suggest this procedure, it leaves the situation in a more friendly light than if the company deliberately shuts down on his service and arbitrarily cuts him off during the winter season. Indeed it might so happen that one of these customers, so abandoned during the winter, might one day become the owner and possessor of a real stop which we might be able to secure if we had not been ruthless and arbitrary in cutting him off at a time when we deemed him and his business unprofitable."

CUMBERLAND MANUFACTURERS SEE INCREASE IN BUSINESS.

The Cumberland Ice Cream Manufacturers' Association held its regular bi-monthly meeting at the Masonic Club, Harlan, Ky., April 16.

The attending manufacturers were entertained at the Kiwanis Club luncheon by the officers of the Harlan Ice & Refrigerating Co. of which H. R. Smith and E. A. Whitcomb are manager and treasurer respectively. Further entertainment included automobile tours in and about the city.

Discussion of general business conditions, of which coal mining is the barometer in southeastern Kentucky, indicated that the manufacturers were anticipating a decided increase in their business during the coming season.

The raw milk supply of this part of the state was considered, also the possibilities of increasing milk consumption by providing an adequate supply and its proper distribution.

It is probable that several ice cream manufacturers in this section will annex a milk distributing department to their business.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in "The Ice Cream Review."

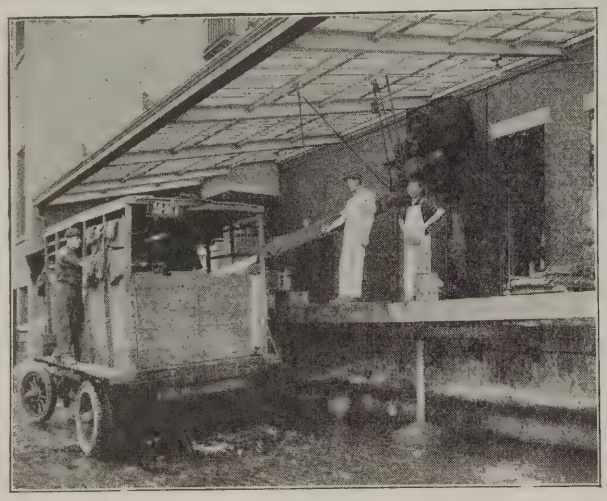
"My Territory is Limited"

You have heard that remark frequently. Yet, the story is told of a farmer in South Dakota who is awakened by the alarm of a Connecticut clock, puts on a suit of Racine-made underwear, and Milwaukee socks, buttons his Chicago suspenders to a pair of Oshkosh overalls, and sets his feet in shoes made in Massachusetts. He washes his face in a Pittsburgh basin, using Cincinnati soap and an Irish linen towel made in Vermont. He draws a Syracuse chair up to a Grand Rapids table, eats a California orange, biscuits made with Minneapolis flour, some Kansas City bacon, and a Battle Creek cereal, on New Jersey dishes, with Connecticut silverware.

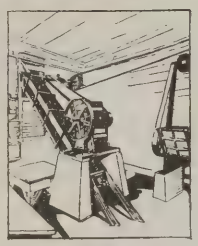
After a hard morning with a tractor made in Ohio, and a plow made in Illinois, he returns to his Chicago meat, Hoboken tea, Maine potatoes, cooked on a Kalamazoo stove, burning Pennsylvania coal, and finishes his meal with a dish of ice cream flavored with Mexican vanilla and sweetened with Louisiana cane sugar.

After lunch he puts on a Philadelphia hat, puts an Indiana harness on his Missouri mule that is fed on Iowa corn and hitches up to an Illinois plow. In the evening, after tuning in on Denver music with his New York radio, he crawls under an Oregon blanket and is kept awake by a South Dakota dog, the only home product on the place.

This farmer's life is surrounded by articles made in practically every state in the Union. Was the territory for these different products limited?



We visit an ice cream factory, anywhere between Newfoundland and Lower California, and we find the milk and cream delivered by a Michigan truck in a New York tank or Ohio can. It is placed in a Cincinnati weigh tank, weighed on a Toledo scale, delivered through a Kenosha sanitary pipe to a Cedar Rapids pasteurizer, forced by a Cedar Falls pump to a Louisville holder.



Before the milk has completed its dizzy whirl through the factory and found a cool place of temporary rest behind a Hagerstown door it passes through a Chicago mixer, a Boston homogenizer, is aged in a Cleveland tank, frozen in a New York freezer, driven by a Michigan motor till the yield, as indicated by a Chicago overrun tester, has reached the required point. The cream is cooled in a Philadelphia can, lined with a Pontiac liner and covered with Kalamazoo parchment. It is hauled on a Faribault truck to a hardening room designed and insulated by Pittsburgh engineers, and cooled with an Omaha machine.

If it happens to be brick ice cream it probably is flavored with Mexican vanilla and Providence coffee, or Washington or Massachusetts maple flavor. Often we find that California oranges, Hawaiian pineapples, Wisconsin cherries or Central American bananas are added to obtain a greater appetite appeal.

And yet some say, "My territory is limited."

Commissioner Lauds Badger Manufacturers

A tribute to Wisconsin ice cream and the Wisconsin Association of Ice Cream Manufacturers was paid by J. Q. Emery, dairy and food commissioner of the Badger state, in an address before the annual Wisconsin convention. Pointing out that the Wisconsin association, which is of recent origin, "and is timely," the speaker declared in its personnel it has furnished "a leadership that appears to have a vision and an appreciation of the opportunities within the grasp of such a state organization and such an industry," and he then went on to set forth the opinion that, "its members have the wisdom to discern and experience to confirm that the production of genuine ice cream of high quality is as a business proposition and practice greatly to their own interest, as well as to that of the consuming public."

J. Q. EMERY.

Mr. Emery went on to show how the Wisconsin association has taken the initiative in the enactment of laws that will provide for high quality ice cream. The position of the Wisconsin food commissioner is a strong reminder of how far on leading food authorities and so-called experts sometimes can go when they publish newspaper and magazine articles purporting to show that ice cream manufacturers try to dodge constructive legislation. The Ice Cream Review on more than one occasion has called the attention of different misinformed authorities of this kind to the fact that ice cream associations are earnestly interested in promoting legislation that will keep ice cream on a high plane.

Maybe Mr. Emery had some thoughts as these when he declared:

"The legislature of Wisconsin has, by inference at least, recognized the ice cream industry as a part of the great dairy industry of the state and of such importance that it was deemed fitting to define and standardize the product co-ordinately with the definitions and standards of milk, cream, milk fat, butter and cheese.

"I am not here to instruct in the technics of ice cream making. However, your industry is subject to regulation by law. Because of this fact and by invitation of your president, I give consideration to some of the fundamental principles and legal enactments which as laws must affect your industry.

"This raises the question of what is law. Law is a rule of conduct or action which is prescribed or is formally recognized as binding by the supreme governing authorities and is enforced by penalties. The supreme governing authority in Wisconsin is the people of the state of Wisconsin as is shown by the style of the enacting clause in the enactment of law by the legislature: The people of the state of Wisconsin represented in sen-

Double Life from Ice Cream Cans

When the inside surface of your cans is gone their use for delivery becomes questionable.

Not so with the ice cream man who uses the

ALLEN
ONE-PIECE SANITARY
CAN LINER

The consumer never questions the condition of the can when lined with an Allen can liner. The liner is sufficient assurance that the product IS sanitary and it turns the attention away from the condition of the container itself. Thus cans that otherwise would not pass inspection for delivery become O. K. by the use of Allen Can Liners.

The Allen Candy Co.
PONTIAC, ILLINOIS

CERELOSE
Is a Success in Ice Cream

CERELOSE is a pure white refined corn sugar which has been found to be of advantage to ice cream manufacturers for use in conjunction with cane sugar.

CERELOSE enables you to increase the sugar solids without over-sweetening the product. This is accomplished by using up to 33% Cerelose of the total sugar content.

Assuming that the total solids are sufficiently high, it is advisable to cut down the milk solids (minus fat) in proportion to the increase in sugar solids added.

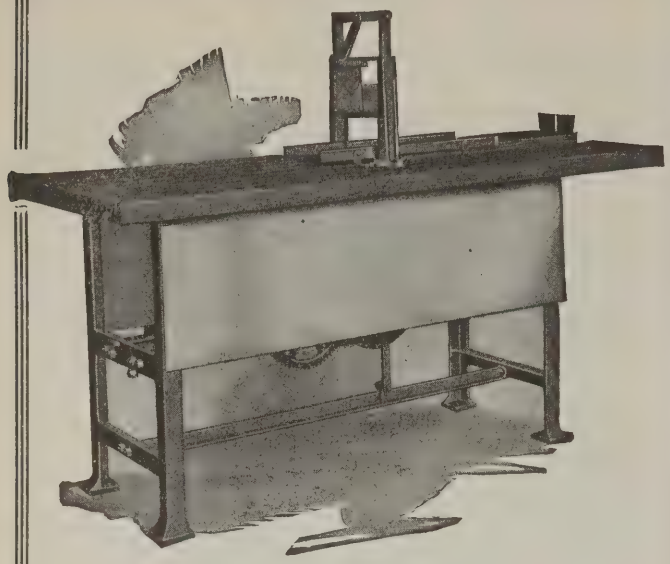
For example:—Replace 500 lbs. of Cane with 400 lbs. of Cane and 200 lbs. of Cerelose.

For further information write

CORN PRODUCTS REFINING COMPANY
17 Battery Place New York City

6 Reasons Why Cerelose is used in the manufacture of ice cream:—

1 — Cerelose emphasizes the richness of the butter fat and develops the natural flavor of the cream in ice cream.



2 — Cerelose is the new solids builder for ice cream. It adds body and weight, improves the texture, and produces smoother cream.

3 — Cerelose is readily soluble and will not crystalize nor form sandy ice cream.

4 — Ice Cream made with Cerelose is more digestible than when made entirely with cane sugar because Cerelose is a dextrose sugar, directly assimilated by the blood. Therefore more ice cream may be consumed particularly among infants and invalids.

5 — Cerelose is considerably cheaper in price per pound than cane sugar.

6 — Cerelose is guaranteed to conform to all Federal and State Pure Food Laws and is recommended by prominent physicians for use in infant feeding.

Motor Driven—Works Automatically

THE NEW ERA
Ice Cream Brick Cutter

Is now equipped with two scale boards that have adjustable scale racks. Each board, with a simple adjustment, will make ten different cuts to the quart, besides cutting quarts and pints.

The feed plate is now equipped with a screw adjustment, making it possible to adjust machine so same will space with unfailing accuracy.

This machine is simple in operation, speedy, accurate, and very durable. It is easy to keep clean and takes up very little space.

The NEW ERA has revolutionized the Brick Ice Cream Industry.

What it's all About

We hear a lot these days about "The Agricultural Situation." The newspapers are full of it. Some politicians lose sleep over it. The President is worried about it, while every man in business or working for another is directly or indirectly affected by it.

It's a subject we ought to all know more about. It's one on which there is a lot said and little truth spoken. But, so all may know in a concise, truthful, yet comprehensive way of what it's all about, two eminent economists, Profs. A. G. Warren, and F. A. Pearson, both of the New York State College of Agriculture — Cornell University, discuss this very essential subject in a new book of 306 pages. The title of this book is "The Agricultural Situation," and $3.00 sent to The Olsen Publishing Co., 5th and Cherry Sts., Milwaukee, Wis., will bring a copy anywhere postpaid. Get a copy and learn the truth of "The Agricultural Situation" and how it affects you.

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

REGARDING SHRINKAGE WHEN ICE CREAM IS DIPPED IN QUART CONTAINERS.

(Continued from page 32)

A still better idea may be obtained from the summary tables. Thus table 5 contains a summary of the weight per quart package and the number of quarts dipped at respective temperatures from 48 gallons of ice cream. Similarly table 6 shows data presented in such a way as to bring out the influence of overrun on shrinkage, while table 7 shows the influence of dipping temperatures on shrinkage.

These two tables present convincing evidence as to the importance of controlling both the per cent of overrun and the dipping temperatures.

Thus an increase in overrun from 78.3 to 99.8 per cent increased the shrinkage in the ice cream from 15.29 to 25.12 per cent, or nearly 10 per cent. Note the shrinkage in this case is expressed in volume of ice cream, a 10 per cent shrinkage, meaning one gallon more shrinkage to every 10 gallons of ice cream. For shrinkage expressed at percentage of overrun, refer to tables 9, 10 and 11. Judging from results obtained, a dipping temperature of about + 2 degrees F. to + 4 per cent F. seems to be the most favorable for maintaining shrinkage at a minimum. The consistency of the ice cream at + 2 degrees F. was medium firm, dipping with comparative ease. The ice cream at + 4 degrees F. was ideal for dipping, but results showed a slightly greater shrinkage than at + 2 degrees F. At — 2 degrees F. the ice cream was too hard to pack and actually required so much packing that it showed a slightly greater shrinkage than at + 2 degrees F. At 12 degrees F. the ice cream was too soft, although ice cream of this consistency is only too frequently dispensed across the counter with corresponding loss.

THE committee's work in this respect agrees with Dr. Ruehe as to influence of dipping temperature on shrinkage, but, on the other hand, our results show that the per cent of overrun also is an important factor in determining the shrinkage when ice cream is dipped. For those interested in interpreting these results in terms of shrinkage in per cent of overrun, tables 9, 10 and 11 tell a real story.

Thus, it is significant to note that while the per cent of overrun in the cans varied from 75 to 100 per cent, the per cent of overrun in quart packages, in only one instance, was above 60 per cent. Thus, while 75 or 80 per cent overrun shows a loss in overrun of about 20 per cent, the 100 per cent overrun ice cream at practically all temperatures, showed a loss of 45 to 50 per cent overrun, as it was dipped into quart pails.

A variation in temperature from + 2 degrees F. to + 12 degrees F. showed an increase in loss of overrun for the higher overrun. However, it is worthy of careful thought and observation that an increase in temperature of from + 2 degrees F. to + 12 degrees F. increased the loss in overrun about 11 per cent, while increase in ovrrun from 80 to 100 per cent resulted in a loss of overrun of 22.50 per cent.

Summary and Conclusions.

1. Sixteen 3-gallon cans of ice cream frozen from the same mix, but varying in per cent of overrun and temperature stored, were dipped by four operators into quart carrying out pails.

2. Carefully checked results, as to weight per quart, show that the same or different operators may vary as much as six ounces, but that the majority check within two or three ounces from each other.

3. The average weight per quart of dipped ice cream, containing between 80 and 90 per cent overrun and of medium firmness, weighs about 23 to 24 ounces.

4. Results indicate that the percentage of overrun is an important factor in determining shrinkage. An increase in per cent of overrun from 80 to 100 per cent caused an increased shrinkage of overrun from 26.74 to 49.23 per cent, or practically 22.5 per cent.

5. Results further tend to show that the temperature at which the ice cream is dipped is another important factor. The ice cream dipped at + 2 degrees F. showed an average loss in overrun of 32.47 per cent, while that dipped at + 12 per cent F. showed a loss of 44.48 per cent, or 10 per cent higher. Expressed in actual shrinkage in volume of ice cream, the + 12 degree F. ice cream shows nearly 6 per cent greater shrinkage.

6. The per cent of overrun on a quart of dipped ice cream seems to average about 50 to 55 per cent, irrespective of what its original overrun was.

7. It is doubtful if the per cent of overrun in the freezer, as determined with an overrun tester, is a true index of actual per cent of overrun in ice cream after the freezer is emptied into three and five gallon cans.

8. Further work is needed to verify results so far obtained and to study other factors, especially as to the influence of composition.

VALENTINE
Frozen Sucker Molds

[Patents Pending U. S. Patent Office]

NOW USED AND INDORSED BY NEARLY ALL LEADING ICE CREAM MANUFACTURERS IN AMERICA

Filling the Valentine mold.

Releasing from molds and wrapping.

$29.50

F. O. B. CHICAGO

NOT one suggestion has ever been received on the Valentine Method for making Frozen Suckers, even though practically all leading ice cream firms in this country are now using Valentine equipment exclusively, and we have from the first urged criticism and suggestions.

The fact is, the method is as near perfection as any mechanical process can be made.

We have published heretofore lists of the more prominent ice cream manufacturers who are using Valentine molds. Firms like Telling, Cleveland; Carry, Washington; Lily, Memphis; Gate City, Atlanta; Hydrox, Chicago, etc. Today this list has expanded until it includes many hundreds of names, among them the very Blue Blood of the Industry.

Why You Can't Go Wrong on Valentine Molds

They are made of best grade acid and rust proof dairy tin and monel metal. Within a space of 30 seconds the mold can be filled, the excess liquid drained off and the mold placed in the brine tank for freezing. It takes less than 15 seconds to defrost the mold and dump the suckers on the wrapping table. The speed, simplicity and uniform excellence of the Valentine operation is unbelievable. Sanitation and cleanliness—complete freedom from mess—are absolute. No syrup can get into and spoil the brine—nor can any brine by any possibility get into the syrup. Note this too; when freezing the tubes are completely submerged—a feat accomplished only by Valentine.

The price of the Valentine Frozen Sucker Mold is only $29.50, F. O. B. Chicago. Terms 2% ten days, net 30 days. One Valentine Special Spill-drain will take care of from one to twenty-five molds. The price is only $8.50. All Valentine equipment is sold under money back guarantee as to quality and performance.

We have enlarged our production, working 24 hours daily and can now ship equipment immediately upon receipt of your order.

Clip the coupon and mail it today.

TRAY-PACK

The 100% Dry Pack Cabinet

(PATENT PENDING)

To service TRAY-PACK, remove trays, carry to street or other suitable place and dump brine, repack at truck, replace trays—that's all—no slop or muss in the dealer's store.

HUNDREDS of TRAY-PACK cabinets now in daily use are proving the truth of our claims for them to the eminent satisfaction of their owners.

The large number of repeat orders and unsolicited expressions of enthusiastic approval which we continue to receive indicate how thoroughly TRAY-PACK fulfills the purpose for which it was built. It fully meets the demand for a cabinet combining the cleanliness of the mechanical unit with the time proven advantages of ice refrigeration—absolute reliability, low investment cost, and minimum cost of upkeep.

Write for free literature describing this remarkable cabinet and the perfect service it makes possible.

WHAT USERS HAVE TO SAY

Coon Ice Cream Co., Inc., Manchester, N. H.

"----We have been very well pleased with the use of the TRAY-PACK Cabinet which we have and regard it as a distinctly forward step in the practice of keeping ice cream----."

The Pleasant Valley Creamery Co., Milton, Pa.

"----Please accept our hearty congratulations on this cabinet, which in our opinion bids fair to displace the iceless in all but shipping accounts."

Auburn Ice Cream Co., Auburn, Wash.

"----The cabinets are sure fine; will hold for 72 hours. We only repack every other day----."

J. J. Becker, Wilkes-Barre, Pa.

"----The cabinets are working in fine shape and we believe the TRAY-PACK will be the cabinet of the future----."

Dewart Milk Products Co., Dewart, Pa.

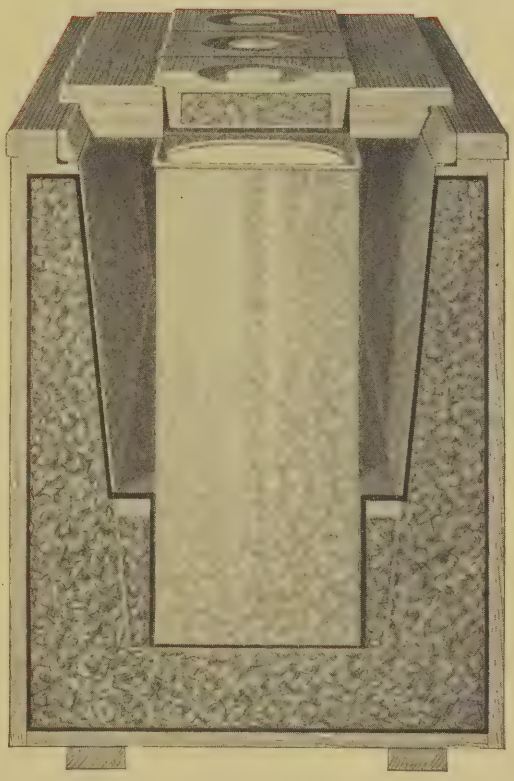
"----We have completed testing the TRAY-PACK Cabinet shipped us and we found this cabinet very satisfactory and we believe will go a long way towards straightening out the present cabinet situation----."

Greenville Dairy Co., Greenville, Pa.

"----This seems to be a wonderful cabinet----."

GRAND RAPIDS

DRY-TANK



[Cabinet Style No. 9]

IN the entire field of ice refrigerated cabinets our DRY-TANK cabinet, with the exception of TRAY-PACK, has no equal. Exhaustive, painstaking, competitive tests has proved this conclusively.

Almost invariably an order for a sample DRY-TANK cabinet is followed by a repeat order and comments such as the following, from M. C. Coppin, Streator, Illinois:—

"----I am in receipt of your cabinet and like it very much. You may ship me by freight as soon as possible five more DRY-TANKS No. 935."

Write for prices and literature describing in detail the many distinct structural and insulating superiorities of this cabinet. Or better still, to completely convince yourself that DRY-TANK offers the soundest possible investment in cabinets of this more or less general type, order a sample case; test it thoroughly; compare it with any the market affords.

WORLD'S LARGEST MANUFACTURERS OF ICE CREAM CABINETS

— — CABINETS — —

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

We Believe in Keeping Abreast With Mechanical Refrigeration, But Not Investing Heavily

By H. H. LITTLEFIELD*

WE HAVE furnished refrigerated cabinets to city customers only, as we do no shipping business. Our routes are all mixed routes and we have noted that a driver can serve a few more stops than was possible when serving customers using ice and salt exclusively.

The cost of power for a refrigerated cabinet varies with the customer. The motor consumes about 300 watts per hour, a four-hole cabinet operates five hours daily, a six-hole cabinet nine hours daily and an eight-hole cabinet fourteen hours daily. With power at five cents per K. W. H., the cost is nine cents daily for a four-hole cabinet, 13½ cents daily for a six-hole cabinet and 21 cents daily for an eight-hole cabinet. Where ten per cent discount is granted, the cost is reduced to 8, 12 and 19 cents respectively. In actual practice we find the cost to average about 2 cents higher than our test figures. This difference is explained by the fact that some dealers use the cabinet for the purpose of refrigerating different food products and drinks, thus increasing the daily operating time of the machine. We have not found the consumption of water to be of consequence. Due to our limited experience we do not feel competent to state what saving this equipment will make possible.

Our cabinets have given very dependable service and have averaged much less than one call each during the season. They have been inspected once during this period. Customers using these cabinets are greatly pleased and prefer them to the ice and salt cabinets on account of their better appearance, greater cleanliness and the fact that they require no attention. Ice cream is kept in perfect condition at all times. This latter is one of the strongest points in favor of the refrigerated cabinets.

WE PAY the operating costs and find that in some cases the dealer imposes on us by refrigerating other food products and freezing ice. We have a seperate meter for each cabinets in all cases. We loan the cabinet free of charge. We have sold no cabinets on any basis. The installation cost runs anywhere from $10.00 to $40.00, depending on different conditions encountered.

Due to the many varying conditions in different cities, we do not feel that any rule as to ownership of cabinets can be applied. In our case we think that we should retain ownership as we can keep the cabinets in servicable condition and realize the possible saving more rapidly. The average dealer would be much more slow to buy and install than the average manufacturer.

THE refrigerated cabinet does meet a part of our service problem, but the full value will not become apparent until we are fully equipped and the dealer

The Influence of the National Dairy Exposition

THERE is no other branch of agriculture into which enters so many factors that are all so completely dependent upon the one thing for their entire existence and success as the dairy industry. Without the cow nothing else matters. Yet each and every factor feels, and has reason to feel, that it is so big and strong that it is willing and ready to assume that its importance rather separates it from any other outgrowth from the same tree, all of which is very good in the general operations affecting the single unit within itself.

But there is much more real feeling of bigness to be found in belonging to a two and a half billion dollar farm value industry than there is to an industry that is 50 per cent or 4 per cent of the whole or what each would get out of a split six or eight ways; and again from union there comes a strength that sort of makes one feel that he can sit in with the big things of the country without being considered small or weak. The thought of being part of a big worth while thing that belongs to the nation's necessities creates a most comfortable and reassuring feeling.

Just to bring this picture of an industry before the whole dairy group was why the National Dairy Exposition was created and it has grown and grown under the generous patronage of those at interest and with it the men themselves that comprise the industry have grown and grown. The annual exposition has stood the test of time and each year grows in standing amongst the most advanced, highly developed expositions of the world. Its influence amongst the breeders of dairy cattle in this and the old world is so marked that the blood of its showyard champions is sought by all constructive breeders. Its influence for better cows upon the farms reaches over the nation and is helping the men of the state colleges and extension service to quicker and more extended results.

Its influence on the milk supply for all of the cities of the country has been such as to give as high a rating to this branch of dairying as accorded to any and all merchandising and other city industries. Its influence in manufacture of all products of milk has been such as to raise the standard of American dairy products universally to a very high plane. And all of this in turn has built up a dairy machinery industry to keep pace with its requirements that is recognized as one of the nation's big industries.

The gathering together once a year of the nation's foremost men in agricultural progress, to view the industry in its forward march, to discuss in convention and in conversation methods for further advancement and the offering of inspiration and encouragement on every hand at this great annual dairy exposition surely makes it one of our nation's most progressive and successful industrial and agricultural expositions.—The National Dairy Exposition News.

The ice cream industry today has established its place firmly among the leading food products and its value as a food and delicacy is constantly spreading throughout the entire country. Improved conditions and care are responsible for this.—From Southern convention address by Ben C. Brown.

The Golden Rule Means Constructive Merchandising

Uneconomic Practices in Ice Cream Industry Will Go as Human and Trade Ethics Develop, Declares Western Manufacturer

IT HAS long been generally recognized in the ice cream industry that the great evil of the average efforts toward merchandising ice cream has been too much thought toward catering to the dealers. Some interesting thoughts in this connection were brought out in an address before the California-Pacific joint convention by K. L. Carver, a member of the Pacific Ice Cream Manufacturers' Association.

Mr. Carver pointed out how constructive merchandising, the same as the term service, has been a by-word with the American merchant manufacturer for the last decade and has been much abused. He added:

K. L. CARVER.

"Many of us conscientiously endeavored to build our business upon the foundation of 'better quality' and 'better service.' No one can question the soundness of the policy of striving to improve quality. In the case of ice cream, popular approval serves as a moderator to prevent the quality being elevated to the point where it becomes a luxury for the classes instead of a food for the masses. But in the matter of service, there seems to be no such outside limiting influence. Our conscience and our pocketbooks are apparently our only guides.

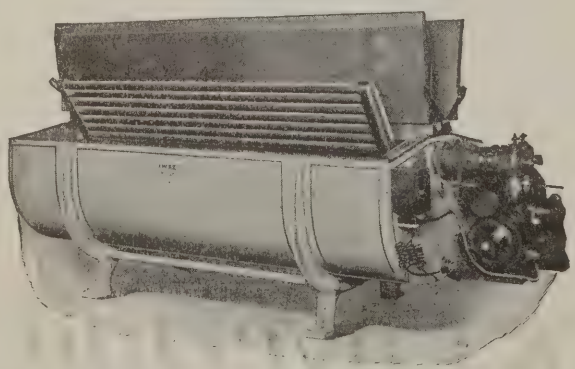
"The tendency is more salesmen, higher-priced salesmen, more deliveries, earlier deliveries, special deliveries, more cabinets, different kinds of cabinets, refrigerated cabinets, more flavors, more ice, more salt, more extravagant advertising, electric signs, more ruinous discounts; in fact, more of almost anything that our dealers insist on—and with it all—lower prices. The inevitable result of manufacturers thus vying with one another to give better service, without proper co-operation or organization, is—too much service.

"Often methods or practices among business houses and individuals have been used so long that they have come to be regarded as standards, while in reality they are but habits or customs or even 'ruts.' A grave is but an exaggerated rut. With us this service rut is getting dangerously deep; to deep to climb out of if we don't watch our step very carefully.

"We have enjoyed our full share of prosperity since the war period. Our margins have been ample—perhaps to the extent of lending some encouragement to over-service and inefficiency. These margins have attracted many newcomers into the ice cream manufacturing field. Under such conditions, truly constructive methods of merchandising our product are imperative—first, to increase the consumption of ice cream so there will be sufficient gallonage to support the many firms engaged in the business; secondly, to determine and stabilize reasonable margins of profit on the same."

AT THIS point he made the observation that constructive merchandising as applied to the ice cream industry is little more than the principle, "Do unto others as you would have others do unto you." He referred to the declaration of President Hovey in an address before the national convention, that ice cream manufacturers "are coming to realize that the dealers and consumers are very important factors in our industry, and that we must pull together for the good of all." Uneconomic practices can but be harmful in the long run, he assured convention delegates.

With regard to exclusive attention to the dealers, Mr. Carver said:



"Too often, in the merchandising of ice cream, the individual manufacturer limits his interest in the retail dealer to an occasional visit of a salesman to take an order; or the gratuitous filling up of ice boxes with cracked ice, or supplying a few highly-colored display cards, or perhaps a sign painted on the side of the store building. This is not a sufficient degree of interest for the manufacturer to show in the retailing of his product. There should be frequent communi-

Minneapolis,
Minnesota.

Gentlemen:-

The four Miller bodies which we are using are giving complete satisfaction and no doubt you will be interested to know that since the first of November we have been icing up the ice cream compartment of these trucks only three times a week and our routine provides for the loading of ice cream and fresh ice in these trucks each afternoon so that when the drivers get on the job in the morning their trucks are all loaded and ready for them to start. We are more than pleased with the results we are getting from these bodies and do not hesitate to recommend them to anyone who is in the market for this type of equipment.

Very truly yours,

BENDFELT ICE CREAM CO.

WHB-LP

President.

The Joseph Miller Company

MINNEAPOLIS, - MINN.

Manufacturers of Refrigerator Bodies and Ice Cream Storage Cabinets—Using Miller Patented Tanks for Refrigerating.

cations by mail direct from the manufacturer to the dealer, with which, from time to time, might well be enclosed practical suggestions on how to sell more ice cream; the importance of cleanliness at the fountain; the importance of adequate advertising display; the importance of courtesy and other suggestions of equal value. It may be said or thought that retail manufacturers will pay little or no attention to these suggestions. Whether they do or do not, is not the point; the point is, that the manufacturer will at least have impressed the dealer with his genuine interest in the latter's daily problems and his desire to be of helpful assistance.

"The next step, and even more important, would be to meet, as an association or by committee, with the various retail dealers' associations, such as the druggists, confectioners and restaurateurs. In Los Angeles, a short time ago, such a meeting was suggested by the druggists' association. Perhaps some of us were starting something that we might not be able to stop. In any event, the meeting never materealized. When something new or unheard of like this is suggested, there are those who are always skeptical and apt to say, 'It can't be done.'

"I am convinced that if we would take these dealer associations into our confidence more often we would be the last ones who would want to stop it."

⚜

NEW SITE SOUGHT.

At the annual meeting of the Garrison Farmers' Cooperative Creamery, Garrison, N. D., a committee was appointed to purchase a site on Main St. for a new creamery building. Work will start promptly and it is expected the plant will be in operation before the coming winter.

The company has met with success in its venture in the creamery business and will now add new lines by including the manufacture of ice cream and other dairy products. Plans are under way to dispose of the old creamery building to be used as a poultry dressing plant.

Officers of the creamery are George Barrow, president; Ben Klinkhammer, vice-president, and Ben Amundson, secretary.

⚜

In years to some I hope you all can retire and reflect upon your business career with the satisfaction that comes with sufficient wealth to keep your latter days as you want to and with the satisfaction that you have given to the industry just as much as you have taken out of it.—From Illinois convention address by Ross H. Woodhull.

SMILES AT YOU.

This truck really seems to follow its company's slogan—"Smiles right back at you."

MANY MANUFACTURERS are profiting by these suggestions!

Just an indication of the wide range of good flavors at your disposal—

VANILLA ISOLATE

A highly concentrated PURE vanilla of delicious flavor made from choicest beans.

VAN VOGUE

A very fine synthetic flavor designed to imitate closely the delicacy of pure vanilla, at a fraction of its present cost.

VANIM

A rich, smooth synthetic concentrate, much like VAN VOGUE but with more pronounced flavor.

CAVAN

A very satisfactory flavor at rock bottom cost. Rich in taste, thoroughly practical—a real aid in meeting close competition.

IF THE unprecedented conditions existing today in the raw vanilla market have disturbed your plans, we have a very valuable service to offer you.

During the past year our laboratories not only have developed two extremely useful new flavors, but have conducted a series of experiments that have proved invaluable in aiding manufacturers to keep their costs down **without materially affecting the character of their products.**

As a result of this intensive work we are unusually well qualified to co-operate with you in working out your immediate flavor problem—**economically.** Write us now; let us help you "get squared away" for the season on vanilla.

.....

Dear Sir:—We are having quite a good deal of trouble with our ice cream not holding up, in other words, sometimes a 5-gallon can will fall down as much as 1 gallon to 1½ gallons. The following is one of our mix batches. We would like you to tell us, if possible, what is the trouble.

Whole milk, 252 lbs., testing 4.4 per cent.
Cream, 197 lbs., testing 43.15 per cent.
Skim milk, 270 lbs.
Sugar, 116 lbs.
Gelatine, 5½ lbs.
Vanilla, 5 ozs.
Merrell-Soule's powder, 52 lbs.
Color, 2 ozs.
Improver, 8 ozs.

Reply: I have analyzed your ice cream mix and you will note the calculations in table one.

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
252.00 lbs. 4.4% milk.....	11.08	21.45	32.53
197.00 lbs. 43% cream	84.71	10.00	94.71
270.00 lbs. skim milk	.....	24.30	24.30
116.00 lbs. sugar	.....	.....	110.20
5.50 lbs. gelatine	.....	.....	5.12
52.00 lbs. skim powder.....	.....	49.40	49.40
1.00 lb. flavor and improver.	.....	.....	.50
893.50 lbs. mix.	95.79	105.15	316.76

You can easily see the calculations on this mix show it to be a standard mix with plenty of solids to stand up well. The trouble you appear to have cannot be because of the composition of the mix, but must be due either to your high overrun which you are getting or to your method of processing the mix, which would lower the solids.

I suggest that if you continue to have this trouble you secure the net weight of a number of five gallon cans of hardened ice cream. You can easily do this by weighing the empty cans and then checking the weight after your cream is hardened. If the net weight of five gallons of your cream is less than twenty-two pounds, your overrun is too high and this may be the cause of the cream not holding up in your cans.

If you will give me further advice or explain your method of processing carefully, and give me the weight of your ice cream, I can probably assist you in stopping this difficulty permanently.

* * *

Dear Sir:—In reply to your favor of the 3rd instant we appreciate your communication very much and will endeavor to the best of our ability to give you the net weight of five gallons of our cream and also the processing.

The net weight is 20½ pounds. After all the ingredients are placed in the mix, except the flavoring, we heat it to 170 degrees, then run it through the viscolizer at a pressure of 2,800 pounds and over the brine coils to the aging vat, reducing the temperature to 51 degrees, then reduce it to 48 degrees to age. If we hold the mix over night we reduce it to 46 degrees. From the time it leaves the pasteurizing vat to the time of freezing is about 24 hours.

We feel sure from the information that you have given us that you will be able now to definitely tell us our trouble.

Reply: In your letter you stated that the net weight of a five gallon packer of ice cream was twenty and one-half pounds. This light weight, due to too high an overrun, is without doubt responsible for the ice cream not holding up in the cans. Your overrun is apparently about 110 per cent. I also notice that you are operating your viscolizer at a pressure of twenty-eight hundred pounds. I suggest that in order to reduce the overrun you operate your viscolizer at not over two thousand pounds pressure and see if that will not eliminate your difficulty. There does not appear to be anything wrong with the composition of your mix or your method of processing. I believe if you will freeze your ice cream so as to get a net weight of twenty-two and one-half pounds to a five gallon can you will not have any more trouble with your product falling in the can.

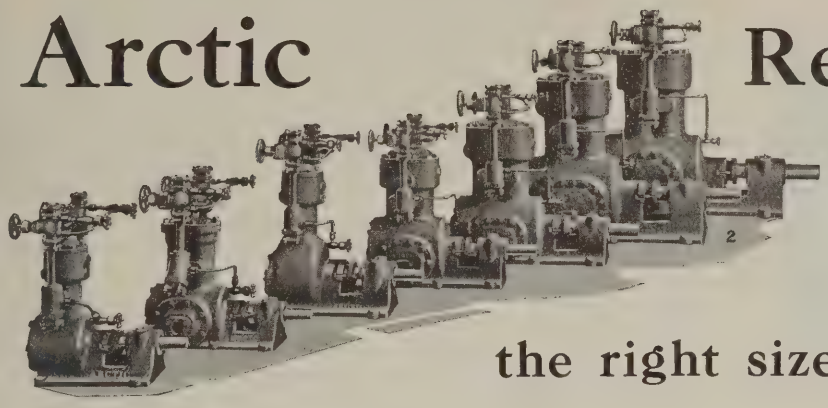
If I can be of further assistance to you in solving any of your difficulties I shall be glad to do so.

EAST PACO
Can Tops Index the
Contents of your Flavoring Room

How Do You Know?

After the miscellaneous flavors are stored in your hardening room, how much time do your men spend in finding out what's what?

Eastpaco can tops not only form a protective liner, preventing ice and salt from finding its way to the ice cream, but they put real system to the storing of flavors in the hardening room.



No trouble to put on and very reasonable in cost. They pay for themselves in the time they save.

Wisdom is in knowing what is best to know and Doing what is best to do."

THOMAS W. DUNN CO.

546 Greenwich Street

New York, N. Y.

Do you know that Thomas W. Dunn Co. were the first to introduce ICE CREAM GELATINE to the ice cream manufacturer and have been selling the finest product ever since?

THEREFORE,—do what is best to do and display true wisdom by using—

Dunn's Gelatine

"We Run a Tankful of B-K Dilution Through the System Every Day"

Well known ice cream and milk plants everywhere have adopted this plan of insuring purified equipment. It requires only a little B-K in the holding tank of water. The results are immediate. Every inch of interior pipe surface from the holding tank to the freezers comes in contact with the B-K dilution. B-K is such a powerful solvent that it penetrates the film of milk solid on the equipment and destroys any bacteria growth therein. B-K is a powerful deodorant. Thus, the germs of off flavors and odors are destroyed at the source.

This method in use over thirteen years. Recommended by health boards and leading experts everywhere. Try the B-K flush for your system. Cheap, efficient.

General Laboratories

Dept. 14 P

Madison, Wisconsin

B-K Bacilikil

At All Dairy Supply Houses

Dear Sir:—This time we have a serious problem regarding our sherbet. Practically the only flavor is orange—there is no call for other flavors.

We make this up in a ten-gallon milk can. Into half a can we pour, stirring well, thirty pounds of sugar, with which has been triturated the amount of Textor suggested by the makers of this product. The can is then filled so that the color, liquid, orange oil, 4 ounces, and 8 ounces of citric solution make up the ten gallons. Five gallons of this is put in the freezer and frozen at 8 degrees until quite slushy. We then add the gratings and juice of two dozen oranges. This is frozen quite stiff and drawn into cans and pans for layer bricks. Two quarts mix are used.

Last year we put our sherbet up in quart packages and we had no trouble. This was quite expensive and entailed considerable labor so we changed to five-gallon cans. When these are put in our dealers iceless cabinets they seem to begin to have trouble. After a few days, when the cans are perhaps half gone, a white rocklike crust begins to form on the surface of the sherbet. Occasionally a lump of a similar nature forms toward the lower part of the can. This crust will get to be a quarter of an inch thick and spreads. We have had no trouble with sherbet in bricks until a few days ago, when we softened some sherbet slightly and put it in some bricks. There is a layer of cream on each side of this sherbet, and it is hard as granite. This sherbet was made with five-tenths per cent gelatine. We have tried both Textor and gelatine, with and without mix, freezing mushy and stiff, but we cannot remedy the trouble. Can you tell us how to correct this?

Reply: I attribute your trouble to several causes; One of them is that you are attempting to make this sherbet without the use of gelatine which I believe should take the place of a part of the Textor which you are using. I suggest that you try to use some gelatine to help in stabilizing the sherbet. Then I notice also that you are using thirty pounds of sugar. This amount of sugar lowers the freezing and holding point of your sherbet so that it cannot be kept in proper condition in the iceless cabinet at the temperature when ice cream will keep very well.

I suggest that you cut the amount of sugar from thirty pounds to twenty pounds and then use less citric acid to make up the batch. In that way you still have sufficient acid in the sherbet and by reducing the sugar it will make it possible both to freeze and hold the sherbet at a comparatively higher temperature. I would suggest that you use about four ounces of gelatine for a ten gallon mix and reduce the Textor to about half the amount you are now using.

I should be very glad to hear from you as to what results you appear to get after following the above suggestions. If these suggestions do not entirely remedy the difficulty I shall be glad to assist you further in any way so that this matter can be adjusted and solved before the season opens next spring.

* * *

Dear Sir:—Herewith is a copy of the mix you worked out for us some time ago and which has been giving very good satisfaction. Please construct this same mix to a 12 per cent one in place of a 14 per cent and would also be pleased to have you furnish us with a mix of the same total solids using the same ingredients except the 8 per cent.

We might say that on our butter we probably should not be figured at 84 per cent on the average, as in your mix enclosed we nearly always were obliged to use 16 pounds in place of 15.2 to have our ice cream to 14 per cent.

Reply: I am glad to suggest below in table one and

MILK CONDENSING *and* MILK DRYING (*Spray Process*) MACHINERY

A SIZE TO FILL YOUR REQUIREMENTS

C. E. ROGERS 8731 WITT STREET DETROIT, MICHIGAN

A trial case of the size batch unit you use will be most convincing. If not satisfied—return balance in 30 days and get full credit.

COMFORT'S
Better Mix Units

Eliminate all figuring and weighing. Put up in "unit packages" all ready for use for 100, 150, 300, or 500 gallon batches of mix. Sixty units to a case.

BETTER MIX UNITS increase the viscosity, enrich the flavor and induce a smoother ice cream.

They are applied during the pasteurization process, exerting their full effect during this process — thus eliminating any delayed action or increased acidity developments.

This mix may also be stored or shipped under the usual condition after pasteurizing.

MEMBER

table two, a 12 per cent and 8 per cent butterfat ice cream mix according to your request.

Table 1.

Ingredients		Fat	Serum Sol.	Total Sol.
7.60 lbs.	sugar	.....	.....	7.22
.50 lbs.	gelatine	.....	.....	.475
16.00 lbs.	8% sweet cond.	1.28	4.32	12.00
13.40 lbs.	butter 80%	10.72	.....	10.72
6.00 lbs.	skim powder	.....	5.68	5.68
56.50 lbs.	water	.....	.....	.....
100.00 lbs.	mix	12.00	10.00	36.095

Table 2.

Ingredients		Fat	Serum Sol.	Total Sol
7.60 lbs.	sugar	.....	.....	7.22
.50 lbs.	gelatine	.....	.....	.475
16.00 lbs.	8% sweet cond.	1.28	4.32	12.00
8.40 lbs.	80% butter	6.72	.....	6.72
8.00 lbs.	skim powder	.....	7.68	7.68
59.50 lbs.	water	.....	.....	.....
100.00 lbs.	mix	8.00	12.00	34.095

You will notice that the total solids of the mix suggested in table two is 34 per cent instead of 36 per cent. It is not possible to build up a formula with 8 per cent butterfat and 36 per cent total solids without increasing the sugar content to 16 per cent or the serum solids to a point where you would be liable to get sandy ice cream. You will also notice that I have increased the sugar content in table one over the original formula which I sent you in 1922.

* * *

Reply to J. W.: I have your letter of recent date in which you have indicated your ice cream formula and have also stated that your ice cream mix gets too thick and heavy. I have analyzed your ice cream mix and you will find the calculations given below in table one:

Table One.

Ingredients		Fat	Serum Sol.	Total Sol.
15.00 lbs.	sugar	.....	.....	14.25
.95 lbs.	gelatine	.....	.....	.902
10.00 lbs.	evap. milk	.80	1.80	2.60
2.20 lbs.	skim powder	.....	2.09	2.09
9.50 lbs.	butter, 84%	7.98	.....	7.98
62.35 lbs.	3¼% milk	2.02	5.37	7.39
	Improver and flavor.			
100.00 lbs.	mix.	10.80	9.26	35.212

If I have interpreted your mix correctly, the cause of your trouble is in using too much gelatine. If your gelatine is of standard grade it should not require a half pound of gelatine and you are now using nearly a pound. I would try this same mix using six ounces of gelatine instead of nearly a pound. You probably will also find that if you continue to use the one ounce of improver you might cut down on the amount of gelatine further. Outside of the large amount of gelatine there appears to be nothing wrong with your method of processing the mix and I am sure if you will reduce the

An excellent window display which the Benham Ice Cream Co., Fresno, Cal., enable its dealers to prepare.

Grape-Pineapple

EVERYONE likes grapes, everyone likes pineapple, but just wait 'til you see how everyone takes to our rare blending of these two national favorites as an ice cream Special!

Read the actual experience of other ice cream manufacturers in their letters to us.

(*Names submitted on request*)

"Rush order for one barrel Grape-Pineapple. Entirely out and it is making a big hit here."

"Grape-Pineapple is a good seller and we shall probably use it in larger quantities as the season advances."

"Indeed pleased with way your Grape-Pineapple has taken with the trade."

Our exclusive blend of Grape-Pineapple is going even better than Orange-Pineapple in many territories, a sensation from the very start! It will pay for itself many times over if given a place in your 1925 line-up of Specials.

Use only two quarts for a 5-gallon mix. No color is needed. You will like the clean grape color as produced by our product.

See the coupon below, ready to return to us for either one No. 10 can (three quarts) or one dozen No. 10 cans of Grape-Pineapple.

$4,600,000 for ESKIMO PIE!

During 1924 —

The public paid approximately $4,686,150 for genuine ESKIMO PIE.

1,464,422 gallons of ice cream were consumed in making ESKIMO PIE.

Over 1,000 ice cream manufacturers made ESKIMO PIE under our franchise.

1924 sales were 195% greater than 1923.

1925 sales through March averaged 71% greater than the same period of 1924—which should mean nearly $8,000,000 worth of PIES sold by the end of the year.

Over half of these sales are during the winter months, covering the overhead and paying a profit to hundreds of manufacturers.

ESKIMO PIE CORPORATION
LOUISVILLE, KY.

gelatine you will not have trouble with the thickening of your mix.

Reply:—I would suggest that if you do not have a copy of the Ice Cream Mix book, published by The Olsen Publishing Company, you secure a copy of this book, the regular price of which is $1.

For instance, if you referred to page 32 of the Ice Cream Mix book, formula No. 8, you would note the same formula as is given below in table one for a ten per cent mix, the formula being for 100 pounds, so that if you desired a 300-gallon mix or 2,700 pounds you would use 27 times the ingredients for a 100 pound mix.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.00 lbs. sugar	.....	.....	13.30
.50 lbs. gelatine	.....	.....	.47
4.00 lbs. skim powder	.....	3.80	3.80
8.50 lbs. sweet butter 84%	7.14	.....	7.14
73.00 lbs. 4% milk	2.92	6.23	9.15
100.00 lbs. mix	10.06	10.03	33.86

Similarly, for a 12 per cent mix you would find formula No. 8 on page 37 as given below in table two.

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol
14.00 lbs. sugar	.....	.....	13.30
.50 lbs. gelatine	.....	.....	.47
2.50 lbs. skim powder	.....	2.37	2.37
11.00 lbs. 84% butter	9.24	.....	9.24
72.00 lbs. 4% milk	2.88	6.21	9.09
100.00 lbs. mix	12.12	8.58	34.47

Then if you desire to use sweetened condensed milk instead of skim milk powder you would find the formula also in the Ice Cream Mix book.

The pressure to which ice cream mix should be viscolized should between 1,500 and 2,500 pounds. Some manufacturers will not use over 1,500 pounds pressure while others claim to get better results at 2,000 to 2,500 pounds.

* * *

Dear Sir:—Please give us analysis of our mix that we are using at present. We are experiencing trouble with sandy ice cream after several weeks in storage.

49 lbs. skim milk powder
81 lbs. butter (82% fat)
140 lbs. milk (3.5% fat)
84 lbs. cane sugar
50 oz. gelatine
29½ gal. water

Reply: I have analyzed your mix and you will find the calculations given below in table one.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
49.00 lbs. skim milk powder	.....	46.55	46.55
81.00 lbs. 82% butter	66.42	.....	66.42
140.00 lbs. 3.5% milk	4.90	12.01	16.91
84.00 lbs. sugar	.....	.....	79.80
4.00 lbs. gelatine	.....	.....	3.80
246.00 lbs. water	.....	.....	.....
604.00 lbs. mix	71.32	58.56	213.48
Per cent	11.80	9.70	35.30

You will note that the analysis of your mix shows only 9.7 per cent milk serum solids which ought not to produce a sandy ice cream.

I believe that your trouble is in your hardening room not being of a uniform enough temperature so that even a small amount of softening of your cream in your hardening room followed by a rehardening due to a lowering of the temperature, and this repeated several times when cream is in storage as long as three weeks, is responsible for your apparent sandy ice cream. Under normal conditions you should have no difficulty with this if you use the mix indicated in your letter.

The Economy of Good Roads

Good Roads Reduce Delivery Costs for Ice Cream Manufacturers

By M. O. ELDRIDGE*

WHILE it has been conclusively shown by various investigators that the cost of hauling by horse and wagon has been reduced by road improvement all the way from 25 to 50 per cent, and in some cases as much as 75 per cent, there is very little authentic information available to show what it costs to haul by motor truck over various classes of road surfaces, or what the saving would be over horse-drawn vehicles.

Everyone who has studied the subject will agree that hard-surfaced roads are prerequisite to successful motor truck operation, and that on good roads, it costs less to haul produce by motor truck than by horse and wagon, due principally to the increased radius of travel and to the possibility of hauling heavier loads, thereby increasing the ton mileage capacity per day.

In this motorized age, the cost of hauling by motor trucks of various capacities operated over various classes of road surfaces is one of the most important phases of the subject of highway transportation. It is therefore urged that the manufacturers, through their research departments, make a thorough study of this phase of the subject in order to determine the relation between hauling costs by motor truck and horse-drawn traffic over roads of the same class, and also the hauling costs by motor trucks over the various classes of road surfaces. The object of this study should be to determine the economy and efficiency, first, of motor truck operations over horse-drawn traffic, and short hauls by rail; and second, of improved roads over unimproved roads.

It is desirable that manufacturers should take up this study, but it is also very desirable that the state highway departments and the government at Washington do the same thing, so that we may have absolutely reliable and authentic information that everyone will believe. If one series of operators collect a certain kind of information, it does not have to have the same weight as though that information were collected by a highway department, or by the government at Washington.

That this subject is worthy of consideration is indicated by the following facts and figures gathered from various sources:

A study of the economic value of road improvement conducted by the United States bureau of public roads, covering the period from 1910 to 1914, and including eight selected counties in various parts of the United States where the main roads were improved during that period, showed that the average gross saving per ton-mile by horse and wagon due to road improvement was 17.8 cents, this being indicated by an average rate of 33.5 cents before the roads were improved, as compared with 15.7 cents after the roads were improved. The net saving on those costs was 11.6 cents, after deducting the cost of interest, and principal payments.

In Franklin county, New York, it was shown that road improvement not only resulted in a saving by horse and wagon, but that an additional saving was brought about by substituting motor trucks for horses and wagons in the hauling of milk. The ton-mile horse cost on the new roads was 12½ cents, and only 8¼ cents for the motor truck. In computing these costs, the usual fixed expenses and operating charges were taken into consideration.

In Dallas county, Alabama, it was shown that the cost of hauling by wagon over the old roads was 30 cents per ton-mile, and over the new roads 15 cents, while the cost for 1½ and 2-ton trucks on the new roads ranged from 9.9 cents to 11.9 cents per ton-mile.

The cost of operation would probably be considerably greater now than before the world war, owing to the general increase in the cost of labor, equipment, accessories, oil, gas, tires, etc., but the ratio between hauling costs by wagon on good and bad roads, and by motor trucks would not vary materially.

(Continued on page 106)

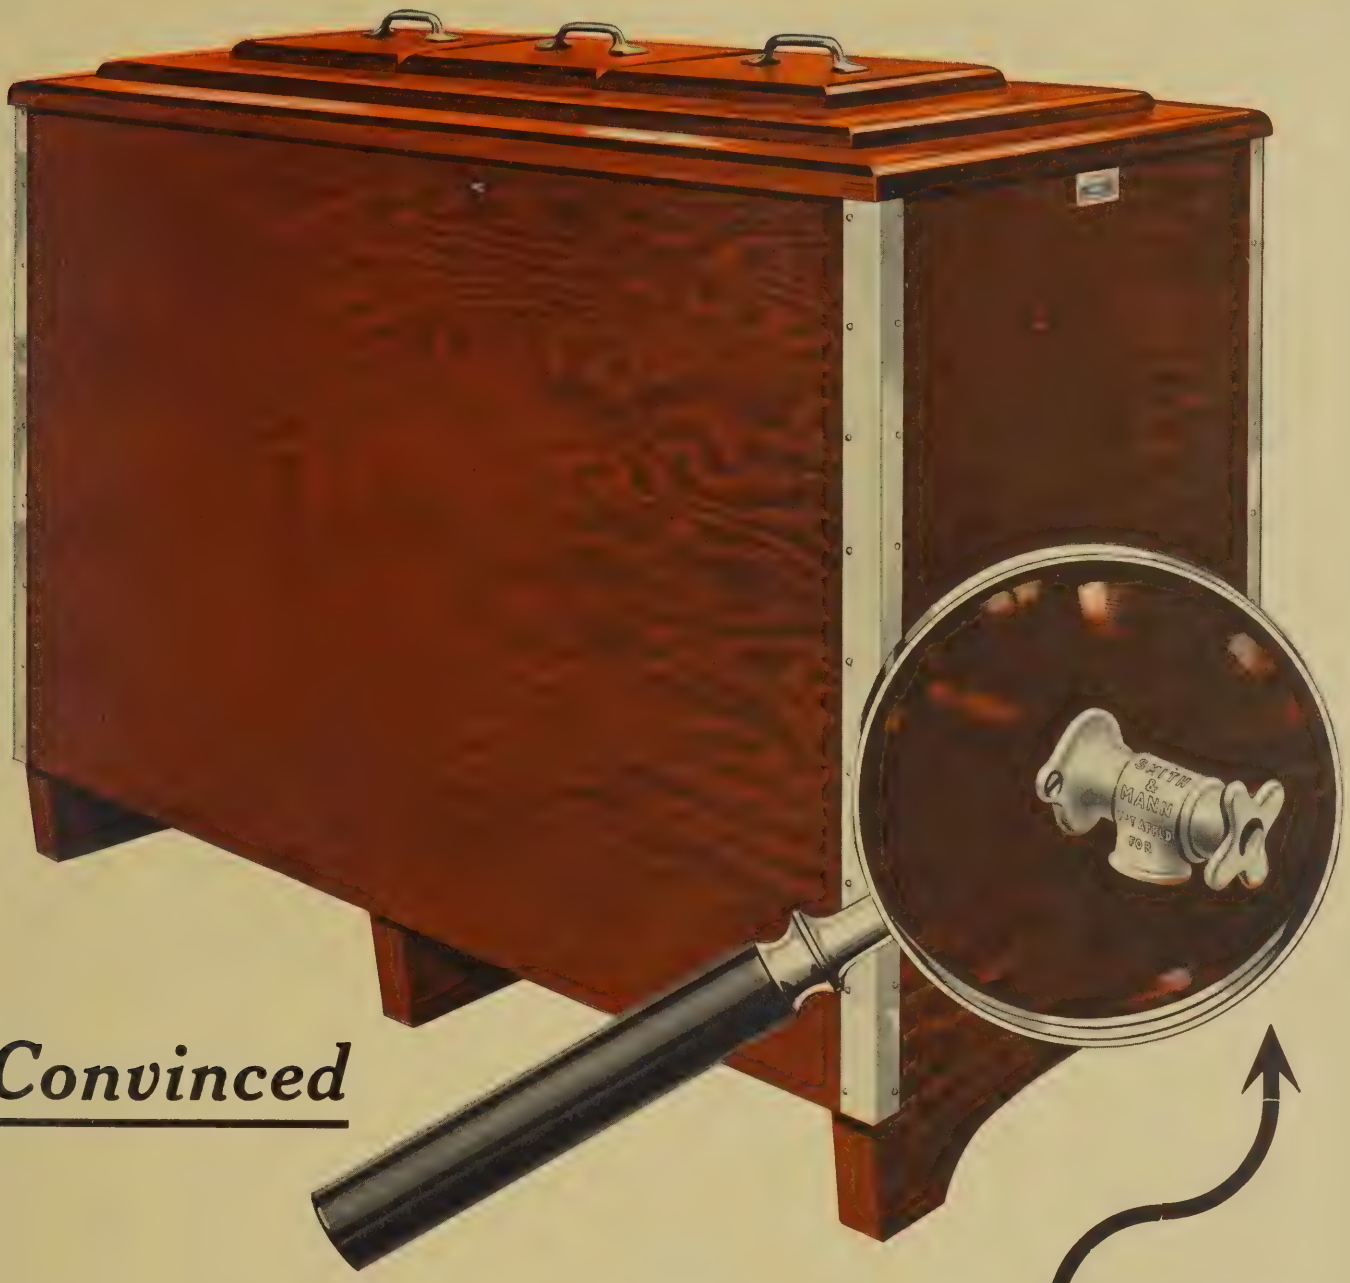
ESTABLISHED 1851

A NATION-WIDE study conducted by the bureau of crop estimates of the United States department of agriculture in 1918 indicated that the average cost of hauling by wagon in the United States over all classes of roads was about 33 cents per ton-mile, while by motor truck it was about 15 cents, a reduction of over 50 per cent. In New England, the average cost was 39 cents by wagon and 11 cents by motor truck, a reduction of nearly 70 per cent, due probably to the fact that there are more good roads in New England than in other parts of the country.

The average cost of moving wheat by wagon throughout the country was 30 cents, as against 15 cents when moved by motor truck. It cost 48 cents by wagon and 18 cents by motor truck to move the cotton crop. That was probably due to the fact that the South has poorer roads than any other section of the country, consequently the cost by motor truck and horse-drawn vehicles was larger in that section than any other.

Assuming these figures to be correct, they indicate that if the main highways of the country, over which the bulk of the traffic is carried, were hard-surfaced, so as to permit the economic operation of motor trucks, that our gigantic highway transportation bill could be reduced by at least 50 per cent.

During the period from July 1 to September 30, 1919, trucks operated by the post office department on the motor vehicle truck routes covered a total distance of 63,740 miles, carried a total of 707,756 pounds, equivalent to 1½ tons per day per route, at a cost of $.2289 per mile. Trucks operated by the same department during the same period on the country motor express routes covered a total distance of 24,883 miles and carried a total of 180,219 pounds, equivalent to 1½ tons per day per route at a cost of $.1778 per mile. If these figures are correct, the average cost of operation per ton-mile amounted to $.1526 and $.1423 per ton-mile respectively on the two classes of routes.

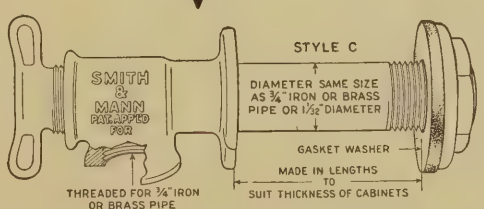


COSTS.

The ice cream industry is becoming more scientific every year and if you do not know what your different costs are, how do you expect to carry on and keep yourself above the danger line? For example, mechanical refrigeration is coming fast and every ice cream manufacturer in the country will have to deal with this system of keeping ice cream in the stores. Now, if you don't know exactly what your delivery costs are under the ice and salt system of refrigeration how are you going to know how much you can lower your selling price to the mechanical refrigerated stop and make the same profit. I have records where the reduction in selling price has varied from 7 to 25 cents per gallon. This wide variation is conclusive proof that in most instances it is based entirely upon guesswork.

You will be confronted in the future with other problems that will require quick decision and he who knows those elements of cost certainly has the advantage.—From California-Pacific joint convention address by Ed Burt.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of "The Ice Cream Review." Then you can stay at home and wait for results. You'll soon have your hands full.



Convinced

By rigid practical tests and the element of time the Anheuser - Busch Company have standardized on the

Smith & Mann One-piece Valves

as the one valve that offers the most service and practical use per dollar of investment.

Always give thickness of cabinet wall when ordering.

Profit by the tests of leading cabinet manufacturers—use *Smith & Mann One-Piece Valves* exclusively. Order a lot and see for yourself.

Summer Novelties Now to the Floor

Unusual Activity Now Noted in Regard to Frozen Suckers, Popsicles, "Drink on Stick", Etc.

THE day of ice cream novelties is flourishing again. The popsicles, the frozen sucker, the "drink on a stick," etc., are attracting more or less attention. Although these products do better in the summer than in other seasons, some manufacturers believe they are something more than novelties, though two or three years ago they were accepted as such.

Manufacturers who are handling suckers and the like are of the opinion that they serve a most useful purpose; that they attract business that otherwise would not be gained. These novelties were the subject of addresses at different conventions last winter. Opinion was divided, many manufacturers, of course, sticking to the thought that the important thing before this industry is the matter of boosting ice cream—plain, old-fashioned ice cream, the dairy product. Others insisted that the sucker and kindred products do much to help the regular business of the ice cream manufacturer, while all are agreed that there is more or less profit to this new business.

As "hot-weather novelties," however, these products seem to be designated, and the opening of the season this year has found more activity in the sucker business than ever before. Children, of course, are the best buyers, though the grown-up young people have helped to make these products popular—at ball games and various outdoor events.

ONE investigator reports that an attractive feature of the sucker business—and this sense that embraces all products of this order—is the fact that it does not "tie up" the freezer equipment. There is virtually no initial investment—no royalties, contracts, etc.

There will be more of this kind of business this summer than in all previous years, according to present indications. There are reasons to believe the suckers will be with us for all time, particularly in the warm-weather months.

July 4 is now the big objective of ice cream manufacturers, and many are preparing for "the Fourth" by arranging for a large business in the suckers.

These novelties are especially useful in combating soft-drink competition, many manufacturers say. They are five-cent sellers and have quite the same palate appeal as the soft drinks.

The suckers and popsicles seem to have won a place for themselves.

WINDOW-TRIMMING CONTEST.

Much interest in ice cream sales was stimulated among dealers handling the ice cream of Moores & Ross, Columbus, O., through a window-trimming contest conducted by that company, the windows featuring ice cream of course. Fifteen cash prizes were offered—$30 for first prize, $25 for the second, $20 for the third, $15 for the fourth and $10 for the fifth.

Your Profits Don't Leak Away Like This with

THE BROOKS DRYPAK CABINET

The BROOKS DRYPAK compartment tank separates the brine from the ice-pack and produces a very low, even temperature at both the top and bottom of the ice cream cans.

Only pure CORKBOARD—3 to 4 inches thick is used in the BROOKS DRYPAK. This is sealed with a heavy application of boiling hot asphaltum, applied to all sides and bottom and backed by waterproof insulating felt. This insulation will never settle or absorb moisture. Its generous use preserves the smaller quantity of ice and salt required.

There are no glued-up panels in the outside construction of the BROOKS DRYPAK to warp or split open and leak refrigeration. The BROOKS DRYPAK is built up of No. 1 Gulf Cypress 1 inch thick and finished in old mahogany with heavy coatings of brine proof varnish.

The covers have no metal handles to be bumped off or rust and corrode. The Smith & Mann one-piece valve prevents leaks within the cabinet wall and consequent deterioration of insulation.

This superior construction plus our guarantee of 48 hours on one icing is your assurance of profit protection.

WE BELIEVE IN KEEPING ABREAST WITH MECHANICAL REFRIGERATION, BUT NOT IN INVESTING HEAVILY.

(Continued from page 86)

uses both a refrigerated cabinet and a refrigerated fountain.

We have never been called upon to make an allowance in the price of ice cream as we serve no customers who own cabinets. If the dealer owned a refrigerated fountain we would make no allowance unless he furnished the entire refrigeration for his ice cream.

We are working into refrigerated cabinets slowly and are using the old-style ice and salt cabinets for the smaller customers. By so doing, we expect to get the best of the life out of this old equipment before we are fully equipped with the new.

There has been much discussion as to what low limit of gallonage a dealer may sell and still be a profitable dealer when a refrigerated cabinet is installed. We find that any arbitrary figure which may be set means little, as we are sometimes forced to install a cabinet in order to retain business when a competitor solicits on this basis.

In conclusion, I wish to state that competitive reasons have dictated much of the policy we have followed. We do not feel sure that this present type of refrigerated cabinet will be the most approved type five years hence, nor are we sure what the average life of this present cabinet will be. Our intention is to keep abreast of this progressive movement, but not to invest heavily in this equipment until our own experience teaches us the best way.

GELATINE IS BOOSTED.

Ice cream manufacturers will be interested in some wholesome publicity that has recently been given gelatine. Newspapers and magazines in various parts of the country in late months have stressed the importance of gelatine in the food. With the growing use of gelatine in various food products, the ice cream manufacturer can have less fear that the use of gelatine in ice cream will arouse any criticism from misled politicians and "food experts."

As a matter of fact, much gelatine has been used in various kinds of food products for many years, though misled legislators occasionally have seen fit to pick at the use of this product in ice cream.

A recent issue of The Wisconsin News, Milwaukee, gives much space devoted to gelatine, its various uses, and produced a number of prize radio recipes, showing how gelatine may be used in the food.

Prudence Penny, Wisconsin News cookery expert, recently broadcast the following talk over WSOE:

Gelatine as a food ingredient has so generally worked its way to the front that we find it today a useful and almost indispensable item in a long list of dishes covering nearly every division of the bill of fare. It is wonderfully adaptable and new uses for it are being devised constantly. It may be used to rescue an insipid soup and give it life and consistency. It is a valued resource when fruit juices do not jell as we thing they should.

"It is famous for lemon jelly, jellied meats, jellied fruits, fruit sherbets, Bavarian creams, snow puddings, sponges, charlotte russes and so on, but it becomes the showiest when moulded into those sparkling, shimmering — I almost said shimmying—and transparent desserts that delight the eye as well as the palate. And I might refer to the endless salads that it makes possible, and above all, to the service it has done us by extending the variety of food dishes, thus saving the housewife many moments of brain racking over what to have for the next meal."

Get Your Cans Ready Now

While activity is low at your plant there is plenty of time to single out the cans that are in need of retinning, rebuilding and repairs.

Intensive Merchandising

OFFERS DAWN OF NEW DAY TO THE Ice Cream Industry

THE New England Association of Ice Cream Manufacturers ties up the story of dairy health with ice cream in an interesting educational bulletin issued by that organization. The bulletin is entitled, "Ice Cream, the Health Food." The sub-title is "Its Value as a Body Builder for Undernourished Children."

It is pointed out in the very start of the book that ice cream, having milk as its principal ingredient, contains the same body-building elements as milk, and then:

"Pure ice cream is simply pure milk, pure cream and a little bit of food gelatine—sweetened, pasteurized, flavored and frozen.

"None of the food value of milk and cream is lost in the making of ice cream, and there is the added value of the sugar, plus the advantage of having all those food values in more appetizing form.

"It is apparent, therefore, that ice cream has food value like milk, and may be depended upon for nourishment and body building.

"Ice cream — formerly regarded as an occasional luxury —is now served on its merits as a food."

It is stressed in the bulletin that children need no coaxing to eat ice cream, a food product of the greatest importance to the health of children. In this connection it is pointed out that—

"Many mothers have wisely adopted the practice of providing ice cream for the between-meal lunches in preference to indigestible pastries or cheap candy of unknown origin.

"Wholesome, delicious ice cream that will build up and strengthen underweight or undernourished children (as it did for those in New London) is a real food that can be eaten freely and safely.

"Parents need have no cause for concern over healthy youngsters who exhibit great fondness for ice cream. It is good for them, builds sturdy bodies and promotes general good health. Let them have plenty of it and watch them grow."

Further information linking up ice cream with the food value of milk is contained as follows:

"Public health agencies urge greater use of it. City, state and national health boards and commissions advise us all to drink plenty of milk. Doctors everywhere recommend and prescribe it for invalids and undernourished children.

"Also milk is a prescribed article of diet on every athletic training table, because it is a body builder.

"Like milk, the food value of ice cream is due to the elements contained in it which are fat, milk, sugar, proteins, mineral matter and vitamins.

"These elements are essential for body maintenance and growth, and especially in the early, formative years, children require these elements because they are necessary to the building of strong, healthy bodies."

The bulletin goes on to show many different wavs to serve ice cream for children's parties, picnics, lunching parties, after motoring, golf, or any other outdoor sport, etc.

* * *

THE Terry Dairy Co., Little Rock, Ark., headed by Will Terry, association leader and one of the South's prominent ice cream manufacturers, recently distributed some interesting merchandising material. This material was in the nature of a folder, one side of which is used for regular correspondence with the company's letterhead, etc., at the top, while the rest of the folder is devoted to interesting facts regarding up-to-date methods of making ice cream on a commercial scale today.

The folder particularly stresses the fact that "every drop of milk used in Terry's ice cream is first carefully pasteurized." This statement is followed up with a guarantee that "only pure milk and ice cream are sold under the name of Terry."

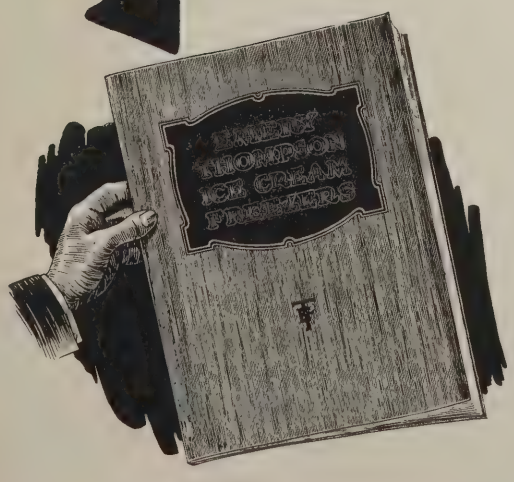
Write for this new catalog

WHY not clip out the coupon at the foot of this page and mail it right now for the new Emery Thompson catalog that points the way to freezing equipment, enabling you to handle bigger business economically. Why not?



IT'S a very fine spirit of co-operation that has been developing between members of the ice cream industry and between the ice cream industry itself and allied interests—locking arms instead of locking horns! That's the idea!

The Emery Thompson organization pioneered in the design and manufacture of equipment that would produce ice cream on a quantity basis. We have endeavored to step along arm in arm with the industry — keeping up with their needs. Just how handsomely the present Emery Thompson line meets every ice cream freezing need is illustrated in our catalog—this catalog describes and pictures the three general types of freezers we manufacture — vertical, horizontal, and direct expansion. May we send you a copy?

ICE CREAM WEEK IN OHIO BEGINS JUNE 5.

June 5 has been set for the opening of ice cream week in Ohio. The campaign will be conducted through the dealers' windows and through literature going into the homes. The following circular has been issued by W. A. Wentworth, secretary of the Ohio association:

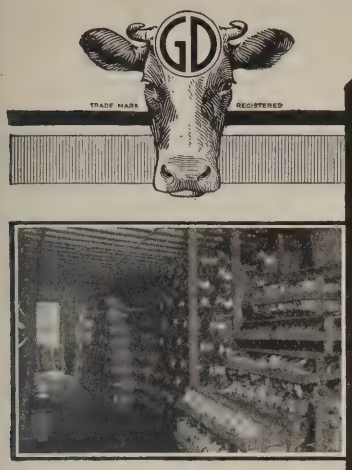
"We have closed the series of eight district meetings, at which consideration was given to the proposed week of intensified ice cream advertising. The manufacturers throughout the state accepted this proposal quite enthusiastically, and in a 100 per cent manner. Although all orders are not in we can say definitely that the newspapers campaign will be conducted in all of the large cities of the state, that is those over fifty thousand population, and definitely in all but six of the smaller cities. At this writing we have not heard from the manufacturer in that city giving us his pledge to support the work and order for supplemental material. These, however, will not in any way interfere with the general plan and we expect that their orders will be received within a day or so.

"The Dealers' Folders will be shipped by express to those whose orders have been receivd to date from Pittsburgh on Tuesday, May 19, and should be in the hands of the ice cream manufacturers by at least the 24th. This will give you opportunity to secure their distribution and posting by Friday, May 29. We should like to have these appear in all dealers' stores in the state on the day prior to Decoration Day, and trust that each of you will see that this is carried out.

"The Wagon Banners and Window Streamers will be mailed from Pittsburgh by Tuesday, May 26, and should be in your hands by May 30, which, in turn, will give you ample time to get them posted by June 5, which is the day that the first ads will appear in the newspapers of the state.

"We have heard of a number of ice cream manufacturers who are arranging to make additional displays in windows of their dealers and suggest that as many of you as possible that the same be done. Such will materially support the newspaper and other advertising campaign, and we urge its adoption. Also in any regular advertising that you may be carrying will you kindly refer to the fact that "IT'S ICE CREAM WEEK IN OHIO" when the dates arrive.

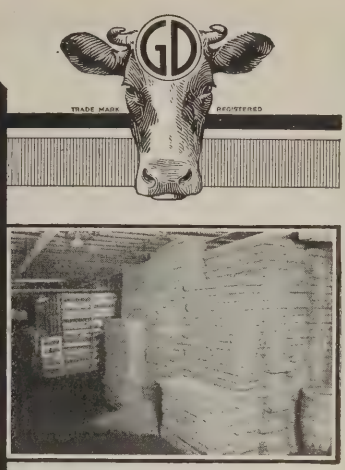
"This plan has been so universally accepted that I am sure every manufacturer is anxious to put it over in a big way, and it can be done through the support of each of you."



FOUR PLANTS FOR BLOMMER ICE CREAM CO. NOW.

The Blommer Ice Cream Co. of Milwaukee has purchased the Purity Ice Cream Co., Lake Geneva, Wis., from Barney Chellini, according to announcement last month by George Blommer. This gives the company four plants, all located in Wisconsin. Besides the main plant at Milwaukee the company operates plants at Kenosha and Wisconsin Rapids.

ICE CREAM BY AEROPLANE.



Ice cream received some good publicity from a stunt performed by the firm of Hawcock's, Monmouth, Ill., wholesale ice cream manufacturers. This firm shipped a large order of ice cream from Monmouth to Washington, Ia., in an aeroplane belonging to the Midway Airways Corporation. The ice cream was made up for the wedding of Miss Oneida Palmer of Washington and Mitchell Sprole of Garner, Ia.

Milk cans and covers always on hand for immediate shipment.

Our Syracuse retail store. Anything in stock from a fever thermometer to a pasteurizer.

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

THE WALRUS CABINET

(Mechanically Refrigerated)

(Patented)

THE above illustration shows a "tilted" view of the No. 3, four compartment, Walrus Cabinet.

Each compartment in all three sizes of Walrus Cabinets is oval in shape and will accommodate two five-gallon packers of ice cream —one packer in front of the other.

There are two Sliding Lids over each oval compartment. The Sliding Lids are light in weight, but very sturdily constructed, and are easily and quickly shifted, as compared with the ordinary round, bulky, weighty and cumbersome type of lift-off lids.

Dispensing from the front or rear row of packers in the Walrus Cabinet is easy and most convenient. Compare the ease and labor saving of these Sliding Lids with that of lifting off a five or six pound bulky round lid several hundred times a day.

The Walrus Cabinet has a sturdy, strong body construction. The linings are of unusually heavy copper. The top and lids are made of heavy, pure, solid nickel silver. The Sliding Lids slide on nickel silver bars. The heavy copper lining is mounted on a flooring of artificial stone, which affords a substantial foundation and prevents punctures and breaks in the copper lining, which often occur in the ordinary type of cabinet when heavy packers of ice cream are carelessly dropped into the cabinet.

The facings on the Walrus Cabinet are not of heavy marble, that would "sweat," stain and break—or white glass, that would break easily—or enameled iron, that would chip and rust and can not be refinished. They are of aluminized Redwood, specially treated, and can be refinished, and thus renewed, easily, quickly, and at small expense.

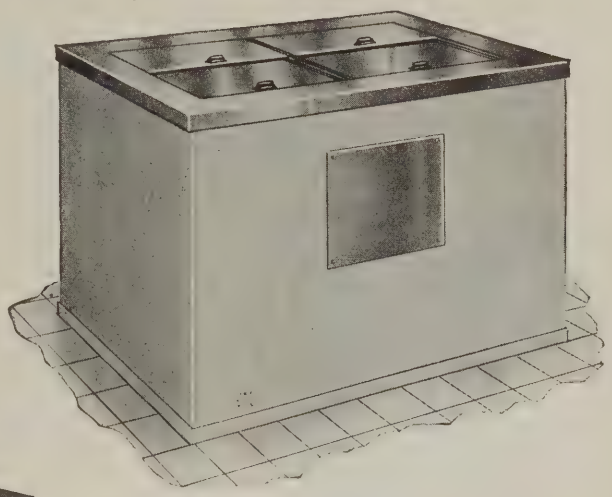
The Walrus Cabinet conforms in height and width to the height and width of the standard Soda Fountain workboard.

Any one temperature desired may be generated and automatically maintained throughout one cabinet.

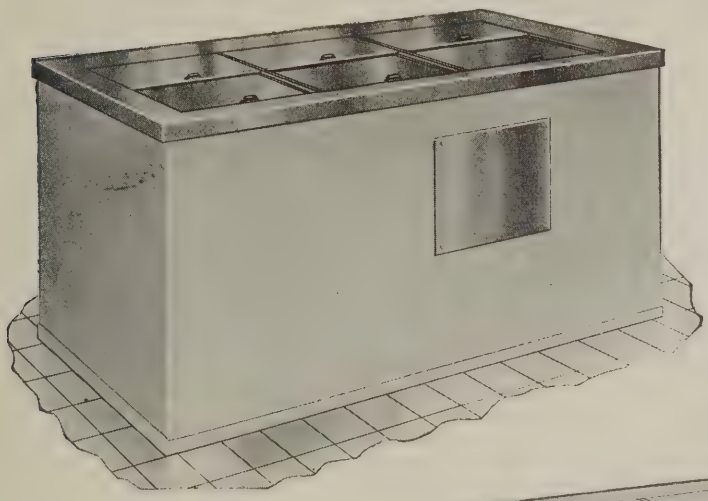
The Walrus Cabinet pays its cost with what it saves in labor, reducing to a minimum the loss in bulk of ice cream and preventing spoilage of perishable goods.

PRICES AND TERMS QUOTED UPON APPLICATION

THE WALRUS CABINET



(Made in three sizes only)



NO. 1 WALRUS CABINET

(Two Compartments)

39″ Long, 30¾″ Wide, 30″ High

Each Walrus Cabinet is equipped with a complete Frigidaire Mechanical Cold Storage or Refrigerating Plant. The Frigidaire equipment is put into operation and adjusted without additional charge, if the purchaser resides within a fifty mile radius of a Frigidaire Service Station. Also, six months' free service is included in the price of a Walrus Cabinet, under the same conditions. Frigidaire is guaranteed against all mechanical defects. Many thousands of Frigidaires are in use.

NO. 2 WALRUS CABINET

(Three Compartments)

52″ Long, 30¾″ Wide, 30″ High

Walrus Cabinets have many advantages in construction, convenience, durableness, appearance and efficiency. They eliminate entirely the use of ice and the labor and muss incident thereto. They function automatically and perfectly. They save perishable foods, prevent most of the shrinkage or loss of bulk in ice cream, are a protection to health and are not any more expensive to operate than the iced Cabinets.

One Way to Answer Dealers Who Say They Are Making No Money

Methods of Dispensing Are Partly Responsible for Failure of Ice Cream Dealers to Make the Most Out of Ice Cream Sales

A NEW ENGLAND ice cream manufacturer was asked the question by his druggist that ice cream manufacturers all over the country have been asked from time to time. The druggists of Springfield, Mass., wanted to know why it was they were not making more money. They put this question before J. C. Tait, head of Tait Bros. Ice Cream Co., and president of the New England Association of Ice Cream Manufacturers. Mr. Tait answered the question in a way that will be of interest to ice cream manufacturers in all parts of the country, in a way that emphasized the importance of retailers learning more about the different angles of merchandising ice cream.

PROF. H. F. JUDKINS.

We speak of the problem of retail salesmanship of ice cream as concerned mostly in getting new sales. That, indeed, is the most important phase of ice cream merchandising, but another of very much importance is that of handling ice cream by the dispenser in such a way as to keep his profits from leaking out in packages.

Mr. Tait answered the question of the Springfield druggists by calling on someone not connected with the industry to make the explanation. He turned to Prof. H. F. Judkins, instructor in Massachusetts Agricultural College. Prof. Judkins explained to the dealers why their troubles were the fault of their own methods of dispensing, rather than with the ice cream. He stated that his experimental work and study had shown that usually "carry-out" ice cream is packed too tightly.

This discussion took place at a meeting that lasted an hour and a half over the regular time, so interesting was Prof. Judkins' talk.

AT THE close of the meeting he went out and purchased ice cream from four dealers to make further investigation to prove his case. These purchases consisted of a quart of ice cream at one place, a pint at another, and two half-pint packages of ice cream. This ice cream was dished from bulk. At each of the stores the ice cream was purchased from a different ice cream manufacturer. In all the stores the ice cream was "in good, firm dipping condition," according to Prof. Judkins.

All of the stores had ice and salt cabinets. In one of the stores, the cabinet outlet was open all the time, "resulting in much refrigeration in freshly formed brine being lost," Prof. Judkins said. In the brief that he prepared on this investigation, he stated that ordinary tapered paper carry out pails was used in each store.

Speaking of these different stores, he said:

"In store No. 1 the cartons were placed in metal racks in which the carton just fitted. This gives support to the carton during dishing and should, on the average, prevent excessively heavy packages being dished. The ice cream was dished out with a spoon. The clerk took very small spoonfuls from the packer, and spent much time in pressing it into the carton. Far more time was consumed than at any of the other stores.

"At store No. 2 a spoon was used for dishing. Not as much care was taken with the dishing and the ice cream was dished in half the time taken at store No. 1.

"At store No. 3 a spoon was used and the clerk took large spoonfuls and jammed them into the cartons quickly. The ice cream appeared in a spongy condition, although reasonably firm.

"At store No. 4 a number 16 scoop was used for dishing, thus taking considerable time. The cartons were rounded up well."

UPON taking the samples to the laboratory to be weighed on scales to .25 ounce, the following results were reported by Prof. Judkins:

	Weight in Ounces.		
No.	Quarts	Pints	½-pints
1	29.50	15	7.75
2	26.25	14	7.0
3	25.25	16.5	9.25
4	27.50	14	6.5
Total,	108.5	59.5	30.5
Average,	27.125	14.875	7.625

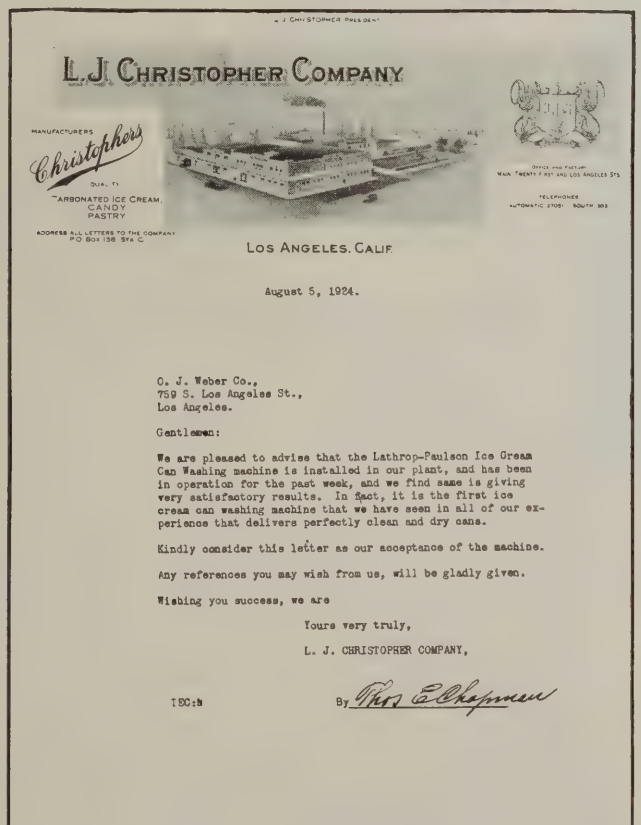
TRADE MARK



New York Chicago Pittsburgh New Orleans Philadelphia Baltimore

600 Cans and Covers or Brick Pans *Per Hour*

Absolutely clean, sterile and dry. Washes all size cans and covers from 20 qt. down to 4 qt. Cans are fed in and delivered at the same end of machine. Small cans may be washed together with larger cans, increasing the capacity to 1200 per hour. Has two speeds. Each can receives 17 distinct intensive treatments.

Machine is self-contained, and if electric wiring is done, it can be installed and ready for operation in two hours. Size: 16′ 10¾″ long, 5′ 9¾″ wide and 7′ 6″ high —over all. Shipping weight, 9400 lbs.

L. J. CHRISTOPHER COMPANY

MANUFACTURERS Christophers QUAL-TY CARBONATED ICE CREAM, CANDY PASTRY

ADDRESS ALL LETTERS TO THE COMPANY P.O. Box 158 Sta C

LOS ANGELES, CALIF.

August 5, 1924.

C. J. Weber Co.,
759 S. Los Angeles St.,
Los Angeles.

Gentlemen:

We are pleased to advise that the Lathrop-Paulson Ice Cream Can Washing machine is installed in our plant, and has been in operation for the past week, and we find same is giving very satisfactory results. In fact, it is the first ice cream can washing machine that we have seen in all of our experience that delivers perfectly clean and dry cans.

Kindly consider this letter as our acceptance of the machine.

Any references you may wish from us, will be gladly given.

Wishing you success, we are

Yours very truly,

L. J. CHRISTOPHER COMPANY,

By Thos E Chapman

TEC:H

L.-P.

ICE CREAM CAN WASHER & DRIER

Only two men are required to operate the machine at maximum speed, and one man can handle the work efficiently at the 300 speed. Cans are washed on outside as well, freeing the cans, lids, pans and covers from brine. This machine eliminates the necessity of washing cans and covers separately. Cans which have been stored and coated with oil do not have to be brush washed. They come out ready for service, or may be piled in storage racks without danger of rust. Machine will also handle brick tanks up to 12 qt. size. All cans are placed in machine upright, and are delivered **absolutely clean, sterile and dry.**

The machine is sturdily constructed and heavily galvanized. Temperatures are thermostatically controlled. Soda solution is automatically controlled by L.-P. Patent Soda Regulator.

Machine is sold on a results-guaranteed basis. Names of users will be gladly submitted upon request. It will not obligate you to obtain full information and price. Send the coupon today.

Name .....

Address .....

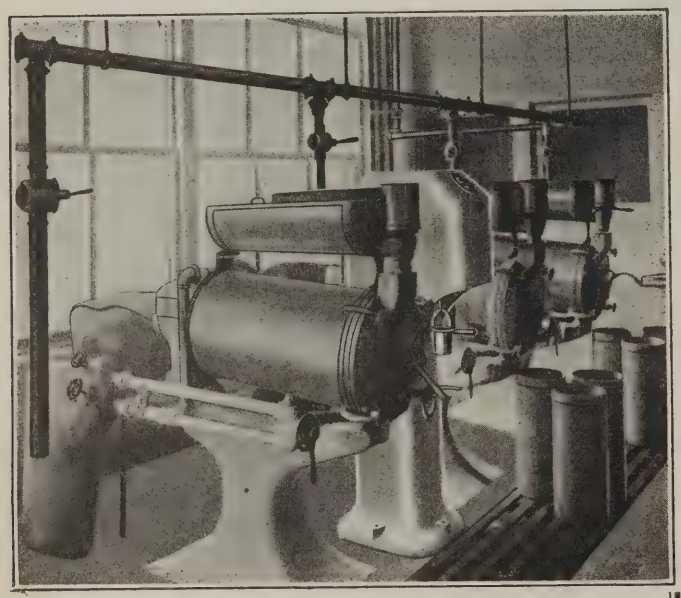
Regarding the weight test, Prof. Judkins said:

"The weight per gallon and overrun of the ice cream from the different stores undoubtedly varied a little, but it is not far from correct to assume that the ice cream weighed on an average, 4.65 pounds per gallon or 23.25 pounds or 372 oz. per 5-gallon can. This is 93% swell on a 9 pound to the gallon mix. This being the case—

372—27.125=13.7 qts. per 5 gallons.

372—14.875=25 pts. per 5 gallons, or 12½ qts.

372— 7.625=48.6 (½-pints) per 5 gallon, or 12.15 qts.



"Note that as the size of the package decreases, the amount of ice cream dipped, figured in quarts, decreases.

"The dealers estimate that they sell an equal amount of quarts and half-pints and 3 times as many pints as quarts. Five quarts, 14 pints and 5 (¼) pints per 5 gallon can, comes out just about 372 oz., and is very close to proportion stated as sold by dealers.

"Price paid for ice cream is $1.35 per gallon including icing service in two cases, $1.30 in another and $1.25 and no icing in fourth case. Assumes prices of $1.35 for all. Prices—60c qts., 30c pts., 15c pts. in all cases."

5×$1.35=$6.75 paid for ice cream.

Sold 5 quarts @ 60c	$3.00
Sold 14 pints @ 30c	4.20
Sold 5 ½ pints @ 15c	.75
Total	$7.95

Sommers Ice Cream Over-Run Tester

SIMPLE—QUICK—ACCURATE

Increases your production.
Improves the quality.
Holds your standard.

THIS CAN EASILY BE OBTAINED WITH THE SOMMERS OVER-RUN TESTER.

LET US PROVE THESE CLAIMS.

Simple plain cup—no loose weights.

Some users write:

"Its accuracy and speed surpasses any other machine we have ever used".

"The graduated dial is as visible as an automobile speedometer".

"It harmonizes perfectly with our porcelain base freezers".

Write for descriptive literature and price.

Damrow Brothers Co.

Fond du Lac, Wis.

$7.95—$6.75=$1.20, gross profit.

With no icing charge, figure 20 per cent of gross profits necessary to do business.

.20×$7.95=$1.59.

$1.59—$1.20=39c, loss on 5 gallons.

(Note—Above assumes all ice cream dished to carry out.)

Prof. Judkins then went on to figure up the profit and loss made by each of the four Springfield dealers selling dipped ice cream, announcing the following results:

Profit or Loss Made by Each of Four Springfield Dealers Selling Dipped Ice Cream.

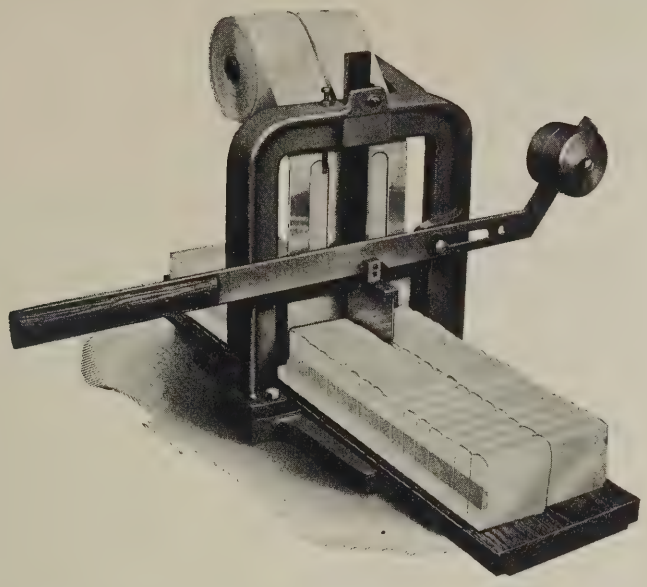
1. 29.5÷15÷7.75=52.25 ozs. sold for $1.05.
   372÷52.25=6.1 ($1.05 lots) per 5-gallon can.
   1.05÷6.1=6.41 receipts.
   5×1.35=6.75 paid for ice cream.
   6.75—6.41=34c loss.
2. 26.25÷14÷7=47.25 ozs. sold for $1.05.
   372÷47.25=7.8 ($1.05 lots) per 5-gallon can.
   1.05×7.8=$8.19 receipts.
   5×1.30=$6.50 paid for ice cream.
   8.19—6.50=$1.69 gross profit.
3. 25.25÷16.5÷9.25=51 ozs. sold for $1.05.
   372÷51=7.3 ($1.05 lots) sold per 5-gallon can.
   1.05×7.3=$7.66 receipts.
   5×1.35=$6.75 paid for ice cream.
   7.66—6.75=91c gross profit.
4. 27.5÷14÷6.5=48 ozs. sold for $1.05.
   372÷48=7.7 ($1.05 lots) sold per 5-gallon can.
   1.05×7.7=$8.09 receipts.
   5×$1.35=$6.75 paid for ice cream and ice and salt.
   8.08—6.75=$1.33 gross profit.

Greatest difference between two dealers is .34 (1)÷$1.60 (2)=$2.03 per 5-gallon can.

The only solution to the matter of "carry-out" ice cream, and its relationship to profits, according to Prof. Judkins, is that the dealers must "either dish quarts that weigh less or sell ice cream in packages put up by the manufacturer if he hopes to remedy the situation." This statement was based upon the supposition that these results are representative.

THIRTY-SEVENTH ANNIVERSARY CELEBRATED.

The 37th anniversay of the Caum Ice Cream Co., Altoona, Pennsylvania, was celebrated with appropriate exercises during the week of May 25. This company, which broadcasts a radio program semi-monthly from station WFBG, Altoona, had a special anniversary radio program for the evening of May 27. The program was made up of selections by the Caum Ice Cream Co. orchestra, a body of ten pieces, under the leadership of "Coxy" Irwin.



The Caum Ice Cream Co. began the manufacture of ice cream in Altoona on May 30, 1882. E. A. Caum, Sr., established the business, which has grown to be one of the largest in the state.

The Caum Ice Cream Co. was incorporated two years ago and the following officers have been in charge ever since: E. A. Caum, president; Thomas Caum, first vice-president; Harry Caum, second vice-president, and Mrs. E. A. Caum, secretary-treasurer.

IMPERIAL CO. TAKES IN MORE TERRITORY.

A new packing truck recently taken on by the Grafton, W. Va., local plant of the Imperial Ice Cream Co., will enable that company to take on considerably more territory. William A. Collins, salesman for the company, announces that the company's product will be distributed to Belington, Phillip and Elkins, and later on another truck will be added to cover the same territory.

The Imperial Ice Cream Co.'s business expands into the states of Maryland, Virginia, Pennsylvania, Ohio, Kentucky and West Virginia.

Anderson "Cut-Wrap" Machine

"It Wraps Slices as it Cuts"

Simple—Practical—Fast Low Priced

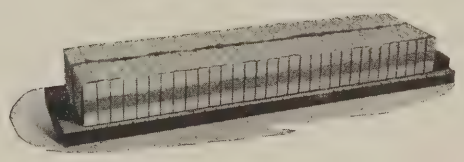
In every plant there is considerable cutting done. You know, cutting by hand, with a knife, is a slow, tedious job—an expensive operation to you.

With an Anderson you will be able to work much faster and save enough time to quickly repay for machine, and it will be a big help on those days when you are rushed for time.

It will quickly cut quarts always of uniform size. It cuts pints two at the time so this, too, is done very rapidly.

The same machine also cuts slices quickly and of a size determined by you—one machine can be used for cutting any number of slices to the quart.

The Cut-wrap slice idea is a good one and appeals to plants large and small, and especially the Cut-Wrap quart idea which is ideal for serving Churches and Socials or large gatherings. Hundreds are being used all over this Country.



Send today for literature and price.

Third National Exposition Area Already Leased Virtually Equals Cleveland 1923 Show

Unprecedented Demand for Booths Reported by Supply Association Months in Advance of Show

ONE week following the beginning of display area leasing in the third national exposition by members of The Association of Ice Cream Supply Men, the offices of the latter in New York announce, a total area had been contracted for virtually equal to the entire area of the second national exposition, held in October, 1923, in the great public hall in Cleveland, an exposition that, at that time, was considered as setting a mark possibly never to be exceeded in regard to floor area.

The Cleveland exposition is now regarded by the supply association as standing as a partly adequate advance measure only of the scope and importance of the third national exposition of this year.

There were displays in the Cleveland exposition by 171 member companies. There were in attendance 4,156 persons. Of these, 2,143 were representatives of ice cream plants and 1,430 of supply companies.

The ice cream men in attendance came from plants in 41 states, the provinces of Ontario and Quebec in Canada; Stockholm, Sweden; Buenos Aires, Argentina; London, England; Honolulu, Hawaii, etc., etc.

The exposition utilized more than 65,000 square feet of space in the famous Public Hall of Cleveland, the building in which 1924 housed the national Republican convention. The Cleveland exposition was held, as will be this year's, in conjunction with an annual convention of the National Association of Ice Cream Manufacturers. At that convention was the largest attendance of ice cream manufacturers in the history to date of the national association.

CAREFUL survey of conditions in the industry preceded the issuance to the supply field from the association's office recently of the following resume:

"The third national exposition will be the greatest in area, the greatest in variety and scope, the greatest in assured attendance and the greatest in general, technical and personnel significance to the industry."

In further comment, the association's announcement continued:

"Since the close of The Association of Ice Cream Supply Men's second national exposition, held in Cleveland, October, 1923, the ice cream industry has experienced a period which, compared with other two-year periods in its history, may be termed revolutionary.

"New methods and equipment have been developed. Manufacturing consolidations have placed production and distribution on new bases. New approaches to existing markets and new efforts to widen markets have been and are being made. New uses of metals and uses of new metals—and of other basic materials—are now current in equipment. Totally new equipment is receiving the final tests of utilization. New forms for the presentation of ice cream have had, are having, their day. Developments in other industries have automatically affected vitally some phase or phases of the ice cream industry.

"In consequence the third national exposition, from any angle of appraisement becomes the most important actual reviewing point, educational pageant and buying center in the industry's development.

"No comprehensive display of the new developments, of the utilization of the new methods—no charting of the manifold progress in all its phases—have yet been made for the industry. The exposition is that display, review and charting.

"The quarter centennial convention of the National Association of Ice Cream Manufacturers becomes in effect an industrial celebration that will enlist the presence of a multitude of ice cream manufacturers.

"Current equipment and processing developments make the exposition more technical in spirit than preceding shows; technical men will be there in greater numbers. Similarly more plant men, superintendents, minor, as well as major executives, will be present than have attended earlier shows."

IN AN editorial contribution to the Exposition Extra, the miniature imitation newspaper published by The the miniature imitation newspaper published by The Association of Ice Cream Supply Men in the interests of the third national exposition of the industry, a significant depiction of the essential relationship of the supply and equipment field to ice cream manufacture is made by Fred Rasmussen, secretary of the National Association of Ice Cream Manufacturers.

It is printed in the first of the year's Exposition Extras, just issued by the supply association.

Mr. Rasmussen's statement follows:

"The progress of ice cream industry in a large measure is depending upon the activities of the National Association of Ice Cream Manufacturers and the activities of The Association of Ice Cream Supply Men.

"The annual convention-and-show, although it is only a part of the work of these two organizations, becomes an expression of the ice cream industry and an important factor in its future progress.

"The interests of the individuals making up these two groups do not always appear the same, yet everyone recog-

nizes that they have many interests in common; and above all, the most important of these interests is to increase the quality and quantity of ice cream made and sold—in this respect their desires are identical.

"We do not need more ice cream factories, or more supply houses, but what we need is a larger volume of business at reduced cost by our present organizations.

"Ask those who have manufactured ice cream for the last twenty years what changes new machinery and new supplies have brought about in the manufacture of ice cream and in the progress of the industry; there can be but one answer—'New machinery and new supplies have revolutionized the industry.'

"The ice cream manufacturer generally has all he can do in taking care of the work which relates to the manufacture and sale of ice cream, and he depends upon the machinery and supply people to develop and bring to his attention new inventions in these products.

"Salesmen of equipment and supply houses are the promoters and interpreters of new ideas from the shops and factories. They are the connecting link between the ice cream manufacturer and the manufacturer of machinery and supplies, and as such play a very important part in the development of the industry.

"That the National Association of Ice Cream Manufacturers and The Association of Ice Cream Supply Men should join in annual convention and show in October is a logical expression of self-interest. There must be a close relation between the manufacturers of ice cream and the manufacturers and sellers of equipment and supplies.

"They are building together and they will progress together, and the ice cream industry will grow in proportion to the degree to which they co-operate in all problems for the general advancement of the industry."

THE following statement has been issued, through its publications and generally throughout the trade by O. S. Jordan, president of The Association of Ice Cream Supply Men, who has personally witnessed, as have many other heads of its company members, virtually the entire development of the quarter century of advancement of the ice cream industry:

"The supply, equipment and machinery companies upon whose products and services the material requirements of the country's ice cream manufacturers rest, rejoice as greatly as the ice cream men in the tremendous record of progress to be celebrated by the industry in 1925.

"It is amazing to reflect upon this progress, which will be visualized as no other method could visualize it, in the great third national exposition for the industry. The exposition will be held concurrently with the 25th annual convention of the National Association of Ice Cream Manufacturers, the quarter century assemblage of the highest but the broadest council of ice cream.

"Twenty-five years ago not a single ice cream manufacturer had what today we mean by a working plant. Not a single freezer of the type in use today was in effective use. There was no such thing as the modern hardening room. Homogenization had been unheard of in connection with ice cream. There was no pasteurization in ice cream. There was no mixing vat; no holding vat. **There was no ice cream industry.** There was only the beginnings. The few individual ice cream businesses that were really businesses had slight capital, were one or two or three-men enterprises.

"Banks had not heard of ice cream as a business. Today the securities of great ice cream companies are traded in daily in many-share lots, in the stock exchanges of the country. Many million dollar manufacturing companies exist. The million gallon a year plant is not a novel sight.

"A quarter of a century ago an occasional salesman visited an occasional ice cream maker, vending some product applicable to ice cream. Today many millions of dollars are invested in great companies, the sale or major activities of which are the development and manufacture of advanced equipment for ice cream plants. Millions of dollars are invested in the obtaining, preparation and distribution to ice cream manufacturers of essential ingredients for ice cream. Great sums of capital are involved in the effective advertising and merchandising of ice cream for manufacturers.

"Twenty-five years ago there was no written record of ice cream. Today there is a current important trade literature. Twenty-five years ago there was no technology, no science, no training in and for ice cream. Today there are men who really should be termed ice cream 'engineers.' Ice

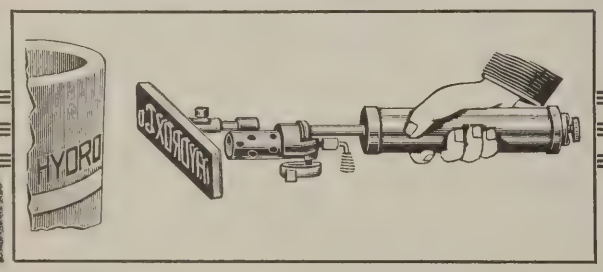
Sanitary Ice Cream Truck

The Sanitary Ice Cream Truck facilitates handling cream from freezers to hardening room.

Will handle any size can in common usage. Avoids accidents in handling, as the operator does not touch the cans until he reaches the hardening rooms.

One man with truck will handle the cream from the freezers as fast as it will flow, no helper being necessary.

Substantially built to stand usage, nothing to get out of order. Can container revolves on a thrust roller bearing and is easily turned.



Style	Diameter	Capacity	Freezer Opening	F.O.B. Price
A	28½ in.	6 cans	30 in.	$50.00
B	23 in.	4 cans	24 in.	45.00
C	34 in.	8 cans	36 in.	62.50
D	40 in.	10 cans	42 in.	75.00

Two or three can containers, placed so that two or three freezers can discharge at one time, can be mounted on one truck, increasing capacity, making less trips to the hardening room necessary. Prices for these special trucks made on application, specifications required.

One regular size truck will be shipped, acceptance on approval.

cream manufacture is a regular part of the curricula of important colleges and universities.

"Twenty-five years ago there was no organizing of industrial interests based upon ice cream. Today there are the National Association of Ice Cream Manufacturers, The Association of Ice Cream Supply Men, and many state and regional organizations in the industry. Twenty-five years ago there was not a man who even imagined an ice cream exposition. Today, this year, there is a great third national exposition of the industry, outranked by less than half a dozen single-industry expositions in the country—probably in the world.

"Many of the supply companies among the membership of The Association of Ice Cream Supply Men have been represented at every ice cream exposition of any magnitude that has been held.

"I speak for all of them in anticipating — not with prophecy but with absolute certainty—the greatest attendance of ice cream manufacturers at this year's exposition that has ever assembled anywhere, for any purpose, at any time."

FORMAL OPENING.

Formal opening of the J. & H. Dairy Co., 118 West Third St., Cedar Falls, Ia., was celebrated one day early in May by inviting the public to inspect the thoroughly modern dairy plant. "Creamery" ice cream, the trade name under which the company will distribute its product, was given to the public in large quantities through the day. Even though the weather was rather cool, adults and children were seen eating many ice cream cones.

George Jensen and U. S. Harvey are the proprietors of the dairy plant. Other dairy products will also be manufactured.

TWO-STORY ADDITION.

The Purity Ice Cream Co., Newark, N. J., is erecting a two-story addition to its plant at 63-67 Lexington St., according to recent announcement. New hardening rooms will be installed, giving the plant a storage capacity of 6,000 gallons of ice cream, we are told by officials of the company.

ICE CREAM MEN WILL ATTEND ROTARY CONVENTION IN JUNE.

Many ice cream manufacturers at this time are dividing their interest between preparations for their own annual national ice cream convention at Detroit in October and the International Rotary convention at Cleveland in June. The Rotary clubs include approximately 250 ice cream manufacturers, many of whom will attend the Cleveland convention and then hurry home in time to shape up affairs for their own silver jubilee at Detroit.

Among the manufacturers who last month had signified their intentions to attend the Rotary convention are:

T. J. McCann, manager of the Imperial Ice Cream Co., Wheeling, W. Va.; Clyde A. Fowler, Rieck-McJunkin Dairy Co., Butler, Pa.; E. B. Hampton, Benton Ice Cream and Bottling Co., Benton, Ill.; Clarence O. Putnam, Utica Ice Cream Co., Utica, N. Y., and L. G. Runk, vice-president, W. E. Hoffman Co., Altoona, Pa.

Ed. F. Dickens, Ed. F. Dickens & Son, Belleview, Ontario, Canada, and Morden Neilson, Toronto, Canada, of Wm. Neilson Limited were not sure last month whether they are coming or not, but "are going to try and make it."

NEW ENGLAND ASSOCIATION MEETINGS.

The May meeting of the New England Association of Ice Cream Manufacturers was being held at Springfield, Mass., as this issue of The Ice Cream Review went to press. Manufacturers met at the Highland Hotel at one o'clock on May 20.

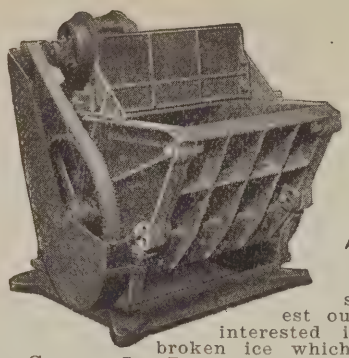
Among matters taken up at the meeting was discussion on insurance of small trucks.

The September meeting of the New England Association of Ice Cream Manufacturers will be held in a place to be decided upon by a committee appointed at the April meeting, this committee consisting of T. P. Grant, J. P. Johnson and W. P. B. Lockwood. The association was informed that the Poland Spring House, where it first planned to hold its meeting, cannot accommodate the manufacturers in September.

OUR MISTAKE.

In the advertisement of the Valentine Machinery & Supply Company, 552 Wrigley Bldg., Chicago, which appeared in the May issue of The Ice Cream Review, a mistake was made in the name of one of the users of Valentine Sucker Molds. The illustration on the left side of the page is of equipment used by the Tabor Ice Cream Company of Cleveland, Ohio, instead of the Taylor Ice Cream Company.

STATE SECRETARIES MAY BE ORGANIZED AT DETROIT.



(Continued from page 12)

secretaries of leading associations in the industry. Any action that may be taken, however, it is generally agreed, will be directed by the national association's headquarters.

The matter now awaits an official bulletin, and there is no indication of when such bulletin will be issued, though it is thought likely that some step in this direction will be taken soon.

You can get somebody to sell you anything you want, if you use "The Ice Cream Review" Want Department.

CREASEY ICE BREAKER

Better Ice for Packing Cabinets

THESE ice cream cabinets for which you supply broken ice constitute one of your heaviest outlays. Naturally you are interested in reducing the cost of broken ice which you must supply. The Creasey Ice Breaker offers the biggest opportunity in that direction, as it gives ice broken to just the right size. This reduces waste from large pieces, which the men usually throw away rather than crack up by hand, and at the same time the amount of snow and slush-ice is much less than with the old style breakers. This is due to the Creasey's sharp pointed, socket-held pick, which shatters the ice like a hand pick, instead of crushing or grinding it. The Creasey interchangeable comb system also helps. All of the ice must be reduced to the regular size, which can be controlled by changing the comb or by moving the adjustable front plate to which the comb is attached. The motor drive is becoming popular because it gives a reliable and constant speed, which is an important factor affecting the size of the broken ice.

The Creasey Ice Breaker is a rugged, husky machine, improved right up to the minute. Many ice cream manufacturers are discarding their old fashioned machines and putting in motor-driven Creaseys in order that the supplying of broken ice may not hold up their output just when they are busiest.

Ask for Catalog R-1125, and submit details of your layout, as our engineers may possibly be able to offer some good suggestions on saving labor in handling ice.

New England Merger to Mean No Change in Management.

Burlington, Vt.—A statement recently made by F. E. McIntosh, president of the Coon Ice Cream Co., with reference to the merger of ice cream and dairy plants in New England, points out that no change in the management or policy of the companies is anticipated as a result of the merger. The New Haven Dairy Co., Tait Bros., Inc., Coon Ice Cream Co., and the Dolby Ice Cream Co. have formed a $5,500,000 merger, and Mr. McIntosh explained that the chief object in making the consolidation was to cover New England, outside of Boston, "in the most efficient and economical manner."

The combined companies make about 4,000,000 gallons of ice cream annually. The Coon Ice Cream Co. has plants in Burlington, White River Junction, Manchester, Portsmouth and Berlin, all in New Hampshire, as well as a plant in Haverhill, Mass., and in Lewiston, Maine. Tait Brothers do a big business in Massachusetts, the Dolby Ice Cream Co. in Rhode Island, and the New Haven Dairy Co. confines its business to Connecticut.

* * *

New York Factory Robbed.

New York City.—Robbers forced their way into the plant of the Reid Ice Cream Co., 613 West 48th St., bound and gagged the watchman after assaultin ghim.

Company officials said the burglars had stolen about $1,000, and had apparently been looking for bonds valued at $25,000, which had been kept in the larger safe up to two months ago, when the Reid company took over the building and business of the Polar Ice Cream Co. Soon after that transaction the bonds were transferred to a safe deposit vault, officials said. The gang of four bound the watchman and then used an electric drill and explosives to break open two large safes and a large steel box, three feet by five feet. A long time was spent by the burglars in sorting papers and checks and looking for cash.

* * *

Horton's Sells 5,000,000 Gallons a Year.

New York—One of America's oldest and greatest ice cream companies—Horton's—serves 5,000,000 gallons of ice cream to 9,000 dealer customers each year. The Horton ice cream business was established in 1857. When Jenny Lind sang in the famous old Castle Garden more than seventy years ago, New Yorkers regularly ate their dish of Horton's. When the first battle of Bull Run was fought in 1861 Horton's ice cream had been pleasing the appetites of New Yorkers for more than ten years. It is still growing and produces more cream each day, and sells it more successfully than any other like concern in the world. Good management, good goods and service keeps it in the lead.

* * *

Rochester Ice Cream Company Not In Merger.

Rochester, N. Y.—A denial has been issued by Samuel T. Nivling, president of the Rochester Ice Cream Co., that his firm is to be included in a giant merger of eight northern New York ice cream companies, which was reported to be moving to form a corporation with a capitalization of $30,000,000. "There is absolutely no foundation to the report," Mr. Nivling said, speaking of the Rochester Ice Cream Co.'s reported connection with the merger.

Announcement also has been made that the J. M. Horton Co. of New York City has rejected the proposal to enter its firm into the reported merger.

Penn State Seniors Visit Dairy Plants.

State College, Pa.—Eleven seniors in dairy husbandry at the Pennsylvania State College made an annual inspection trip to milk and ice cream plants of Harrisburg and Philadelphia, April 6 to 9. The group was in charge of Prof. W. H. Martin, head of dairy manufacturing work at the college.

On April 6 they visited Russ Brothers' ice cream plant, the Hershey ice cream plant, and the Pennsylvania Milk Products Company plant in Harrisburg, and then went on to Philadelphia.

April 7, 8 and 9 were spent in the Quaker City. The party there visited the milk and ice cream plants of the Supplee-Wills-Jones Milk Company, the Philadelphia Dairy Council, the market milk plant of the Scott-Powell Dairies, the market milk and ice cream plants of the Breyer Company, the Colonial Ice Cream Company, two milk and ice cream plants of the Abbot Company, and the butter market.

* * *

Business Anniversary Observed.

Philadelphia, Pa.—The week of April 6 marked the sixth anniversary of the entrance of Abbott's Alderney Dairies in the ice cream business in Philadelphia, Camden, Atlantic City and Bridgeton. The occasion was observed by the company with a celebration at its large Philadelphia plant. Ice cream dealers from Philadelphia, Camden, and various other cities for miles around Philadelphia attended the celebration. They inspected the making of Abbott's ice cream and the plant.

Since its modest start six years ago, the Abbott's ice cream business has grown till today it ranks as one of the leading ice cream manufacturing concerns of the industry.

Safecrackers Get $2,000.

New York, N. Y.—Safecrackers ripped open two large safes in the office of the Harrison Highgrade Ice Cream Co., Inc., at Nos. 59-61 Goerck St. They escaped with more than $2,000 in cash, several liberty bonds and small pieces of jewelry. The damage they did was more than $3,000.

Max Swersky, the manager, found the place in disorder when he opened the office. Although detectives believe the robbers must have been at work at least six hours, no one in the neighborhood heard the noise.

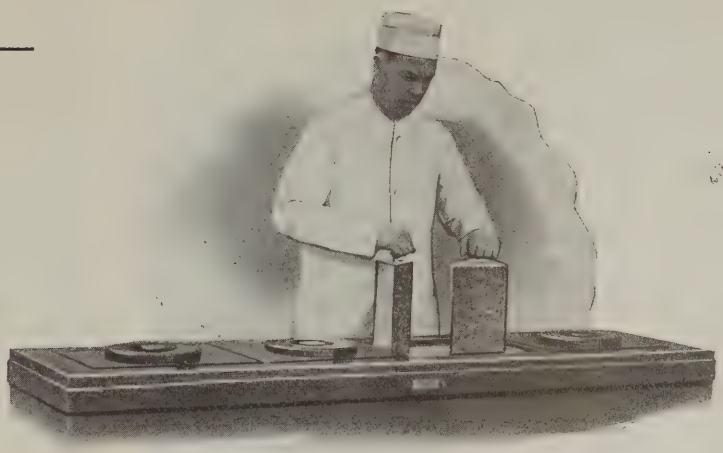
SOUTH.

Some Ice Cream History.

Nashville, Tenn.—Some interesting history on the development of the Nashville ice cream industry was given in a story in a recent issue of The Nashvile Banner, the author being Laura Norvell Elliott. Speaking of the industry's evolution in that city she said:

The growth of the ice cream industry in Nashville during the past fifty years would seem phenomenal were it not for the fact that this particular product is so new in the world that its development may be likened to the growing years of a child when rapid growth is naturally expected. The fact is, ice cream was just about born fifty years ago and it is still so young as an industry that it has failed to reach its full stature and maturity. But it has gone a long way.

For instance, fifty years ago C. H. A. Gerding, pioneer ice cream manufactuurer of the city, was turning a little five-gallon hand freezer, which represented his day's output. While today the output of one plant alone in Nashville, that of the Union Ice Cream Company, runs daily into the four-thousand-gallon figures.



The growth of ice cream during those earlier years was attributable to its popularity as a dessert. It was hard to make, correspondingly expensive and accepted by the hostesses of entertainments as the crowning feature of their parties or dinner menus. But the growth of ice cream in recent years is not only attributable to its popularity as a dessert, but to the fact it has come to be recognized as a really excellent food. Mothers are feeding it to young children in the place of fancy drinks and candies, and doctors are recommending it as an article of diet for invalids and all who are under-nourished. Nashville is still far below the per capita consumption of ice cream as compared with eastern cities of the same size, but the population as a whole is waking up to the advantages of ice cream as a daily article of diet and the per capita consumption is increasing accordingly.

From the beginning C. H. A. Gerding proved that ice cream was wanted and other people began making it. Rogers Brothers opened an "ice cream store" and later this company was succeeded by the Nashville Ice Cream Company, which bought them out. Working for the Nashville Ice Cream Company in those earlier years was a youngster by the name of Drake. Though only a boy, he caught a vision of what the ice cream industry

Naturally—

This Cartridge is Standard for any Waltham Truck or Cabinet, and for any Soda Fountain.

THE Waltham System is extremely simple. Sealed inside these interchangeable cartridges is a special chemical compound, a compound which will not only freeze, but whose temperature can be reduced far below the freezing point. It is a routine matter to freeze these cartidges in your hardening room to ten below zero.

The driver, delivering cream at a store, simply leaves fresh cartridges at the same time. The used cartridges, still retaining most of their refrigerant, come back to the hardening room and stay there just long enough to drop the temperature by the few degrees that it has risen in the store. The freezing cost is obviously slight.

Cabinets, soda fountain inserts and truck bodies made by this company have been worked out to handle this system so that it yields remarkable profits.

Operation Cost is Lower

And your equipment investment is also less with the Waltham System of refrigeration for ice cream distribution. It is iceless, saltless and non-mechanical. It is easy to run; it is quicker and cleaner than ice; it pleases your dealers; it boosts your sales, and it has been in actual use long enough to prove its superiority in practical business.

Here is the record of the latest engineer's test of the Waltham System. Note the even temperature maintained by the cream when the refrigerating cartridges are replaced only once every forty-eight hours.

WALTHAM CABINET TEST

Average room temperature 70°
Cartridges changed every 48 hours

March 25	11
March 26	6
March 27	8
March 28	7½
March 29	10
March 30	7
March 31	8½
April 1	6
April 2	7
April 3	5½
April 4	8½
April 5	5
April 6	7

Note: At no time during the test run was the cream soft. It was hard and in good serving condition throughout the test which as shown was continued through a period of 12 days.

How would you like to hold all your cabinets like this? Especially when both investment and running expenses are lower than with any other system.

THE

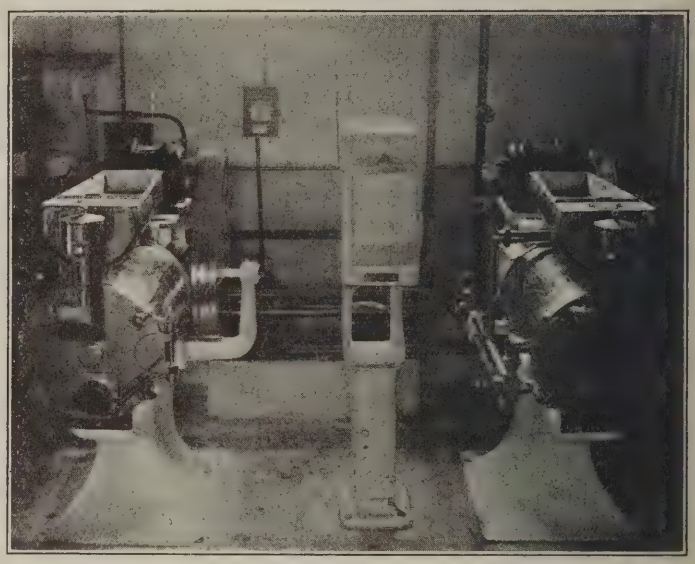
HOUSING COMPANY, WAVERLEY, MASS.

could become, and he stuck to it until as W. E. Drake, secretary and general manager of the Union Ice Cream Company, he heads what is generally conceded to be the largest ice cream company in the Middle South today.

Other early ice cream companies in Nashville included those of Henry Sudekum, father of the "Sudekum boys," John Decker and Dorider and Sidebottom. Of those very early companies the only two remaining are Decker's and the Union Ice Cream Company, the latter being a combine of the Drake and Sudekum interests.

When Mr. Sudekum was asked what he remembered about the early days of ice cream making in Nashville, he replied emphatically:

"Remember? Doggone hard work—that's what I remember!"



Mr. Sudekum then went on to explain how ice cream manufacturers had first operated little five-gallon, hand-turned freezers, that they had then "fooled with steam for awhile," and felt they had reached the pinnacle of success when gas power was discovered. With the coming of electricity to the industry twenty-five years ago, Mr. Sudekum declared everything was literally revolutionized and the business sped forward.

While there are approximately one dozen firms making ice cream for their own use in Nashville, there are but three large manufacturing plants, which supply the trade generally, these manufacturing plants being Decker's, Taylor's and the Union Ice Cream Company.

Additional Equipment for Clopton.

Decatur, Ala.—Additional equipment has recently been installed in the factory of the Decatur Ice Cream & Creamery Co., of which J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers, is president and manager. The company recently bought two 50-quart direct

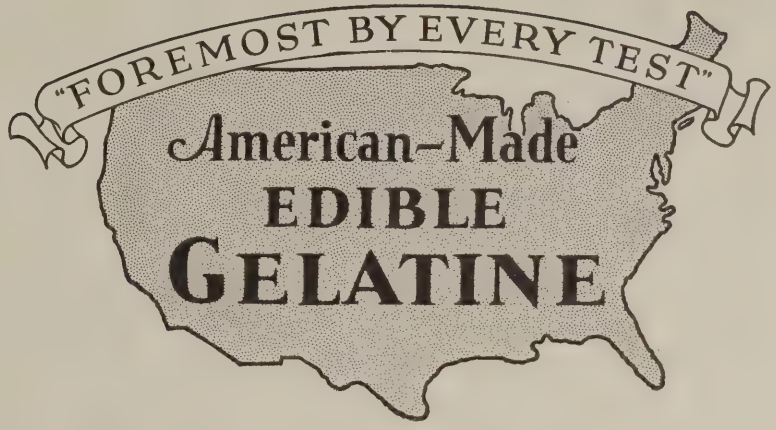
Partial view of freezer room, Decatur Ice Cream Co., Decatur, Ala.

motor driven freezers that are now in operation. These freezers have a capacity of one gallon a minute each.

The company also purchased and recently was installing an additional 6½ by 6½ refrigerating machine, which will double the refrigerating capacity and will enable the company to have a complete double unit on all equipment in the plant.

"Business has been fine with us so far this season and we promise to show an excellent gain over 1924," states Mr. Clopton.

* * *



Shetler Heads New Company.

Wheeling, W. Va.—A new ice cream company will operate under the name of the Shetler Ice Cream Company and conduct business in Wheeling, Moundsville and Bellaire, according to announcement. George W. Shetler, until recently manager of the Shetler Hygrade Ice Cream Company, here as vice-president of the Baker-Evans Co., its owners, resigned his position recently to accept the presidency and general managership of the new organization.

Mr. Shetler has severed his connection with the Baker-Evans Co., of which he was vice-president, and manager of the Wheeling plant named after him. He stated that the present Shetler Hygrade Ice Cream Co. would probably now assume the name of its owners, the Baker-Evans Co. Mr. Shetler's resignation became effective Sunday, March 15.

Incorporated for $50,000.

The new organization is to be incorporated for $50,000. Proper papers have been filed at Charleston, and proceedings are now under way to effect the incorporation. Mr. Stetler

WHY?

Many Ice Cream Manufacturers are now using only *American-made* Gelatine in their product.

Because—

It is made where government standards for purity, cleanliness and quality are the highest of any country in the world.

Because—

American manufacturers of gelatine are spending thousands of dollars to tell the public of the health value of gelatine products.

Because—

In every way, American made gelatine is "Foremost by Every Test."

stated that it would likely be completed by tomorrow, Thursday.

The new company has already acquired two plants, located at Bellaire and Moundsville. They have absorbed the Old Home Dairy at Bellaire and the Purity Ice Cream Company at Moundsville. Mr. Shetler stated that, although the products of the two plants would be sold in Wheeling, no plant has yet been established in this city. The company, however, plans to establish a plant as soon as a favorable location can be secured.

Mr. Shetler stated that the new concern is confined strictly to the Ohio Valley, using Ohio Valley capital, and Ohio Valley wheat cream, unlike competitive companies. The Baker-Evans Company, for instance, operates plants at Cleveland, Youngstown, Huntington, Wheeling and Lagon, W. Va.

Kentucky Company Stages Ice Cream Parade.

Louisville, Ky.—The National Ice Cream Co., Louisville, operating the largest plant in the state, and a very sanitary one, staged a big parade through the business district of Louisville on Saturday, May 2, lining up forty trucks, three double team wagons and four single team wagons, having a total of 47 vehicles used in delivery service, besides some outos. The parade was headed by a machine in which rode Mayor Quin of Louisville; General Manager W. A. Heuser of the company, and prominent business men and city officials. From the trucks toy balloons were passed out in numbers and a large quantity of brick ice cream, put up in special cartons so that it could be pitched to crowds along the parade line. It took one hour and 35 minutes to complete the route, which took in the principal streets with the exception of Fourth St., on which the city permits no parades.

* * *

"Daddy" Williamson Pins Faith to Quality.

South Pittsburg, Tenn.—The ice cream manufacturing concern operating here was opened in 1918 by A. R. Williamson, present proprietor of the Williamson Ice Cream Co. Since beginning operations, the company has endeavored to produce a quality product, and, according to Mr. Williamson, this factor is greatly responsible for the rapid increase in business. It is reported that the plant is at the present time one of the most modernly equipped ice cream manufactories to be found anywhere.

Mr. Williamson reports that he specializes in fancy creams and unique designs for parties.

* * *

New Poinsettia Plant Opened.

Orlando, Fla.—The new plant of the Poinsettia Ice Cream Co. was opened with public ceremonies on May 14, with many visitors on hand. The plant is on Boone St. From 3 o'clock to 5 o'clock, there were constant streams of visitors to look over this plant, which is one of the most up-to-date ice cream factories of any city this size in the country.

W. J. Barritt, past president of the Southern Association of Ice Cream Manufacturers, is head of the Poinsettia Ice Cream Co. The main plant is located in Tampa. There are branch plants at St. Petersburg, Lakeland and Clearwater.

* * *

Southern Items.

Memphis, Tenn.—The ice cream industry in the Sunny South is coming back again with more and better business in 1925. The season is opening up rapidly, though there was some prolonged cool weather in March. There was not much winter, and the winter and pre-spring trade season has been about normal. Many new entries in the trade and some improvements with the old established places are announced.

The Consumers' Supply Co., Murfreesboro, Tenn., is operating a large ice cream factory in that city, the county seat of Rutherford county, one time the capital of the state in pioneer days.

Humboldt, Tenn., is to have a new ice cream factory. This is the largest town of Gibson county, located on the Mobile and Ohio and Louisville and Nashville railroad. G. T. Barger of East St. Louis, Ill., has been there perfecting arrangements. The factory will be located in the building recently occupied by the Coca-Cola Bottling Works, on Ninth Avenue, and was started late in April. Humboldt has under way a new union depot.

The Poplar Ice Cream Co., L. Coletta, proprietor, 806 Poplar Avenue, Memphis, has a modern and sanitary place, opened a year or so ago at that location. Mr. Coletta has

been an ice cream man in Memphis for years. This company is featuring brick and bulk ice cream.

The Irvin Ice Cream Co., Houston, Tex., is featuring Hy-Grade ice cream and Eskimo pies this spring.

Henderson & Ulrey, Barbour Place, Memphis, are featuring ice cream tubs and other wooden containers.

The Union Ice Cream Co., Nashville, Tenn., one of the largest industries of its kind in the South, has been taking some entire page advertisements in the daily editions at Nashville. Many new packages, both quart and pint size, have been introduced. Many of the grocers are handling this product. A very fine list of dealers who handle the product is published.

The Brinkley Ice Cream Company's factory, Brinkley, Ark., was formally opened for business in April. The management celebrated the occasion by keeping open house and serving samples of the ice cream to about 800 visitors, including residents of Clarendon, Brasfield, Wheatley, Cotton Plant and other neighbors. Cecil Simpson is local manager. N. Perry will be in charge of the manufacturing end. In the contest to secure a name for the product of the factory, the name, "The Cream of Creams," suggested by Mrs. W. B. Williams, was adopted.

The City Creamery, Third and Rock Sts., Little Rock, Ark., in a page display in the Little Rock papers invited a spring visitation of their friends to visit "Arkansas' largest and most completely equipped ice cream plant." Demonstrations were made on the Nizer cabinets by engineers and experts. The factory has been extensively remodeled and enlarged since last season. They pasteurize all the cream, milk, sugar and eggs which they receive in large glass lined receiving vats. The company has a complete ice-making machine that makes 20 tons of ice a day for the packing of ice cream to be shipped to all parts of Arkansas. There are three large storage rooms, where perpetually snow-covered ammonia pipes keep the thousands of gallons of cream at zero temperature.

John Decker & Sons, 1411 Church St., Nashville, is one of the celebrated ice cream concerns of Nashville. For thirty-five years, since 1890, when established, this company's name has been Synonymous with pure ice cream and candies in the Nashville section. John and George Decker head the business.

PACIFIC WEST.

San Francisco Ice Cream Company Lauded by Civic Publication.

San Francisco, Cal.—A recent issue of the San Francisco chamber of commerce publication, known as "San Francisco Business," carried an interesting article about the development of the ice cream industry in that city, which particularly featured the plant of the National Ice Cream Co. This ariticle shows that the National Ice Cream Co. was organized in 1906, that year producing 50,000 gallons of ice cream, whereas today, in a much larger plant, this company has an annual output of 1,300,000 gallons. The article had some interesting things to say about the development of ice cream consumption in California, where the per capita consumption is greater than for the nation as a whole. It was pointed out:

"Not only, too, has the development of the production end been carefully and painstakingly built up, but the matter of education has come to enter into the industry—education of the public to the food values of ice cream—and actually the industry has been forced to expand all along the line to meet this created demand until the modern, sanitary ice cream plant of great proportions has become an involved and exceedingly detailed piece of mechanism.

"Probably the best illustration of the industrial end of the business is found in the progress of the National Ice Cream Company, 366 Guerrero St., by far the largest ice cream plant in this district."

The headquarters of the National Ice Cream Co. are in San Francisco. From this center there is conducted a wide distributing business from plants around Sonoma, Marin, San Francisco, San Mateo, Napa, Alameda, Contra Costa, Monterey and Santa Clara.

The article shows that the National Ice Cream Co. has 300 employees on an average, and in the summer months they have between 400 and 500. The company has a fleet of five glass-tank trucks in operation and a total of 150 vehicles in operation in various departments of distribution. G. Smith, plant manager of the company, was quoted as follows:

" 'So,' said Smith, 'we have been building and expanding constantly, and as we have done so the consumption of our product has increased proportionately. In California last

New Ice Cream Confection.

Seattle, Wash.—"Snax" is the name of a new ice cream confection introduced by the Velvet Ice Cream Co. It is the result of experiment to devise something combining the ice cream cone, the frozen bar and the ice cream sandwich, this experiment covering more than a year, according to S. H. Berch, president and manager of the Velvet Ice Cream Co. He added:

"For more than a year," states Mr. Berch, "we have been experimenting upon this combination of ice cream and cake, striving to perfect something which would combine the advantages of the ice cream cone, the ice cream sandwich and the ice cream bar and eliminate their disadvantages. Naturally, the principal difficulty in using a cake shell to pack ice cream in at the factory lay in getting a cake that would be perfectly pure, wholesome and palatable and at the same time stand up for a sufficient length of time after being filled.

"When we finally achieved that, it was necessary to have machinery made which would produce these cake shells in large quantity and fill them automatically. Now we can make and fill great numbers of 'snax' per day, and none of them are touched by human hands at any stage of the process. The result is a package that is perfectly sanitary, that enables the dealer to hand them out with the greatest rapidity and without loss of time either to his customer or himself, and that does not make the fingers sticky and mussy.

"We are opening distribution of 'snax' in Seattle but expect to extend it as rapidly as manufacturing facilities will permit and are confident that it is going to become an unusually popular article."

Growth of Washington State Plant.

Tacoma, Wash.—The rapid development of the business of the Olympic Ice Cream Co., especially during the past two years, was outlined in an article in the Tacoma Ledger. The company started in business 15 years ago as a small retail plant manufacturing what was then considered a luxury. It now occupies a plant at 613-15-17 East 35th St., valued at a quarter of a million dollars.

In 1923, when A. Robbins became manager of the company, a survey conducted showed that 40 per cent of the ice cream consumed in Tacoma was manufactured outside the city and shipped in. However, under Mr. Robbins' management, this situation has been changed and it is reported that not only has the importation been stopped, but a very considerable amount of ice cream made in Tacoma is now shipped to other points. The company has originated many distictive flavors and packages besides the usual forms and flavors of ice cream which have come to be considered as standard.

The plant is described as "a model of convenience and sanitary arrangements," and it is reported to be one of the most complete and well arranged ice cream factories in the West.

Ice Cream Leaders Plan Washington's Dairying Development.

Seattle, Wash.—Dairy leaders of the state of Washington are looking forward to the time when dairying will supplant lumber as the chief industry of that state, and with this thought in mind, representatives of all branches of the dairy industry met recently at the Chamber of Commerce building to effect a permanent organization. The object of this association is to educate the public to the wider use of milk, milk products and different features of the dairy industry.

The meeting was attended by delegates from the Ice Cream Makers' Association, Milk Distributors' Association, and Buttermakers' Association.

W. V. S. Robb of Seattle, former president of the Pacific Association of Ice Cream Manufacturers, H. E. Turner of Turner & Pease, and Frank Bird of the Pure Milk Dairy

were authorized to select a committee of fifteen representing dairy interests throughout the state to prepare a plan of organization.

It was pointed out by Prof. E. V. Ellington, head of the dairy department, Washington State College, Pullman, that Washington's $40,000,000 dairy industry is being weakened by lack of organization, internal dissension and dairy substitutes. He said it is important that the dairy interests of the state organize to combat influences that are undermining the strength of the dairy industry.

Dr. L. C. Pelton, superintendent of dairying and livestock of the state department of agriculture, Olympia, pointed out some ways in which a dairy council could serve the industry and supplement the work of the state department. J. A. Scollard, president of the United Dairying Association, a statewide organization with headquarters in Seattle, pledged the support of the 7,000 farmers in that organization.

Other speakers included Mr. Robb, Mr. Bird, Dr. E. A. Smith, chief of the city milk inspection department; R. W. Frame, one of six representatives of the Northwest products committee of the Seattle Chamber of Commerce attending the meeting, who pledged the support of that organization; F. V. Fisher, president Seattle Cream Company; James Crehan, manager of the Mayflower Dairy; August Kristofferson, manager of A. Kristofferson, Inc.; Carlyle Hall, Bradner & Co.; Otto Tamm, Enumclaw Co-operative Company; Harvey M. Shaffer, president Seattle Milk Shippers' Association; Clyde Palmer, Dairy Machinery Company; George Gue, Auburn, and Thomas Owens, Redmond.

* * *

130,000 People Supported by Dairy Industry in California.

San Francisco, Calif.—Enough people to populate a city nearly as large as Sacramento and Fresno combined are constantly dependent upon the dairy industry of California for their livelihood. This is the statement of Sam H. Greene, secretary-manager of the California Dairy Council, following a complete survey of the dairy industry of the state. The figure totals 130,000 persons and includes the families that are engaged in the production, manufacturing and distributing branches of the great dairy industry which last year returned $119,000,000 in actual money. It is roughly figured that 100,000 people are in the production branch of the industry, and approximately 30,000 are in the manufacturing and distributing branches.

In the production of dairy products alone, there is an investment of upwards of $250,000,000, or nearly half the total which California received last year for all of its agricultural products. This figure covers only the land, buildings and equipment, and cattle which furnish to California's distributing and manufacturing plants the millions of gallons of milk, and millions of pounds of butter and cheese, and evaporated milk, and millions of gallons of ice cream. It does not include the investment represented by the state's 750 odd manufacturing and distributing plants and the vast number of vehicles of transportation attached thereto.

The dairy industry of California is now making a fight to have passed Assembly Bill 878 to regulate the manufacture and sale of oleomargarine and to place a tax on this commodity.

Opening of New Plant.

Opening as the Glacier Creamery at 606 East A Street, Ontario, Calif., a new ice cream plant was started by D. W. Dillingham, president, Mark Dillingham, factory superintendent, and C. E. Light, secretary-treasurer, May 2, 1925.

Mark Dillingham is a graduate of the University of Wisconsin and for a time worked for the George C. Mansfield Co. of Milwaukee. He came out to California three years ago, working for the Los Angeles Creamery about two years and for Arrowhead Creamery, San Bernardino, a few months. The two brothers were in business at Otis, Colo., before coming to the Pacific shore-land. D. W. Dillingham has been with the Crescent Creamery, Los Angeles, as salesman, and for a time with the Los Angeles Creamery in the pasteurizing department.

They expect to work around a 250-gallon capacity on ice cream for the present, devoting other parts of their equipment—which is said to cost about $4,000 to $5,000—to butter, bottled milk and cream. Their slogan is to be "Quality to Spare."

What will probably be simply known as "Fosselman," is to be a modern plant devoted to the manufacture of ice cream for wholesale distribution at 444-448 South Fair Oaks

Bankers Enthuse Over Globe Plant.

Los Angeles, Cal.—On April 25 a committee of the members of the Los Angeles Chapter, American Institute of Banking, visited the Globe ice cream plant, located corner of Jefferson and Hill Sts., Los Angeles, to make their own inspecion. This fraternity of bankers, without officials' previous knowledge, made a request to be shown through the Globe plant. Since the various ice cream manufacturers throughout the United States are keenly interested in the important topic pertaining to their business, and of obtaining public interest and keeping it, the photograph of the group of bankers standing in front of the main entrance of the Globe plant again proves that people will go out of their way to visit an ice cream factory when they hear so much about it, when they themselves are firmly convinced it is worth their time to go on a tour of inspection, as they did on April 25, when they called in a body, spent two and one-half hours hours in our plant, and showed they were keenly interested. They listened very attentively as the lectures were given, and after they had completed their tour of inspection they went away "strong boosters for ice cream." Under date of April 27 the following letter was received by A. A. Comey, vice-president and general manager of the Globe Ice Cream Co.:

Los Angeles Chapter American Institute of Banking,
721 So. Hill St., Los Angeles, Calif.
April 27, 1925.

A. A. Comey, Vice-President and General Manager:
Globe Ice Cream Company, 230 West Jefferson St.,
Los Angeles, Calif.
"Dear Sir:

"On behalf of the officers and members of the Los Angeles chapter, I want to express our appreciation to the Globe Ice Cream Co. and to you personally for the courtesy extended to us on Saturday in affording our membership a tour of inspection to your plant.

"To me personally, and to all those who attended, I believe it was a very instructive and enlightening visit. We were all impressed with the very evident desire on the part of your company to serve the public the very best at a reasonable price. No one who passed through your factory could help seeing that the plant was a model of cleanliness and efficiency.

Yours very truly,
(Signed) E. G. POMEROY,
President."

A snapshot of the visiting bankers.

Increases Ice Cream Sales 33 1/3% During January and February

Morgan Bros. Drug Stores

Store No. I
3001 P St. Nw.

Washington, D.C.

March 27, 1925

Zero Products, Inc.,
623 B Street, N.W.,
Washington, D.C.

Gentlemen:

Confirming our recent conversation; while I was favorably impressed with the claims made by your salesmen to me regarding Zero Heathized Ice Cream, I was not fully sold on your product until I had personally examined the official records of the Board of Health of Washington, D.C. These records clearly evidenced that Zero Heathized Ice Cream was not only the purest, (indicated by lowest bacterial count) but the richest.

Proof of Purity

Since I made the change to Zero Heathized Ice Cream, about six months ago, I have noted a very marked increase in my Ice Cream business. I have just carefully checked my gallonage purchases and find that; comparing the months of January and February of 1925 with the corresponding months of last year, I have purchased and sold 33-1/3% more Ice Cream.

33 1/3% Increase

While these figures are very gratifying, they do not express my ultimate satisfaction, namely; the pleasing of my customers. Several of my patrons, not knowing of my changed Ice Cream, were under the impression that Zero Heathized Ice Cream was one of the fancy Ice Creams made by one of Washington's leading caterers. I have had more favorable comments on the quality of Zero Heathized Ice Cream in the last six months, than I have received in all my previous many years experience, combined.

Pleased Customers

In addition to the above, it gives me great pleasure to state that the service I have received from your company is of the best. I have found it dependable, courteous and most satisfactory.

Yours very truly,

MORGAN BROS. DRUG STORES,

By M. W. Morgan

There's proof for you! An ever-growing following is demanding Heathized Ice Cream from our clients' dealers. They may not have told you that they do, but the hundreds of thousands of gallons added to our business tell us they know about it and that they seek the dealers who display the Heathized sign.

Write us today and let us show you how Heathized Ice Cream will increase your sales and profits.

ICE CREAM IS A BUY-WORD IN CALIFORNIA.

Much Activity Noted Among Manufacturers in Coast Cities.

By Emil Held.

Los Angeles, Calif.—The Golden West appears to have held its own and progressed in the ice cream industry. The "season" was off to a good start. Buying power is greater this year. Manufacturers are making greater sales efforts. Plants are being enlarged and improved.

With a daylight capacity of about 6,000 gallons a day at 817 East Eighteenth St., Los Angeles, the Alfred Pure Ice Cream Co., Inc., is having an addition erected just east of the present structure, which will enable the company to double its facilities for freezing, mixing and hardening.

C. J. ALFRED

C. J. Alfred, president of the company, foreseeing the possibility of expansion, planned eleven years ago with that idea in mind. The freezing room on the main floor was at that time placed on the east front half, and in like position on the second floor the mixing room was arranged. When the new building is completed in July, it will only be necessary to remove these sections of the wall in order to connect the units for the expansion of these two departments.

The new structure will have three floors, each 46 by 100 feet in dimensions. The old cooling tower will give place to a new one in the addition where also a hydraulic elevator will be installed. Another 50 h.p. boiler is to be added.

The brick and concrete garage and warehouse adjoining the rear of the present structure will also touch the new addition, walls being altered to meet requirements of easy access to paint shop and supply rooms on second floor. A new packaging machine awaits completion of these changes.

Alfred's New Plant.

Excavations under the addition now in course of erection have been prepared for further installation of another 50-ton ice tank.

The total plant was started 11 years ago with an opening June 15, 1914, construction having been begun in 1913. Mr. Alfred came to California foom Ridgeway, Pa., where he had been in the ice cream manufacturing business for 30 years. He sold out there to a firm which still continues his old firm name.

Six years ago Alfred's added a plant in San Bernardino

We recommend "UNEEDA BAKERS" Ideal Wafers. National Biscuit Branches thruout the U. S. can supply Ideal Wafers for Sanisco Machines at $1.70 per container of 725 wafers, or you can order direct from us.

No Sales Lost with SANISCO *Service*

TRADE MARK

When the crowds come thick and fast around your ice cream counters at the beaches and summer amusement places, your ability to boost gallonage is dependent upon the speed of service your dispensers can render.

Every customer that turns away for lack of service is so much gallonage gone. Can your stands afford to turn away business for lack of service when a "Sanisco," the quickest serving outfit, can be had on such reasonable terms?

The Sanisco Company

1019 3rd Street Milwaukee, Wis.

AVOIDING MISTAKES

More mistakes are made through lack of information than through intentional carelessness.

Lack of sanitary cleanliness in the manufacture of ice cream always results in loss of quality and profits, both of which are easily preventable when

Wyandotte Sanitary Cleaner and Cleanser

is used.

Hundreds of ice cream producers first tried and then continued to use this unusually efficient, uniform, quality cleaner for they found it not only equal to all claims as to its purifying and cleansing properties, but also that it reduced cleaning costs to a minimum.

These results are guaranteed with every barrel of Wyandotte Sanitary Cleaner and Cleanser or the trial costs nothing.

It cleans clean.

Ask your dealer.

for hardening its Los Angeles product for trade in that territory, after having carried on agency distribution for three years prior to that time. A five-ton electric truck is being used to haul the product of "The Sanitary Factory," as the plant is called, to the city which is the beginning and the end of the trail known far and near as the "101 mile drive on the rim of the world."

Alfred's has a creamery at Tipton, where the Southern Pacific Railway sets a refrigerator car every morning for shipment that night of cream, as well as evaported milk, in 100-gallon cans to the Los Angeles factory.

In addition to using bulletin boards, some newspaper advertising and attractive cut-outs, this firm issues "Alfred's Dealer Magazine" exclusively for the trade; a magazine for consumers with which to interest consumers in their products, and occasionally a booklet entitled "Ice Cream Novelties for Special Occasions."

The company includes the president and founder, a son, M. I. Alfred, vice-president, and R. J. Powell, secretary-treasurer.

* * *

Blair & Helm, who have conducted a dairy at Brawley, Calif., are adding a small ice cream plant and will also engage in the wholesale distribution of the frozen dainty. They expect to meet growth as warranted.

Notes From Far and Near

WASHINGTON — MAINE
CALIFORNIA — FLORIDA

Pine Bluff, Ark.—Charles Hooberry, manager of the Velvet Ice Cream Co., with branch at McGehee, purchased $15,000 worth of machinery and equipment for the two plants. Mr. Hooberry looks forward to a very prosperous ice cream year.

Hornell, N. Y.—The Hornell Ice Cream and Candy Corp. has been incorporated with a capital of $25,000. Among the incorporators are E. S. Copeland and M. I. Landman. The attorney in charge is J. T. Foody.

Schenectady, N. Y.—The case against the International Ice Cream Co., conducted before the federal trade commission by reason of alleged discrimination in prices, has been dismissed by the board after a long legal controversy. The Country Maid Ice Cream Co. of North Adams, Mass., asserted that its business was materially injured because of the practices of the International Ice Cream Co.

Osage, Kans.—The Osage Ice & Ice Cream Co. has been incorporated with capital of $25,000.

Burnet, Tex.—The Burnet Ice Cream & Produce Co. has begun construction of a cold storage plant.

Lyons, Kans.—The Sterling Ice Cream Co. has enlarged its hardening room from a daily storage capacity of 200 to 600 gallons. The plant is under the management of Hugh Adams.

Arkansas City, Kans.—The Radley Ice Cream Co. is successor to the Finney Ice Cream Co. C. A. Radley is the owner and L. J. Blevins, general manager.

Johnson City, Tenn.—A consolidation of six ice cream corporations was formed which operated in Bristol, Johnson City and Kinston, Tenn., and Appalachia, Va. The new concern, Southern Ice Cream Co., will operate with headquarters in Johnson City. S. R. Jennings is president.

Evansville, Wis.—The Crystal Ice Co. has made improvements in its plant and machinery has been installed for the manufacture of ice cream.

Concord, Mass.—The Beaverlock Farm, Inc., is building a modern creamery and ice cream plant.

New Glarus, Wis.—The Eagle Products Co., recently incorporated with $50,000, will manufacture ice cream and beverages. Incorporators are C. E. Trainor, H. H. Kuntz and Joseph E. Dorais.

Jersey City, N. J.—Fred Bosselman of 126 Monticello Avenue, suffered loss through having the interior of his ice cream manufacturing establishment destroyed by fire.

Jersey City, N. J.—R. F. Shortmeier has moved from his old address at 312 Central Ave. to 302 Central Ave.

Bristol, Tenn.—The Southern Ice Cream Co. was granted a charter authorizing it to manufacture and deal in ice cream, with capital ranging from $500 to $100,000. The incorporators are George C. Sells, president; A. B. Bowman, secretary, and J. H. Simmons, treasurer, all of Johnson City, Tenn.

The Olsen Publishing Company
5th & Cherry Sts. Milwaukee, Wisconsin

Miami, Fla.—Buena Vista Ice Cream Co., established by J. R. Boyd and P. P. Bourier about two years ago, finds it necessary to enlarge its plant.

Frederick, Okla.—M. T. Cochran, who operates an ice cream plant at Altus, Okla., will open a plant at this point.

Harrison, Ark.—A new ice cream plant has been opened here by W. S. Bennett on North Spring St. Although the plant is only of moderate capacity, it is equipped with new and up-to-date machinery.

Walnut Ridge, Ark.—The Moore Ice Cream and Bottling Works has been sold by D. B. Moore to W. E. Sauer. The new concern will be operated under the firm name of Walnut Ridge Ice Cream Co. Mr. Sauer announced an expansion program for this summer as well as improvements to the plant.

Indianapolis, Ind.—The Branham & Camp Ice Cream Co. will open a plant at 1948 Park Ave.

Memphis, Tenn.—The Lily Ice Cream Co. is reported as now being affiliated with the National Dairy Products Corp., a $15,000,000 firm of a national scope. Stock in the local business was exchanged for listed stock in the corporation, but the Lily company will continue to be operated under the old management.

Ely, Neb.—Good progress is being made on the installation of ice cream machinery in the remodeled plant of the Ely Cold Storage Co.

Bristol, Va.—The Dixie Ice Cream Co. has been incorporated with capital stock of $50,000. W. L. Gemmel is president and E. C. Hamilton, secretary. A new factory is being erected on Commonwealth and Euclid Aves.

Gallatin, Mo.—The Runnels Bros. Ice Co. is installing a modern ice cream plant, to be operated in connection with its ice plant.

HOW FAR IS THIS TO GO?

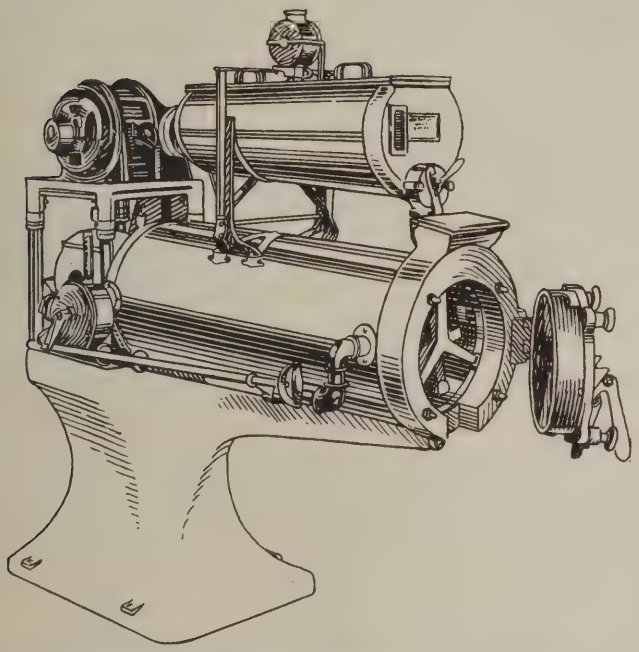
Ice cream delivery was halted one day early in May in Chicago due to officials of the Chicago Ice Cream Wagon Drivers' Union asserting that 350 members of their organization had been locked out by ice cream manufacturers without notice. The manufacturers denied this charge. An all night conference between employers and union officials failed to bring about an adjustment, this resulting in the stoppage of delivery.

Manufacturers proposed a readjustment of wagon drivers' wage scale, claiming that under present conditions about 25 per cent of the drivers receive weekly pay of $100 to $200, and sometimes as high as $250, depending on weather conditions, while 75 per cent receive an average of from $53 to $75 a week.

The present wage scales provide a weekly pay of $21 for a seven-month period and a $10 scale for the remaining five months, plus a 7-cent-a-gallon commission on all deliveries. The union now is demanding a basic scale of $40 a week, plus 5 cents a gallon on all cream delivered.

As this issue of The Ice Cream Review went to press no agreement had been announced.

Stationary engineers employed by the Chicago ice cream manufacturers recently were awarded a wage increase of five cents an hour. This brings the new scale to $1.05 an hour, it was announced by John Gorey, business agent of the union.



PLANT IMPROVEMENTS.

Alterations and improvements have been made to the Plymouth, Pa., plant of the Golden Quality Ice Cream Co. In addition to the many alterations throughout the entire plant, S. Goldstein, manager, reports that several thousands of dollars have been spent for the installation of the very latest type of ice cream manufacturing equipment. He reports that nearly $30,000 has been spent in bringing the plant up to its present day standards. The entire plant, which was formerly occupied by a brewing company as a storage plant, is now used in the manufacture and storage of ice cream.

NEW PLANT OPENED BY BROOKSHIRE CO.

The opening of the handsome new home of the Brookshire Ice Cream Co., Meridian, Miss., on May 21, marked the growth of an enterprise that began thirteen years ago with an investment of $1,000 in borrowed money. The company was established in 1912 by N. D. and J. W. Brookshire, who are well known in ice cream manufacturing circles of the South. The former is secretary of the Mississippi Ice Cream Manufacturers' Association and prominent in Southern association activities. The plant is located on the site of the Brookshires' old home, a log cabin structure erected at the close of the Civil War.

CLARK PLANT TAKEN OVER BY HOFFMAN BROS.

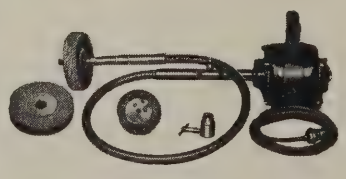
Announcement has been made that the Clark Brothers' ice cream plant of Indiana, Pa., has been taken over by the Hoffman Co., with headquarters in Altoona, Pa. The latter firm has been established since 1892, and operates plants in Tyrone, Philipsburg, Barnesboro, and Altoona. The Hoffman Co. is a subsidiary of the Rieck-McJunkin Co., one of the prominent ice cream companies of the East, with headquarters in Pittsburgh.

It is reported that the consolidation of the Clark and Hoffman companies will in no way change the personnel of the present force. C. W. Clark will continue as manager of the Indiana plant. Mr. Clark announced that this connection with the Hoffman Co. will enable the local plant better to serve the public in the vicinity of Indiana.

CALIFORNIA PLANT PLANS OPENING.

The new plant of the Benham Ice Cream Co., at Bakersfield, Cal., was being made ready for a grand opening when this issue of The Ice Cream Review went to press, according to announcement by L. W. Wilson, general manager of the company's headquarters at Fresno, Cal.

The new plant, located on Chester Ave., will have a capacity of 1,000 gallons of ice cream a day with ample room to triple the capacity of the plant if business warrants it.



Direct expansion coil shelves have been installed in the hardening rooms, and individual electric drives were put on all machines. L. A. Benham is president of the company.

REPORTS BUSINESS INCREASING.

Early in April the Velvet Ice Cream Co. began operations at Tuscaloosa, Ala., and, according to J. S. Perry, manager, "business has been much better than was expected." Mr. Perry advises that when they started in business tub freezers were used, but in less than thirty days thereafter it was found necessary to install brine freezers.

Mr. Perry was proprietor of the Perry Creamery Co. of Tuscaloosa, which he disposed of before opening the Velvet Ice Cream Co., distributing ice cream on a wholesale and retail basis. Quality in product is one of the outstanding features of this business, says Mr. Perry.

LABEL AS YOU GO

YOU CAN SEND ANYONE TO THE HARDENING ROOM FOR DIFFERENT FLAVORS INDEXED WITH CAN TOPS

KVP PRODUCTS

With K. V. P. can tops there is no question — no doubt about the contents — the label is in clear sight from every angle.

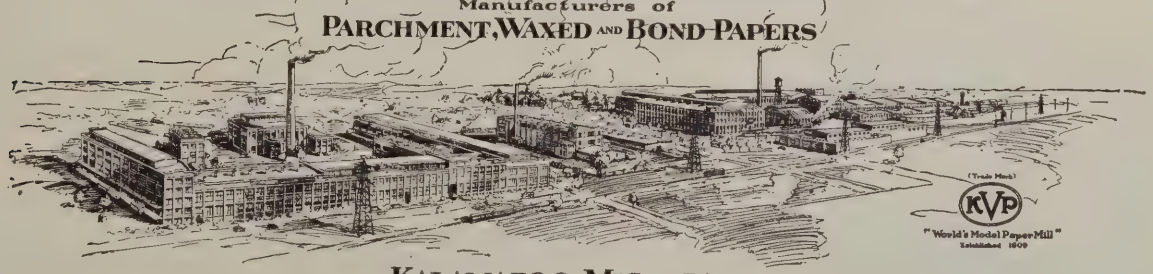
They Protect the Contents as they Label the Container

As your ice cream is drawn from the freezer the cans should be topped with one of these K. V. P. Indexed Can Tops.

That will give the contents protection until opened at your dealer's cabinet, and tell you without doubt what is in each can as it stands piled up in the hardening room.

K. V. P. FLAVOR LABELS are as convenient as the thumb index of the dictionary. This systematic labeling puts order into any hardening room, saves space and makes it possible for any one to select the correct flavors for any particular order.

Frozen Sucker Wrappers — Tissue weight, (20-22 lb. basis)



K. V. P. Genuine Vegetable Parchment, wrap your frozen confections properly. No taste, no smell, no fibre—complete protection from sticky fingers and soiled clothes. Orders filled promptly.

When asking for samples and prices mention this advertisement and get a useful Papricloth Handi-blanket.

FOULDS CO. TAKES OVER CONE COMPANY OF AMERICA.

Announcement has been made that the Cone Company of America, makers of Havacone, is taken over by The Foulds Company.

Havacone products have a wide distribution east of the Mississippi, and officials say the effort always has been toward a quality reputation. It is announced that the new owners are already committed to the same policy. At present plants are being operated in Chicago and Long Island City, N. Y. It is expected that The Foulds Co.'s Syracuse plant will shortly be devoted to the manufacture of Havacones.

The Foulds Co., which acquires the business, plants, good will, contracts, etc., of the Cone Company of America, is well known as manufacturing owners of a number of food products. It was formed some years ago as a merger of a number of long established companies making and selling advertised and trade-marked grocery package goods. R. M. McMullen is chairman of the board, and C. S. Foulds is president. The principal offices are at No. 522 Fifth Ave., New York City.

J. R. Wells, former president of the Cone Company of America, is a vice-president in The Foulds Havacone Co., Inc. Mr. Wells is widely known to the trade.

Herman Lapat will continue in charge of Western sales.

The Fairmount Creamery, Columbus Branch, has purchased several Tanks and will testify that they were entirely satisfactory and a good buy.

THE NEW DOLLY TRUCK.

To save time, labor and merchandise—that's the purpose of the new Marion Dolly truck, manufactured by the Marion Tool Works, Inc., Marion, Ind. Company officials say they incorporated many exclusive advantages in design and construction never before available in Dollys. They are light enough to be moved anywhere, but sturdy enough to last for years, we are told. The conveyance is of solid metal

construction throughout, the description shows, with Marion certified malleable frame, steel axles and wheels with roller bearings.

The company declares that Marion Dollys are without equal in moving heavy loads from one part of the ice cream factory to another, and in moving shipments from the receiving platform to the warehouse. The saving in manpower alone enables Marion Dollys "to pay for themselves in practically every ice cream factory each month." Officials add:

"Back of their inception and development was 15 years' experience in handling rolls of paper in one of the largest mills in this country. As a result Marion Dollys are naturally making a record as efficiency equipment wherever used. They eliminate loss of time and material in handling large rolls of paper and heavy crates, barrels, casks, packages, boxes, etc. They are built low to the floor (preventing jarring) and have no sharp edges (preventing damage to merchandise). Holes are provided for attaching any special skids, platforms or bodies the user may desire."

One man can handle heavy loads because the wheels lock sideways while being loaded, it is declared, so that the truck "stays put and won't crawl or creep away from you." Then when loaded, it is further set forth, the truck can be easily pushed anywhere desired in the ice cream plant, as the wheels run without friction and those on the center axle are larger than on the ends, permitting tilting and easy guiding.

* * *

DELCO-LIGHT DOUBLES CAPACITY.

Announcement has been made that improvements and alterations are under way by the Delco-Light Co., Dayton, O., which will double the output of its plant. This step is made necessary by the continued increased demand for the company's electrically operated ice cream cabinets, as well as models for homes and apartments, we are told.

The company's complete line consists of fifteen models, ranging in price from $190 to $750. Judging by the sales reported for the first three months of 1925, and orders on hand indicate the sale of 50,000 Frigidaires during the year, officials claim.

The Mark of Merit

Ice Cream Manufacturers

You Can Have Perfect Control of Your Mix With the Jensen Revolving Vertical Coil Batch Mixer

UNIFORM FLAVOR is obtained only when the mix contains smallest amount of air during pasteurization, homogenizing and aging.

AIR which causes **FOAM** produces oxidized, metallic or bitter flavor.

REVOLVING VERTICAL COIL BATCH MIXER furnishes the ice cream manufacturer a process by which he is able to overcome these most objectionable evils.

REVOLVING VERTICAL COIL EXPELS AIR AND GASES.

BLADES—located at extreme bottom of coil furnish maximum agitating and mixing at bottom of vat where sugar and heavy materials tend to settle.

POSITIVE FORCED CIRCULATION of heating medium assures the greatest efficiency in heating and eliminates any possibility of burning the mix and producing a cooked flavor.

STUFFING BOXES ARE ENTIRELY ELIMINATED, therefore no grease or other contaminating verdigris can seep into the mix during pasteurizing and aging periods.

SQUARE CONSTRUCTION requires one half usual floor space.

OPERATING POWER reduced one-half.

THE WARFORD POWER TAKE-OFF.

The Warford power take-off unit, which has just made its debut, is a new unit in combination with the six-speed auxiliary transmission, and, according to officials of the Warford Corp., it "places the Ford on a par, so far as utility goes, with the most expensive trucks on the market."

The new unit is bolted to the transmission case and is operated by a large countershaft gear. This assembly, we are told, allows power take-off operation at the Ford speeds—two forward and reverse. An exclusive feature of the new unit is the fact that the transmission may be engaged and the truck driven with the power take-off in operation. The device is furnished with the sprocket shaft extending either forward or back of the unit, as may best suit requirements of the customer.

To permit the device to sustain heavy loads over long periods of time with varying speeds, and to provide for silent, frictionless operation, the new unit is equipped with Gilliam tapered roller bearings throughout.

The new unit, officials of the company say, is succesfully operating such equipment as concrete mixers, pumps, dump bodies (mechanical or hydraulic hoists), spraying outfits, electric generators, electric welders, winches (such as used by telephone companies for pulling cables), sand blasts, air compressors, drilling rigs, for water wells, post holes and light ditching.

"Without doubt the new unit will be found available for many other uses," company officials believe.

* * *

SUPPLY CO. HAS HANDSOME PLANT.

One of the striking developments of the modern business trend is the tendency to brighten up factories. There once was a time when manufacturers had an idea that any kind of a plant was good enough for the purpose of production. Dairy manufacturers for a long time have understood the importance of breaking away from shabby exteriors, realizing that the outside impressions a plant yields has a lot to do with the public's attitude toward the product manufactured in that plant.

Nowadays we see more plants that make a nice appearance on the outside, some of them with pretty flowers around the outside, clinging vines, etc.

One of the leading supply firms of the industry, the Standard Milk Machinery Co., Inc., Louisville, Ky., believes the supply manufacturers should be just as careful in the appearance of their plants as the ice cream manufacturers. This firm has not gone in so much for fancy trimmings, flowers, etc., but its plant at Louisville is an exceedingly neat and attractive building.

The plant is one story high, a brick structure, with partial overhanging loft, and has a nice, neat appearance, inside and out. The building measures 100 feet wide by 250 feet deep, with 35,000 square feet area, including the overhanging loft or balcony. The company employs thirty men with an office force consisting of five people.

The company, which is one of the pioneer concerns in the South manufacturing dairy supplies, began operation on a production basis in the fall of 1914. Since then it has become a national figure in the production and distribution of dairy equipment.

* * *

SECOND ANNUAL SHORT COURSE FOR DAIRY SUPPLY SALESMEN.

Dairy supply salesmen will have an opportunity to take a special two weeks' course in ice cream manufacturing at the Pennsylvania State College August 15 to 28. Last year, the Salesmen's Club of the Association of Ice Cream Supply Men, co-operating with the dairy husbandry department, in-

augurated the first course, which was attended by 30 salesmen. The firms represented were: Cherry-Bassett-Winner, National Baker Egg, J. G. Cherry, D. H. Burrell, David Michael, Brown and Shaw, Milligan and Higgins, Taylor Instrument, Joe Lowe, Dewart Milk Products, H. O. Wilbur, G. R. Ryan and Harold H. Sinclair.

Plans and arrangements are being made to make this year's course even more successful than the first one. Special attention will be given to the manufacture of ice cream and other dairy products used in the ice cream industry. New machinery and equipment which are being installed in the college creamery, will give better facilities for practical work than ever before.

Located in the geographical center of the greatest ice cream state of the Union and in the wonderful Nittany Valley, Penn State College offers an interesting place where two weeks of profitable work and pleasure can be combined. The climate is ideal, the scenery wonderful and there are opportunities for golf, tennis, sight seeing and other recreation.

A club has been leased for the two weeks where room and board will be provided at a reasonable rate. Facilities are also available for married men who wish to bring their wives. An incidental fee of fifteen dollars ($15.00) will be charged to cover the expense of giving the course. While facilities for giving the course are good, it will be necessary to limit the number taking the course to about thirty men. Further information regarding the course can be obtained by writing to W. H. Martin, dairy department, the Pennsylvania State College, State College, Pa.

The enrollment for the course will be handled through the office of the secretary of The Association of Ice Cream Supply Men, 1328 Broadway, New York City.

THE DRYPAK CABINET.

The Brooks Drypack cabinet is described in an interesting folder recently issued by the Brooks Cabinet Co., Norfolk, Va. The folder described the Drypak cabinet as being entirely new and different in construction from all other cabinets, affording "the biggest saving of ice and salt that has ever been offered the ice cream manufacturer."

It is set forth in the folder that the Drypak cabinet makes ice last longer and produces a more even temperature; that the brine chamber contains cold brine drippings from ice pack; that it "insures perfect refrigeration at the bottom of ice cream containers;" that Drypak compartments will accomodate 3 or 5 gallon, tall or squat cans, or any kind of package ice cream; that it has galvanized iron reinforcements; that outer casing is made from No. 1 gulf cypress, one inch thick, has high insulating value and vertical construction; that heavy, pure corkboard insulation, three or four inches thick is provided, and that brass clips prevent removable Drypak container from floating.

* * *

HENRY C. LAUER.

Henry C. Lauer, vice-president and general manager of F. Bischoff, Inc., Brooklyn, who died on March 21, was for many years widely known in the ice cream industry. For the past eight years he served as general manager of F. Bischoff, Inc. In announcing his death, the company issued a circular, from which the following is taken:

"Always a most conscientious and untiring worker, he cheerfully gave much of his time and energy to the problems confronting the manufacturers of chocolate and cocoa, toward bettering existing conditions wherever possible. He was a firm believer in close co-operation among the members of the industry, knowing that only in this way could beneficial and lasting results be attained."

* * *

TRIUMPH CO. WINS COURT BATTLE.

The Triumph Electric Co., the parent body of the Triumph Ice Machine Co., Cincinnati, O., has been adjudged to be solvent in an order issued in the United States District Court of Dayton, O., by U. S. District Judge Hickenlooper. This verdict followed a long, drawnout litigation in which the Triumph Electric Co., a million dollar concern, was involved in the possible process of bankruptcy, the suit having been brought by the McIlvain & Spiegel Boiler & Tank Co., the National Lead Co., and the Stacey Bros. Gas Construction Co.

WRIGHT-ZIEGLER ADDS ICE CREAM DEPARTMENT.

An ice cream department has been added by the Wright-Ziegler Co., Boston. This was announced in the April issue of the company's house organ, "The Milk Can." W. G. Finch of Grand Rapids, Mich., who has been connected with the dairy industry virtually all of his life, has been made head of the company's ice cream department.

In making this announcement, the following appeared in the April issue of "The Milk Can:"

"To make this department efficient we realized that it would be necessary to secure the services of a man who had had broad experience in the equipping of ice cream factories, and who was able to cope with the mechanical difficulties that ice cream manufacturers frequently encounter. After careful investigation of the records of several engineers who had specialized in the ice cream field, we secured the services of W. G. Finch of Grand Rapids, Mich."

W. G. FINCH.

Mr. Finch was brought up on a dairy farm. His first business connection was with Swift & Co. at Alma, Mich., and from this creamery he went into the service with the overseas forces in France. Upon his return to the United States, he was employed by the A. H. Barber-Goodhue Creamery Supply Co., Chicago. Mr. Finch was the first to patent and put on the market a successful automatic batch weigher, we are told.

* * *

"DECORETTES."

"Decorettes" is the name of a product now being offered by Rockwood & Co., with main office and factory at Brooklyn. This product is described by the company as "the supreme topping," and is said to be a pure chocolate product. The company claims that it is used and served at many up-to-date soda fountains in the country, being used to add to the eye-and-palate appeal of ice cream in the dish and in the cone. It is packed in cans, drums and barrels.

* * *

BENNERS MOVES OFFICES.

Announcement has been made of the change of address of the Harry A. Benners Southern Selling Service, offices having been moved from 702 United Fruit Bldg. to 525 Carondelet St., New Orleans. Harry A. Benners, president of the Dixie Flyers, is head of the concern.

* * *

GIFFORD-WOOD INCREASES CAPITALIZATION.

The Gifford-Wood Co., Hudson, N. Y., announces an increase in capitalization, necessitated by the issue of special common stock for the benefit of employees of the company. The employees and heads of departments have subscribed to all of the stock thus made available. The company put this plan into effect to allow employees to benefit by their own efforts, officials say.

The increased capitalization was effective April 1.

* * *

NOODLEMAN COMPLETES NEW PLANT.

Announcement has been made of the completion of the new plant of the Houston Cooperage & Tub Co., Houston, Tex., of which Jacob Noodleman is president. Mr. Noodleman advises The Ice Cream Review that he has been busy during the past year building this new plant. Machinery has

been installed and the company now is manufacturing "all kinds of barrels and kegs." The manufacture of ice cream tubs will begin June 5, according to Mr. Noodleman, who adds that he will begin circulating among members of the industry at that time.

* * *

Superior Refrigeration, Inc., of Lima, O., has announced two types of electrical refrigerating machines for household and commercial uses.

The Superior air-cooled refrigerating machine is built in four models, as follows:

No. 12— 75 to 150 pounds equivalent ice capacity
No. 22—150 to 250 pounds equivalent ice capacity
No. 32—250 to 450 pounds equivalent ice capacity
No. 42—450 to 650 pounds equivalent ice capacity

There are also four models of water-cooled machines of the same capacities as above. Prices range as low as $300 f. o. b. factory.

These machines are designed for use in meat markets, grocery stores, delicatessens, ice cream cabinets, etc., as well as residences and apartments.

Superior refrigeration is not a newcomer in the field of domestic electric refrigeration. The concern was first organized about twelve years ago for the manufacture of refrigerating machines of from 3 to 5 tons capacity. About five years ago the firm began the manufacture of smaller machines for residential use. These first machines are still in use in a number of cities throughout the country, although the firm in those days was seriously handicapped through inadequate finances and lack of an aggressive sales policy.

Last winter the Superior Refrigerating Company was reorganized and E. A. Wiliams, Jr., business man of Lima, O., became president. Mr. Williams was for ten years the president and active directing head of the Garford Motor Truck Company. Associated with Mr. Williams as owners and directors of the re-organized company are the following business men:

A. W. Wheatley, president, Delphos Mfg. Co., and the Wheatley Loan & Discount Co., Lima, O.

F. L. Maire, president, the Old National Bank, Lima, O., and of Maire Bros., well known oil operators.

Frank Komminsk, secretary and treasurer, White Mountain Dairy Co., Lima, O.

Fred W. Cook, president, Globe Box Company, Lima, O.

Roy S. Layton, attorney, Wapakoneta, O.

Frank Andrews, refrigeration engineer, Wapakoneta, O.

The company has already extended its manufacturing facilities to meet the demand and reports that connections have been made with several large central stations and electrical dealers to handle Superior products in many of the principal cities.

KENTUCKY PLANT COMPLETED.

The new Glasgow, Ky., plant of the Brown Bros. Ice Cream Co., which was begun in January of this year, has been completed and is now running full blast, manufacturing 1,000 gallons of ice cream daily.

The building is 85 by 50 feet, and is constructed of concrete. The latest type of equipment is reported as being in operation at the new plant. The ice storage room has a capacity of two cars, and the hardening room has a capacity of 1,500 gallons of cream.

Brown Bros. own three ice cream plants in Kentucky, a smaller one at Elizabethtown, and one similar to the Glasgow plant at Bowling Green.

⚜

ANOTHER NEW PLANT.

The newly constructed plant of the Nodaway Creamery Co., Maryville, Mo., recently opened its doors for business. The creamery is now housed in spotless white, a thoroughly modern and splendidly equipped plant for the manufacture of ice cream and butter. C. E. Barnett is manager of the creamery.

"Nodaway butter" and "Nodaway ice cream" will be manufactured and distributed in surrounding communities. Mr. Barnett is a highly reputed cheesemaker and ice cream maker, having had several years experience in Kansas, Iowa and Missouri.

⚜

WEIGHTS BILL SHELVED AT RICHMOND.

A measure was recently introduced by a member of the council of Richmond, Va., requiring that all ice cream must be sold by weight rather than by measure. This was bitterly opposed when it came up for a hearing on Wednesday, May 20, by both the dealers and leading manufacturers of ice cream in that city. The measure, therefore, at the request of the patron, was shelved for the time being, according to announcement by T. J. Strauch, chief dairy inspector at Richmond.

⚜

Miss Frances Stalvey of Savannah, Ga., has been declared winner of a prize contest staged by the Chapin-Sacks Corp. in that state. The same concern conducted other contests in other states.

—plus

the quality that only Hercules can build into a cabinet.

THE announcement of the Garrett Counter Cabinet in April, with its undisputable advantage over the old style ice and salt storage cabinet, has created a vast amount of interest in the ice cream industry. Inquiries and orders poured in at such a rate it was very soon found our manufacturing facilities were inadequate to the occasion. Other arrangements had to be made to meet the demands of the industry. After a careful investigation into the matter, the Hercules Corporation, of Evansville, Indiana, was selected as the manufacturers best able to build into the Garrett the structural superiority and quality demanded of it. The Hercules Corporation, with its huge eight million dollar plant, equipped to the smallest detail, its staff of engineers and trained workmen, its experience and standing in the manufacturing field, enjoys an unblemished reputation and the confidence of all with whom it comes in contact. So Hercules was selected, thereby writing another chapter in ice cream cabinet history.

In taking over the construction of the Garrett, the Hercules engineers added their engineering experience to that of our own organization and the result is the last word in cabinet construction, ice economy, and, most of all, the ABILITY TO KEEP AN EVEN TEMPERATURE AT ALL TIMES ON THE CREAM.

With Hercules manufacturing the cabinet we are prepared to offer you the most efficient cabinet possible. A trial will convince you. We can now handle orders on the shortest possible notice and inquiries and orders will receive our most careful and prompt attention.

Iceless Cabinet with "Shipping Customers" Reduces Delivery Bill

By J. W. NEUMAN*

WE HAVE not furnished iceless cabinets to our city customers. We have supplied iceless cabinets to several shipping customers. The reason for giving these shipping customers iceles cabinets was that we could not reach them with our truck and in order to give satisfactory service we installed refrigerated cabinets. These accounts were some of the most desirable accounts we carry on our books. We have found that by giving these customers automatic refrigeration, their cream is in much better shape than when they were icing it themselves and it has increased their sales from 10 to 15 per cent.

We have an iceless cabinet route which is operated 100 per cent during the winter months; but which during the summer months has ice and salt cabinets. The number of stops on this route during the summer months is 25, during the winter season, when a complete iceless cabinet route, 17. Prior to the installation of these cabinets on this route, it required a five-ton truck. At present we are operating a 1½-ton truck.

We know that the use of the refrigerated cabinets have effected savings in our delivery. We started installing iceless cabinets in the latter part of 1923, and have been installing them as follows:

November, 1923	9	June, 1924	4
December, 1923	11	July, 1924	8
January, 1924	2	August, 1924	2
March, 1924	13	September, 1924	8
April, 1924	6	October, 1924	8
May, 1924	8	In stock	3

To obtain the maximum saving possible by the using of these cabinets, we have found it necessary to rearrange our routes and for this reason, we cannot give you any correct example in figures of the savings effected. We have no route equipped with the iceless cabinets which was operated as the same route previous with the ice and salt delivery.

The electric consumption for a six-hole cabinet during the month of August was 50 K. W., or 1-6/10 K. W. per day. This cabinet also used 851 gallons of water in 31 days. The dealer sold out of this cabinet 267 gallons of ice cream during the same period. The average cost per K. W. of this particular cabinet was 10 cents. The water rate was $1.50 per month, or a cost of .024 cents per gallon of sales.

Another iceless cabinet shows the following: From March 16 to April 16, over a period of 30 days, a six-hole iceless cabinet consumed 39 K. W.s at 10 cents per K. W. and 2,370 gallons of water. There was sold through this cabinet during that period 278 gallons of ice cream.

The difference of the water consumption in these two cabinets was due to reducing the amount of water consumed about one-third and which increased the current consumption 10 K. W.s in the 30 days.

The consumption of water is of vital importance in some communities where water rates are exceptionally high. In small towns in our section, where water supply comes from a great distance, the rates are rather high. In this case the consumption of water is not to be forgotten. In one locality in our section the water rates are as follows: $1.00 per month for 4-hole cabinet; $1.50 per month for 6-hole cabinet, and $2.00 per month for 8-hole cabinet.

The cabinets in our belief are of a dependable service, although, like any other piece of machinery, it required a certain amount of service and attention.

THE average number of calls we have received are about two calls per month for service. We inspect our cabinets every month; this has a tendency to cut down the number of service calls. In some cases, some cabinets have required no attention whatsoever, while others, probably four or five service calls have been made. The cost of our inspection and service have averaged about $2.60 per cabinet per month, exclusive of transportation.

Where the iceless cabinets have been installed, the customers are very well pleased. In 90 per cent of the cases, should they have to go back to the ice and salt method of dispensing ice cream, they would discontinue handling ice cream. Following are some of the reasons why they are pleased with the iceless cabinets. 1. Their ice cream is always of uniform temperature. 2. It increases their sales from 10 to 15 per cent. 3. It has increased their profits, due to not having a rising and falling temperature. 4. If the driver is late their

The Mechanical Era

This is the age of machinery. Everywhere you see machinery doing work that our forefathers did less well and at greater expense by hand. You wouldn't think of trying to compete today equipped with the open cream vat and a box churn. You would be outclassed at the start. Your labor cost too high. Your losses too great. Then why handicap yourself with an old-fashioned, inefficient cooling system? Machine cooling is better and cheaper.

It isn't too late to get the benefit of Mechanical Refrigeration this seasen. The late summer months, when the ice supply is low, is when it means most to the creameryman.

cream is always in condition to sell and they do not have to wait for the driver if he is late. 5. It eliminates salty ice cream.

It has been our experience that the iceless cabinet keeps the ice cream in a satisfactory condition.

We do not pay the operating costs of the cabinet. We have not found any of our dealers making his own water ice or request sweet ice for his fountain.

We have loaned the cabinets to our dealers. We do not charge a rental or pay for the current or water for the operation of the cabinet. The dealer agrees to use our ice cream exclusively for two years.

WE BELIEVE that the ice cream manufacturers should retain ownership of these cabinets at all times, that we have the control over whose ice cream should be sold through that cabinet. Last year our legislature passed a new food bill, which makes it unlawful for any person, association, partnership, or corporation, to sell, offer for sale, expose for sale, or have in possession with intent to sell, any ice cream, including coated ice cream and the coating thereof, in any container which is falsely labeled or branded as to the name of the manufacture thereof; or to misrepresent, in any way, the place of manufacture of ice cream, including coated ice cream and the coating thereof, or the manufacture thereof.

We pay the installation of the cabinet. This varies from $37.50 to $42.62 per cabinet.

At the present time we do not have a dealer owning his own cabinet, but it is our belief that there should be a difference of not exceeding 10 cents per gallon should he own his own refrigerated cabinet.

In regard to the value of the ice and salt cabinets, I would say that most of the old manufacturers probably have depreciated their ice and salt cabinets, and that at the present time, they are carrying very little on their books in value for ice and salt cabinets.

TRUCKS PROVE REAL ADVERTISING ASSETS.

The new High Point Creamery Co., High Point, N. C., has gained wide publicity in that territory by its two new, bright yellow trucks that distribute its product. The trucks bear the words, "The Ice Cream with a High Point."

The ice cream will be distributed under the trade name "Clover Ice Cream." The creamery began operations a short time ago in a plant which is reported as being thoroughly modern in every detail, having cost in the neighborhood of $75,000.

In addition to manufacturing ice cream, the creamery makes butter, and will supply the public with pasteurized milk and cream. J. R. Willis of Roanoke, Va., said to have 20 years experience in the dairy industry, is in charge of the new plant.

THE DEALER'S ATTITUDE.

One of the oldest problems in the industry is the dealers' attitude toward ice cream. In his annual address before the Southern convention in New Orleans last November, President W. J. Barritt stressed the importance of having manufacturers work to bring about the condition that will make ice cream "the dominant commodity in the minds of dealers instead of one as they often refer to as a necessary evil."

FACTS

Concerning the Patent on The Frozen Sucker or Fruit Icicle Also the Ice Cream Sucker

DO NOT be confused by the misleading statement that there are no patents on the frozen sucker or fruit icicle. Such a statement is an obvious effort to evade the fact that the process of manufacture is covered by the Burt patent and that it is just as much an act of infringement to use a patented process as to make a patented product.

The process of manufacturing frozen suckers or fruit icicles by freezing a handle into a body of an edible substance which is fluid at normal temperatures so that the handle is secured in place by congelation is covered by the Burt patent No. 1470524, and all infringers will be prosecuted.

The Burt patent is many months ahead of any other patent relating to frozen suckers and Burt is the originator of this idea.

Our royalties are small, indeed far less than litigation would cost to be an infringer.

Work fast and get our exclusive or non-exclusive license which will avoid all future trouble and will put your concern on the main line to cash in on the greatest thrill ice cream men have ever known. THE NEW, CLEAN AND CONVENIENT WAY TO EAT ICE CREAM AND ICES.

Have your own patent attorney look up the Burt patents or write us today and we will mail copies of the patents. Also tell us what city, county or state territory you want, and the population of same, as our plan of collecting royalties is on a population basis of your territory. Payment is made every thirty days and only during the length of season your factory is making suckers. You have no reports to make to us, and we do not pry into your business or check your sales records.

Our license does not require you to purchase our molds, equipment or supplies, such as sticks, wrappers and flavorings. You may use any make you wish. We will, however, gladly answer any inquiries, giving our licensees the benefit of our wide experience as to the best machines and sources of supplies.

Dates and numbers of patents and trade mark registrations which have been allowed Burt in the United States and Canada.

U. S. Patent No. 1,470,524 granted Oct. 9th, 1923.
U. S. Patent No. 1,470,525 granted Oct. 9th, 1923.
U. S. Trade Mark Reg. 190,701 granted Oct. 21st, 1924.
U. S. Trade Mark Reg. 126,923 granted Oct. 14th, 1914.
Canadian Patent No. 241,363 granted July 8th, 1924.
Canadian Patent No. 247,219 granted March 3rd, 1925.
Canadian Trade Mark Reg. No. 34,886 granted Feb. 9th, 1924.
Other applications pending in United States and Canada.

I have been advised by my patent counsel, Robb, Robb & Hill, of Washington, D. C., and Cleveland, Ohio, that in their judgment the patent rights under which I am now licensing, broadly cover the process of making frozen suckers or fruit icicles, and corresponding advice has been given to certain of my licensees by their patent counsel investigating this matter.

Have You Entered $75 Cash Prize Contest?

Not Much Time to Enter Contribution in The Ice Cream Review's Contest for Merchandising Ideas

TIME is short for the $75-cash-prize contest for the best ideas on merchandising ice cream, announced in the May issue of The Ice Cream Review. At that time it was stated that June 15 would be the last day on which contributions would be received for consideration. To be perfectly sure that everybody has a chance to get into this contest, however, it has been decided to extend the time to July 1.

Now let the letters come on!

What are you doing to increase the consumption of ice cream? What ideas have you on the subject? Down in your heart you know that you have many ideas on this all-important subject, and nothing so pleases you as to buttonhole a friend in the industry from time to time and talk him blue in the face about what is being done, what you are doing or what should be done to get more ice cream moving over the counters of the retailers.

That's just the line of matter we want in this connection. Put your ideas on paper in just the same manner as though you had a buttonhole-grip on one of your best friends and were chatting away with him over a couple of after-dinner cigars.

It was explained in the May issue that the winning contribution means $25 to its author. Second prize is $15, fourth prize $10, and fifth prize $5.

CONTRIBUTIONS will be judged solely on the merits of the ideas—not with regard to literary excellence. You don't have to be a Richard Harding Davis or Booth Tarkington to tell a story that lies so near your heart as that of selling more ice cream. It is something in which all of us are interested, and nobody ever read one of O. Henry's masterpieces with greater interest than will other ice cream manufacturers read what you have to say on this subject.

Talk straight from the shoulder; a spade is not a garden implement, and you don't have to call it such. Evil conditions in this industry are not to be spared for the reason that they are unpleasant; they are things which we must face squarely.

YOU have conducted highly successful merchandising campaigns yourself and should be prepared to tell others how you worked. The money involved means least of all; no manufacturer would be expected to take valuable time to write something—even for just a few minutes on just a couple of sheets of paper—for $25. The best thing you will accomplish will be to give others some ideas on how we can increase ice cream consumption, and those others, in turn, will give you some ideas, and so on and on. Ideas don't stop; put them in motion and they keep going on and on for improvement and enlargement.

It has been explained that The Ice Cream Review will have nothing to do with this contest. The judges will be selected from men having no connection with this publication.

But this is something that cannot be put off. You intend to do it tomorrow, but something always turns up to interfere—always does. Give us your ideas today. You don't have to write a long letter, though you can if you wish. One of the greatest essays ever written—and a first-prize winner, too—was said in eight words. Try your hand at it; you can say a whole lot in a few words.

Do it today!

REST ORDERED FOR HAMMOND.

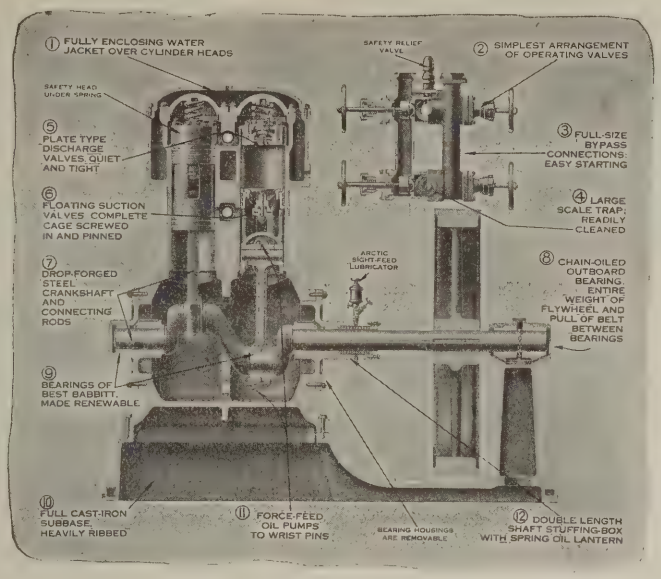
R. L. Hammond, general secretary of the Indiana Manufacturers of Dairy Products, is on the temparary retired list for the present—at least, his friends hope it is just a temporary matter. The strain of the pace has been too much for the Hoosiers' energetic secretary, and late in April he was forced to absent himself from his office for a month, under orders by his physician. He left his advance preparations for the dairy exposition in working order, however, and business still is going on, with his assistant, Miss Corinne Howe, in charge.

SELL ICE CREAM AND SERVICE.

I would suggest to each manufacturer that you make a survey of the type of customers you serve and ascertain the percentage of unprofitable stops on your books, and after a study of this survey, and a careful analysis of the situation, you will be in a position to reduce the number of stops, lessen the truck and driver expenses, all of which, in the end, will result in a greater profit in your business; in other words, serve only profitable stops in each and every case, and thus sell both ice cream and service.—From California-Pacific joint convention address by John M. Bonner.

DOWN WITH HIM!

The meanest man in the world has been unearthed by the Meridian (Miss.) Star. He is described in the following item in a recent issue of that paper:



"A father, accompanied by his two little sons, one five, one seven, walked up to the soda fountain, ordered a plate of ice cream. After eating one service he called for another. While eating the ice cream, the two little boys, just large enough to place their chins on the marble serving counter, stood in obedient silence, their little heart-throbs unseen, wistful eyes and eager desires for this wonderful child's delight denied, while the 'Meanest Man in the World' satisfied his selfish wants."

8 PER CENT FAT STANDARD SET FOR DISTRICT OF COLUMBIA.

In view of the proposed national standard for ice cream, special interest centers around the fact that congress has passed a new District of Columbia milk, cream, and ice cream bill, which provides for minimum fat content of 8 per cent, which figure is advocated by the National Association of Ice Cream Manufacturers.

That part of the bill relating to ice cream follows:

"Ice cream means the frozen product or mixture made from pasteurized cream, milk or product of milk sweetened with sugar, to which has been added pure, wholesome food gelatine, vegetable gum, or other thickener, with or without wholesome flavoring extract, fruits, nuts, cocoa, chocolate, eggs, cake, candy, or confections, and which contains not less than 8 per centum, by weight, of milk (butter) fat."

NEWS FROM FAR AND NEAR.

Oneida, Tenn.—Some of the incorporators of the newly organized Oneida Ice and Ice Cream Co. are J. I. Waldeman, Leo Neele, James Lewalen and W. S. Neele. The capital is reported as $18,000.

Newbern, Tenn.—The Newbern Ice Cream and Creamery Co. was capitalized for $25,000. J. E. Conway and W. W. Pointer are the incorporators.

Austin, Tex.—The Dixie Ice Cream Co. has been capitalized at $10,000. Ben R. Sawyer is president and S. L. Smith is secretary.

Lubbock, Tex.—The Bell Ice Cream Co. was incorporated with a capital of $25,000 by Joe T. Bonner, F. L. Denison and J. C. Mitchell.

Tacoma, Wash.—The Royal Ice Cream Co. suffered a small loss by fire.

Weirton, W. Va.—The Weirton Pure Milk Co. will erect a $15,000 ice cream plant on Avenue A.

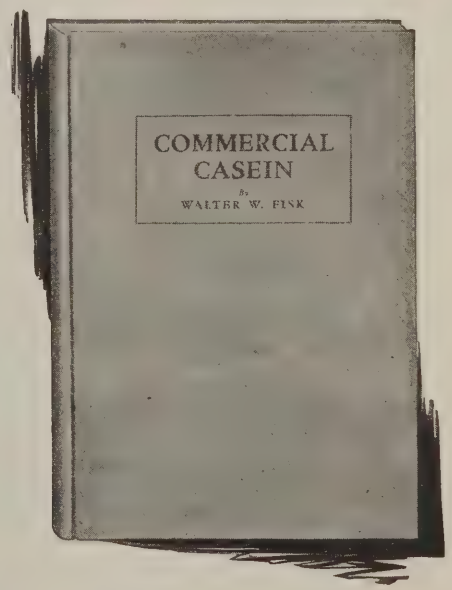
Stanley, N. D.—Charles Anderson of Warwick recently rented a building here and installed complete equipment for the manufacture of ice cream on a large scale.

Weston, W. Va.—The Weston Dairy Co. will soon begin the manufacture of ice cream.

Walters, Okla.—C. E. Trumbo plans to open an ice cream factory here.

Allentown, Pa.—The plant of the Weed Ice Cream Co. recently was purchased by the Farber Ice Cream Co. of Lancaster, Pa.

Minot, N. D.—The plant of the Purity Ice Cream and Dairy Co. was damaged by fire recently.



Gallatin, Mo.—The Runnels Bros. Ice Co. has begun installation of modern ice cream equipment.

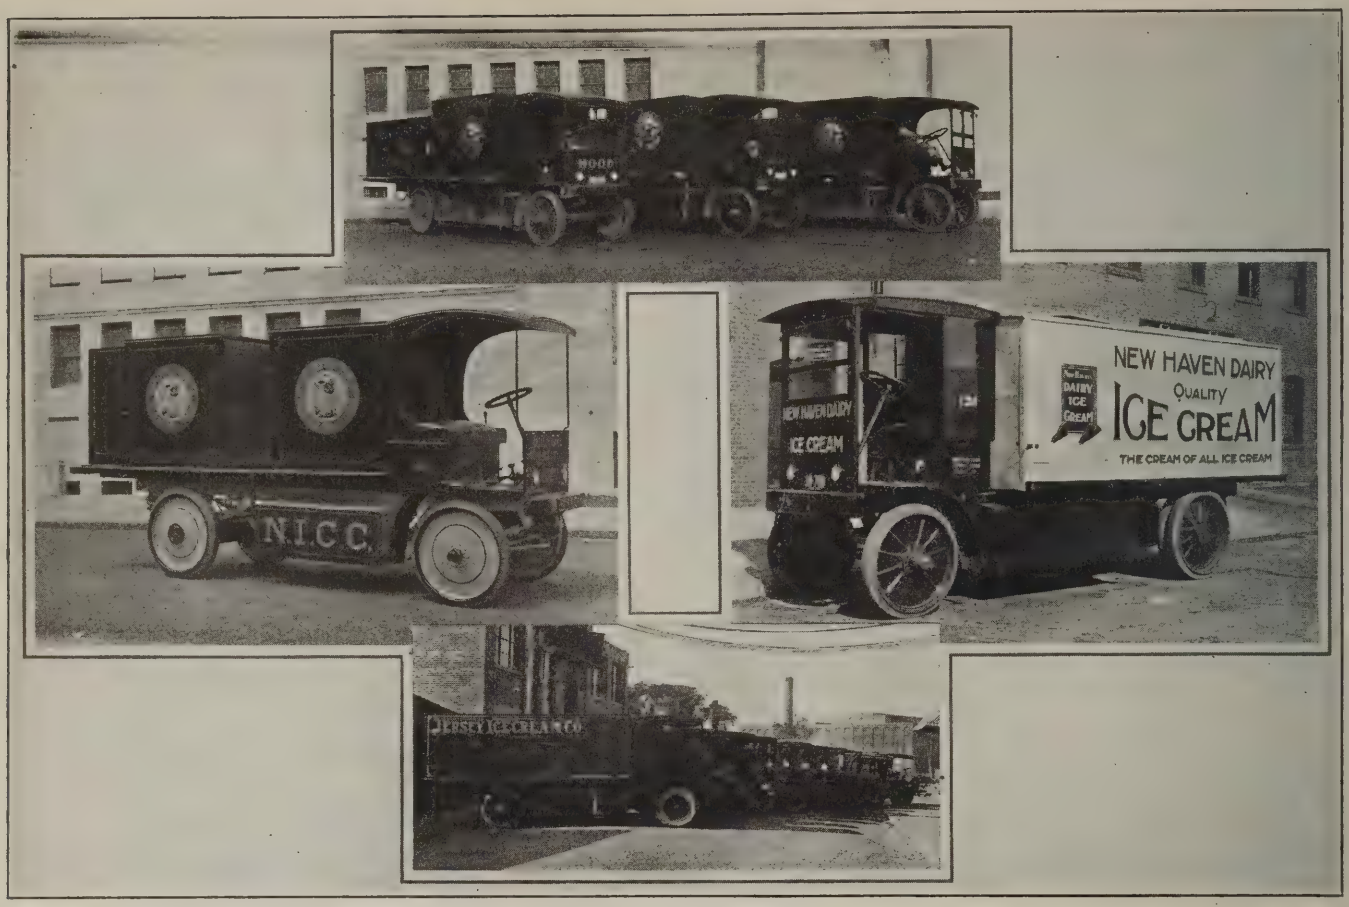
Iola, Kans.—Charles N. York of Waterbury, Conn., will locate a new ice cream factory here, it is reported.

Manchester, Ia.—The Hutchinson Ice Cream Co. of Cedar Rapids, Ia., has taken over the Edward Hruby ice cream factory.

Jasper, Tex.—The Jasper Ice Cream Co. will soon begin operations. R. C. Neyland and R. B. Laniler are proprietors.

Cambridge, Mass.—The Neapolitan Ice Cream Co. has purchased property, and it is expected it will broaden its facilities.

Using Surplus Skimmilk



for making Commerical Casein — how to make it—how to market it, is all explained in this book.

HELP WANTED

HELP WANTED!

We have been requested by Fred Rasmussen, secretary of the National Association of Ice Cream Manufacturers, to furnish his office with back numbers of The Ice Cream Review for the past four or five years. We are unable to comply with the secretary's request but we thought perhaps some of the readers of The Ice Cream Review would be willing to part with their old copies. Following is a list of the copies needed:

1920—January, February, March, April, June August.

1921—January, February, October.

1922—January, April, May.

1923—February, July, August, October, December.

1924—January, February, March, October.

If you should have any of these copies to spare, kindly forward them to The Olsen Publishing Company, 501 Cherry St., Milwaukee, Wis. 6-25

SALESMEN—Big demand for our small, complete soda fountain. Very profitable side line. Lowest price, well advertised. Good commission. Address J. Charles, 637 No. Michigan, Chicago. 6-25

WANTED—Manager for ice cream factory, large city Middle West. Must be man of forceful character, thorough system, strong executive and sales ability, also thorough knowledge of all details of ice cream manufacture and distribution. Prefer man who can invest reasonable sum; this, however, not absolutely essential. Address: R-352, The Ice Cream Review. 6-25

THERE IS A GOOD OPPORTUNITY WITH US for a man who is acquainted with the ice cream industry and fully experienced in selling ice cream machinery. We want several men with such qualifications, either whole or part time. Please apply by letter giving complete information and an interview will be arranged. Eskimo Pie Corporation, Louisville, Ky. 6-25

POSITION WANTED

POSITION WANTED — As ice cream maker. 7 years experience. Make fancy ice cream and sherbets, etc. Address: R-335, The Ice Cream Review. 6-25

POSITION WANTED — As manager of ice cream or ice cream and milk plant. Have had eighteen years practical experience with an aggressive and progressive company in which time have had to do with every phase of the business. Will locate in any locality that promises possibilities. Address: R-324, The Ice Cream Review. 6-25

POSITION WANTED—By middle aged married man. 15 years practical ice cream making—some creamery experience. At present employed, but can make change on two weeks' notice. Willing and capable worker. Any good offer accepted. Can give best of references. Desire position with a future. Am a sticker—10 years in one plant. Good reason for making change. Address: R-318, The Ice Cream Review. 6-25

POSITION WANTED—By practical man with years of experience in the business. Able to save you money and make goods that will get you trade and hold it. Large and medium size plant experience. At present employed. Will take month or 6 weeks to make a change. Address: R-309, The Ice Cream Review. 6-25

POSITION WANTED—By married man. Have had Penn. short course in manufacturing commercial ice cream. Have had 10 years experience. Thoroughly understand viscolizing, homogenizing, standardizing, testing or mixing. Have some experience in milk plant and butter. Must be year round position. Can give best of references. Prefer Iowa or Middle West. Would like to give present employer 30 days' notice. Address C. E., 101 Fairfax Ave., Wheeling, W. Va. 6-25

POSITION WANTED — By experienced married man, 37 years old. Foreman of milk plant for 5 years and understand standardizing of milk and cream, buttermaking, ice cream, ice cream mix and refrigeration. Also am mechanic. Good references. Permanent connection with advancement desired. Address R. S. Wells, 119 First St., S. E., Le Mars, Ia. 6-25

POSITION WANTED—In ice cream or milk plant. College graduate with special training in dairy products manufacturing. Willing and capable to handle any phase of work connected with the dairy. Address: R-317, The Ice Cream Review. 6-25

POSITION WANTED — Dairy chemist and production superintendent, experienced and dependable, desires position with progressive organization. Able to produce results. College graduate. References furnished. Address: R-345, The Ice Cream Review. 6-25

POSITION WANTED—As ice cream and dairy supply salesman. Experienced. School superintendent at present. Desire permanent connection. Address: R-365, The Ice Cream Review. 6-25

POSITION WANTED — By laboratory man with 7 years practical experience. Thoroughly familiar with testing and standardization of ice cream mixes. Also buttermaker. Seeks position to enlarge his practical experiences in the ice cream plant. Wisconsin Dairy School certificate. A No. 1 references. Not afraid of work. Wages reasonable with a concern that offers a future to a sober, loyal man who can produce results. Address: R-371, The Ice Cream Review. 6-25

POSITION WANTED — By experienced ice cream maker. Understand operation of modern equipment. Address: R-366, The Ice Cream Review. 6-25

POSITION WANTED — As production manager. Know the ice cream business from A to Z. 20 years experience. Can handle any size plant. Best of references furnished. Address: R-370, The Ice Cream Review. 6-25

POSITION WANTED—As first class ice cream maker. Understand all branches of the business. Best of references furnished. Address: R-369, The Ice Cream Review. 6-25

FOR SALE BARGAINS

BUSINESS

Trade Marks Department

Conducted by National Trade Mark Co., Washington, D. C.

The following are trade-mark applications pertinent to ice cream pending in the United States Patent Office which have been passed for publication and are in line for early registration unless opposition is filed promptly. For further information address National Trade-Mark Company, Barrister Building, Washington, D. C., trade-mark specialists.

As an additional service feature to its readers. The Ice Cream Review gladly offers to them an advance search free of charge, on any mark they may contemplate adopting or registering.

SER. NO. 194,446. (CLASS 46. **FOODS AND INGREDIENTS OF FOODS.**) The Hendler Creamery Company, Baltimore, Md. Filed March 26, 1924.

No claim is made for the descriptive words "The Velvet Kind" or "Ice Cream." The trade-mark comprises an oval background in yellow, upon which is distinctly printed the word "Hendlers" in blue, with a flourish beneath said word also in blue, the words "Ice Cream" appearing in yellow on the flourish, and the words "The Velvet Kind" are printed in red on the lower part of the yellow background. The background has an elliptical margin in blue, with radiating bands and lines in stippled blue and white, and on this margin is an elliptical band of stippled blue and white.

Particular description of goods.—Ice Cream.

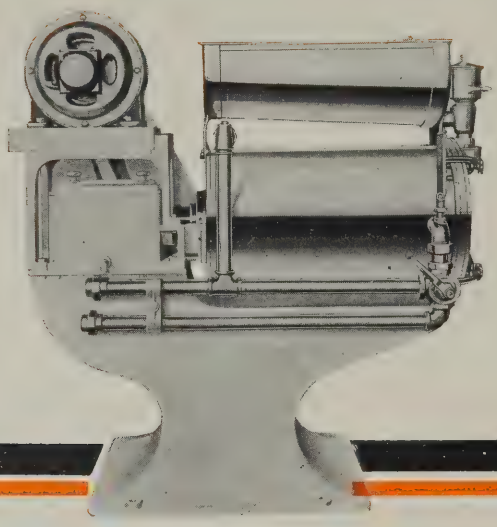
Claims use since 1916.

BRANCH PLANT FOR DIXIE CREAMERIES.

The management of Dixie Creameries has completed arrangements to establish a branch ice cream plant at Camden, Ark., according to Clarence Ford, general manager of the Hope, Ark., plant.

The corporation started less than five years ago on a small capital and is now a $100,000 enterprise, having plants in Hope and Magnolia, Ark., and in Minden and Homer, in Louisiana.

The plant located at Hope, which is said to be one of the best equipped plants in the state, manufactures more than 2,000 gallons of ice cream daily and operates an eight-ton ice plant.



It is reported that the company paid approximately $85,000 to farmers last year for cream and milk. It reports a yearly average business of about $200,000.

If stone work is well put together, it means that a thoughtful man planned it, and a careful man cut it, and an honest man cemented it. If it has too much ornamentation, it means that its carver was too greedy of pleasure; if too little, that he was rude, or insensitive, or stupid, and the like.—Ruskin.

The ICE CREAM REVIEW

July 1925

Cherry Freezers

Over Capacity
Removable Cylinders
S. K. F. Ball Bearings
Hinged Heads
Easily Cleaned

What a story the above five descriptive phrases tell!

They mark the difference between Cherry freezers and just mere freezers. The keen competition in the ice cream manufacturing field makes it essential that manufacturers keep costs low—but never stint quality.

Cherry Freezers are the answer—they have been foremost leaders in the ice cream industry for years.

You will find Bulletin 2063 a real help in deciding on which freezer to buy. Write for your copy today.

Many representative, many leading ice cream manufacturers have reserved hotel rooms for the National Convention-Exposition.

Many of them today are choosing one, two, four, a dozen, from their company rosters to accompany them to Detroit.

There could not be a bigger National Convention--Exposition than 1925's, unless there were a bigger ice cream industry!

Hotel Statler accepts ONLY ice cream manufacturers' reservations. Other hotels, for general occupancy, are: Book-Cadillac, Tuller, Wolverine, Fort Shelby.

JULY 1925

"I DID it to meet competition" is the excuse advanced in an attempt to justify about all of the evils that have grown up in the ice cream manufacturing industry. It is the excuse for poor ice cream. It is the excuse for trade practices—some of which are honest.

Most of the men who employ this excuse are sincere. They honestly believe that things done to meet competition need not be measured by the Golden Rule. They believe that the law of equity doesn't apply in competitive channels.

If the man who seeks to punish a competitor would be content with returning as much as he received then it would not be so serious. In such case conditions would remain as they are. They would not grow worse. But the man who feels that a competitor is "putting something over" is seldom content with returning as good as sent. He is only satisfied when he can go the competitor at least one better. That keeps both hunting for new schemes and new weapons. What started as a pillow fight leads to hair pulling, then rocks and finally guns.

These competitive battles cost money and the ice cream manufacturers are the ones who pay. More and more men in the industry are realizing this fact and the general trend is, we are confident, toward better conditions.

The ice cream industry is a young industry. It has grown so fast during recent years that men and money have been attracted into it. Some of these men expected too much. When anticipated profits failed to materialize they blamed competition and they started out to revolutionize trade practices. Revolutions always cost money whether pulled off in the ice cream industry or in Mexico or in Guatemala.

As we see it, this industry is about due to emerge from its youthful period of growing pains. It is about due to settle down in its manhood of strength and understanding. The men in it who have passed through, or at least viewed, one bad competitive battle after another, are convinced that the industry can continue to grow only as trade practices are dictated by good sense and understanding instead of hate and foolishness.

These men would not eliminate competition in the industry. They would only discourage ruinous competition—dishonest competition if you please. They would encourage real honest-to-goodness competition, the kind that is based on sound business principles and good salesmanship.

Yes, we see better times ahead. There are unmistakable signs of a sound development of this industry. The spirit of true co-operation is working. We are just at the threshold of the greatest development that any industry has ever experienced. "Them's our sentiments," based on our knowledge of what is transpiring among the men who are leading the industry.

NEWS stories in the metropolitan press recently emphasized the fact that a number of children in New York City were made ill by eating "hokey pokey ice cream." One little seven-year-old girl died. Investigation proved that the "ice cream" was shaved ice flavored with an extract of wintergreen.

The business of the manufacturer of good ice cream suffers because of the prevailing ignorance of his product. Anything that is cold, flavored and sweetened is termed "ice cream" by many people and reporters from metropolitan newspapers are among them. Whether sold from a peddler's push cart or in a gilded cafe "ice cream" may be anything as long as it is flavored and sweetened, is frozen and melts readily. If it kills some child, "ice cream" gets another black eye.

Public ignorance regarding legitimate ice cream is widespread. It will prevail until education dispels it—until the men in the ice cream industry tell the consumers of this country the true story of their product.

The individual ice cream manufacturer can't tell this story. When he sounds the praises of his product he is adopting the same tactics that the push cart peddler uses. Everything he says about his product is tinged with selfishness. The consumer is susceptible to his advertising appeals, to be sure, but no standard for ice cream is fixed in his mind. He accepts any claims made for the manufacturer's particular brand of ice cream as so much advertising, nothing more. He may be pleased with his purchase but his confidence in "ice cream" is not strengthened very much. He is still ready to believe damaging statements about the product.

An industry is no stronger than the confidence that the public places in its product. The milk bottlers in this country went through an experience in establishing public confidence in their product similar to what ice cream manufacturers are going through. They are now enjoying the results of a widespread advertising campaign in which the true story of pasteurized bottled milk was told over and over again.

What is the result? No longer is the city milk supply blamed for every epidemic that arises. City people now buy bottled milk with confidence in its purity and wholesomeness.

What has been accomplished in establishing public confidence in a bottle of city milk can be accomplished for commercial ice cream. Instead of striving so hard to gain public preference for certain brands of ice cream the men in this industry should strive for public confidence in all ice cream, at the same time fixing in the public mind a standard for the product.

The right sort of an educational campaign, persistently followed, will do it. It's the big thought behind the co-operative advertising campaign sponsored by the National Association of Ice Cream Manufacturers.

THE men who were at Waldenwoods at the conference have a different conception of this great ice cream industry than they ever had before. They gained an inspiration that only such a meeting can give. These men are going to think in terms of an industry in the future, and they are going to be instrumental in building an ice cream industry that only "dreamers" have dared to think about heretofore..

These men left their businesses during the busy season of the year to plan for bigger things—not how to build tonnage for their plants, but how to stabilize and popularize an industry. True, they will profit individually in the years to come, but it takes a lot of faith and love for an industry to pass up local business problems and spend time and money to build up the other fellow's business, along with yours.

That's the sort of spirit that led men to Waldenwoods. It's the sort of spirit that we will wager our last dollar on. It's the sort of spirit that will build this industry.

AT THE Waldenwoods meeting President Hovey of the National Association of Ice Cream Manufacturers said that the big problems confronting the ice cream industry are uniform cost accounting, destructive competition, educational publicity, standards, and selling by weight. That statement just about sums up the whole situation. Now it's up to the men in this industry to solve them. They will do it, too.

LET'S Meet in Detroit in October" is proving to be a popular slogan. From all parts of the country come evidences of unusual interest in the big doings in the Motor City next October. Make up your mind right now to be there when the gavel sounds, and lay your plans accordingly. With another year's experience in dealing with some of the big problems which made last year's convention so interesting ice cream manufacturers should find the 1925 convention very much worth while.

WE MOVED last week. It came as a climax to several weeks' fretful contacts with masons, carpenters, plumbers, painters, electricians and other willing recipients of our hard earned savings. On the day before moving day the weather man prophesied cool weather for the following day. We planned accordingly, and then the weather man turned on the heat and we sweltered and fumed like a fat man digging ice out of an old ice house. The only thing that kept us going was the thought that out in the ice cream factories, in hamlet and in city, our friends were happy. We knew that they were sweating, too, and were happy in it. Some folks don't like hot weather. We admit that we don't like it on moving day, but we can bear it even then with magnificent equanimity because our friends are happy. Come on, Summertime, do your durndest, you can't make us mad.

BULLETIN OF EVENTS.

National Dairy Exposition—Indiana State Fair Grounds, Indianapolis, Ind., October 12 to 18, 1925. Secretary, W. E. Skinner, 910 South Michigan Ave., Chicago.

National Association of Ice Cream Manufacturers—Twenty-fifth annual convention to be held at Detroit, Mich., the week of October 19, 1925. Convention headquarters, Hotel Statler. Secretary, Fred Rasmussen, Telegraph Bldg., Harrisburg, Pa.

Pacific Slope Dairy Show—Oakland, Calif., November 14-21. Manager, Frank T. Murphy, 216 Pine St., San Francisco.

Texas Ice Cream Manufacturers' Association—Annual convention, Houston, November 18, 19 and 20. Secretary, A. J. White, care Mistletoe Creameries, San Antonio.

Oklahoma Association of Ice Cream Manufacturers—Annual convention, November 23 and 24, 1925. Hotel headquarters will be announced later. Secretary, W. M. Hawk, Tulsa.

Southern Association of Ice Cream Manufacturers—Annual convention at Lexington, Ky., December 1, 2, 3 and 4, 1925. Convention headquarters, Phoenix Hotel. Secretary, J. W. Clopton, Decatur, Ala.

Kansas Association of Ice Cream Manufacturers—Annual convention, Kansas City, December 8, 9 and 10. Convention headquarters to be announced later. Secretary, B. T. Perkins, Pittsburg.

Pacific Ice Cream Manufacturers' Association—Second joint convention with the California and Southwestern States Ice Cream Manufacturers' Association, Portland, Ore., January 12, 13, 14 and 15, 1926. Secretary, Bert H. Walker, Royal Ice Cream Co., Tacoma, Wash.

California and Southwestern States Ice Cream Manufacturers' Association—Annual convention to be held jointly with the Pacific Ice Cream Manufacturers' convention at Portland, Ore., January 12, 13, 14 and 15, 1926. Secretary, Jay H. Kugler, 57 Post St., San Francisco, Cal.

Ohio Association of Ice Cream Manufacturers—Annual convention, during last week in January, 1926, at Columbus. Convention headquarters not yet named. Secretary, W. A. Wentworth, 509 Outlook Bldg., Columbus.

Industrial Information Bureau Approved for Ice Cream Industry

Ambitious Plans Laid Toward Protecting and Advancing Industry's Welfare on National Scale

AVENUES toward intensive development of the ice cream industry on a national scale were opened up as a result of far-reaching lines of action set in motion following a conference of members of the executive committee, directors and directors-at-large of the National Association of Ice Cream Manufacturers June 6, 7 and 8 at Waldenwoods, Mich.

Characterized by association officials and directors as "one of the most inspiring and purposeful meetings in the industry's history," the Waldenwoods conference was marked by the greatest enthusiasm in discussing plans to promote the ice cream industry.

Assured of the whole-hearted support of representative leaders, the executive committee, at the conclusion of this noteworthy meeting, went in session with the way open to lay plans for financial co-operation that will enable members of the ice cream industry to stay in touch at all times with matters vital to their welfare—legislation, relations with other industries, statistical data, publicity data, etc.

An industrial information bureau that will keep members of the association in touch with everything relating to their business will be established under the plan approved by the national executive committee. The bureau will be under the direction of Executive Secretary Fred E. Rasmussen at Harrisburg, Pa. The bureau will be maintained with the co-operation of The Association of Ice Cream Supply Men, officials of which organization attended the meeting to pledge their organization support.

The bureau will be a part of the National Association of Ice Cream Manufacturers' Headquarters at Harrisburg.

IN ANNOUNCING definite steps toward establishing the bureau, Executive Secretary Rasmussen went before the general meeting of directors and directors-at-large, following the executive committee meetings with the following statement:

"The executive committee today has approved the policy of establishing a common source of information for the two associations. Last night was the most wonderful meeting that I ever attended. It means that this industry will develop a co-operative publicity campaign. You may think about it in the way of increased sales of your product. I think of it in an additional light. I see in that movement something ahead which will mean more to the industry in the future than the money you might be able to make the next few years from increased sales. A co-operative publicity campaign, backed by the entire industry is going to eliminate the 'Civil War' which is going on in the ice cream business today.

"The co-operative publicity work will be an important factor in having the uniform cost accounting system generally adopted by the industry when ready for distribution."

The Plan

The following statement in regard to the executive committee meeting held at Waldenwoods has been issued by Fred Rasmussen, executive secretary, National Association of Ice Cream Manufacturers:

"At a meeting held by the executive committee of the national association at Waldenwoods, it was moved and carried that the executive committee approve the general plan outlined for financial co-operation between the National Association of Ice Cream Manufacturers and The Association of Ice Cream Supply Men for establishing a common source of information for the ice cream industry, including a national legislative information service for members of the two organizations, a statistical service dealing with all phases of the ice cream industry, gathering information on trends of the industry and stimulating public interest in ice cream; which whole service will eventually bring about an industrial reference library for the ice cream industry.

"It is understood that after information has been gathered and distributed the two organizations reserve the right to independent action.

"It was also voted that a report including the addresses and discussions at the Waldenwoods meeting be published for distribution to the ice cream industry."

An outline of the working plan for the bureau may be summed up as making the following provisions:

1. An up-to-the-minute record of legislation, federal, state, and in some degree local, affecting ice cream or the ingredients going into it or the products used in manufacturing it, will be maintained with particular current reference to such matters as sale by weight, butterfat content, pasteurization requirements, uses of colors, etc., etc. This legislative information in full detail will be available through The Association of Ice Cream Supply Men to all its members.

2. Statistics will be gathered and collated, concerning:

(A) Gallonage production.

(B) The relation of the ice cream industry to other industries (for example, relationships of ice cream and sugar refining industries, ice cream and various milk products industries, etc., etc.)

(C) Trends of processes and methods in the industry (iceless cabinet status and trends, hopper system use and trends, "central station" mix preparations, results and trends, university research results and trends, etc., etc.)

The Association of Ice Cream Supply Men, through its membership, will assist in the collection of many of these statistics; all the statistical information obtained by the bureau will be available through the association to its members.

3. A regular organized publicity campaign (other than that of paid advertising) will be carried on; that is, the bureau will constitute a source of information, facts, features, photographs, etc., etc., for presentation in newspapers and magazines, by radio, in addresses, etc., throughout the country, to the end that misunderstandings in the public mind concerning ice cream may be removed and the general consumption of ice cream stimulated. Data suitable for such uses will be collected in part by our association through its members; all the publicity data which the bureau obtains will be available to our members for use by them in the ways mentioned.

4. An industrial reference and record library will be built up by the bureau. This library will be accessible to members of our association.

IN THE words of the supply association officials, developments at the Waldenwoods conference mean

Ice Cream for Men Who "Get Up" Again

Walter Johnson, Baseball Super-pitcher, is One of America's Greatest Ice Cream Fans, Ice Cream Helping to Keep Him Fit Through 19 Years of Gruelling Service

"And then spoke up Sir Isaac Barton:
'Fight on, my men, with might and main;
I'll lie down and bleed awhile—
And then get up and fight again."

SEVERAL years ago they said he was through—all in. A good man while he lasted, but now ready for the discard. He showed 'em different. Last fall he went before the mighty men of Gotham—once, twice and three times. Twice they beat him; twice he went down; twice they crushed him under bombardments of base hits. Wearied and worn from his exertions, disappointment gnawing heavily at his heart over the prospect of failing to realize a life's ambition to pitch a winning game in a world's series, he strode out for a third effort—and won!

National Photo

WALTER JOHNSON.

Walter Johnson is great, not simply because he has for 19 years been one of baseball's wonder men, undoubtedly the greatest pitcher in baseball history. He is great, not only because he has more speed and more control than any other baseball pitcher in the world, with eyes as sharp as an eagle's and with a physique remarkably preserved after his many years of service.

Walter Johnson is great, for the reason that he is among those mighty men who, going down for a time, have the grit to get up and fight on again.

THERE is an interesting story to Walter Johnson's success. It is a story of clean living, of wholesome habits, of temperance, moderation. It is a story of ice cream and dairy health. Walter Johnson was "brought up" on dairy products, and he has been a friend of ice cream, milk, butter and cheese for these many years.

"What does he eat?" so many say, in remarking about a great man's health. Johnson has a good, wholesome appetite, but he does not gum up his body with unwholesome, indigestible foods. He is particularly careful on the day before he is going to pitch. He makes no engagements for the evening preceding that day; he goes to bed and gets plenty of sleep. Then, before game time he makes away with a quart of ice cream —and nothing else. Just ice cream. That's good enough for the best baseball pitcher in the world.

Johnson does not wait until he is to pitch to eat ice cream; he always has been fond of the product and knows its food value. He was "brought up" to appreciate the value of milk and milk products.

He was reared on a farm at Humboldt, Kans., and lived there until he was fourteen years old. When asked about dairy products by The Ice Cream Review he immediately waxed enthusiastic, and this is what he had to say:

"During all those years (while he was "coming up" at Humboldt, Kans.) the principal article of food was milk and its products—plain milk, buttermilk, butter, cheese—and ice cream, when I could get it. I feel that they gave me the foundation for the wonderful health and endurance that I have always enjoyed.

"I have four healthy children, who drink plenty of milk. They are all above the average in weight and height. I feel that any child who is deprived of good milk and ice cream, is, indeed, to be pitied."

Walter Johnson's Family—the Wife and Kiddies, All Ice Cream and Dairy Fans.

Make Your Best Ice Cream Months *Still Better*

Frigidaire Cabinets are made in four and six hole single row models, and in four, six and eight hole double row models. All double row models are 30 in. wide and 30 in. high to conform with standard fountain interiors.

The next three months are *ice cream months*—torrid days and nights, when the retailer who sells *good* ice cream is going to sell lots of it, and is going to build up a reputation that will hold patronage during the fall and winter months. That's why *now* is the time to install Frigidaire Electric Ice Cream Cabinets. They assure *constant* and *dependable* refrigeration—temperatures *always* low enough to prevent softening, shrinkage and waste—firm, cold, delicious ice cream from the first spoonful in the can to the last one—freedom from the annoyance and muss of packing and repacking.

By increasing the production of Frigidaire Ice Cream Cabinets more than 300 per cent in 6 months, we will be in a position by July 15th to make immediate deliveries. You can begin at once to get the increased sales, the real savings and the larger profits that come with the installation of Frigidaire Ice Cream Cabinets.

Frigidaire is approved by the National Board of Fire Underwriters

Weight Question Unsettled

Increased Cost to Consumer and Additional Handling Cost Would Result from Adopting Weight System, It Is Shown at Washington Probe

By UTHAI VINCENT WILCOX*

WHETHER the consumer really will be benefited through selling ice cream by weight was a point not settled in the conference at the bureau of standards of the department of commerce at the eighteenth annual conference of weights and measures, May 25 to 28.

The public, concerning whom all were anxious, figured largely as the unknown quantity. Jos. G. Rogers, secretary of the department of weights and measures of the state of New Jersey, presumably spoke for the average citizen, W. W. Skinner, chairman of the committee on weights and measures, definitions and standards, and Harry Klueter, assistant dairy and food commissioner of the state of Wisconsin, whose paper was read by George Warner, chief inspector of weights and measures of the same state, presumably spoke for the public as well, as did V. F. Hovey and Fred Rasmussen, president and executive secretary, respectively, of the National Association of Ice Cream Manufacturers, and E. A. G. Intemann, representing the New Jersey Retail Ice Cream and Candy Manufacturers' Association.

VERNON F. HOVEY,
President, National Association of Ice Cream Manufacturers.

Mr. Rogers, New Jersey, whose paper was read by A. W. Schwartz, was most emphatic in advocating some sort of legislation based on weight. He stated that the experience of New Jersey indicated that the overrun, or the swelling due to the presence of air, or carbon dioxide in some cases, caused the original material placed in the freezing rooms to swell in some instances to 120 per cent of its volume. This was a hardship on the dealer, he claimed, because of the shrinkage due to repacking.

IN New Jersey alone some 40,000,000 quarts of ice cream were sold last year, a wholesale price valuation of $13,200,000 paid to the manufacturers. Shrinkage of 20 per cent claimed by the manufacturers makes a difference of $2,640,000 of this total.

Contrasting sales by weight with the present system, there would be increased cost to the consumer and also add to the handling cost. Several hundred thousand dealers who handle ice cream in the summer months, including 61,000 druggists and 41,000 confectioners, would have to undergo many expensive hardships in making such a change, while the manufacturer and distributor would be subjected to increased opportunities for the dishonest employee.

Mr. Intemann of the Retail Candy and Ice Cream Dealers was also much exercised regarding this loss of profit due to the shrinkage of ice cream. He declared that unscrupulous practices in over-fluffing, due to price competition has brought about a condition demanding regulation of some kind in the interests of the public as well as the retailer.

Lack of knowledge of this shrinkage and just how much to expect, and lack of understanding of the business of making ice cream were serious factors for many retailers. "We old-timers understand and get along all right," he said, "but the new fellows get pinched."

He was as emphatic in his appreciation of the manufacturers' side as the difficulties of the retailers, and having no specific suggestions urged that the officials and manufacturers make a very complete study of the situation and then draft some regulations fair to all.

THAT there are weighty arguments on the other side all who have to do with the manufacturing of ice cream know. While weights of cans can be standardized, perhaps, there is still the difficulty in marking cans because of freezing rooms and the handling of tins—no markers can survive, and nothing will stick to the cans. This was a real problem, declared both President V. F. Hovey and Executive Secretary Fred Rasmussen.

Labor in handling ice cream in the factory would be greatly increased through adopting the system of selling ice cream by weight, it was brought out by Mr. Rasmussen. Showing that 80 per cent of the ice cream is handled during the summer months, Mr. Rasmussen said:

"In the flush of the season, thousands of packages leave the factories daily. In selling ice cream by weight, all empty cans must be weighed and marked and, when filled, marked again with the net weight. This may seem a simple operation but it is a fact that it is almost impossible to mark tin cans. Paint, crayon and pencil cannot be used. Tags are impractical because they are difficult to attach and frequently get lost in the hardening room and on the trucks. The weighing of the can with its difficulty of marking at the time they are filled is not the only additional work, but the weight of each can going from the hardening room must be recorded and checked on the trucks. The weights on the cans, which are returned from the routes, must be checked before again placed in the hardening room. All records in and out of the hardening room and the checking in and out of the driver's load at present is kept by the number of cans or packages. In the busy season, the work can be handled under this plan more rapidly and at less cost than when obliged to check each can by weight.

"Brick ice cream is made from slabs of ice cream cut by machine. It is impossible to make them all uniform in weight. Bricks are wrapped in paraffined packages and it is practically impossible to mark the weight on paraffined paper. Bricks of ice cream decrease in weight during storage which will further complicate the problem.

"There are numerous cups and packages which are now machine filled and which it is not possible to fill with such machine to exactly the same weight. Hence each package if required to be sold by net weight must be weighed individually, the expense of which would make the sale of such

PROOF!

YOUNG MEN'S CHRISTIAN ASSOCIATION
OF PITTSBURGH
Downtown Branch

February 23, 1925.

The Russ Manufacturing Co.,
Cleveland, Ohio

Dear Sirs:

We have been operating since September 15, 1924, one of your Walker-Mizer type soda fountains. The results obtained are satisfactory in every way.

I do not hesitate to recommend similar equipment at any time.

Sincerely yours,
Building Superintendent

EMS:DL

HOOK DRUG COMPANY
MARKET AND NOBLE STREETS
INDIANAPOLIS

April 8, 1925

The Russ Manufacturing Co.
E. 58th & Walworth Ave.
Cleveland, Ohio

Gentlemen:

We wish to express our appreciation of the prompt and careful installation of the thirty-five-foot Russ "Bilt-Rite" fountain just made at our Meridian & Washington Store. Not only was the work well done but the installation is one of the most beautiful we have ever seen.

The first installation, the 20-foot job, was made the early part of March, 1924, and except for a few minor adjustments to regulate the temperature has given us no trouble whatever. We have been able to maintain a temperature that would keep soda and drinking water as cold as we desired and a zero temperature on ice cream, if we wish it.

There is a great economy in the dipping of the ice cream due to the fact that it is always hard - besides the many other advantages that the fountain offers.

Sincerely yours,
President

JAB/ts

WHATEVER a manufacturer may say for his product, or his competitors may say against it, counts for little in the final analysis. The important thing is what the buyer or user has to say, based on actual experience.

The Russ WALKER-MIZER PATENTS **Bilt-Rite** *Fountain*
3 temperatures without icing

has proved its true worth to many users throughout the country. It is saving them money, labor, time, bother, mess. It is increasing their business and profits by enabling them to serve perfectly conditioned ice cream, refreshingly cold fountain drinks and bottled goods, and stopping all shrinkage losses.

BILT-RITE Fountains MORE than earn their way. Catalog on request

THE RUSS MANUFACTURING CO.

BERT A. SMYSER
PHARMACIST
14TH STREET AND PENNSYLVANIA AVENUE, S. E.

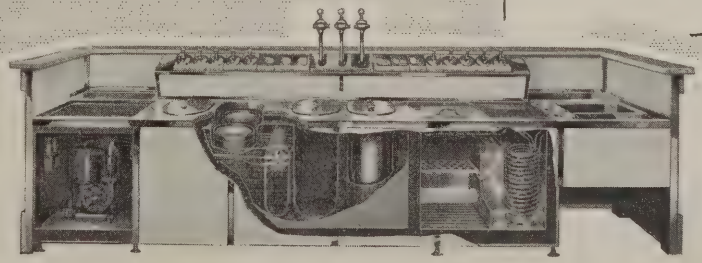
WASHINGTON, D. C., Feb. 14th, 1925

The Russ Manufacturing Company,
5700 Walworth Avenue,
Cleveland, Ohio.

Gentlemen:

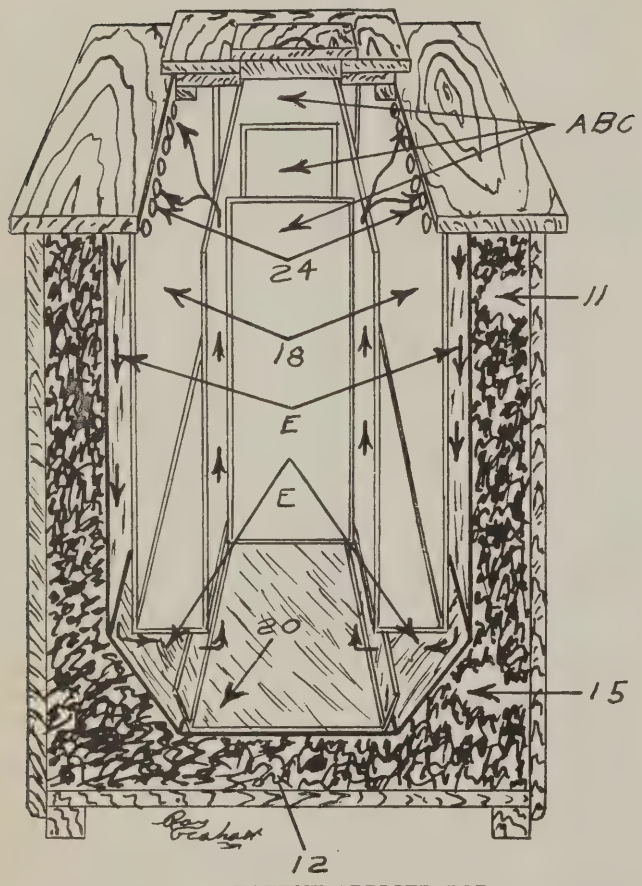
I am glad to answer your inquiry as to the service rendered by the new Walker Type mechanically refrigerated fountain which you installed for me.

At the outset let me say that the appearance of my store alone would justify the expenditure. The muss of ice and salt packing is gone and my store is always clean. The ice cream is in perfect condition day and night. The bottle goods are very cold and the labels are always on the bottles, as the bottle compartment is perfectly dry.



Now comes the important part; the soda and drinking water is colder than I have ever been able to draw from any other type of fountain and I have eliminated entirely the use of chipped ice in drinks. My customers comment daily of the coldness of the drinks and tell me that my sodas have improved greatly.

The ice cream manufacturer has made me a better price by ten cents per gallon on the ice cream and this, together with the saving in shrinkage and ice purchases will soon pay for the fountain.



It will be a pleasure to answer any inquiries from prospective purchasers and I will recommend that they purchase the Walker Type fountain which does the work one hundred percent.

With best wishes for your success, I am,

Respectfully yours,
Bert A Smyser

Hats Off! It's Here

PATENT APPLIED FOR

Short arrow heads indicate direction of air circulation

11. Three inches two-ply Corkboard, one layer insulation paper.
15. Six inches Corkboards.
12. Four and one-half inches Corkboards. ABC Storage Compartments.
18. Ice and Salt Chamber.
E. Air passage between Ice and Salt pan and insulation walls.
24. Air holes admitting air to air passage "E."

What we mean by COLD BLAST

1. A continuous circulation of cold air through the Storage Compartments.
2. No warm air can come in contact with the Ice Cream.
3. The top layer of Ice Cream will not soften as it does in other Cabinets.
4. A uniform temperature through the entire depth of Storage Compartments.
5. The temperature of the air is maintained at a closer proximity to the temperature of the cooling medium (the brine) than in other Cabinets.
6. The "Cold Blast" will hold cream in good condition for two to three days on one icing when necessary. Fifteen to thirty pounds of ice and salt daily (owing to size of Cabinet) will maintain a uniform temperature and keep cream in good condition.
7. The "Cold Blast" is a Dry Storage type. No ice or salt comes in contact with the Ice Cream cans.
8. The Ice and Salt pan is made in four standardized sections. Remove one or all sections in a few minutes for repairs or replacement, makes the Cold Blast a permanent fixture. It will last a life time.

The air being admitted to the air passage "E" in less volume than the capacity of the Storage Compartments cools more quickly and becomes colder causes the air to settle downwardly, and under the Ice and Salt pan and thence upwardly through the Storage Compartments. When the lids are replaced a continuous circulation is established.

COLD BLAST CABINET CO.

The "Cold Blast"

A Real Dry Storage Ice Cream CABINET

Requires no Electric Power and very little Ice and Salt, but she is sure a "cold baby." You never saw one like it before and will never see a better one. The Air Circulation feature (patent applied for) of this Cabinet puts it in a class by itself. It is a new breed.

The same amount of air comes in direct contact with almost three times the number square inches of the cooling surface of the Brine Pan than any other Dry Storage Cabinet, which results in the same effect as adding more expansion coils to your hardening rooms. A much colder temperature can be produced with the same amount of Ice and Salt than in other Cabinets. The directed air circulation feature (patent applied for) puts the cold air where you want it, in the storage compartments. The air is thoroughly refrigerated before it can enter the Storage Compartments.

Will ship a "Cold Blast" on thirty days trial. *It is the best little salesman we can send you* for "Actions speak louder than words."

Puts the small dealer on an equal footing with a competitor who may have mechanical refrigeration.

Write for circulars describing more fully the details of this Cabinet.

Ottumwa, Iowa

Ice Cream Advertising

THE ADVERTISING BUDGET
How to Lay Out a Complete Year's Campaign

Questions answered for readers of The Ice Cream Review
by MILES D. ALLEN

WHENEVER the word "budget" is mentioned we invariably think of the family budget, with its usual run of funny stories. For this reason, perhaps, the subject of an Advertising Budget is an unwelcome one and is conscientiously side-stepped by most ice cream manufacturers as being something outside of their business and beyond the realm of comprehension. However, an Advertising Budget is most essential in coordinating the advertising effort of any concern, and it is, positively, the first and most important step in laying out an advertising campaign.

It is the intention of this article to explain in simple detail just what steps are necessary in making up the Advertising Budget and the best ways to secure information for its formation.

In figuring an advertising budget never allow the cost of the campaign to be your first consideration. The item of cost is the last part of the budget, not the first.

The first step is to consider what different forms of advertising to use. Past experience will readily indicate what forms are best and which forms are the weakest. If you are a new concern, just starting in with no past experience in advertising, the best and quickest way is to learn of the past experience of manufacturers in your same line of business. What will work for one should work for another, but remember that results should be obtained in your own original way. Results and application are two different things. If you take the results of other manufacturers as your working basis, remember that the matter of geographical location plays an important part, and what may work for one manufacturer may not prove successful for another a great distance away.

Of the several forms of creamery advertising, the following mediums seem to be the most successful:

(1) Newspapers
(2) Trade Publications
(3) Billboards and Sign Walls
(4) Street Car Advertising
(5) Direct-to-Dealer Advertising
(6) Direct-to-Consumer Advertising
(7) Package Inserts
(8) Radio
(9) Display Signs and Material

Questions Answered

This new department has been originated by The Ice Cream Review with a view to answering the many complex questions which arise concerning Sales and Advertising problems. Mr. Miles D. Allen, an advertising man with years of practical advertising experience, has been retained by this magazine to answer any questions or to give suggestions on any kind of problem. Send your questions direct to The Ice Cream Review and they will be answered immediately.

AFTER you have selected the mediums, you are then prepared to take the next step, which is laying out the campaign itself. This part of the budget takes time and careful attention. You must figure out about how much of each medium you will use, and then construct layouts for it. Work ahead with the definite idea in mind of putting all your lay-outs and dummies in a portfolio, which will be neat, attractive and easily referred to. If you use newspaper copy, lay out several pieces of copy just the way it will appear when published, and if you use art illustration, get an artist to make the layouts for you. This may seem a needless expense, but it is the logical way to get a budget into working form.

Follow the same procedure for your other types of advertising. Figure out your ideas on display material, street car cards, billboard designs — in fact, everything you intend to use. Wherever color is to be used, use color in your budget. Make it exactly like the finished advertising is going to be.

After all these steps are taken you are prepared to take the last and final step—that is, figuring cost.

BUDGETS are usually confined to a set amount, that amount usually being figured as a percentage of the gross sales of the preceding year, or a percentage of the anticipated gross sales of the ensuing year. In specifying the amount you will expend for each particular item of the budget, you are absolutely safe in figuring the largest percentage of it to go to help your dealer, and a small percentage of it to go to the public. By this statement, do not get the erroneous impression that the public is not important, but they can be advertised to more cheaply than the dealer. A small amount of money will go a long ways in advertising to the public.

And finally, do not expend your entire appropriation for the various budget items without leaving quite a substantial amount for an emergency fund. There are always items of an unexpected nature which the most carefully prepared budget cannot foresee, that will have to be taken care of.

The value of a well-planned budget is manifold, but probably its greatest usefulness, as far as time-saving

"Illini" Special to the National Convention

Ice cream manufacturers of Western points have been invited to be guests of the Illinois Association of Ice Cream Manufacturers on a special trip to go to the national convention at Detroit from Chicago, this train leaving the Chicago Dearborn station at 12:30 noon, Sunday, October 18, over the Wabash Railway, reaching Detroit at 7:30 p. m. (Detroit time) on the same day.

Secretary N. Loewenstein of the Illinois association has issued a circular in which it is stated that this train will be operated under the auspices of the Illinois Association of Ice Cream Manufacturers, and that all manufacturers traveling by way of Chicago are cordially invited to join the Illinois manufacturers "as we want this ice cream special to pull out of Chicago 100 per cent strong."

The train will consist of high grade all-steel equipment, carries two diners to serve luncheon leaving Chicago, and also an observation car.

The circular follows in part:

"Beginning September 1, reservations may be made at this office, or by writing the Wabash Railway Company, 144 South Clark St., Chicago, Ill., advising the number of seats required on the special train.

"Our object in sending out notice at this early date, is to enable you to make your hotel reservations at Detroit, fixing your arrival date in that city, Sunday evening, October 18.

"Make up your mind early to join us so that we will be ONE BIG HAPPY FAMILY to the national convention. Be sure to have your ticket agent route your ticket 'WABASH RAILWAY FROM CHICAGO.'"

THE DAIRY COW AS A BIBLE CHARACTER.

If we go back 4,200 years before Christ was born and as we were told today, before the word brother was ever formed or understood, we find those people back there in that remote time groping for some means of symbolic expression of their valuation and dependence upon the dairy cow. And back there in those remote times we find those early people deified the dairy cow, and we come down to modern times, and we find when we turn to the Great Book, that milk is mentioned in the Bible from Genesis to Revelations 49 times.—From remarks by M. D. Munn, president of the National Dairy Council, speaking before Waldenwoods meeting of ice cream manufacturers in June.

FALL OUTING FOR NEW ENGLAND MANUFACTURERS.

The regular fall outing of the New England Association of Ice Cream Manufacturers will be held in September at the Forest Hills Hotel, Franconia, N. H., it has been announced by Secretary W. P. B. Lockwood. The meeting was held last fall at Poland Springs, where accommodations were not available for next September.

A baseball game between the Charlestown branch of the Turner Centre System and some other team to be decided will be one of the features of the outing.

Don't be without a position, when at a small cost you can locate one through the Want Department in "The Ice Cream Review."

DIXIES!

5¢

easy to handle–
easy to sell–
profitable–

Look ahead a little to next Fall when the first chill winds quiet the call for ice cream—when gallonage drops and when you will be puzzling your brain for something to keep your hardening room full, your drivers busy, and those yawning cabinets filled.

Then you will want 5c Dixies. They have been proved to be the greatest off-season boon ever offered to the ice cream industry. These attractively packed little portions of your best ice cream for 5c sell ice cream when folks shiver at the thought of an ordinary plate of cream.

The name Dixie itself suggests the sunny clime of Dixie Land.

5c Dixies will carry your overhead this Winter. This is a strong statement! Ask us where it has been done.

Cool weather will be here in 90 days. You will need some preparation to handle Dixies. ***Look ahead.*** Write now to

Detroit Convention and Show Committee now at Work

Local Ice Cream and Supply Men Co-operate on Big Scale to Insure Success of Entertainment and Local Arrangements

REPRESENTATIVES of Detroit ice cream companies and supply houses at a dinner at the Detroit Golf Club on June 5 organized a general committee to assist in local arrangements and entertainment for the week of the National Convention and Exposition, October 19-24, inclusive.

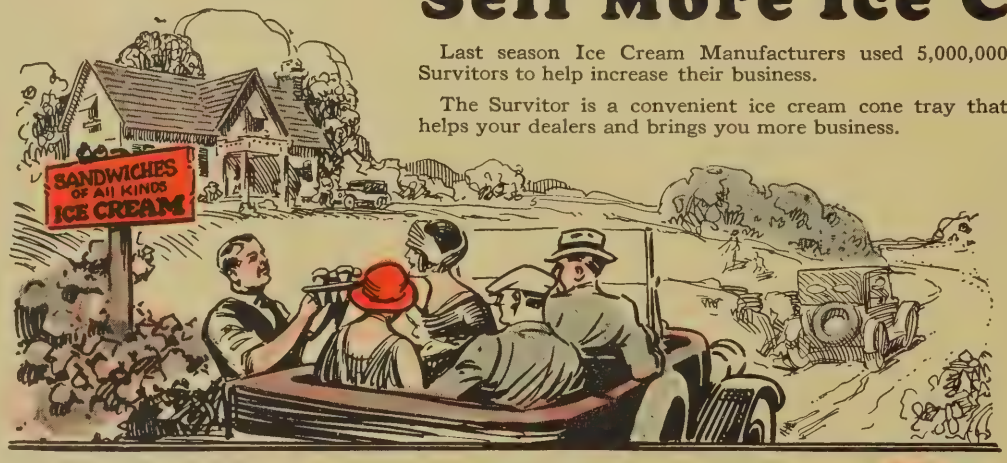
Jack Harris of the J. B. Ford Co. was elected general chairman. On the committee are representatives of the following companies:

Consumers Ice & Creamery Co., Arctic Dairy Products Co., Stroh Products Co., Absopure Ice Cream Co., Kelvinator Corp., Menasha Printing & Carton Co., John W. Ladd Company, Buhl Stamping Co., C. E. Rogers and Dairy Products Merchandising.

Messrs. N. J. Dessert and John W. Ladd are acting as joint chairmen of the local hotel committee. Messrs. Dessert and Ladd are also organizing a committee of Detroit ladies to assist in ladies' registration and entertainment.

Glen Cowan is chairman of the transportation committee.

A. Fernald is chairman of a committee to put in operation a unique and educational luncheon and catering feature, further details of which will be issued later.



The Association of Ice Cream Supply Men has announced the receipt of communications from representative ice cream manufacturers in all parts of the country definitely indicative of a record-breaking attendance at the 25th annual convention of the latter organization and the third national exposition for the industry managed by the supply group.

Some of the names included in this advance list of attendance certainties are: Wm. A. Schwindeler, St. Louis, Mo.; S. M. Ross, Columbus, O.; W. R. Cammack, St. Paul, Minn.; S. N. Sutton, Vicksburg, Miss.; B. H. Walker, Tacoma, Wash.; Chas. G. Morris, New Haven, Conn.; A. H. Graeszel, Milwaukee, Wis.; S. T. Nivling, Rochester, N. Y.; F. J. Bridges, Chicago, Ill.; H. K. Geist, Grand Forks, N. D.; and E. B. Geisel, New Orleans, La.

Wm. E. Hoffman of the W. E. Hoffman Co., Tyrone, Pa., will attend with five of his company's representatives; L. S. Wilson, with four representatives of the Wilson Ice Cream Co., Port Huron, Mich.; Morden Neilson, Wm. Neilson, Ltd., Toronto, Ont., Canada, with two; Geo. L. Boedeker, Boedeker Manufacturing Co., Dallas, Tex., with four; E. N. Hershey, Hershey Creamery Co., Harrisburg, Pa., with four; C. S. Hutchinson, Hutchinson Ice Cream Co., Des Moines, Ia., with three; Thomas Hall, Russ Brothers, Harrisburg, Pa., with three; Imperial Ice Cream Co., Parkersburg, W. Va., with twenty; H. Hughes, Hughes Ice Cream Co., Lexington, Ky., with three; Hoeffler Ice Cream Co., Buffalo, N. Y., with six; M. T. Cochrane, Altus, Okla.; A. J. White, San Antonio, Tex.; H. Cuscaden, Cuscaden Ice Cream Works, Louisville, Ky.; H. T. Pangburn, Pangburn Co., Ft. Worth,

MENASHA PRODUCTS
The Imprint of Quality

An announcement—
of interest to the Ice Cream Industry

FOR many years Menasha has supplied the Ice Cream Industry with most of its packages.

Your present brick cartons and pails with multi-colored advertising designs are Menasha developments. The white-lined round container is Menasha's idea. In many other ways both the quality and character of packages have been improved by Menasha.

Through more than twenty-five traveling representatives in touch with ice cream manufacturers in all parts of the country, we have considered problems of the ice cream industry as our own problems and have made our organization a clearing house of trends and ideas.

It now seems certain that we shall see a steadily increasing use of the factory-filled package brought about by conditions over which the trade has little control.

Our contact with the ice cream industry has made us firmly believe in the future of packaged business and convinced us that in the development of package and carry-out trade lies one of the greatest possibilities for increased sale of ice cream.

We have constituted ourselves package engineers to the industries with whom we do business. In line with this policy of research and development we are offering the

NEW MENASHA SNAPPY-PACKIT

a handy 10c package complete with spoon and napkin. Other Menasha packages in half-pint, pint and quart sizes are the logical solution of your package problems.

Whatever your package and carton requirements may be, we invite you to discuss them with us.

Ice Cream Weeks are Successful

Wisconsin Will Follow Examples of Indiana and Ohio Manufacturers With Ice Cream Week In August

ICE cream manufacturers are taking more interest in special ice cream weeks this year than ever before. Different states have either held or are getting ready to hold an ice cream week. Wisconsin will put the frozen product in the limelight in the Badger state the first week of August.

Plans for the occasion, which will be in connection with dairy week, were discussed at a conference of ice cream and dairy leaders at Madison on June 11.

Indiana and Ohio manufacturers are highly satisfied with results of campaigns of one week's duration conducted in those states.

Ohio ice cream week was planned and sponsored by the Ohio Association of Ice Cream Manufacturers. All over the state, from June 5 to 12, urged by the slogan, "It's Ice Cream Week in Ohio," everybody was invited to eat ice cream.

The announcements of the Ohio association say that "This association is organized for the promotion of good fellowship among the manufacturers of ice cream within the state and for the interchange of modern ideas and methods," and the association has a reputation all over the country of living up to its creed. For more than a year the idea of a week of stimulation and general education has been under consideration by a special committee, and early in the year this committee set out to crystallize the idea and make it work.

One of the Posters in Connection with Ohio Ice Cream Week.

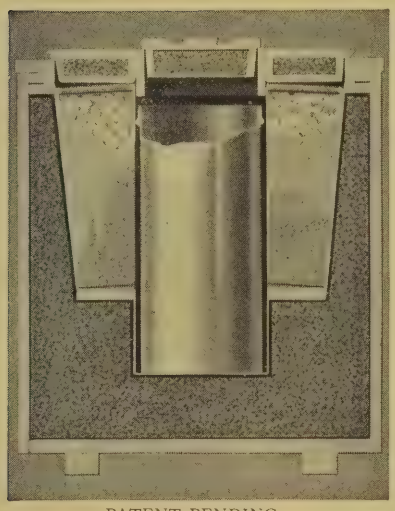
FIRST of all ice cream advertising specialists were called in and invited to submit ideas for a campaign that would completely cover the state, and the date of the experiment was determined. Then, when the campaign had been approved and its exact cost determined, Secretary W. A. Wentworth set out to cover the state and submit the plan to the members.

The association divides its membership into eight districts, and meetings were held on successive days in every one of these districts. Any doubts the committee or its secretary may have had as to how the proposition would be received by the membership were quickly dispelled after the first meeting. The idea went over with a bang everywhere, and the various quotas were subscribed in record-breaking time, and then everybody got together to boost the campaign and do his part.

THE first step in advertising was a broadside folder, addressed to ice cream dealers, carrying the caption, "We'll Tell 'Em, You Sell 'Em," telling them about the campaign, when it was to commence, what was to be done by the manufacturers, and inviting co-operation. The folder was so designed that after it had served its purpose in enlightening the dealer it could be used as a full sheet window poster announcing that "Next Week is Ice Cream Week in Ohio," coupled with a secondary slogan, designating Ohio as "The State O' Happiness." These broadsides were ordered by the manufacturers in large enough quantities to supply every dealer, and were distributed by drivers, sent through the mails or delivered as each manufacturer thought best.

One week later each dealer received a supply of big colored window streamers, showing the line, "It's Ice Cream Week in Ohio," printed across an outline map of the state, and inviting the passerby to "Get Some Now." These streamers were first displayed on the morning of June 5, and were given prominence all through the week.

In addition to these forms of publicity, wagon banners, three feet wide, in full colors, carrying a design that tied up with the broadside and the window streamer, were furnished to each manufacturer and were put on each side of every truck or delivery wagon he owned.



BUT the backbone of the campaign was the newspaper advertising. Seventy-five different newspapers were used in 47 cities and towns, and a liberal amount of country newspaper advertising was planned. Six-column space was used for the opening announcement with proportionate daily advertisements as the campaign went along. Each advertisement featured the same illustration as was used in other publicity, carrying the line, "It's Ice Cream Week in Ohio," and calling the state itself, "The State O' Happiness." Some of the head-

TREMENDOUS POPULARITY Indicates OUTSTANDING VALUE of

TRAY-PACK

The 100% Dry Pack Cabinet — Style 10

In only six months time after being placed on the market TRAY-PACK has won national acceptance; and its popularity continues to increase by leaps and bounds.

PATENT PENDING

To service TRAY-PACK, remove trays, carry to street or other suitable place and dump brine, repack at truck, replace trays—that's all—no slop or muss in the dealer's store.

There can be just one answer to such an amazing success—*Outstanding Value*—value that is expressed in advantages and economies so apparent that it has won the enthusiastic approval of practically every manufacturer who has investigated it.

From coast to coast, in the service of hundreds of manufacturers, TRAY-PACK has proved that it thoroughly combines in one cabinet the cleanliness of the mechanical unit with the low cost and absolute reliability of ice refrigeration. Certainly then it offers the most logical solution to your service problem.

In justice to yourself get better acquainted with this remarkable cabinet and the perfect service it makes possible. Write for free literature or better still place your order for a sample cabinet.

lines were, "All Around Ohio They're Eating Ice Cream for Dessert," and "This Week Every Ohio Home Backs Ice Cream to Win." Brief mention was made of the food value and wholesomeness of ice cream and a general appeal was made to eat more of it. Each advertisement was signed by the Ohio Association of Ice Cream Manufacturers, no individual manufacturer's name being mentioned.

All told, more than two hundred advertisements were inserted during the week, and this was supplemented with a series of newspaper stories stressing food value, importance to state of dairy products, wholesomeness, nourishment for children and grown-ups, etc.

From start to finish of the campaign Secretary Wentworth kept in close touch with every district and with each individual manufacturer, seeing that he was properly supplied with advertising materials and was given information of every new development. At this writing it is impossible to compile results in gallonage figures, but sufficient is known to say that the campaign was a complete success. The special committee of the Ohio association in charge of the campaign consisted of S. M. Ross, Moores & Ross Milk Company; Everett Antrim, Furnas Ice Cream Company; Bert Milliken, Milliken Ice Cream Company; David Schlagel, Cleveland Ice Cream Company, and Barker, Duff & Morris of Pittsburgh handled advertising details.

INDIANA'S SUCCESSFUL ICE CREAM WEEK.

By R. L. Hammond.*

ONE HUNDRED AND SEVENTY-FIVE THOUSAND pieces of advertising material was distributed throughout the state during May 3 to 9, which was known in Indiana as "Ice Cream Week." During this period sixty manufacturers of ice cream in the state co-operated in a co-operative advertising campaign. This campaign was sponsored by the Ice Cream Division of the Indiana Manufacturers of Dairy Products Association, at which time an effort was made to focus the attention of the consuming public on ice cream and to create good will for the industry.

The plan of the campaign, in brief, was as follows:

1. Ice cream manufacturers throughout the state used uniform advertising materials.
2. These materials were furnished by the association.
3. The materials used were:
   (a) Posters—22x28 inches in size and made in four colors. These were used on wagons, trucks and in dealers' stores.
   (b) Window Strips—7x22 inches in size, and also made in four colors. Four different window strips were used, one during each week in May.
   (c) Newspaper Ads—For those who desired to use this type of advertising, copy was furnished. In most instances two newspaper advertisements were run, one announcing "Ice Cream Week" and the other calling attention to the essay contest.
   (d) News Items—These items also called attention to "Ice Cream Week" and were published by the papers free of charge.
   (e) Booklets—The booklets told of the food value of ice cream, how it was made, and gave numerous ways in which it might be served.

One of the special features of the campaign was an essay contest for children under sixteen. In this connection the association offered one hundred dollars in prizes for the best essays written on the subject, "Why I Should Eat Ice Cream Every Day." Through this contest we hoped to acquaint the children and their parents with the fact that ice cream was a real food and deserved a regular place in the diet. Rules of the contest were distributed by the ice cream dealers. It was necessary for each child to go to some store where ice cream was sold to get a copy of the rules. In this respect it was found that dealers were very willing to co-operate as it brought people into their stores. At the last minute many calls were received from dealers buying ice cream from manufacturers who did not co-operate, asking for material. These calls were the result of inquiries being made and the dealer having no information to give out. That a great deal of interest was taken in this contest is shown by the fact that nearly four hundred essays were received, representing 107 towns within the state. The three winning essays are here reproduced.

One of the Posters in Connection with Indiana Ice Cream Week.

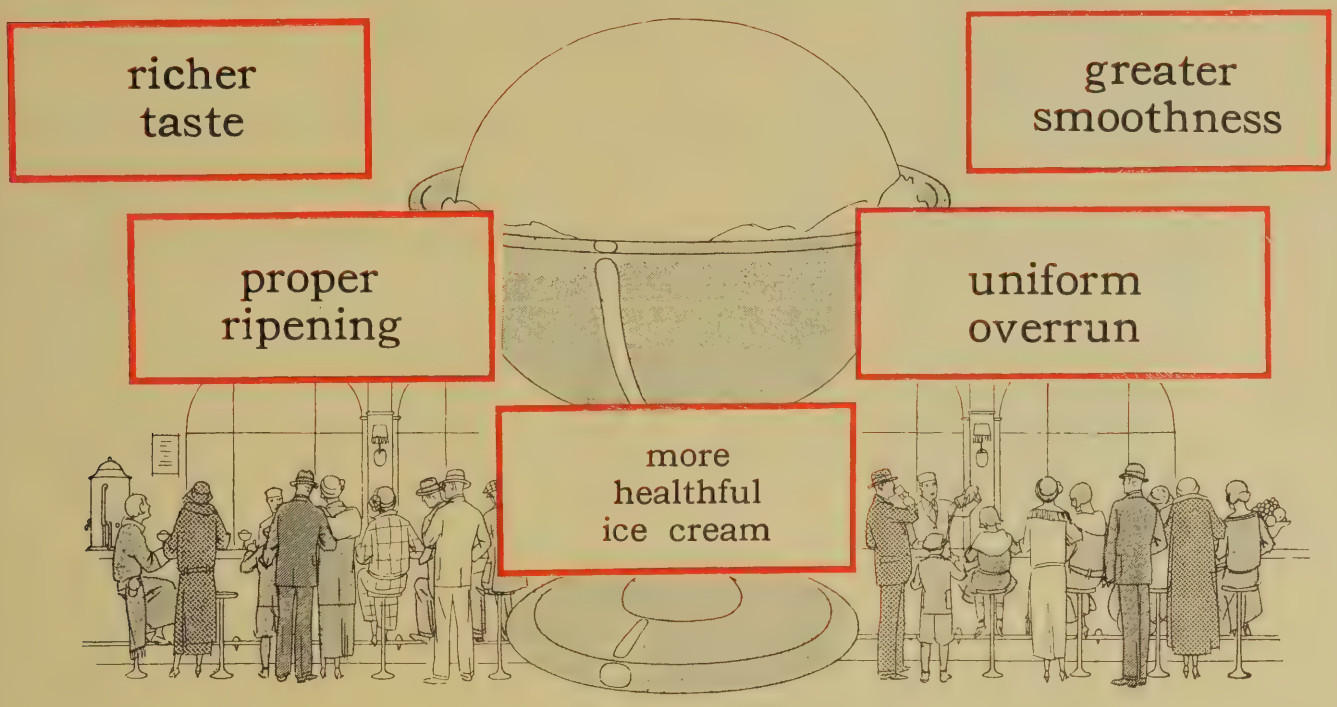
WINNER OF FIRST PRIZE.

A generous serving of ice cream each day
Makes any child willing to work as well as play.

I think I should eat ice cream every day because it is food, and I eat food every day.

Ice cream contains the materials and forces necessary to help make the body healthy. Of what is ice cream made? I mean plain, wholesome, palatable ice cream. It is made of milk, eggs, sugar, flavoring, fruits and nuts.

Milk is a complete food because it contains all the necessary food properties in such a form that the body can readily digest and make a part of it.



It contains water, fat, sugar, mineral matter, and proteids. Proteids are tissue building substances.

Eggs, like milk, contain some of the most necessary properties to feed and build up the body. They contain water, fat, mineral matter, albumin and proteid. The body needs all these things in making tissue, muscle, bone and good rich blood.

Sugar is pleasing to the taste. It has a wonderful food value. It gives heat and strength to the body. That is why children, who are more active than grown-ups, like sweets so well.

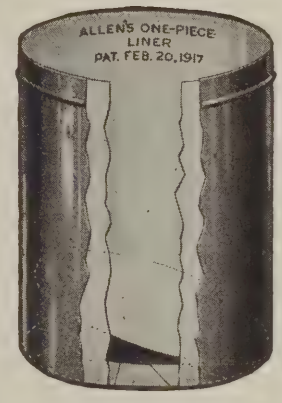
INDUSTRIAL INFORMATION BUREAU APPROVED FOR ICE CREAM INDUSTRY.

(Continued from page 6)

"that The Association of Ice Cream Supply Men and the National Association of Ice Cream Manufacturers have definitely joined hands to 'chart' the economics of the ice cream industry."



The meeting gave every assurance that the ice cream industry is on the threshold of the greatest degree of perfection in organized efforts to protect and further the welfare of the industry. The plans of the association mean that the public will be made better acquainted with ice cream, adverse newspaper publicity will be curtailed, wholesome publicity will be given to this industry, members of the national association will stand closer together and work with greater harmony and understanding.

The spirit of the conference was all summed up in the words of Mr. Rasmussen when he went before the last session of the meeting and said:

"There isn't a man here who isn't going to remember this meeting to his dying day."

THIS step will put the National Association of Ice Cream Manufacturers on the same plane with the ranking industries of the country that have established comprehensive research bureaus for their members. Mr. Rasmussen will occupy in the ice cream bureau virtually the same position of "official mouthpiece for the ice cream men of the country. But—

"I can only help you to the extent to which you make it possible," he said with much feeling. "I feel, in speaking for the ice cream industry of this country, a great responsibility. Sometimes I don't even want to think about the responsibility because it looks so great and I should so hate to make a mistake, but when I think of the fact that I am only to give expression to how you feel, then I know I cannot fail because you will back up that to which you have given expression."

Co-operation Means Ice Cream Industry's Salvation

Ice Cream Bodies and Dairy Groups Have Important Points of Relationship

By FRED RASMUSSEN*

PRESIDENT HOVEY, when asking me to accept the position as executive secretary of this association, and after outlining some of the problems of the ice cream industry, concluded by saying: "We want the national association to become a clearing house for all the problems of the industry." For three months I have been trying to visualize what the problems of the ice cream industry are, and I doubt whether a single day has passed without a new problem or a new phase of an old problem coming to light.

The problems of the ice cream industry may be classified for convenience under two general heads:

1. The relation of the ice cream manufacturer to other groups.
2. Problems relating to the manufacture and distribution of ice cream.

No industry today can be sufficient unto itself. Each year every phase of our commercial life becomes more and more complex. Each industry is constantly increasing the number of contacts with other industries and other agencies. New contacts mean new problems, and unless an effort is made for a mutual understanding and a spirit of co-operation and tolerance is shown by all parties, misunderstandings will arise resulting in loss of temper, time and money, and, what is more, inevitably delay progress.

One of the most important functions of the National Association of Ice Cream Manufacturers is to develop a spirit of co-operation and a spirit of tolerance with all other industries and agencies with which the ice cream manufacturers come in contact. In dealing with other groups there are two viewpoints which we must constantly keep before us: first, we as manufacturers, must be prepared to enlighten others about our problems, and we should, as far as possible, anticipate our problems and be prepared with facts and figures to make our position clear; secondly, we should keep in mind that, in most cases, we are ignorant about the other fellow's problems and viewpoints and we should, therefore, give to him the same courtesy and consideration that we expect to be given by him; in other words, let us always keep before us the Golden Rule.

THIS association is surrounded by a group of similar associations and groups. We are a part of a certain neighborhood. As an association, we will be judged by our actions and our attitude towards others, the same as individuals are judged. An association develops individuality, character and reputation, based upon its attitude and action.

It is impossible to enumerate or classify all the different industries and agencies with which the ice cream manufacturer comes in contact, but the following deserve our most careful consideration:

1. Co-operation with state association.
2. Other branches of the dairy industry.
3. Manufacturers and dealers in machinery and supplies.
4. Educational and experimental institutions.
5. Regulatory officials.
6. The public and publicity.

THE greatest asset of ice cream, as a food, is the fact that it is classed as a dairy product; the fact that it has all the elements of nutrition in easily digested form; the fact that it contains vitamines essential to life and growth. Those life-giving qualities were imparted to the ice cream by the dairy cow. It is to the interest of the ice cream manufacturers, therefore, to help promote the dairy industry, to get the viewpoint of the farmer and to understand his problems and difficulties. The butter, condensed, evaporated milk and milk powder industries are inseparably linked with the ice cream industry and the closest relationship exists among them all. The interest of the dairy farmer and the ice cream manufacturer does not always appear to be the same. There is competition between the different groups of dairy interests; nevertheless, all have many fundamental problems in common where mutual welfare can be promoted by co-operation. The American Dairy Federation and the National Dairy Council merit the support which the ice cream manufacturers are giving to these two general dairy organizations.

The National Association of Ice Cream Manufacturers and the International Association of Milk Dealers are at present co-operating in working out a uniform cost accounting system for the ice cream industry. Other groups, with which we should cultivate a closer relation, are the American Association of Butter Manufacturers, the Association of Evaporated Milk Manufacturers and the Association of Dried Milk Manufacturers.

State and regional associations are members of the national association. We need strong, active state and regional associations as well as an active national association. The one does not take the place of the other

(Continued on page 60)

* Executive secretary, National Association of Ice Cream Manufacturers. Address at the Waldenwoods conference, June 6, 7, 8.

"Watch Rasmussen!"

It is not often, these days, that The Ice Cream Review can make space just for one man's speech. This exception is made because of an exceptional condition and an exceptional speech. The exceptional condition comes about from the highly inspiring conference of representative ice cream men at Waldenwoods early in June. The exceptional speech was the one delivered by Fred Rasmussen, executive secretary of the National Association of Ice Cream Manufacturers.

Probably no one ever so hit the nail on the head so many times, as regards conditions in this industry, as did this man who lately has taken over the direction of the most important lines of action ever undertaken in the ice cream industry.

Several times prior to the Waldenwoods meeting the word was passed around by wise men in the industry—"Watch Rasmussen." There is no doubt that a very great deal is expected of this singularly useful man who has been drafted to the ice cream industry after so many constructive years in the fields of dairying and, later, finance. His is the hand at the electric plugs of the great national program now in the making for the ice cream industry. In contact with him you will readily recognize that he does not waste words. And there are a lot of words in his speech at Waldenwoods—quoted here. And none of them are wasted. Read them—all of them. Familiarize yourself with what he has to say, keep in touch with his activities. In other words—

"Watch Rasmussen!"

What Will a Garrett Do?

Hold cream in perfect condition longer than any other cabinet with only one icing!

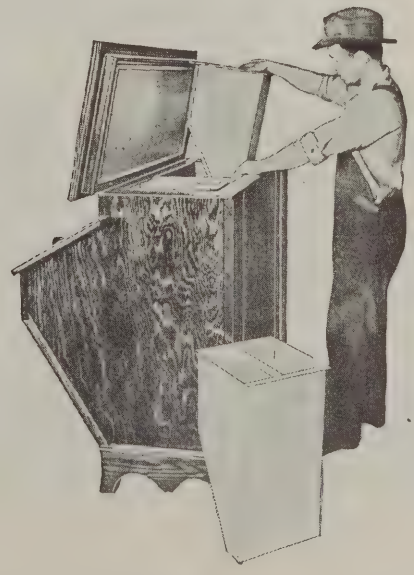
Hold a more even temperature than any other cabinet on the market!

Cut down your servicing costs materially!

Cut down your repair bills and service equipment investments!

Go anywhere it is necessary to keep cream!

Require very little more room than the old style cabinets and that only in height!



Increase the good will of your dealers and the sale of your ice cream!

MAKE US PROVE IT.

National Advertising Program Scores Big Triumph at Waldenwoods

Enthusiasm Rampant at National Executive Conference Last Month

UNANIMOUS endorsement of the national advertising program launched by the National Association of Ice Cream Manufacturers was a development at the Waldenwoods conference of officials and directors of the association which has been hailed as an outstanding triumph in efforts to advance ice cream in public popularity. The fact that this remarkable conference brought forth wholesome evidence of nation-wide support to the advertising program is all the more reassuring in view of the fact that some of the staunchest supporters of the program at Waldenwoods were manufacturers who previously had been opposed to the program.

Development at the Waldenwoods "session extraordinary" leaves the way open for the carrying out of the ambitious undertaking for which Will A. Schwindeler, chairman of the association's advertising committee, and others have made the most earnest kind of fight. This stamp of approval follows the taking of the advertising program to state and regional conventions in all parts

Hoo's Hoo and How

E. B. LEWIS, J. M. Horton Ice Cream Co.

By J. PAUL ATWOOD*

THE business offices of J. M. Horton Ice Cream Co. are not the coolest place that can be found in the summertime. When the thermometer registers 50 in the shade it may not be difficult to work enthusiastically, but when it shoots up to 100 degrees, or thereabouts, work is not the most popular thing in the world. Yet, on an exceptionally hot August afternoon, when other bookkeepers were trying to get finished with their accounts as quickly as possible so that they could go to beaches and to parks, one of them was planning a little extra work.

Down in the manufacturing plant there was a great rush of orders. Everyone wanted ice cream, and there were not enough men to fill the orders. So the bookkeeper finished his own work and then started to chop ice, and to shovel salt. The other men joked with him over his ambition. One of them suggested sarcastically that some day he would be president of the company. But E. B. Lewis did not mind the joking. He was not thinking much about the possibility of becoming president. That, according to him, was sheerly incidental.

Ten years ago Mr. Lewis was made president of the company. He had served it for twenty-two years before he rose to the highest position. And every one of those years he worked in the same way that he did when he first started as a bookkeeper.

He is rather a short man and he is inclined to be thin. His hair is grey, but that only emphasizes the sharpness of his eyes. There is nothing pretentious about Mr. Lewis. Other men in his position, separate themselves from the public by dozens of secretaries and elaborate office systems. When I went to see Mr. Lewis he came out to greet me in the big central office. Several other people were waiting to see him, and he attended to all these interviews himself. Private secretaries may be all right, but Mr. Lewis believes in doing as much work himself as is possible.

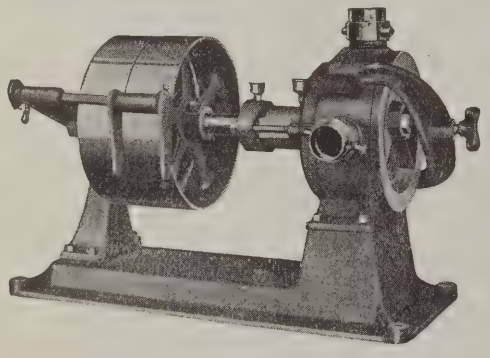
HIS office is a plain room in which pictures of the company's plants hang in prominent positions. For thirty-two years now, the Horton plant has been a great part of his life, and he is not able to talk very long about his own career without introducing his business.

"I've been working all my life," Mr. Lewis said, "and I have been connected with the Horton company for the greater part of my business career. It has developed greatly in that time. I remember when the wheels were turned by hand, and then when we put in the first machinery. It has been wonderful. I have enjoyed every minute of my work."

That is probably one of the reasons why Mr. Lewis has been so successful. He believes in enjoying work, and in doing it as though he were enjoying himself. But, according to him, that is the way it should be, instead of something that is exceptional enough to talk about. He did not go into the Horton company's offices because he had any particular desire to work for an ice cream concern. In those days, young men did not choose so much. He was a bookkeeper, and he got a job; most important, he did not keep that one, but made it into a better one.

"My father died before I was born," Mr. Lewis continued. "My mother was a school teacher and she was very anxious that I should have a good education, but I had to work from the time I was twelve years old. By the time I was twenty-four I was an expert bookkeeper, but that is all the education I got." He continued:

"I have often thought that if circumstances had been different I would have been able to go to college. Then, perhaps, I would have gone into some other business. Perhaps I would have been an architect.



"When we were erecting some of our largest plants I had to depend on trained men to help me," he complained. "But I am becoming a little more reconciled to my lack of knowledge. Today is a time of specialization, and so I do not feel the need of wider skill as much as I did before."

WHAT Mr. Lewis does not say is this: When he was working for Mr. Horton, and some new buildings had to be planned, he was called upon to design them. He studied at night and used every book on architecture that he could find. After the plans were made, he was appointed supervisor of construction, and before he considered his job finished, the building had to be ready for occupancy.

This ability as an architect Mr. Lewis attributes to

Wisconsin Manufacturers Lay Plans For Ice Cream Week

Officials Approve Steps to Feature Ice Cream During Wisconsin Dairy Week—Further Plans to be Formed at Milwaukee Meeting, July 9

WISCONSIN ice cream manufacturers are making ready for the part they will play in Wisconsin Dairy Week, which will be observed in the state the first week in August. George D. Mansfield, head of the George C. Mansfield Co., Milwaukee, is chairman of the ice cream division of the Wisconsin Dairy Club, under whose auspices state-wide Dairy Week has been launched in Wisconsin.

The matter of funds to exploit ice cream during Dairy Week has been taken up by Chairman Mansfield and by A. H. Kramer, president of the Wisconsin Association of Ice Cream Manufacturers. Two checks of $25 each have been received from two members of the association, it is reported by the secretary. Mr. Mansfield has asked other members of the association to do likewise.

A. H. KRAMER,
President, Wisconsin Association of Ice Cream Manufacturers.

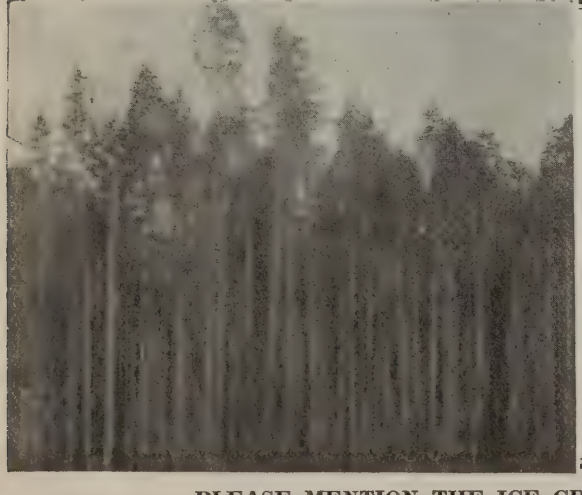
Dairy Week in Wisconsin will give the ice cream manufacturers the opportunity to help their dealers put ice cream to the front. There will be several hundred thousand visitors in the state of Wisconsin during Dairy Week, it is estimated by the Greater Wisconsin Association, which has given its co-operation to Dairy Week. This will mean that the exploitation given ice cream in Wisconsin at that time will be greatly more far-reaching than just among citizens of the Badger state.

Dealers will be aided in preparing attractive ice cream displays. A special Dairy Week brick will be presented by Wisconsin manufacturers. This will be advertised in newspapers.

Regarding the plans of the association, Chairman Mansfield, following an important meeting of the Wisconsin Dairy Club at Madison on June 11, issued an announcement of which the following is a part:

"In conference with the ice cream manufacturers attending the luncheon at Madison it was the consensus of opinion that we carry out our part of the program as regards a special dairy week ice cream brick and window posters advertising same, along practically the same line as we proceeded National Dairy Show week last year. It seems necessary that I appoint a committee for a conference on the general outline of the work that the state ice cream manufacturers are to carry out, and I hereby appoint the following:

A. H. Kramer, Madison; D. D. Smith, Fond du Lac; A. E. Sorge, Reedsburg; C. E. Wright, Beloit; J. D. Hughes, Milwaukee; Ralph Baker, Marshfield.



"I earnestly request that all gentlemen appointed on this committee, if possible, be present at the next dairy club luncheon at the Republican House, Thursday, July 9, at which time we will have to formulate and conclude fully our arrangements for Wisconsin Dairy Club week.

"This dairy week will benefit the ice cream industry through its being allied with other dairy interests to the end that it educate the people of the food value of ice cream."

THE July meeting is expected to bring about some definite lines of action toward pushing ice cream during dairy week. The Wisconsin association is no stranger to movements of this kind. A special brick was featured by the Badger manufacturers during the National Dairy Exposition in Milwaukee last year. There also was a special booth at which information concerning ice cream was available to visitors at the exposition.

The Madison meeting of the Wisconsin Dairy Club was attended by about 100 representative dairy and ice

This Cartridge is Standard for any Waltham Truck or Cabinet, and for any Soda Fountain.

THE Waltham System is extremely simple. Sealed inside these interchangeable cartridges is a special chemical compound, whose temperature can be reduced far below the freezing point. It is a routine matter to freeze these cartridges in your hardening room to ten below zero.

The driver, delivering cream at a store, simply leaves fresh cartridges at the same time. The used cartridges, still retaining most of their refrigerant, come back to the hardening room and stay there just long enough to drop the temperature by the few degrees that it has risen in the store. The freezing cost is obviously slight.

Cabinets, soda fountain inserts and truck bodies made by this company have been worked out to handle this system so that it yields remarkable profits.

Why Delay Your Dealer's Trade?

With no ice and salt to pack, your drivers can stop in each store a much shorter time. No interfering with the fountain's business, no mess to clean up, no salt to spoil the cream—and best of all, refrigeration that keeps it smooth and firm without excessive hardness.

These are the reasons why dealers are strong for the ice cream manufacturer with Waltham System Service.

The Waltham System gives complete refrigeration for cream distribution from your hardening room to the dealer's customer. Not only iceless and saltless it is non-mechanical, inexpensive to adopt and it cuts operating costs at once. Its superiority has already been proven in actual use.

Write at once for the facts regarding this revolutionary system.

Twenty-five Years of Development To Be Depicted at Detroit

Display of Ice Cream Machinery and Accessories in Use 25 Years Ago to be Shown at Detroit Exposition in October

AN HISTORICAL display of ice cream equipment and accessories used many years ago will be one of the features of the exposition at Detroit in October. Twenty-five years' development will be illustrated by this display, which will be under the auspices of The Association of Ice Cream Supply Men.

Officials of The Association of Ice Cream Supply Men are seeking the aid of ice cream manufacturers of the country in getting together old-time machinery and equipment. In addition to the mechanical end of the display, the association also is seeking ice cream advertising material of 25 years ago, including company letterheads, bill-heads, newspaper stories regarding ice cream and ice cream plants of that period.

This display will emphasize the strides made in the industry in the last several years, it is pointed out by officials of that organization, who add:

"Anything that visually can emphasize the difference in scope, methods, etc., etc., of the great ice cream industry of today and of its weaker, younger self of 25 years ago and more is desired by the exposition committee.

"Possibly it will not be able to use all of the historical material, that it may learn of through the co-operation of the manufacturers of the country. It will use enough to show, as has never yet been shown, the mighty strides ice cream has made since the century opened.

"It is believed that many manufacturers can let it be known where old equipment of the type described or of correlative types may be found today. They are asked to give exact information as to names, addresses, items of equipment, etc., etc.

"Many also, it is believed, will find or notify the association where it will find early printed matter, advertising material, etc., etc., relating to ice cream as a business."

* * *

The usual fare and half fare rates will prevail in connection with the Detroit convention-exposition, it has been announced. All railroad passenger agents have issued instructions for ticket agents from coast to coast to issue convention certificates with tickets purchased by delegates to the National Association of Ice Cream Manufacturers' silver anniversary convention.

* * *

Between 4,500 and 5,000 persons are expected to attend the Detroit pageant, it is estimated by railroad officials who have been making preparations to transport the large bodies of ice cream manufacturers from different parts of the country.

* * *

In connection with the display of ancient ice cream equipment at Detroit, an excerpt from an article by Roberts Everett, secretary-manager of The Association of Ice Cream Supply Men, for a trade publication, will be of interest:

"It was about 1903 when the first step toward the present day freezer was taken. It was about 1905 that an early, and for the times, effective method of hardening was developed. Ten years later it was replaced by the still-air method. It was nearly 1910 before homogenizing was made adaptable to ice cream. It was not until the same date that pasteurization came into the technology of ice cream. The brine freezer brought the mixing vat. Then came the glass-lined tank.

"Without any one of these developments in ice cream production—and consequently in distribution, in profits, in the general merit and standing of the industry and of the men in it—the present stature of ice cream as a business could not have been approached."

* * *

Notes on Coming Exposition.

(From the Exposition Extra.)

Many new flavoring specialties will be available for inspection and test. One, in the making of which are used fresh creamery butter and fresh, heavy cream, produces a flavor reminiscent of a childhood candy flavor, as well as enchanting texture richness.

Another is a novel chocolate specialty.

News to the ice cream industry will be a furnace, displayed at the show, used in heating soldering irons.

Cylindrical ice cream containers with colored printing on the curving sides, made possible by new offset printing methods, will be displayed.

There will be displayed an automatic ice cream can filler with a capacity of one 5-gallon can in each five seconds.

There will be displayed a wholesale type of ice cream delivery body, comprising several new improvements.

Ice Cream Investment Was More Than 270 Million Dollars in 1923

More Than 222 Million Gallons Made That Year, It Is Shown by Tabulation, For First Time, of Production in Subsidiary Establishments

IN CONNECTION with the Census of Manufactures, 1923, the department of commerce, U. S. census bureau, has made a special tabulation showing the quantity and value of ice cream made both by establishments classified in the ice cream industry and by those classified in other industries. A table giving this information by states has been prepared by the department for the first time in the history of ice cream statistics. We were told a year ago that the 1923 production was 294,000,000, while the total production here is given as 222,104,773 gallons.

The difference between this total and the total production of ice cream in 1923, as estimated by department of agriculture, bureau of agricultural economics, 294,000,000 gallons, is accounted for by the fact that the census figures do not include data for establishments reporting products valued at less than $5,000 nor the ice cream made in hotels, restaurants, soda fountains, and homes, whereas the department of agriculture estimates cover such production.

Production of Ice Cream By Quantity and Value By States, 1923:

(Includes value of ice cream made as a subsidiary product by establishments classified in other industries.)

State	Total		Reported by establishments assigned to— Ice cream industry		Other industries	
	Gallons	Value	Gallons	Value	Gallons	Value
United States	222,104,773	$270,424,149	193,108,730	$238,191,785	28,996,043	$32,232,364

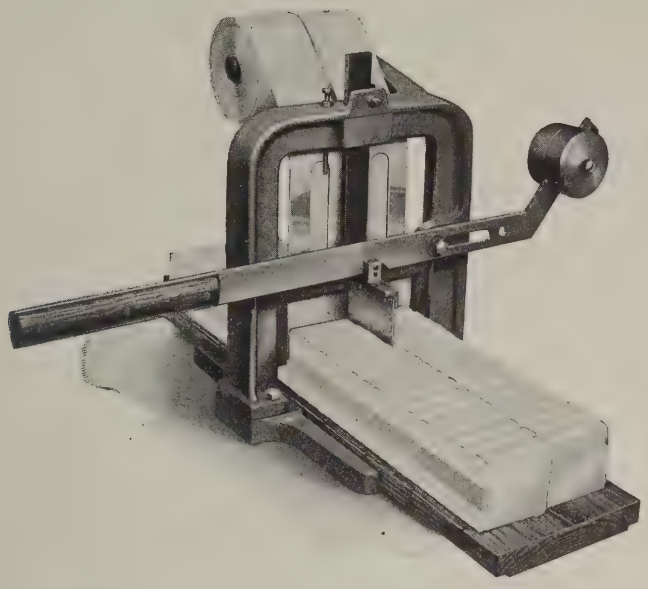
Indiana's Great Secretaries

Hoosiers' Three Great "H's" — Harvey, Holly and Hammond

MUCH interest now centers around the Indiana Manufacturers of Dairy Products, an association that has had a very useful career. Interest in the association at this time grows out of the efforts that body is making in connection with the coming National Dairy Exposition, to be held at Indianapolis in October. One of the distinctive features of the Indiana association of dairy products is the number of high-class men that have served as general secretary.

J. J. HARVEY.

A. P. HOLLY.



R. L. HAMMOND.

James J. Harvey, at this time one of the leading exponents of the Southern dairy manufacturing industry, became general secretary of the Indiana association in 1918, succeeding C. W. Hale, who had taken that post two years previously. Mr. Harvey rendered exceedingly valuable services to the association until 1921, when he was engaged by one of the leading supply houses of the industry, now being located in Atlanta. At that time he was succeeded by A. P. Holly, who held this important post until 1923, giving it up to become general manager of the City Dairies of St. Louis.

R. L. Hammond succeeded Mr. Holly last year, and has followed in the footsteps of able men who have done so much to build up the Indiana association to one of the most important in the industry. The "Indiana" always has had a good secretary. This thought has been voiced many times. It accounts for many things.

THE Indiana association comprises a milk division, ice cream division, and butter manufacturers' division. The association was organized in 1916. R. F. Miller was the first president. Other presidents since then were John A. Risch, E. A. Marple, Ed. S. Nance, Roy S. Atkinson, Bert G. Moore, L. H. Wilson, J. M. Antrim and P. P. Triller.

Anderson "Cut-Wrap" Machine

"It Wraps Slices as it Cuts"

Simple—Practical—Fast Low Priced

In every plant there is considerable cutting done. You know, cutting by hand, with a knife, is a slow, tedious job—an expensive operation to you.

With an Anderson you will be able to work much faster and save enough time to quickly repay for machine, and it will be a big help on those days when you are rushed for time.

It will quickly cut quarts always of uniform size. It cuts pints two at the time so this, too, is done very rapidly.

The same machine also cuts slices quickly and of a size determined by you—one machine can be used for cutting any number of slices to the quart.

The Cut-wrap slice idea is a good one and appeals to plants large and small, and especially the Cut-Wrap quart idea which is ideal for serving Churches and Socials or large gatherings. Hundreds are being used all over this Country.

Send today for literature and price.

Bergmann Ice Cream Packaging Machine—

The latest and most improved machine for packaging small units of ice cream. Rapid, self-contained, automatic, motor driven. Capacity only limited to speed of operator in keeping machine supplied with cups and lids and taking away filled cups with lid inserted. Fool proof and rustless. Easily cleaned. Strongly constructed.

If you are marketing packaged ice cream you are interested in this machine. Send for complete information covering this and larger size machine.

WISCONSIN MANUFACTURERS LAY PLANS FOR ICE CREAM WEEK.

(Continued from page 32)

cream leaders of Wisconsin. There was enthusiastic speeches regarding possibilities for increasing the consumption of dairy products through united efforts in getting over intelligent information. Officers of the association were highly pleased with the evidence of widespread co-operation in the movement.

Among the speakers were Dean Russell of the University of Wisconsin College of Agriculture, Dairy Commissioner J. Q. Emery, J. W. Jackson of the Wisconsin Bankers' Association, Mrs. C. E. Hatch of Milwaukee, who is in charge of the committee laying preparations for dairy week, and several others.

TWENTY FIVE YEARS OF DEVELOPMENT TO BE DEPICTED AT DETROIT.

(Continued from page 34)

Among displays of automatic refrigerated ice cream cabinets will be included those representing both the air and the water cooled types of compressor and condenser, reflecting various improvements not yet introduced to the industry.

One of the displays will be a mechanically refrigerated soda fountain with five separate temperature controls for brick ice cream, bulk ice cream, dry storage, water bath and water cooling, and syrup sections of the fountain.

An automatic ice cream cup feeder, filler and capper for sundae cup packaging, which handles one or two flavor ice cream, or sherbet and ice cream jointly, at a 4,500 cup per hour capacity, will be displayed.

Among various ice and salt cabinets will be a type having square cream compartments especially designed for holding all sizes of bulk containers, with the several compartments removable.

There will be displayed a slab slicer for splitting eight quart slabs into four smaller length-wise slabs, suitable for use in any coated bar handling machine.

Salt, handled at the mine by new machinery which practically eliminates the slight percentage of foreign substance to which ice cream manufacturers have necessarily been accustomed in rock salt, will be displayed.

Ice cream freezers, embracing new developments of design and construction resulting in more rapid discharge, will be displayed.

HOFFMAN COMPANY ENTERTAINS EMPLOYEES.

Employees of the W. E. Hoffman Ice Cream Co., Altoona, Pa., were guests at a jolly get-together at the Penn Alto Hotel. Plant managers and forces from the company's six plants enjoyed dinner and listened to some interesting speeches. L. G. Runk presided very creditably as toastmaster, we are told, and the chief speaker of the evening was President W. E. Hoffman, whose remarks were along constructional lines.

The occasion was enlivened with both vocal and instrumental music.

The Hoffman company is now a unit of the National Dairy Products Corporation, which maintains more than thirty ice cream plants. The plants represented at the dinner are located at Altoona, Phillipsburg, Tyrone, Barnesboro, Indiana and Mifflin, all in Pennsylvania.

$60,000 PLANT IN FLORIDA.

The Seminole Ice Cream Co. is erecting a new plant at Miami, Fla., at a cost of about $60,000. The plant, which is to be modern in every detail, is being erected on N. W. Tenth St., and will be two stories high and will cover an area of 5,000 square feet. The new plant is expected to be ready for occupancy about August 1, and 1,000 gallons of ice cream will be produced daily.

The company was started in September, 1922, and has enjoyed a steadily growing business, according to W. A. Perry, president. The Seminole Ice Cream Co. has its own dairy, of 175 cows, the entire output of which is used by the compauy in the manufacture of ice cream.

The first floor of the new plant will accommodate the freezing department, hardening rooms and receiving and shipping departments, while the pasteurizers will be located on the second floor. Two refrigerated trucks, each with a capacity of 100 gallons of ice cream, and guaranteed to keep the contents cold for 24 hours, have been purchased. These trucks deliver the company's product to outlying towns.

DOUBLES CAPACITY IN ONE YEAR.

A 100 per cent increase in capacity since beginning business in February, 1924 is reported by S. P. Tracy, Tracy Creamery Co., Springfield, Mo. At the start the company was equipped with a 13-ton refrigerating machine and one 50-quart brine freezer. The management built two rooms of 1,500-gallon capacity each and only put coils in one. Before June 15 it was found necessary to equip the other hardening room. Early in June the company added another 13-ton compressor and a 50-quart brine freezer.

The plant is so arranged that with a minimum expense the company can again increase its capacity 100 per cent by building hardening rooms and adding ice tanks, compressors, freezers and other necessary equip ment.

DO YOU KNOW

That 21,000,000 letters went to the Dead Letter Office last year?

That 803,000 parcels did likewise?

That 100,000 letters go into the mail yearly in perfectly blank envelopes?

That $55,000 in cash is removed annually from misdirected mail?

That $12,000 in postage stamps is found in similar fashion?

That $3,000,000 in checks, drafts and money orders never reach intended owners?

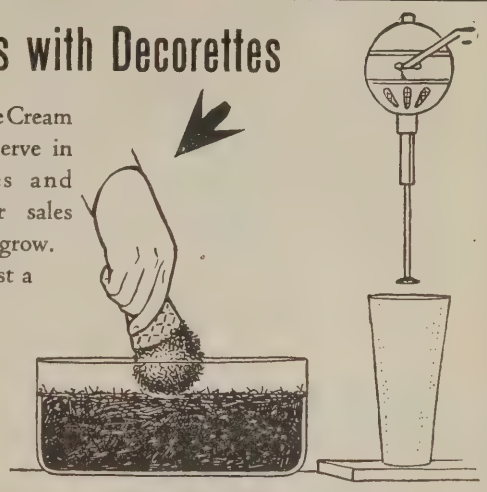
That Uncle Sam collects $92,000 a year in postage for the return of mail sent to the Dead Letter Office?

That it costs Uncle Sam $1,740,000 yearly to look up addresses on misdirected mail?

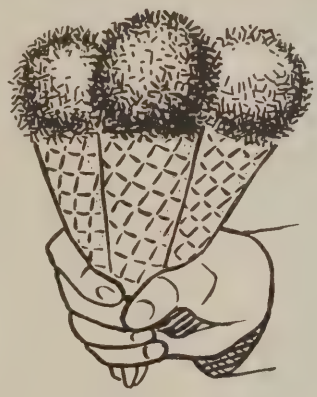
That 200,000,000 letters are given this service yearly, and that it costs in one city alone $500 daily?

And Do You Know

That this vast sum could be saved and the Dead Letter Office abolished if each piece of mail carried a return address, and if each parcel were wrapped in stout paper and tied with strong cord?



Moral: Every man knows his own address if not that of his correspondent.



Put it in the upper left-hand corner!

DECORETTES

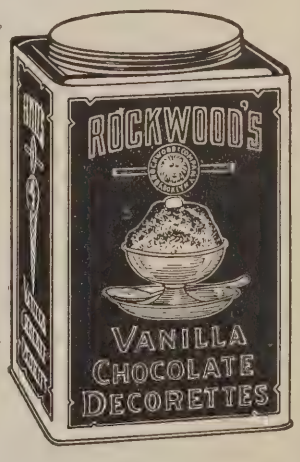
Do This with Decorettes

Dip each Ice Cream Cone you serve in Decorettes and watch your sales and profits grow. Requires just a second.

The Result

Surely you've heard of this Finest Pure Vanilla Chocolate Topping.

Gives class and character to Sundaes, and as for Ice Cream Cones—oh, boy!



Pleases the eye, improves the taste, stands up under climatic changes.

Will Double Your Cone Business

A pure vanilla chocolate product. One pound will cover 200 cones.

Your jobber can supply you.

Dairy Refrigeration

Pipe and Pipe Erection

By F. B. FULMER

THE arrangement of the piping systems around the refrigerating plant is one which requires much careful consideration, both as to size and prospective additions and changes in the future. As a rule the suction and discharge lines which are directly connected to the compressor are governed by the size of the connections on the machine. Should there be any possibility of future increase in required capacity, it might be economical to make provisions for it when erecting the first part of the system. To illustrate, when installing the first compressor, which is of ample capacity to meet the present work, it will be assumed that a two inch suction line will be large enough to allow a margin above the immediate requirements.

F. B. Fulmer

However, the "unit system" of construction might be arranged so that an additional hardening room could be constructed along side of the present one, and the return flow of the ammonia gas could be through the same suction line, but the additional load might tax the capacity of the two-inch line, hence it might be well to install a two and a half inch line in the first place, as the cost of erection would be about the same and the added first cost of the larger size pipe would be very small and its capacity would be over 50 per cent greater.

In some cases future connections have been considered and tees placed in the lines and a plug put in one opening, with the intention of the plug being removed when the new connection is made. This is better than having to cut into the line, to place a tee where it is needed, but a better method would be to put a short nipple in the tee instead of the plug and put a valve on the exposed end of the nipple. While the first cost of the valve is much greater than that of the plug, the valve would eventually have to be placed on the line, and it is a positive insurance against having to shut down the operation of the plant when the new connection has to be made, with the loss of time, perhaps some loss of ammonia and the inconveniences which are associated with such occasions. This method will also apply if there is any possibility of another compressor being added at the other end of the suction line. In figuring the capacity of pipes, the rule of area of circles is followed, which is, the area of circles are to each other as the square of their diameters. Thus a two-inch pipe and a three inch pipe would stand to each other for capacity in the ratio of 4 is to 9.

IN LAYING out a pipe line for ammonia, the connections should be as direct as possible, with a few angular bends as is consistent with the requirements and no arrangement which will act as a trap for the liquid. This will also apply with steam and water lines. In the larger plants there will be a multiplicity of connections for ammonia, air, steam and water and it may require no little study for the installation as a whole to achieve the greatest convenience and accomplish the highest degree of efficiency.

The modern tendency with the larger installations of piping systems is to eliminate as many joints as possible and weld the various pieces of pipe into a continuous coil. For hardening room work, where the pipe shelf method is used, the scheme is to make each shelf a continuous coil and have flange connections with the pipes above and below.

View looking lengthwise of a hardening room, showing general scheme of pipe arrangement.

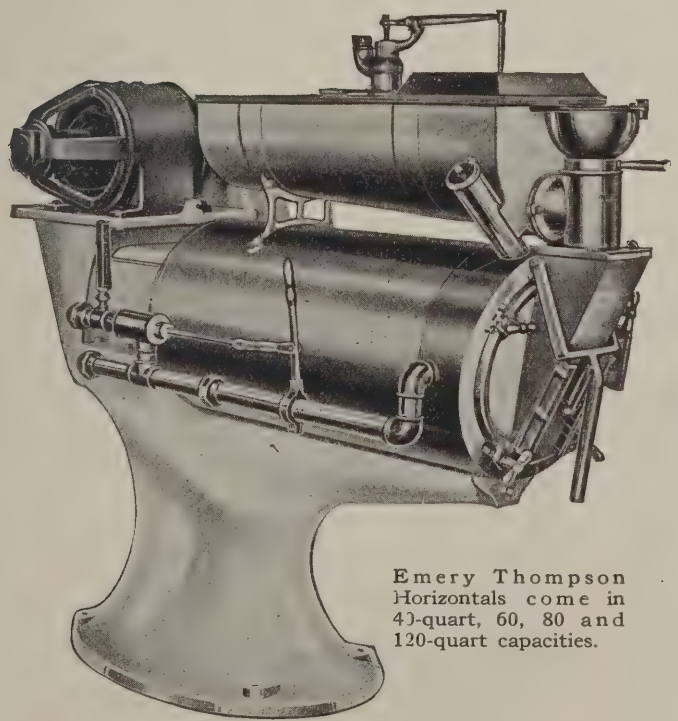
With the smaller installations the cost of securing a welding outfit might be prohibitive and in many cases it is convenient to have jointed connections, so there is considerable of the erection of ammonia pipe that is made by using the threaded joints, with companion flanges, one-half of the flange being on each pipe with a gasket in the groove and the joint made tight by drawing up on four bolts. This applies for the straight pipe line, and where there are tees and elbows the connection is usually made with the flange fittings rather than the screw fittings, as in the latter case any change made after the line is completed will necessitate either cutting the line or taking considerable of it down to accomplish what is desired.

To have a tight and serviceable threaded joint the threads on the pipe and fittings must be in good condition so that there will be a metal-to-metal contact. To secure this result the first essential is that the threads should be absolutely clean; and the next is that the very best lubricant be used in order to prevent friction, and they should not be screwed up fast enough to make any change in the temperature of the material. The friction is due to the large amount of bearing surface of the threads and when there is any grit on the surface of the threads the friction is greatly increased and the resulting heat produced causes expansion, and as the pipe is lighter than the fitting, it expands more, and when cooling takes place the pipe contracts more than the fitting and the tendency to leak is created.

The manufacturers of ammonia fittings are attempting to standardize all fittings the same as the manufacturers of sanitary pipe and fittings have adopted a na-

IN THE SWIM

The Ice Cream manufacturer who operates Emery Thompson Freezers is busy every minute of the day, weekends, and holidays. He knows that his own plant is "In the Swim" handling, efficiently and economically, the biggest business it has ever handled—making better profits for him this summer than ever before.



The simplicity and ease of operation, accuracy, dependability and durability of Emery Thompson Freezers make the rush season a pleasant season.

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

tional standard. Practically all of the pipe threads used in America are the Brigg's standard, which were devised in 1834, but the fittings have not been of uniform size as regards length and one part of a companion flange of one make would not line up with the other part made in a different factory. The Brigg's thread has straight sides and a cross section of the thread will present an angle of 60 degrees and it is cut to almost a perfect point. The British standard is known as the Whitworth thread which forms an angle of 55 degrees and has slightly rounded points.

The threads on a pipe should be cut on a perfect taper so there will be a gradual tightening as they are screwed into a fitting. The taper should be not more than ¾-inch per foot and this is the standard that all fittings should conform to. It may not be absolutely necessary to have a taper thread to make a tight joint, but it is more convenient and far safer to use a standard taper thread for all work. The length of the thread depends on the diameter of the pipe that is being used, as will be observed by referring to the following abbreviated table of standard pipe dimensions. Also, it will be noted, that with the exception of the 2½-inch pipe, all of the actual sizes are slightly larger than the nominal dimensions:

Table of Standard Pipe Dimensions.

Nominal internal	Actual internal	Thickness of pipe walls	Metal square	No. threads per inch	Length of threads required
in.	in.	in.	in.	of screw	in.
⅛	.27	.068	.0717	27	¼
¼	.364	.088	.1249	18	⅜
⅜	.494	.091	.1663	18	⅜
½	.623	.109	.2492	14	½
¾	.824	.113	.3327	14	½
1	1.048	.134	.4954	11½	9/16
1¼	1.38	.14	.668	11½	⅝
1½	1.611	.145	.797	11½	⅝
2	2.067	.154	1.074	11½	11/16
2½	2.469	.204	1.708	8	15/16
3	3.067	.217	2.243	8	1

On the pipe which is larger than three inches, there are eight threads per inch of screw for all sizes, and for each additional inch in diameter, the increased length of threads required will average about 1/16 of an inch. It is well to observe that all standard pipe is measured for size on **the internal diameter,** up to and including the 12-inch size, and then the size is measured on **the external diameter** and is marked "O. D."

FOR ammonia work the standard pipe is used in most cases on the low pressure side, but for the high pressure side there is a stronger pipe used, which is known as the "extra heavy" or the "double extra heavy" as the case may be. All of these various pipes have the same external diameter, as the following table will show; this is necessary for threading and fitting the pipe. The internal diameter is less, as the pipe walls increase in thickness. The figures given are those connected with one-inch pipe for the three classes, and are used for purposes of illustration. Larger sizes are proportionately stronger.

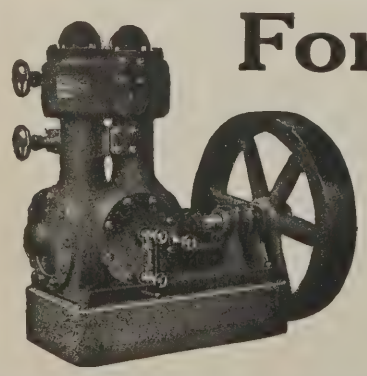

Table Illustrating Strength of Different Classes of Pipe.

	Standard pipe inches	Extra heavy pipe inches	Double extra heavy pipe in.
External diameter	1.315	1.315	1.315
Internal diameter	1.048	.957	.599
Thickness of wall	.134	.179	.358
Per cent of increase over standard pipe		34	168

As has been shown before, the length of the threads on a pipe is governed by its size. In ammonia work around a refrigeration plant it is usual to find considerable 1¼-inch pipe used, so this size will be taken to illustrate practical work. With a set of good pipe dies it is the usual practice to cut about ten threads on the pipe, but the last two threads will not be perfect, inasmuch as their crest will be wider than the crest of the perfect thread and the bottom of the groove will not conform to the thread on the fitting, so it is advisable to disregard the last three threads for practical use.

A PRACTICAL rule for pipe threading is to cut the threads so that the pipe will go into the fitting from two to three threads by hand and then go approximately four threads more when using a 24-inch pipe wrench, when it should be absolutely tight, thus giving seven effective threads in the joint. This will be compared to the table for "Standard Pipe Dimensions" and for the 1¼-inch pipe we find that the required length for the thread is ⅝-inch and that for this size there are 11½ threads per inch, so the mathematical calculation will give (⅝×11½=)7.1 threads required, which corresponds almost exactly with the practical rule of 7, just given.

Experience will demonstrate how much force to apply to have a perfect threaded joint fit perfectly tight. The practical advice of "put it home" when using a pipe wrench should be followed with considerable judgment, as the application of too much force may distort or break the pipe or the fitting into which it is being screwed. It is not an uncommon thing to see a pipe fitter bracing himself and pulling with considerable force when assembling pipe and fittings. Without careful measurements and knowing the composition of the metal used, it would be a difficult matter to compute the force required to injure the joint being assembled, but if

For Lasting Satisfaction

York
Refrigerating
Equipment

One reason why there are so many installations of York Refrigerating Equipment is that its satisfactory working condition does not pass with the seasons. York Equipment does not mean satisfaction until the first signs of wear show up, but a year in year out dependable service that stands the strain of rush seasons without injury to its long life.

Let us show you just why York Equipment lasts longer.

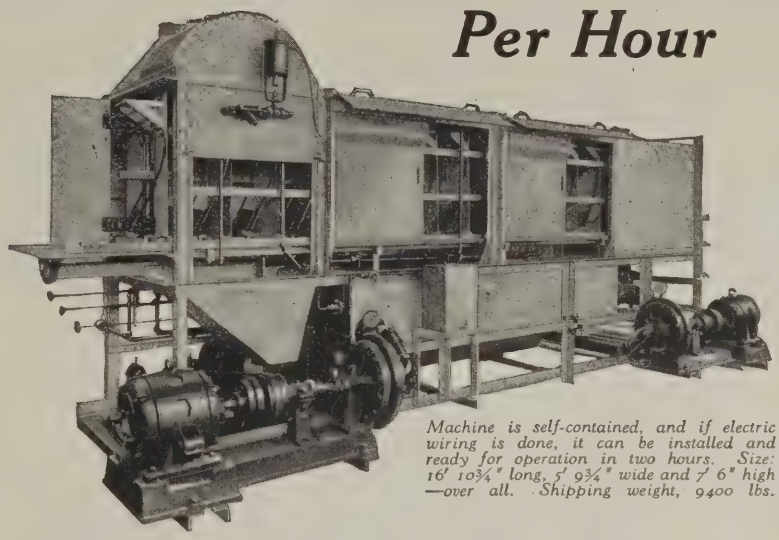
there is a force of 100 pounds applied on the end of a 24-inch wrench and the 1¼-inch pipe and fitting were placed in a vertical position, the theoretical weight which this set of conditions could lift is 158,733 pounds. From a practical standpoint it would be impossible to accomplish results anywhere near the theoretical figures, as the threads would strip long before such a force was generated.

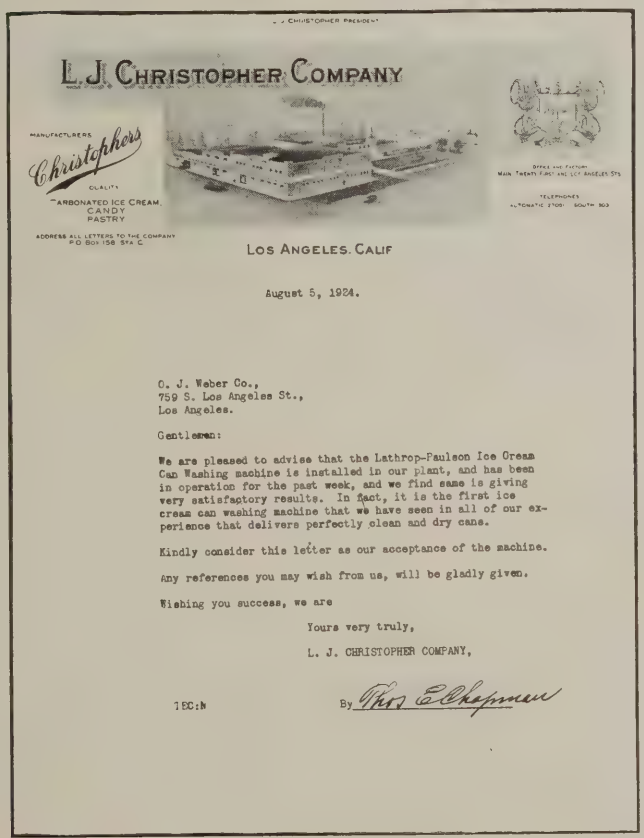
IN MAKING up an ammonia joint the threads should be thoroughly cleaned. A good method is to have a wire brush to quickly clean off all of the coarse grit and dirt incident to the cutting of the threads and then use a paint brush two inches wide, which has been dipped in gasoline to clean off the oil that may remain after the wire brush has been used. The threads of the fitting should be cleaned likewise, and then one of three methods can be used in making the joint tight: The sweated soldered joint, the ordinary solder joint and the litharge joint.

The sweated soldered joint is made by coating the threads and adjacent surfaces of the pipe and fitting with a layer of solder and heating them by dipping into a pot of melted solder and, while they are hot, screwing them together, particular attention being given to the position of the bolt holes in the flanges and fittings, so they will line up in correct position when ready to be used. It is the usual practice to set the pipe and fitting in a vertical position and fill the recess of the fitting with solder. A joint made like this is really a shrink fit and is extremely tight and requires to be heated if it is ever taken apart.



The ordinary soldered joint may be made by oiling the clean threads and screwing the pipe into the fitting to the correct position and then heating them to a temperature which will melt solder. This burns the oil off and the soldering acid is applied to the recess of the fitting and the pipe threads and the stick of solder applied until the recess is entirely filled and allowed to cool.

The litharge joint is made by applying a thin coat of the cement made by mixing dry litharge powder with enough glycerine to make a paste of the desired consistency. Only a small amount of the paste should be made up at any one time, as it will harden within a few minutes in ordinary room temperature, and when once set is useless for making tight joints. Enough of the paste is put on the pipe and fitting to have a small layer partially fill the recess in the fitting when the pipe has been securely screwed in and a small layer at the end of the pipe, inside the fitting, which acts as a seal when it hardens. Care should be taken that no considerable amount of the litharge cement is forced into the fitting, as it will form in lumps when set and prove to be a menace to the system. Litharge joints, when properly made, are very durable and are usually taken apart with difficulty. Heating the joint with a blow torch is the most effective way of taking it apart.



ALL pipe used for ammonia work should be cleaned from the dirt and mill scale which may be present. Placing the piece of pipe in a vertical position after threading and before it is screwed into the fitting, and giving it a few sharp blows with a hammer will usually remove the greater part, and should the pipe show evidence of having much mill scale the better practice would be to clean the inside with a wire brush placed on the end of a smaller size pipe, something after the manner of a boiler tube scraper. Pipe which is very dirty on the inside should be blown out with compressed air

600 Cans and Covers or Brick Pans *Per Hour*

Absolutely clean, sterile and dry. Washes all size cans and covers from 20 qt. down to 4 qt. Cans are fed in and delivered at the same end of machine. Small cans may be washed together with larger cans, increasing the capacity to 1200 per hour. Has two speeds. Each can receives 17 distinct intensive treatments.

Machine is self-contained, and if electric wiring is done, it can be installed and ready for operation in two hours. Size: 16' 10¾" long, 5' 9¾" wide and 7' 6" high —over all. Shipping weight, 9400 lbs.

Los Angeles.

Gentlemen:

We are pleased to advise that the Lathrop-Paulson Ice Cream Can Washing machine is installed in our plant, and has been in operation for the past week, and we find same is giving very satisfactory results. In fact, it is the first ice cream can washing machine that we have seen in all of our experience that delivers perfectly clean and dry cans.

Kindly consider this letter as our acceptance of the machine.

Any references you may wish from us, will be gladly given.

Wishing you success, we are

Yours very truly,

L. J. CHRISTOPHER COMPANY,

By Thos E Chapman

TEC:N

L.-P.

ICE CREAM CAN WASHER & DRIER

Only two men are required to operate the machine at maximum speed, and one man can handle the work efficiently at the 300 speed. Cans are washed on outside as well, freeing the cans, lids, pans and covers from brine. This machine eliminates the necessity of washing cans and covers separately. Cans which have beeu stored and coated with oil do not have to be brush washed. They come out ready for service, or may be piled in storage racks without danger of rust. Machine will also handle brick tanks up to 12 qt. size. All cans are placed in machine upright, and are delivered **absolutely clean, sterile and dry.**

The machine is sturdily constructed and heavily galvanized. Temperatures are thermostatically controlled. Soda solution is automatically controlled by L.-P. Patent Soda Regulator.

Machine is sold on a results-guaranteed basis. Names of users will be gladly submitted upon request. It will not obligate you to obtain full information and price. Send the coupon today.

before being assembled. Steam should not be used for this purpose, due to the liability of moisture being retained inside after the pipe has cooled off.

The amount of pipe required for a cold storage room depends on the desired temperature. For hardening rooms experience has demonstrated that a liberal allowance of pipe contributes to the ultimate efficiency of operation. Good practice will allow one and one-half lineal feet of 1¼-inch pipe for each cubic foot of space in the hardening room. This allows 3.4 square feet of external pipe surface for each cubic foot of room space and other sizes of pipe used can be calculated accordingly.

In erecting ammonia pipe (or any other pipe for that matter) due consideration should be given for proper supports so that no unnecessary strains are thrown on the joints, otherwise the bolts may work loose and a leak will result. If the strains are of a severe nature, the pipe may break in the threads near where it enters the fitting and a severe leak will follow. These strains are the result of expansion and contraction as the temperatures change and care should be taken that the pipe is arranged as free as possible to allow for these changes. As an illustration, it will be assumed that the suction line coming back to the compressor is 50 feet long. The pipe when originally erected had a temperature of say 60 degrees and when it is conveying the cold gas from the hardening room it has a temperature of 15 degrees below zero, or a change of 75 degrees in temperature. The length is (12×50=)600 inches and the co-efficient of lineal contraction for the metal in the pipe can be taken a 0.000006 then we find that the pipe will contract (60×0.000006×75=)0.27 of an inch.

SOME idea of the force of contraction contained in the illustration just given can be gained from the following: It will be assumed that the suction pipe is 2 inches in diameter, and by referring to the table for "Standard Pipe Dimensions" it is found that the cross sectional area for 2-inch pipe is 1.074 sq. in. In a computation of this nature there is a factor used which is known as the "co-efficient of elasticity" and, for this particular pipe, this factor can be taken as 30,000,000. Then the force developed by the contraction would be (0.000006×75×1.074×30,000,000=) 14,499 pounds.

In placing a given amount of pipe in a hardening room it is the general plan to utilize a part of the pipe for the shelves to hold the ice cream. The shelving is usually arranged so that the largest sized cans of ice cream are located on the floor and lower shelves, and the smaller ones are placed higher up and the bricks are located on the top shelves, as is shown in the side view of a hardening room in the illustration.

TO get the required amount of pipe in a hardening room there are usually several layers of coils placed near the ceiling, supported by suitably arranged angle iron frames. The practice is to make up the shelves with continuous coils and use as few joints as possible. This also applies to the coils near the ceiling, and in order to get sufficient pipe in the room the pipe bends are made quite short. Pipe bends curved to a radius of less than four diameters of the pipe are undesirable for two reasons: First, a pipe curve with a smaller radius is very hard to make and retain its original strength, and second, the expansion and contraction strains on the small radius bend are more severe than with larger ones, and these strains will have a tendency to weaken the pipe in the weld and a leak may eventually develop. When 1¼-inch pipe is used the coils should be made with at least 5-inch centers.

Where flange joints are used care should be taken that the gasket recess is cleaned and a fiber gasket carefully fitted in and the bolts drawn up evenly and quite tight. Lead has been used for gasket material in many cases, but as it has but very limited elasticity it is not as desirable as fiber made for ammonia work.

Pipes and fittings are subjected to two classes of stresses; one the working stress, due to the pressure, and the other due to faulty design or improper erection. Practically all of the fittings used in ammonia work are made from soft steel or malleable iron and are very strong. It is desirable to use soft steel pipe in preference to iron pipe, due to the greater tensile strength.

The tensile strength of steel of this character is taken to be from 55,000 to 60,000 pounds, and the thickness of the pipe walls as shown in the table of "Standard Pipe Dimensions," for 1¼-inch pipe is 0.14 of an inch. Then the theoretical bursting strength of this pipe will be (55,000×.14=) 7,700 pounds, and as a factor of safety of 8 is used in calculating the working pressure we find that the pipe is safe up to (7,700÷8=) 962 pounds, and as this pressure is never obtained in practical operation it is easy to be seen that a failure in an ammonia pipe system must be due to some hidden defect in the pipe or fitting, or due to carelessness of erection or of operation.

Replies to Inquiries

Dear Sir:—We use in our present mix of one hundred gallons the following:

Sugar, 115 lbs.; butter, 107 lbs.; gelatine, high grade, 4lbs.; concentrated val., 40 drams; water 547 lbs.; Merrill Soule m. p., 103 lbs. This gives a total of 903 pounds.

We first put water in pasteurizer and then sift Merrell-Soule milk powder from original cans into cold water and thoroughly dissolve. Then we turn on steam and heat to 100 degrees. Sugar and gelatine is then added. The gelatine is mixed with 20 or 25 pounds of sugar first, and then we take about 10 gallons of heated water and powder and dissolve in it thoroughly, from which place it is transferred to the pasteurizer with the rest of the mix. Butter is then added and heated to 170 usually. It is held for thirty minutes. After being cooled down in pasteurizer to 130, it is homogenized at 2,500 pounds pressure. In this pasteurizer it is again cooled off to 35 degrees and kept for 18 hours before it is frozen. We get all the way from 200 to 208 gallons of finished cream. We have had no trouble at all. We are making a good cream. We continually hear some one say that some other place is putting out better cream than we are and we want to remedy our trouble, if any.

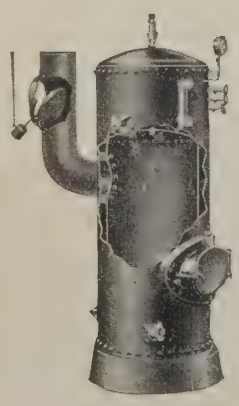
Reply: I have analyzed your ice cream mix as given in your letter. You will find the calculations given below in table one:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
115.00 lbs. sugar	.....	.....	109.25
107.00 lbs. butter	89.88	.....	89.88
4.00 lbs. gelatine	.....	.....	3.80
103.00 lbs. milk powder	.....	97.85	97.85
574.00 lbs. water	.....	.....	.....
903.00 lbs. mix	89.88	97.85	300.78
Per cent	9.95	10.80	33.30
Per cent sugar	12.74		

You will notice that there can be nothing wrong with the percentage ingredients of your mix. I am, however, suggesting in table two another mix testing 12 per cent fat and containing about 35 per cent total solids. You can try this out and see if you think it will make you a better product:

Table 2.



Ingredients	Fat	Serum Sol.	Total Sol.
117.00 lbs. sugar	.....	.....	111.15
4.50 lbs. gelatine	.....	.....	4.27
129.00 lbs. 84% butter	108.00	.....	108.00
100.00 lbs. skim powder	.....	95.00	95.00
549.50 lbs. water	.....	.....	.....
900.00 lbs. mix	108.00	95.00	318.42
Per cent	12.00	10.55	35.38
Per cent sugar	13.00		

I again want to assure you that the composition of your ice cream mix, as shown by table one, should produce a very satisfactory ice cream providing, of course, you are able to secure a very good quality of butter and a good fresh, soluble milk powder. The quality of ice cream which you can produce from day to day will depend more upon the quality of your raw material than on a high butterfat and solids content.

I have carefully reviewed your description of the method of processing your mix, and I am sure you should secure good results. I have just one criticism to make on your method of processing, and that is where you heat your mix to 170 degrees, holding it for thirty minutes. I am wondering just why you should want to heat the mix to this high temperature when a temperature of 145 degrees, held for thirty minutes, would give equally as good if not better results. I believe this lower pasteurizing temperature will result in removing the objections some of your customers appear to have made.

* * *

Dear Sir:—I note that I forgot to give the item of fat in my last letter to you. Just today one of our customers called up and made the same complaint—that the

"The Genuine Chocolated-Coated Ice Cream Bar"

cream will not stand up and needs so much icing. They do not complain about the flavor or texture.

Our mix is as follows: 1080 lbs. 3.6 whole milk, 38 lbs. skim milk powder, 22 gals. Libby's evaporated 8%, 258 lbs. sugar, 7 lbs. high quality gelatine, 208 lbs. sweet butter, 24 ozs. Gumpert's improver, vanilla to suit. The whole ingredients are heated to 145 degrees and held for 30 minutes, cooled to 110 and viscolized, then cooled to 35 degrees and held for 48 hours.

We get from 400 to 410 gallons finished product each time. Now please remember, the only complaint we have is that it requires so much more icing than other brands do. How can we correct this trouble?

Reply: I have made an analysis of your mix, which you will find below in table one. You will note that the butterfat is 12.8 per cent and the total solids 36 per cent, the sugar content being 14.4 per cent.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
1,080.00 lbs. 3.6% milk	38.88	92.65	131.53
38.00 lbs. skim milk powder....	.....	36.10	36.10
193.60 lbs. evap. milk 8%..	15.48	34.84	50.32
258.00 lbs. sugar	.....	.....	245.10
7.00 lbs. gelatine	.....	.....	6.65
208.00 lbs. sweet butter.....174.72		.....	174.72
1.50 lbs. improver	.....	.....	1.42
1,786.10 lbs. mix	229.08	163.59	645.84
Per cent	12.80	9.16	36.16
Per cent sugar.....	14.40		

Your sugar content is still quite high which, along with 22 per cent of milk solids, gives you a rather high total solids and that, along with your overrun, is possibly the cause of a little trouble in the hands of some of your dealers. I believe you could easily cut your sugar down to 13 per cent and still have a product perfectly satisfactory from the standpoint of flavor. It is also possible that if you were to eliminate the improver you would have a little less difficulty. You should have an ideal product from the standpoint of texture except that the rather high sugar content makes it necessary to have the holding temperature a little lower than possibly your competitor's cream.

* * *

Dear Sir:—We would appreciate very much if you could favor us with a formula for making a first class French ice cream. N. C.

Reply: I am indicating below in table one ingredients for ten gallons finished product of French ice cream, with suggestions as to the method of preparing the mix for this kind of ice cream.

Table 1.

Formula for French ice cream
For ten gallons ice cream.

33.00 lbs. 20% cream
10.00 lbs. sugar
3 oz. gelatine
3 doz. eggs
flavor

1. Separate yolks and whites of eggs. Add four or five pounds of the sugar to the yolks, beating until smooth.

2. Beat whites of eggs to a stiff froth and then mix with the yolks and sugar.

3. Add the eggs and sugar to about a gallon of the cream and heat to 160 degrees F. long enough until it begins to thicken. When thick add to remainder of mix and freeze either at once or after holding several hours.

4. The gelatine can be dissolved in a little water

and stirred while hot either into the custard mixture or to the batch when all ingredients are together.

* * *

Dear Sir:—Below I give you our mix. We have a little trouble with sandy ice cream in the winter months, principally the maple walnut, which seems to get sandy after it has been in stock for a while.

Twenty batch mix follows:

77 gal. 3 and 3¾% milk
20 gal. super-heated unsweetened condensed milk, 27% solids
140 lbs. sugar
6 lbs. gelatine (Essex)
116 lbs. fresh unsalted butter
15.11 lbs. skim milk powder

We viscolize and pasteurize our whole mix except flavoring, pasteurize to 145 degrees, then run over a brine cooler, cool it down to about 38 degrees, and hold at that temperature until ready to freeze.

We use a standardizer and pull every mix when it gets to 4½ pounds. After we pasteurize we hold same for 30 minutes, then cool down to 120 and viscolize at 2,200 pounds pressure.

Any information that you can give us will be greatly appreciated. C. B.

Reply: You will find the analysis given below in table one, where you will note the calculations indicate that your mix is very well balanced, except that it might possibly contain a little higher per cent of sugar.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
77 gal. or 662.20 lbs.			
3.75% milk	24.82	56.72	81.54
20 gal. or 180.00 lbs.			
27% condensed	.....	48.60	48.60
140.00 lbs. sugar	.....	.....	133.00
6.00 lbs. gelatine	.....	.....	5.70
116.00 lbs. 84% butter	91.44	.....	97.44
15.00 lbs. skim powder	.....	14.25	14.25
1,119.20 lbs. mix	116.26	119.57	380.53
Per cent	10.40	10.68	34.00
Per cent sugar	12.50		

You will note that the sugar content is only 12½ per cent while most all ice cream factories use 13½ to 14. The larger amount of sugar would also increase the total solids from 34 per cent to 35½ or 36 per cent.

I have carefully noted your description of the processing of the mix and it does not appear to me that your trouble is due either to the composition of the mix or your method of processing. I have noted that you are using a super-heated, unsweetened, skimmed condensed milk. It is possible that during the winter time you are keeping this condensed milk in too cold storage. Possibly your condensed milk has been frozen for some time before you use it in the mix.

There is no apparent reason why you should get a little sandiness in the maple-walnut cream and not in the rest of it. Perhaps if you can describe your method of holding the condensed milk and whether or not your skimmed condensed is always fresh or old, or any other conditions relative to your raw material, it is possible I can definitely suggest a remedy for your trouble. I am also just wondering whether the condition you describe is really a sandy condition or whether a coarse grainy condition of your ice cream.

* * *

Dear Sir:—We are making a mix as follows:

20 lbs. 25% cream
23 lbs. 4% milk
3 lbs. skim milk powder
6½ lbs. sugar
3 oz. gelatine

Let Reyam Specials Help You

Boost Your Summer Ice Cream Business

Don't let well enough alone this summer. Strike out after a record ice cream business by using these Reyam Quality Specials. They are thoroughly dependable, and, furthermore, are guaranteed to satisfy you and delight your trade.

ESTABLISHED 1851

Is this a well balanced mix? Do you recommend the use of condensed milk instead of skim milk powder? Or is it a "price" question? What suggestions could you make regarding this formula? Do you advise the use of rennet as a ripener?

Reply. You will find the calculations given below in table one:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
20.00 lbs. 25% cream.....	5.00	1.34	6.34
23.00 lbs. 4% milk	.92	1.96	2.88
3.00 lbs. skim powder.....	.....	2.85	2.85
6.50 lbs. sugar	.....	.....	6.17
.25 lbs. gelatine	.....	.....	.24
52.75 lbs. mix	5.92	6.15	18.48
Per cent	11.20	11.70	35.00
Per cent sugar	12.30		

I would state that your mix is very well balanced and you should be able to secure very satisfactory results.

Relative to the use of condensed milk instead of skim milk powder I would state that there is no preference as far as results to be gained by using either one or the other. If you are able to get a very fine flavored, fresh skim milk powder you should be able to produce as good ice cream as with a fresh condensed milk.

Relative to the use of rennet or some sort of ice cream improver, I am glad to state that I am not opposed to the use of any of the improvers or to the use of rennet. These products, however, should not take the place of proper aging of the ice cream mix. In using the rennet or improvers I suggest that you use only half the amount as usually called for in the directions that come with the package, experimenting in this way until you arrive at the correct amount to use.

* * *

Dear Sir:—We want a mix to be figured as follows: Fat, 10 per cent, using only sweet cream of 40 per cent fat, or test, and asking you to what proportion of sweetened condensed milk as desired, as well as powder.

We wish to use both sweetened condensed and powdered, unless you suggest some better way.

Reply: According to your suggestions, I am indicating below in table one, an ice cream mix testing 10 per cent butterfat and properly balanced for serum solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
7.60 lbs. sugar	.....	.....	7.22
.50 lbs. gelatine	.....	.....	.475
16.00 lbs. sweet cond.....	.....	4.32	10.72
25.00 lbs. 40% cream.....	10.00	1.32	11.32
5.00 lbs. skim powder.....	.....	4.75	4.75
45.90 lbs. water	.....	.....	.....
100.00 lbs. mix	10.00	10.39	34.485

You stated in your letter that you had an opening for an ice cream maker from the first of April until the first of October. I just recently had a letter from A. E. Daddow, Loup City, Nebr., of the Ravenna Creamery Co. This man writes that he would like to come further south for a position.

I do not know Mr. Daddow personally nor anything about his work. I am just referring you to him in case you want to follow it up further.

JUNK IT.

CO-OPERATION MEANS ICE CREAM INDUSTRY'S SALVATION.

(Continued from page 26)

but each of them in its field supplements and strengthens the work of the other. The national association should be a clearing house for the activities of the local association and should be able to furnish local associations with facts and information gathered from all parts of the country, to assist them in handling local problems. It is, of course, out of the question for local associations to collect all information dealing with statistics, laws, practices and trends in the industry from all parts of the country, and the one place where all such information should be available for the use of local associations is the national association office. Plans are now under way for a conference of all state associations at the time of the national convention in Detroit and it is hoped at that time to have a discussion of ways and means by which a closer co-operation can be worked out between the state and national associations.

FRED RASMUSSEN.

The two fundamental principles to have in mind is that the national association can be made more effective working through local associations, and that the service of the national association to local organizations represents a great saving because each state association would have to establish a source of information at considerable expense.

THE Association of Ice Cream Supply Men occupies the same position within the machinery and supply field that the national association holds to the ice cream industry. About 65 per cent of the members of The Association of Ice Cream Supply Men are associate members of the national association. The two organizations are co-operating in the promotion of the national convention and show. Although the interests of the two associations are not the same in every respect, there are a number of fundamental activities in which their interest is identical. Both associations are interested in the general growth of the industry or, in other words, increased consumption of ice cream. They are interested in getting together and keeping on file all printed information in regard to the industry, and in all statistical and legislative information of the industry and in national publicity. There is an opportunity for additional and more definite co-operation between the two associations on the following points::

1. Establishing a national legislative information service for the members of the two organizations. The service should apply to federal, state, and, as far as possible, to municipal legislation. Classified records should be kept of legislation affecting ice cream, ingredients and equipment used in its manufacture. Innumerable laws enacted and innumerable laws proposed come under this heading, such as, butterfat standards, sale by weight, compulsory pasteurization, use of color, and gelatines, sanitary laws and many others.
2. Statistical information. The ice cream industry is

56 hours' service from a single icing inspired this letter

HENRY A. FABRA PROP. The Fabra DRUG STORE FALMOUTH, KY.

Friday, November 28, 1924

Mr. Cryer,
French Bros. Bauer Co.,
Cincinnati, Ohio.

My dear Mr. Cryer:

"The A-B 'Dry Refrigerating' Cabinet was received here last Monday. We iced it at 10:00 A.M. the same morning and did not disturb it again until 7:00 P.M. Wednesday evening.

"Fifty Six hours! And about half the original packing of the ice was still in its compartment. We received two 5-gallon tubs on Wednesday afternoon and used the ice from only one of them for re-icing the cabinet.

"The shipment of Wednesday afternoon included 16 quarts of brick cream. This we placed in the middle compartment. There are eight or ten of these quarts there now, and as firm as when first put in.

"My dear friend Cryer! Thru the many years that I have been a customer of French-Bauer I have been the recipient of many courtesies and, at your hands personally, manifold favors, but this last one is the crowning one. I thank you! And I feel now that we can handle creams with more satisfaction, much less physical labor and what is of the greatest importance - with more profit.

"Again I thank you!"

Henry A Fabra

woefully lacking in statistics. For an industry to be without statistics is like a ship to be without a rudder. Business today cannot be conducted economically without basic statistics. There is a mass of data which can be collected from other industries from the supply men and from the ice cream manufacturers, and if brought together, tabulated and interpreted will give a world of information in regard to the progress and trend of the ice cream industry. This information will not only be of great commercial value but it has a great publicity value in keeping the ice cream industry before the public in an interesting way. It is very easy to get stories woven around statistics into the newspapers.

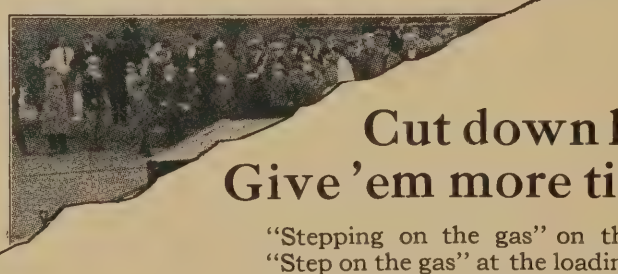
3. Trend of processes and equipment in the industry. What is the actual status regarding the ice cream cabinet today? How many cabinets have been installed? To what extent is the Hopper system used? How many states have compulsory pasteurization, etc.? An industry never stands still. It is always possible to trace definite trends of development. A knowledge of trends in processes, in equipment and trade practices enables us to anticipate problems and prepare to meet them.

4. Establishing an industrial reference and record library. There has never been an attempt made to keep any files of the trade journals, bulletins, or other printed information at the office of the national association. There is not even a complete file of the annual report of the association. The place of all places to have on file a history and record of the ice cream industry is in our association. The carrying out of the activities mentioned above will automatically tend to create an industrial reference library. Files should be kept of all trade journals dealing with the ice cream trade, of all research and experimental publications, and such publications of allied industries which will bear directly on the ice cream industry.

5. Stimulating public interest in ice cream. Upon this important subject depends the future increase in sale of ice cream and increased sale of ice cream equipment and supplies. The two organizations are equally interested in educating the public to a realization of ice cream as a food. If working independently, there will be duplication of effects and likely misunderstandings. To make the work effective, they need the same source of information, and if working in co-operation the work will be far more effective.

Some may say the ice cream manufacturers are big enough to run their own business, and do the things mentioned without co-operating on a financial basis with other groups. Undoubtedly this is true, but the question is: Can we, through co-operation with the Association of Ice Cream Supply Men, do a better job, do it quicker and far more economically and to mutual advantage? None of the activities are being done by either association at present. It is agreed by both groups that there has been, and is, an increasing need for this work. By co-operating, better results can be obtained at a saving of at least $6,000.00 annually to the two associations.

THE activities mentioned above can be classed under one heading—"Establishing a source of information for the ice cream industry." This information to be at the disposal of both groups for their independent action. Such co-operation in no way would place the one association under any obligations to the other. It is purely a business proposition in the interest of economy and efficiency. Co-operation on a more definite financial basis is a question of policy of the two associations and is brought to your attention because it is believed to be worthy of consideration.



In discussing the question of co-operation with The Association of Ice Cream Supply Men, I would be remiss if I did not call attention to the affiliated group — The Salesmen's Club. The salesmen of the equipment and supply houses are the promoters and interpreters of new ideas from the shops and the factory. They are the connecting link between the ice cream manufacturer and the manufacturer of equipment and supply. This club numbers approximately 950 members who are daily in personal contact with the ice cream manufacturers. They are an integral part of the ice cream industry and this association is ready to furnish them information about the industry and the aims and purposes of this

(Continued on page 150)

The GLASS LINING

An Equipment and Service Magazine for the Dairy Industries

Vol. 2. No. 3.

Pfaudler Insulation Scores Again!

Photo taken shortly after the fire at the Hunding Dairy Co., Chicago, Ill.—The specially applied Pfaudler Insulation protected the milk in this tank against fire to the extent that 5 days later the cream was used for making butter. This butter was up to regular standards.

A severe fire! Walls and ceilings burnt out! Temperatures of at least 1000° F. Heat enough to break down ordinary equipment! But here Pfaudler Insulation (in the form of Armstrong Cork combined with glass lined steel and a special sheathing) offered such a resistance to the heat that the milk raised only a few degrees in temperature.

As the story goes, the temperature of the milk before the fire was 36°;—five days later in had risen to only 45° and was still sweet. This is an increase of only 11°, based on extreme temperature conditions.

If anything can be perfect in machinery manufacture, then the insulation of this tank was perfect. This is the same type of insulation which enabled a Pfaudler truck tank last October to make a run of 700 miles and a further holding of the product for a week, with a loss of only a few degrees F.

The milk in the Hunding Dairy tank could have been used for bottling purposes except for a slight off-flavor resulting from the entrance of smoke through the observation glass. However, the cream was separated and used for butter which was up to regular standards.

The only repair parts required for the tank were a couple of peephole glasses and an angle stem thermometer.

This is the first case of its kind on record, that we know of.

Insulin—What it Is, What it Does, How it is Made

The greatest medical discovery in 50 years is insulin. How the proper administration of this solution will undo many of the ill results of improper eating and how this product is being produced commercially to meet the widespread demand for it makes a very interesting story in this month's "The Glass Lining". This one article makes the whole issue more than worth while.

A Pay-Envelope House Organ Service for Small and Medium Sized Dairies

Do you sometimes feel that your organization needs "toning-up", that you would like some systematized method of showing your employees in a tactful yet forceful manner the correct attitude on such subjects as thrift, punctuality, courtesy, etc.? Here is a house organ service which may be purchased at a very low rate.

OVER 300 "C-GALS" IN OPERATION

Pfaudler's new 100-gallon Pasteurizer (Starter Can, Storage Tank, etc.) has been given an ovation by the trade. From all over the country the orders have come in—many of them by mail. The "C-Gal" has hung up a record for popularity which is unequalled in the history of dairying. Buy a "C-Gal".

ICE CREAM WEEKS ARE SUCCESSFUL.

(Continued from page 22)

Fruits contain water, sugar, acids and proteid. They help us to digest our food easily. The fruits most commonly used in making ice cream are bananas, different kinds of berries, pineapples, peaches and cherries.

Nuts add richness to ice cream and variety to its flavor.

Ice cream is so wholesome and nourishing. It is used one season just as well as another. It is in reach of all, because it is sold at the groceries just as potatoes, figs, rice, bread and milk are.

Ice cream is rich in vitamines. "Uncle Billy"—W. F. Roes—talked to the school children of our city in April about vitamines in foods. Vitamines put pep and vim into children and make them rosy-cheeked, give them graceful bodies, keen minds, sparkling eyes, and sturdy muscles.

Ice cream is an excellent health food for grown-ups, as well as for children. It is very nourishing for the sick. It is very pleasing to the taste, and helps to strengthen the body.

Ice cream is a food that is easily and quickly digested.

Even though I eat ice cream every day, the one thing that keeps me from tiring of it is because there is such a variety of it. We can get it in so many different flavors and kinds. We can get it in such a variety of shapes. We can get ice cream in shapes of rabbits, chickens and lilies for Easter; turkeys and pumpkins for Thanksgiving; Santas, trees, etc., for Christmas, and many other forms for other holidays.

That's why I say, with all the kiddies of America, that "Since ice cream is a food,—body-building and health-giving"—I SHOULD EAT ICE CREAM EVERY DAY.

Some kiddies don't like milk,
And others don't like eggs,
But do you hear of many
Who won't for "ice cream" beg?

And when they get their "ice cream"
They never stop to think,
That they have both the milk and eggs
They refused to eat and drink.

MARY A. P. MILLER, (age 9 years)
718 S. Fifth St., Evansville, Ind.

* * *

SECOND PRIZE,

The friendly cow, all red and white,
I love with all my heart;
She gives me cream, with all her might,
To eat with apple tart.

Milk has been the food of the races from the time of Adam and Eve, down to the present time. It is the food upon which we, as babies, started our climb to adult manhood and womanhood, and we must rely upon it when we are old and our digestive powers are no longer able to manage solid foods. It is Nature's all-round food, given to her hungering children to be their faithful, ever-ready friend.

Milk is rich in nourishment, and it contains three vitamines that have been found to be invaluable to the growth and vigor of the individual. Milk contains, in fact, all the necessary food values. The butterfat and milk sugar give heat and energy to the body, while the protein and lime are the building materials. Each, in its own way, makes the body bigger and stronger. Lime builds bones and teeth, even as the protein finds its way to the muscle and strengthens and rebuilds them.

Ice cream, a milk product, with all the above strong points, is a food supreme.

Ice cream may be eaten with the perfect assurance that it is pure and clean. The creamery buys the milk for ice cream from government inspected dairies only, insuring purity and cleanliness. From the time the milk is brought in, fresh from the country, by the hands of hardy farmers and dairymen, it is handled with the utmost care to protect it from contamination of any sort. Then, **all** ice cream is made from pasteurized milk. This process insures absolute freedom from germs. The cans and all containers from the very first are scalded, aired and sunned, and thus kept scrupulously clean.

Ice cream is the most delicious, pleasing and palatable milk product. It has a cool, soothing effect when eaten that makes it an ideal dessert. Once eaten, you invariably want more. It is quite possible to have as much of this nourishing dainty as the appetite craves, for the price is remarkably low, as compared with other foods of equal value.

Milk products are about the only foods that may be dupli-

Comparative Tests Prove

Mapleine's

Unmatched Quality

When an extract salesman tells you his maple flavor is as good as Mapleine, prove out his claims before taking a chance on impairing the selling quality of your ice cream.

Flavor two freezers of ice cream, one with Mapleine and the other with the supposedly "just as good" flavor.

Compare the two batches 24 hours later and again after 48 and 72 hours. Then you will be thoroughly convinced in Mapleine's favor.

A long stay in the hardening room, though an ordeal for synthetic flavors, never daunts Mapleine. The longer the ice cream remains in the cooler the more evident and outstanding Mapleine's superiority becomes.

Mapleine is made solely from vegetable ingredients—contains no chemicals or ethers to evaporate and change flavor in freezing and storing. It will not freeze out, fade out or change flavor a particle no matter how long the ice cream is stored.

Mapleine is a proven flavor that is building up sales for manufacturers in every part of the country and will do as much for you. Convince yourself.

There is only one Mapleine and it is always identified by the Crescent Trade Mark. Look for it.

MAPLEINE

cated at every meal and yet not become tiresome. Ice cream is numbered among these, and one reason for its ever-novelty is the variety of ways it may be used. If the meal is a picnic, a cone just hits the spot. If a formal dinner is being served, there are many fancy ways it may be fixed. When the various fruits are in season, ice cream gives them an added flavor. In fact, it is one of the best desserts ever made and goes well with any dainty dish, or composes a dish by itself.

The pleasure alone that it gives would justify its place on the daily menu if nothing else was considered, but when we think of the real, sustaining food value that lies concealed in the gleaming frozen dish, we can appreciate its true worth.

Suffice it to say,
Eat ice cream every day.

RUTH FISHBACK, (age 15 years)
315 E. Sixth St., Bloomington, Ind.

* * *

THIRD PRIZE.

"One man's meat is another man's poison."

True of many things we eat, but not of ice cream.

Most people eat ice cream because it is such a dainty dessert, never thinking of the food value it contains.

Ice cream is made from cream, the richest and best portion of milk. Other ingredients used in the preparation of this delicious food are—sugar, flavoring extracts and sometimes fruit and nuts.

Until recently, ice cream was considered a luxury. Now, it is known as a real food for all ages. It is refreshing, invigorating and rebuilds the body and mind, carrying in delicious form the high nutritive values of milk.

I recently visited an ice cream factory and watched the men work. Everything is so nice and clean. I think I like ice cream better by seeing through the plant.

Throughout the entire process of making ice cream, it is never touched by human hands.

The ingredients are mixed in a great churn-like machine. After being frozen it is placed in the cooler until ready for use.

The building is then scrubbed and made clean and sanitary, ready for the next day's freezing.

Although ice cream was first made in Italy in 1756, Mistress Dolly Madison, wife of the fourth president of the United States, was the pioneer in serving the wonderful food product in this country. She served it at state dinners in the White House during her husband's administration in 1809.

For more than a century we have been using ice cream as a dessert in this country. Today nearly every civilized nation knows about ice cream as a dessert or a delicacy.

Ours is the only nation in the world that has officially proclaimed it as an essential food, now recommended by prominent physicians and leading food scientists.

Secretary of Commerce, Herbert C. Hoover, who had charge of feeding 1,200,000 children in devastated France and Belgium, makes the following statement in regard to dairy products:

"The foundation of child health lies in proper feeding. The white race cannot survive without dairy products."

During the war the National Food Administration placed ice cream in class three because they found it was exceptionally high in food value. One quart of ice cream equals two pounds of lean beef, 1.8 pounds of ham, 2.8 pounds of eggs or 5.2 pounds of potatoes. Therefore, even at its present price, ice cream is yet one of our cheapest foods.

A pint of ice cream contains as much iron as four ounces of raisins. Ice cream is high in minerals necessary for building bones and teeth. It is rich in nitrogen which builds up the muscles, rich in fats and sugar which produces energy.

Ice cream may be eaten freely by old and young, the convalescent and the sick, primarily because it is a milk product.

We should eat ice cream every day because it contains all elements of nutrition for life and growth, including vitamines. It contains lime, which we must have for bones and teeth, and some for our blood and other parts of our body.

Adults also need lime because our bones are constantly wearing away, little by little, and must be replaced. Milk is the chief food for lime.

Ice cream promotes health and growth. This has been proved by health experts who have given to children who were underweight, a dish of ice cream with their midday lunch. These children showed marked improvement in health, weight and vigor, also in their studies, as well as in physical activities.

All forms of athletic contests, whether in baseball, football, tennis, running, jumping or boxing, require alert minds, strong muscles, and bodily endurance.

Athletic trainers have ice cream regularly on the training table and the leading athletes eat plenty of it.

Food and nutrition experts pronounce ice cream one of

MOOKOW

SALES PLAN

The new sensational Selling Plan that Pays it's Own Way and Furnishes it's Own Advertising

EXCLUSIVE RIGHTS GIVEN TO ONE COMPANY IN EACH CITY

Here's what it does~

1st It appeals directly to those who are the largest consumers of ice cream—the children.

2nd It furnishes them a strong incentive to eat more ice cream. It appeals to the child whether he is rich or poor for in primary instincts all children are much alike.

3rd It insures the interest and co-operation of the parents. It insures the help of the mother in completing the series of pictures, and through the message conveyed to her, she is sold on ice cream as a necessary part of the child's diet.

4th It eliminates all waste of printed matter as it is a selling campaign going directly and exclusively to interested prospects.

5th It limits the benefits derived exclusively to the manufacturer who issues the books, his dealers, and their customers, and no part of the cost goes to help build up some other manufacturer's business.

6th It gives the manufacturer, practically without cost, the active help and co-operation of an army of children and their mothers—the greatest buying power in the world.

7th It affords a complete and perfect tie-up between manufacturer, dealer, and consumer, which is not possible with any form of *general* publicity known at this time.

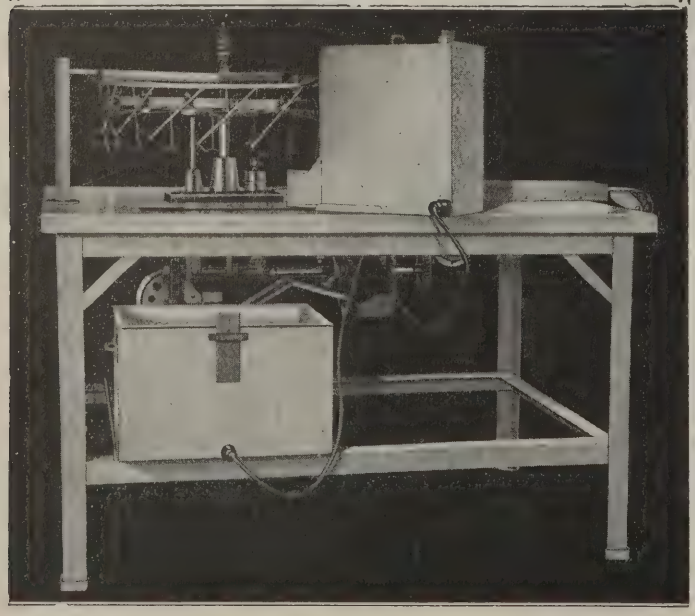
To Serve them Right



The Northwestern Bar Cabinet keeps the Eskimo pies in the right condition in all sorts of weather. Its neatness, attractiveness and practicability makes it an ideal sales medium that can be placed to good advantage in many places where ice cream can be sold in no other way.

Try a few.

More than 350 ice cream manufacturers are using the Northwestern Cutting and Dipping machine to make the popular Eskimo Pie or Chocolate Coated Ice Cream Bar, because its investment cost is only $375.00 complete and its production cost so low.

Full details of this equipment are contained in our special circular. Send for it.

NORTHWESTERN CORPORATION
MORRIS - ILLINOIS

our very best foods, highly nourishing and a very economical food.

We do not have to be coaxed to eat ice cream, as we often do other foods recommended for body building.

Ice cream is a refreshing health food for all out-of-doors lovers. It is readily obtained and easily carried.

Eat ice cream when golfing, motoring, on picnics or lunching parties.

It is a treat at any time and always a health food.

ADA MYRA YOUNG, (age 12 years)
Covington, Ind.

Weather conditions during the campaign were very unfavorable, but even in the face of this, those taking part in it are of the opinion that it was a success. On account of the splendid co-operation on the part of both the manufacturer and the dealer a very wide distribution of advertising material was obtained.

In the majority of cases the dealer appreciated the fact that this campaign would materially benefit him if it served the purpose for which it was intended, and sought to place the advertising material in his store in such places as it could be seen. Some dealers even co-operated to the extent of offering special prizes if the essay contest was won by a child in his city.

While it is not possible to say just to what extent this campaign influenced the sale of ice cream, we are of the opinion that it did cause some increase. The campaign did, however, draw a great deal of attention to ice cream and create much good will for the industry. Manufacturers for the most part are highly pleased with the association's first efforts along this line and by profiting by our experiences in this campaign we feel that any future campaign held may be made even more effective.

HYDROX ABSORBS ALLEN ICE CREAM CO.

The Allen Ice Cream Co., Rockford, Ill., has been absorbed by the Hydrox Corporation, with headquarters in Chicago. Plans are under way to make the Rockford plant one of the largest ice cream factories in that section of the country, with a distribution system that will cover northwestern Illinois and southern Wisconsin.

Officials say that arrangements are being made for the enlargement of the plant from its present capacity of 300,000 gallons of ice cream daily to 600,000 gallons daily. A corporation to control the Rockford plant will be organized with a capitalization of $250,000, it was announced.

Although the new company will be a part of a big corporation headed by John C. McInnerney of Chicago, and which is a subsidiary of the still greater and larger National Dairy Products Co., it is stated that the management of the company will be vested in Rockford men. George R. Courtright, for years secretary and treasurer of the Allen Ice Cream Co., will be manager of the Rockford plant. Burt M. Allen will retire from active service in the business, although it is understood he will retain some holdings in the new corporation, and may even accept a position on the directorate.

When the Allen Ice Cream Co. erected its new plant in 1918, provisions were made to take care of future expansion, and for this reason no addition will be made to the building although the capacity of the plant will be greatly enhanced.

Anyone who studies the advertisements in this magazine does not have to be told that it is a profitable habit. He collects the profits daily.

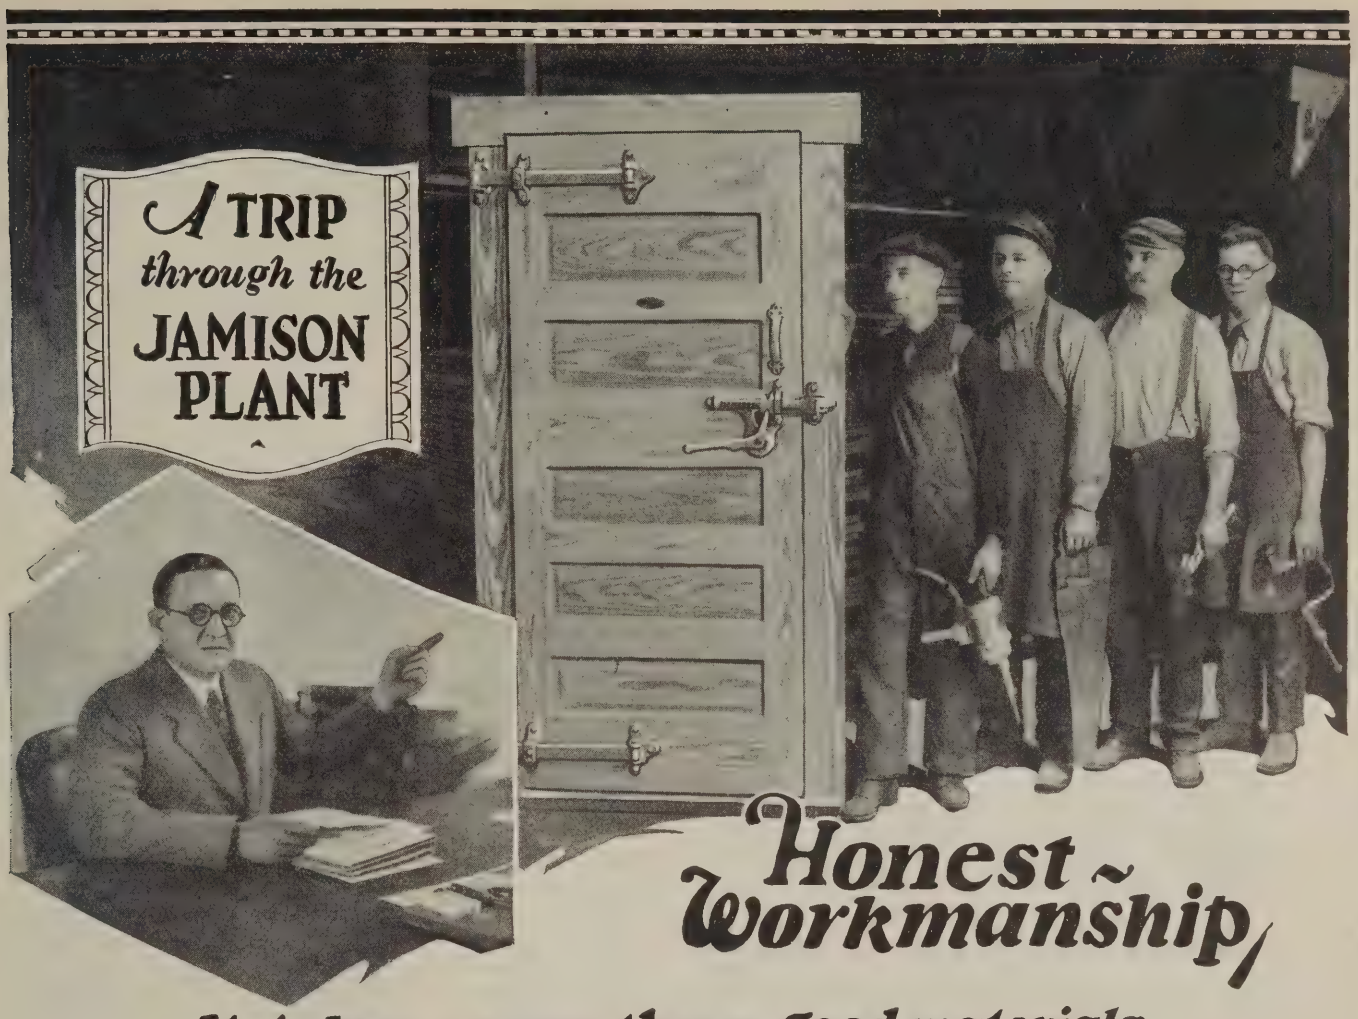
WEIGHT QUESTION UNSETTLED.

(Continued from page 10)

packages impractical. It must be kept in mind that special packages can only be marketed at a reasonable price on the basis of quantity production."

He went on to explain that there would be many difficulties to face the retailers through this change in the dispensing of ice cream by weight. Regarding this confusion, he said:

"Every retailer would have to purchase at least two sets of scales, one for retail sales and one to check his purchases; for unless the retailer is going to purchase scales and weigh all cans received, there will be an increased opportunity for drivers to be dishonest with the dealer, charge for more than delivered and pocket the difference. Not only will there be an increased cost to dealers in purchasing scales but the retailer knows that on account of the viscous character it will take longer to dispense ice cream by weight than by volume and extra clerks will be needed during the rush hours."



He went on to show that the public has always been purchasing ice cream by volume, "or we might say purchasing by the eye." In the house, he pointed out, ice cream is served by the eye at an estimated number of dishes to the quart. Although ice cream of different flavors vary considerably in weight, in most places all standard flavors are sold at the same price per quart. He added:

"In a large plant weights taken of 25 cans, each of different flavored ice cream, give the following weight per gallon — vanilla ice cream, 4.70 pounds; chocolate, 5.70 pounds; pineapple, 4.76 pounds; and nut caramel, 5.25 pounds. If a purchaser was to get the same volume of different kinds of ice cream, it would be necessary to figure out a weight scale by which this could be done. Also a difference in the condition of the cream when sold will cause a variation in volume for the same weight and customers will object to getting a less volume for the same price at different times.

"There is no doubt at all, that every housewife, when purchasing ice cream, has in mind a certain volume necessary to properly serve a certain number of people. If ice cream were to be sold by weight, this housewife might, at times, get two quarts for three pounds, and the next time only get a quart and a half for the same weight. This would cause immediate dissatisfaction, for there is no possible doubt that the purchaser of ice cream always has and always will want a certain volume for a given price, regardless of weight. A constant variation in volume for a given price would cause endless dissatisfaction, which the retailer would not want. This condition would result in a demand by the retailer for the lightest ice cream possible, so that he might give the greatest volume for a certain weight. There would be constant strife to get the lightest ice cream possible from the manufacturer and probable refusal to accept a can of ice cream that did not meet the views of the retailer for lightness. There would be constant haggling over weights, resulting in loss of confidence and good will."

EXPLAINING that this system had been tried without favorable results in California, Mr. Rasmussen read a telegram from Charles C. Johnson, California state treasurer, formerly superintendent of weights and measures, the telegram stating:

" 'Upon learning you will have a hearing on matter of defining proper butterfat and weight standard for ice cream and thinking my experience and investigations into question as former superintendent of weights and measures in California extending over considerable period might be of assistance. Can assure your committee that after spending over one year making investigations with assistance of all prominent dairy and food officials in California, we found that fixing a weight standard for ice cream entirely impracticable and abandoned any attempt of introducing regulations for such enforcement.' Upon inquiry of the California, Southwestern States Ice Cream Manufacturers' Association in regard to experiences of retailers selling by weight, the following telegram was received: 'Only California retailers who tried selling by weight were druggists Los Angeles and vicinity who abandoned idea three years ago. Too much trouble explaining to public why containers were not packed full. Several arrests

Honest ~ Workmanship

It takes more than *good materials* and *good intentions* to make *good Doors!*

THIS plant isn't so large but what the "boss" calls every man by his first name. If he wants to know what kind of a machinist Bill Smith is, he doesn't have to consult a card index. When the general manager steps out of his office and into the factory he isn't in a strange community. The faces of the workmen are all familiar. Most of them are the same faces that were there a year ago, and the year before that, and farther back.

It takes more than good lumber to make a good house. It takes more than good cloth to make a good coat. It takes more than good rubber to make a good tire. Plus these things, it takes sincere purpose on the part of the man who is "bossing" the job—and **interest** on the part of the man who is doing the work.

There aren't any kickers, or loafers or knockers in our busy little factory here in Hagerstown. Most of the men who wield the hammer and the saw and the drill have been here for years—and expect to be here a good many more.

We find that loose screws, damaged lumber, carelessly installed insulation and **repeat business** don't go together. But, we also find that satisfied workmen and satisfied customers DO GO TOGETHER. **We keep both.**

Texas Barrel Company

announces another improvement in double bottoms in the manufacture of Ice Cream Shipping Tubs.

This double bottom will be a revelation to the Ice Cream Shipping Industry, and is amply protected by U. S. Government Patents. There is nothing like this tub on the market and it is vastly superior to the old-style double bottom tub which we have been manufacturing.

Durability and long service are the first consideration, and our guarantee goes with each tub.

Quality Packages and Prompt Shipment Our Motto.

TEXAS BARREL COMPANY

Box 665 Houston, Texas

for slack filled packages. Idea not popular with public. Dealers convinced of impracticability as demonstrated in tests by officials state department of agriculture and dairy division, University of California.' "

The weights system would be a burden directly bearing upon the public, he declared. It is estimated that this increased cost would be from five to seven cents a quart. The dealers would profit from this altogether.

THE unfairness of the system was brought out when it was explained that ices, which have the least food value, consequently being of less value than plain ice cream, really are heaviest in volume. Although the weight of a gallon of ice cream may vary considerably, Mr. Rasmussen brought out that the total percentage of food value may be quite the same.

Declaring that any retailer is privileged to sell ice cream by weight if he so desires, regardless of whether manufacturers sell by the weight or volume, Mr. Rasmussen explained that the total cost to the retailer of his week's supply would be the same. If, therefore—

"* * * a retailer buying ice cream by volume desires to sell by weight, all that it would be necessary for him to do would be to determine the average weight of ice cream purchased and from this establish a selling price per pound, which would net him a reasonable profit. The majority of ice cream dealers and manufacturers do not want to sell by weight.

"Different retailers frequently sell ice cream at prices varying from 40 to 70 cents per quart, and it is a well-known fact that some dealers who are not making a profit are trying to gain trade by underselling their competitors."

THERE are two states that had seriously considered regulation of ice cream—California and Wisconsin. The latter state was represented by Harry Klueter, assistant dairy and food commissioner, who sent George Warner, chief inspector of weights and measures. Mr. Warner stated that standards were fixed as to ingredients in quality, also methods for testing overrun. These tests were easily applied by field inspectors. An objection was made to weight as a basis, because some might give increased weight by the use of skim milk rather than other materials. He also urged uniform sizes of dippers and utensils for measuring small quantities, as an aid for the retailer in solving his problem of losses.

W. W. Skinner, chairman of the committee on definitions and standards, told how that organization seeks to arrive at intelligent control based on exact knowledge of the facts. The purpose was to fix limits for the protection of the consumer, rather than to bring up problems that would be troublesome all the way around. The committee's tentative proposal of weight standards was 4¾ pounds to the gallon and an overrun of 85 to 90 per cent.

The cry of some that ice cream was filled with air, and hence money spent for ice cream bought air, would be misunderstood by many. Yet the public would not buy ice cream that did not have air in it, for air gave the smoothness.

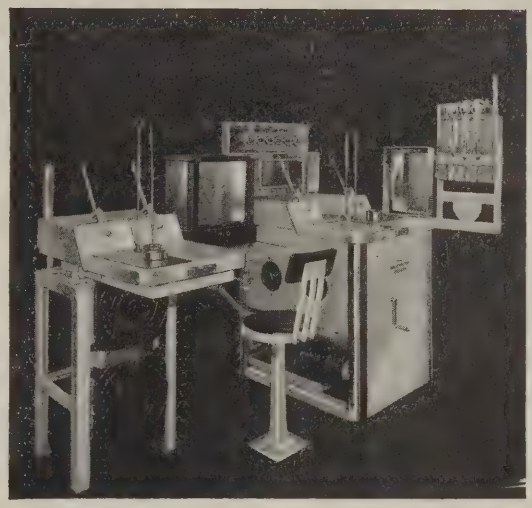
Weight measure was made more difficult because of a wide variation due to flavors. Figures cited were vanilla, 4.7 pounds to the gallon; chocolate, 5.7 pounds; pineapple, 4.76 pounds; nut caramel, 5.25 pounds. This fact would require some adjustment, or education, of the public to the fact.

There was also stressed the well-known fact that the housewife buys ice cream by bulk, seeking to serve a certain apparent quantity rather than by weight. She wanted so any dishes to go around, and would not be satisfied merely by weight.

Until another conference should come, the weights and measures officials would further study the matter.

ACCURACY PAYS

It pays to test and control your overrun



It pays to test your butter fat and solids

The operator cannot tell the overrun in his ice cream, no more than you can tell the weight of a potato by looking at it.

There are Seventeen Factors

that affect the overrun. Three freezers standing side by side of the same make, purchased at the same time and supplied with the same mix, the same brine, may vary 20 per cent in overrun.

Mojonnier Model D Milk Tester

To be able to buy your raw materials for your mix absolutely on the basis of actual butter fat received—to be able to standardize your ice cream mix to within .05% and eliminate all guess work, is a paying proposition for the ice cream maker.

WITH THE

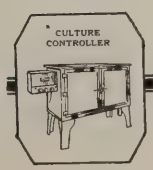
Mojonnier Milk Tester

You can standardize the value of your butter fat in your mix to within a few hundredths of 1%. Then you can control to an exact nicety the total solids including milk solids not fat, sugar, gelatine, in addition to the butter fat. If your ice cream maker gives your laboratory analyst a sample of the complete mix including sugar at 8 o'clock, in a half hour the operator can tell him the exact butter fat and total solids content in the mix.

The Hydrox Corporation advise that the Mojonnier Tester pays for itself every month in the flush season.

The Mojonnier Ice Cream Overrun and Weight Tester

enables you to control your overrun absolutely. You do not have to guess. You can test and control it while the cream is still being frozen.



Used by the progressive plants throughout the country to insure their customers uniform ice cream.

THE ADVERTISING BUDGET.

(Continued from page 14)

is concerned, is that it gives the Advertising Manager a complete outline to follow and when the host of salesmen who try to sell every device to the creamerymen come around, your advertising manager can say with utter candor, "I like, or do not like, your proposition, but my hands are absolutely tied. I have but so much money to spend this year and our budget is all made up and all the money will be spent on already decided forms of advertising. Therefore, as much as I like your proposition I am compelled to say 'No'."

CENTRAL PENNSYLVANIA MANUFACTURERS MEET.

Forty members of the Central Pennsylvania Ice Cream Manufacturers' Association held their regular monthly meeting and luncheon at State College, Pa., May 26.

Altoona, Bedford, Portage, Tyrone, Johnstown, Philipsburg, Clearfield, DuBois, Punxsutawney, Ridgeway, Brookville, Somerset, Indiana, Barnesboro, and State College were represented by those in attendance. Talks were given by L. G. Runk, president of the association, Altoona; John M. Thomas, president of the Pennsylvania State College; Prof. A. A. Borland, head of the dairy husbandry department, and Professors W. H. Martin and C. D. Dahle of the ice cream manufacturing department at the college.

After the meeting the ice cream men visited the college creamery and watched the students making the frozen delicacy in the college ice cream plant. They were also much interested in the research work being carried on now by the dairy manufacturing staff on factors affecting the freezing point and rate of hardening of ice cream and the relation between gold number and other tests in the selection of gelatine for ice cream manufacture.

This latter project is very important due to the fact that 95 per cent of the ice cream manufacturers use gelatine in making the popular confection. The gelatine functions to prevent formation of ice particles which tend to cause the product to become coarse or grainy after a few days.

NO MERGER CONTEMPLATED.

Denial has been made by Henry W. Breyer, president of the Breyer Ice Cream Co. of New York City and Philadelphia, that his company will be merged with the National Dairy Products Co. The Breyer company has a new plant under construction in New York, which will have a capacity of 7,000,000 gallons of ice cream annually. It is expected to be in operation within sixty days.

Officials of the Supplee-Wills-Jones Company of Philadelphia, also state that there is nothing in the rumor.

As soon as we definitely convince ourselves that business is a form of public service and that the community is as much entitled to the results of experience and investigation in the field of business administration as it is to the realms of science, we shall have a new public regard for business activity and a notable strengthening in the business structure now too subject to the devastations of ignorance of progress in what is less an art than science. — Henry Bruere, vice-president, Metropolitan Life Insurance Co.

The BEST Vanilla Sells the MOST Ice Cream

This better vanilla pays in dollars and cents

Don't use Michael's Mexican merely because you insist on the best, but because it *actually sells more ice-cream.*

MICHAEL'S Mexican

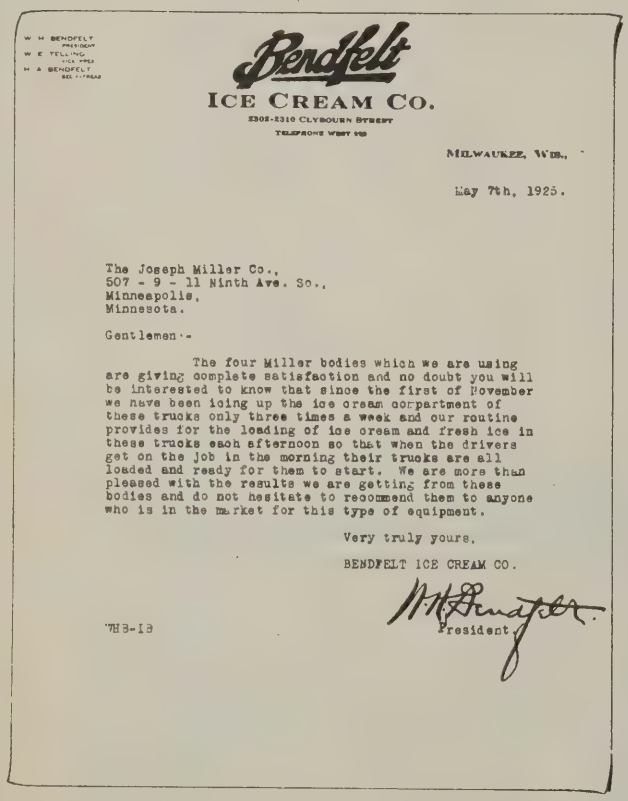
"America's Flavorite"

makes a vanilla ice-cream so mellow-mild, so deeply delicious, that people unconsciously eat more of it. Records prove an average sales-increase of 25%. If you're "from Missouri", *make the test!*

DAVID MICHAEL & CO., Inc.
Front and Master Sts. Philadelphia, Pa.

Make This Test at Our Expense

Place a trial order. Use all you can to give it a full, fair trial. If MICHAEL'S Mexican Vanilla Bean, Vanillin and Sugar Pulverized does not produce the finest vanilla ice-cream you ever tasted, return the remainder at our expense, and we will cancel the charge. DO this, by all means.



MILLER
Refrigerator Bodies

"We SELL You One—You BUY More"

Read what Mr. W. H. Bendfelt says about the four Miller Bodies that his company is using:

Bendfelt
ICE CREAM CO.
2302-2310 CLYBOURN STREET
TELEPHONE WEST 420

MILWAUKEE, WIS.,

May 7th, 1925.

The Joseph Miller Co.,
507 - 9 - 11 Ninth Ave. So.,
Minneapolis,
Minnesota.

Gentlemen:-

The four Miller bodies which we are using are giving complete satisfaction and no doubt you will be interested to know that since the first of November we have been icing up the ice cream compartment of these trucks only three times a week and our routine provides for the loading of ice cream and fresh ice in these trucks each afternoon so that when the drivers get on the job in the morning their trucks are all loaded and ready for them to start. We are more than pleased with the results we are getting from these bodies and do not hesitate to recommend them to anyone who is in the market for this type of equipment.

Very truly yours,

BENDFELT ICE CREAM CO.

WHB-IB

President

ICE CREAM FOR MEN WHO "GET UP" AGAIN.

(Continued from page 8)

IT IS generally understood that a very large percentage of the athletes who lose out in the major leagues do so by "eating themselves to death." Veteran newspaper observers are unanimous in this opinion.

The great John L. Sullivan, conquerer of all the mighty men of his kind, and today believed by many to have been the greatest fighter who ever lived, was, in turn, conquered—conquered not so much by the fast, lithe, tricky Jim Corbett, as by his own unconquerable appetite. John Barleycorn and an unchecked appetite for unwholesome foods played the important part in the great Sullivan's downfall.

The story is told that following his defeat at the hands of Corbett, Sullivan, suddenly coming to himself and resolving to cut out booze and immoderate living, quickly became fond of ice cream in turning to a new diet. From then on, to his dying day, the mighty John L. was a friend of ice cream.

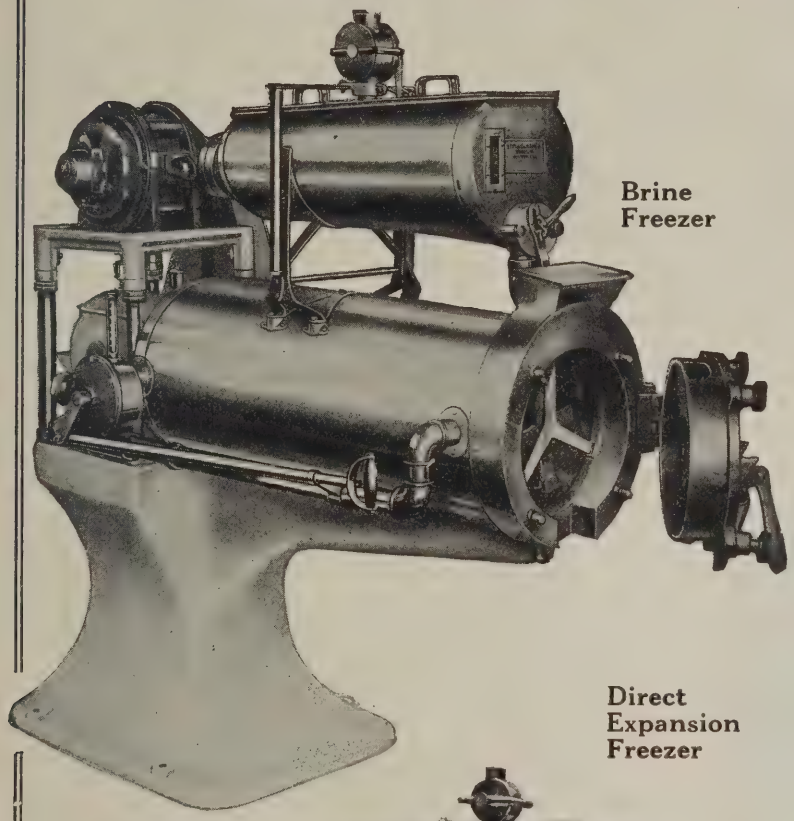
DAKOTA PLANT HOLDS FORMAL OPENING.

Formal opening of the modern plant of the Langenfeld Ice Cream Co., Watertown, S. D., was held on June 25 by inviting the public to inspect the plant while in operation, as well as a complete program for the entertainment of the visitors. The entire community seemed to enter into the spirit of the occasion and a parade emphasizing the importance of dairying, races, short addresses, band concert, and in the evening a big pavement dance, all these were numbered among the attractions on the program. Souvenirs were given to all who attended, and special souvenirs were offered to farmers bringing in cream on that day.

The building now occupied by the Langenfeld Ice Cream Co. is located on Kemp Ave. W., and was formerly occupied by the Park & Grant Mercantile Co. The plant has been entirely reconstructed to meet the requirements of the up-to-date ice cream manufactory, and it is now one of the most modernly equipped and sanitary ice cream and creamery buildings in the Northwest, according to announcement. Cement and tile floors have been laid throughout the building, replacing the wooden floors, and the walls have all been reconstructed with cork insulation in the remodeling process.

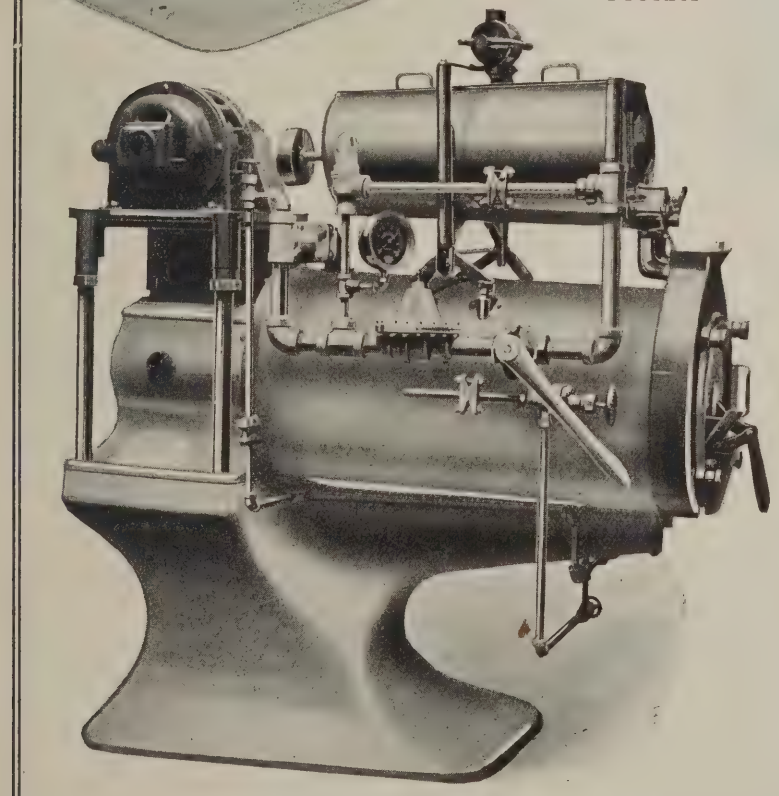
The front of the remodeled building is divided between the business office and the ice cream manufacturing room. New electrically operated machines are located in the latter, and the operation of these can be viewed from the street through large plate glass windows looking in on a "spotlessly white, cool room, finished in tile." The plant has a capacity of over a thousand gallons of ice cream daily. The two hardening rooms have a storage capacity of 3,000 gallons.

Among the labor-saving and efficiency devices that attracted the attention of the visitors was the rapid handling of cream cans as they are delivered full to the plant. There are two unloading ports opening into the alley at the height of the ordinary delivery vehicle. One is for express or other large consignments of cream and the other is for single can deliveries such as are made by farmers in the vicinity of Watertown. The cans are received on a long chain of rollers down which they glide to the scales for weighing.



New boilers have been installed in the basement. Nearly 2,000 feet of coil, through which ammonia is pumped, is contained in the two brine tanks, which are part of the new refrigeration system installed.

It is said that the Langenfeld plant represents one of



U. S. HEAVY DUTY ICE CREAM FREEZERS

BRINE — DIRECT EXPANSION

Universally Appreciated---because of the following exclusive features:

Brine Freezer

Direct Expansion Freezer

POWER SAVING:—Effected through the exclusive use of the famous Hyatt Roller Bearings in the U. S. Heavy Duty Freezers.

SMALL UPKEEP:—Effected through the use of finest materials obtainable.

REDUCES LABOR COST:—Effected through the exclusive use of the U. S. Automatic Batch Weigher.

MODERN CONSTRUCTION:—Effected through the exclusive use of the Patented Whipping Device, which is another exclusive U. S. feature.

VERTICAL DISCHARGE:—Another exclusive U. S. feature.

SANITARY:—No soldered or braised joints on the inside; all Nickel Silver. No brass coming in contact with the cream in any shape, manner or form.

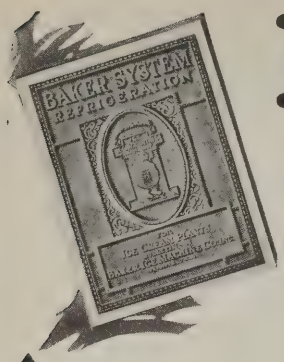
LEAK-PROOF BRINE CYLINDER:—The brine coils are very ample and have nothing to obstruct the free flow of the brine.

PRESSURE CONTROL:—Effected through the use of the exclusive U. S. Pressure Regulator.

OVERRUN CONTROL:—Exclusive U. S. feature.

SAVES REFRIGERATION:—Effective through the exclusive use of U. S. features.

SPEED OF OPERATION:—The U. S. Heavy Duty Direct Expansion Ammonia Freezer can be started up the same instant that the compressors are started.



ADAPTABILITY:—There is no special equipment necessary in the installation of U. S. Heavy Duty Direct Expansion Ammonia Freezers.

REDUCED FARES TO NATIONAL DAIRY EXPOSITION.

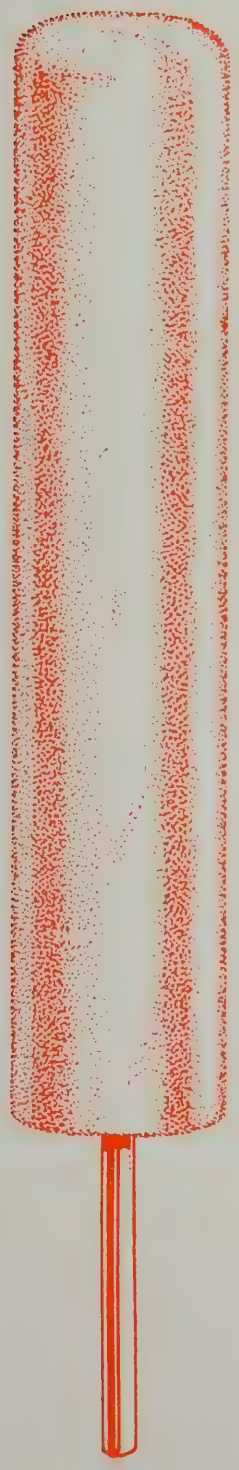
The regular one and one-half fare rate will be granted to visitors attending the National Dairy Exposition, Indianapolis, Ind., October 10 to 17. In Indiana, Ohio, most of Illinois, St. Louis and Hannibal, Missouri, Keokuk, Ia., Louisville and adjacent Kentucky points, the open excursion rate will prevail. In all other sections of the United States and Canada arrangements have been made or are pending for granting a one and one-half fare on the certificate plan. To gain advantage of the reduced fare under the latter agreement, visitors pay the regular full fare on the going trip and procure from their local railroad agent a proper certificate—not a receipt — for the half-fare rate on the return journey. Immediately upon arrival in Indianapolis this certificate must be presented to the endorsing officer at the show headquarters. When properly endorsed, it will entitle the holder to the one-half fare rate on the return trip.

Dates of sales under both plans are October 9 to 14, inclusive, in Middle Western states. In more distant states selling dates vary according to location. Purchasers of excursion tickets have until midnight October 23 to reach their original starting point. Holders of validated certificates are entitled up to and including October 21 to return tickets.

FIRE DESTROYS TENNESSEE PLANT.

The Clarksville Pure Milk Co., Clarksville, Tenn., was destroyed by fire a short time ago, and plans are now under way for the construction of a new building to house its dairy and ice cream plant. George L. Castner, Jr., manager, in speaking of his future plans, stated that he will erect a fireproof milk plant.

Some of the machinery and equipment in the old plant was saved from destruction, and Mr. Castner estimates his loss between $10,00 and $15,000. In addition to the portion of equipment rescued from the fire, there was also rescued 100 gallons of milk and 150 gallons of ice cream. These products were stored in a refrigerator and were still cold, the ice cream even being nicely frozen, despite the fact that the fire had raged for some time and had nearly completely destroyed the plant. In explaining this, Mr. Castner said the refrigerator was cork lined and heavily reinforced on both outside and inside with concrete.



ARKANSAS PLANT "COMES BACK."

Arrangements have been completed by the Velvet Ice Cream Co. for the leasing of a two-story brick building at 825 Main St., Pine Bluff, Ark. The building will be completely remodeled and reconstructed into a modern ice cream manufactory.

It will be remembered that the plant of the Velvet Ice Cream Co. was destroyed by fire not so long ago, and Charles Hooberry, manager, states that work will be rushed on the leased property to completion as rapidly as possible. The front will be of plate glass and the floors of concrete and white enamel interior, which will make the place an exceedingly attractive as well as sanitary factory.

FROZEN SUCKER

JULY 1925

Frozen Sucker Hailed As the Missing Link of the Ice Cream Industry

Successful Advent of New Frozen Product in Middle West and Other Sections Impress Manufacturers that Suckers Will Enable Them to Win Back Ground Lost to Beverage Industries

IS THE frozen sucker the missing link in the ice cream industry? There are reasons to believe, in the opinion of many ice cream manufacturers queried by The Ice Cream Review, that this comparatively newcomer will put the ice cream industry in position to step forth and claim a very great volume of business that has been lost to other industries, notably the manufacturers of soft drinks.

Although it is too early definitely to predict as to the future of the frozen sucker, there are striking evidences that, thus far, it has enabled several ice cream manufacturers to attract new business that previously was unattainable. This conviction has grown, not from results in any particular locality but after first-hand investigation by a member of the staff of The Ice Cream Review in different parts of the Middle West, particularly in southern and central Illinois and southern Missouri; and also after checking up on reports from other Western states and Eastern centers.

The frozen sucker, according to The Ice Cream Review's investigation, has resolved itself into the matter of being a by-product of the ice cream plant, not in the strictest literal application of the word, but in the purpose it serves. That purpose seems to be pretty well fixed; the sucker is a line of defense for the business that has been slipping through the hands of the ice cream men into the tills of the manufacturers of soft drinks. The situation regarding the frozen suckers seems to simmer down to these points:

1. It gives the manufacturer a profitable five-cent seller.

2. It appeals principally to children, who do most of their buying with nickels.

3. It appeals strongly to those adults who have highly developed appetites for soft drinks.

4. It does not appear to interfere with ice cream sales, though there are indications that it deflects some business from the ice cream cone.

5. There is no great investment involved; no great risk of money in costly equipment and materials.

6. It does not conflict with the manufacturer's regular run of business.

7. It has been very profitable where promoted with only a fair amount of advertising and a reasonable bit of encouragement to the dealers, though it has been most successful in vicinities where it has been well advertised and where there has been close co-operation between manufacturer and dealer.

Summed up, the sucker has been notably successful in attracting considerable additional profits to those manufacturers who have made reasonable efforts to promote the product, even with just fairly good co-operation with the dealer.

WEIGHING different angles of the matter, the effort has been made to bring out conditions that might be termed unfavorable to the sucker. Thus far no manufacturer interviewed by The Ice Cream Review has brought out any point that might be termed unfavorable. However, after all is said and done, the frozen sucker, at the present time, is a novelty. Manufacturers have learned to move cautiously, with regard to novelties. It is pointed out by some members of the industry that its very newness makes it a novelty, but the same gentlemen, in arguing for the permanence of the product, point out that ice cream itself at one time was a novelty.

Will the frozen sucker repeat? Even manufacturers who have made very great profits from the product this summer do not show much concern over this question.

"So far as investment is concerned, what difference does it make?" suggested a manufacturer doing business in a large city in the lower part of the Middle West. "Naturally, all of us who have made money on the sucker hope it will come back strong next year, and there are reasons to believe that it can, indeed, be made to come back stronger than ever. But it doesn't take but a few hours of sales for a manufacturer to pay for all

Pulling Chestnuts Out of the Fire

THE advent of the frozen sucker reminds us that for many years the problem in the ice cream industry has been to establish the link or links that make for closer connection with the potential business that never has been developed for our industry. The Ice Cream Review repeatedly has pointed out that the biggest business the ice cream manufacturer handles is the business for which he receives no money—the business that burdens our industry with a share of the expense without yielding any returns to us.

We are in the soft drink business; whether we know it or not, whether we wish it or otherwise, the fact remains that we have been drawn into a position where we actually have to help the men who are competing with us—the men who are getting the very nickels and dimes for which the ice cream industry is striving.

"The soft drink people must be laughing up their sleeves at what great asses we ice cream men are in furnishing icing service with which their products are kept cold and refreshing at no expense to them, with the ice cream manufacturer holding the bag while they get the bulk of the profits. We are pulling their chestnuts out of the fire," declared a Western manufacturer recently.

Is the frozen sucker the ice cream industry's missing link? Will this new product enable the worm to turn and claim some of the business that he has been helping others to get? Will the sucker enable ice cream manufacturers to come forth and crack through the surface of that vast, heretofore unscratched market to which we have just as much right as anyone else? Will it enable us to develop among more people a liking for frozen products?

The Ice Cream Review has made an attempt to answer these questions through a general and first-hand investigation of possibilities through the frozen sucker. This investigation is given careful discussion, beginning on this page. The matter is worth a little reflection.

initial expenses in producing the sucker, and whether or not the sucker repeats, there is no danger of our being 'stuck' at any place. Our regular ice cream business is going on all the time, even growing in proportion to weather conditions this year." He continued:

"We are told that the frozen sucker will be with us again next summer and the next, and so on. Maybe so. We nearly always have something new every season and it may be that something new will come up next season. I am of the opinion, however, that if there is something new to keep the sucker out of the limelight, it must be a product with great merit and with exceptionally good profits as a five-cent seller.

"The sucker is the only really good nickel seller with substantial profits that our company ever has handled. It looks like a repeater. The idea certainly is all there. The person who likes pop—and a comparison of the ice cream industry's volume with the volume of the soft drink people shows that a very great many people do like pop—can immediately recognize the superiority of the frozen sucker over the unfrozen soft drink. It is more refreshing, more appetizing. It is particularly popular because of its refreshingness. It has linked us up with a very large volume of trade that otherwise we never should have gained with any amount of advertising the food value of ice cream.

"As I see it, the sucker has attracted to us not only the kiddies and the people who have the soft drink appetite, but it has reached a large class of people that once were hopelessly—very hopelessly—lost to the ice cream industry—the men and women who don't want to get fat.

"For once we have a talking point without the necessity of mentioning food value. That always has been a harassing score for the ice cream manufacturer. On one hand we have to contend with the people who look at ice cream as a delicious luxury for the wealthy. While seeking to prove its value as a food product for the masses, we have had to defend a flank attack from the men and women who say they cannot afford to eat ice cream for the reason that its food value makes them grow fatter. And if there is any person hard to move from a position, it is the fat person who is determined to reduce."

Here is the way the sucker was heralded in dozens of cities.

"The frozen sucker," this gentleman added, "strikes me as being the ice cream industry's missing link. I know of no reason why it should not abide with us forever."

IT WAS pointed out to this gentleman that his records showed a very considerable falling off in sales. His first day's sales amounted to some several thousand dozen suckers, while on the day of the interview, some two weeks after the first day's production, sales had dropped to something less than one thousand dozen suckers a day.

"Surely sales have dropped off," this man countered. "I should have been foolish not to expect it. I suppose there will be a further drop, but if consumption should fall off two or three hundred or so, I still would be making good money—darn good money—on a product that is just incidental to my regular business," he added.

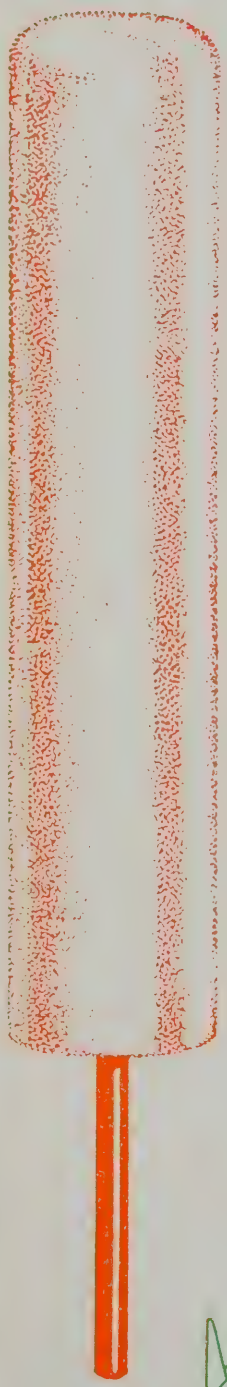
"But regarding the drop in sales, it will be noticed that the heavy drop came three days after the introduction of the product. For two or three more days there was a gradual decline. Then for the last week or so sales have held their own. The first drop was due entirely to reaction, which is just the same with human nature in any sort of matter—ice cream or Irish potatoes; shoes, ships or sealing wax.

"But has it occurred to you that we have an excellent opportunity not only to win back consumers who have dropped out but also to attract many, many thousands of grown people who must be educated to the sucker? It is true that many grown-ups now are consumers of suckers, but the vast majority are people who feel too dignified to be seen munching a product that always has been associated with the child.

"We must expect to do some missionary work with the grown-ups in connection with the suckers the same as we have had to do with regard to ice cream, the same as the bottlers of soft drinks had to do in their industry, the same as the candy manufacturers had to do for their product, and so on. We didn't get grown people to eating ice cream over night, except in the case of young ladies.

"The candy people, except in the case of courting swains, did not get much patronage from grown-ups for many, many years. The soft drink people, however, have had it easier, and we can have it just as easy because of them. The ice cream industry for many years has been 'carrying' the soft drink man by furnishing the dealers the ice with which our very competitors' products have been cooled. Now we can profit greatly from the ground work the soft drink people have accomplished; we can take advantage of the running start we have toward winning new adult customers to frozen suckers. Turn about is fair play.

"On this point, we shall do well to keep in mind that our product is a frozen beverage. There is nothing to gain by advertising anything except the fact that it is refreshing, appetizing and wholesome. As a beverage we can attract many customers; associating it with candy means that we shall encounter prejudice from the fellow who regards the sucker as a thing for the child.



"I insist upon believing that the frozen sucker is the ice cream industry's missing link—the go-getter of new business—the opener-up of new sales avenues."

"THE missing link." This thought was voiced in different ways by several other manufacturers visited by The Ice Cream Review's staff man. Surprisingly enough, some manufacturers are unshaken in the belief that the sucker not only does not operate against ice cream sales, but actually serves to develop among many people the habit of eating a frozen product in cases where this habit never before had been developed. Different manufacturers told of people known to have eaten a dish of ice cream a few minutes after partaking of a frozen sucker.

As to developing the "habit," it is generally recognized by merchandising experts, advertising men, and so forth, that habit very largely controls sales in virtually every industry, particularly regarding delicacies and drinks. A certain popular soft drink brand has become the world's greatest seller in the line of beverages simply for the reason that it has certain properties which

(Continued on page 126)

— — — LET'S MAKE PERMANENT BY HIGH AND ADVERTIS-

ONE of our executives made a trip through the midwest in the middle of June. Wherever he went, Frozen Suckers were the rage. But he found traces of dissatisfaction among the public in some places — always due to *just one cause* — a letting down of the Quality!

He also reported this: Where the advertising on Frozen Suckers was best, sales were best. To this there was not a single exception.

This is the first year the Frozen Sucker has become a truly national item. It is being made in almost every city and town in America, and the Ice Cream Industry, without disturbing its ice cream sales, is winning a splendid profit which heretofore has gone to the beverage industry.

Yet, even in this short time, the bugaboos of cheapened quality and unwillingness to advertise are creeping in here and there, threatening the present and future of this highly profitable, easy-selling specialty.

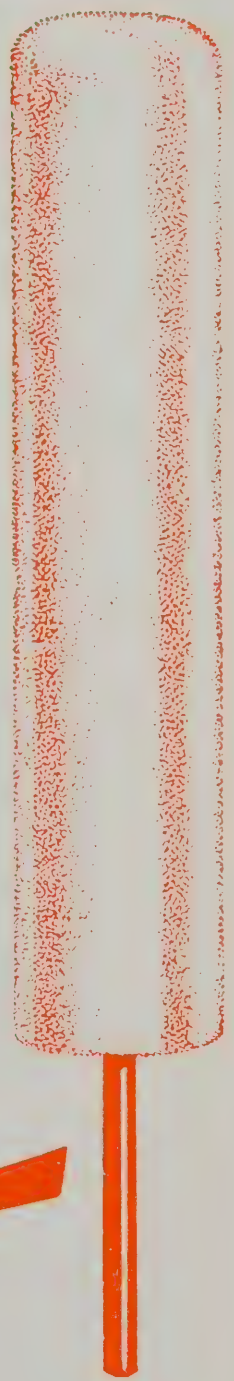
Our plea is, let us keep Frozen Suckers as a permanent profit-maker for the Ice Cream Industry by shutting out these bugaboos *right now*.

In advocating Quality we do not mean every firm must use "Kist" flavors. Under our "Friendly Agreement" plan,

Kist

REG. U. S. PAT. OFF.

FROZEN SUCKERS HOLDING QUALITY ING THEM PROPERLY



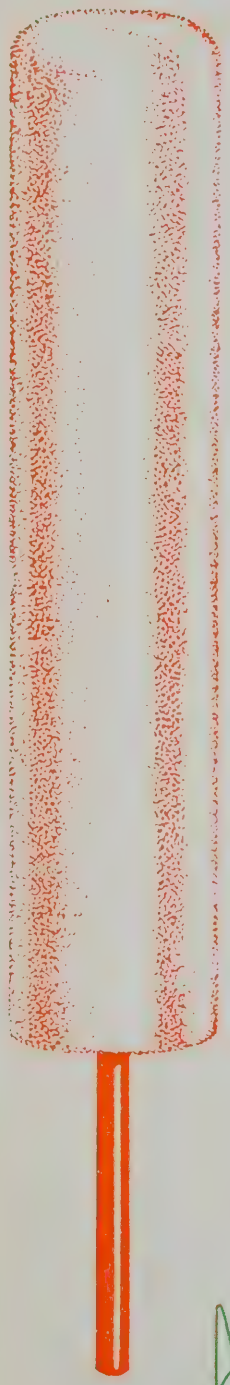
we ordinarily franchise only one firm in a town, hence other flavors naturally obtain a considerable part of the business. And even though we believe "Kist" flavors have been accepted as standard in the Industry, yet we know there are other good flavors which, if used, will hold up this ideal of Quality good and high!

Good flavors cost money just as good ice cream does. The ingredients used and the processes employed must bring a fair price. Yet the Flavor is almost a negligible factor in the cost of finished products put out by the Ice Cream Manufacturer, whether Frozen Suckers or Ice Cream. *And it is the flavor and color which make or break the sales to the public.* Surely this is the last place to economize!

The cost of the proper amount of the best flavors made (including our own), to flavor and color a dozen Frozen Suckers is only 1 1-10 cents. If a cheap flavor is used, costing half as much, the saving would be only 11-20ths of a cent per dozen. *We repeat, this is the last place to economize.*

Use the best flavors, acids and sugar you can buy—then watch your mix, your freezing, your wrapping, your hardening and your delivery and the public will never complain. On the other hand, the public will continue to *want* Frozen Suckers whenever it is thirsty and will buy them season in

[Continued on next page]



Kist

REG. U. S. PAT. OFF.

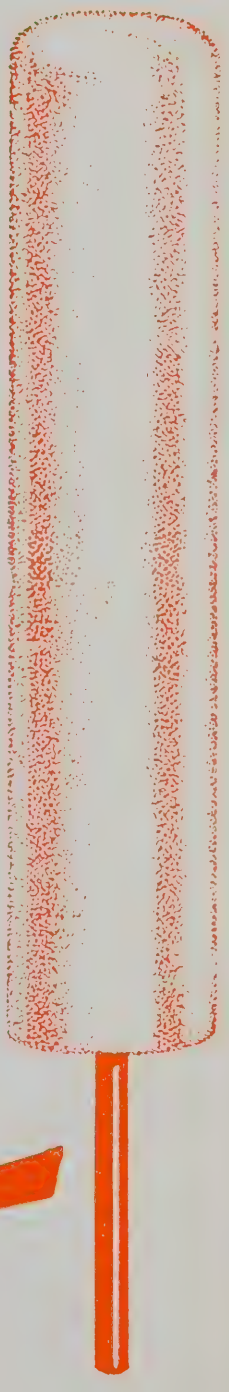
BEST FLAVORS ADVERTISING ARE FROZEN SUCKER

[Continued from preceding page]

and season out just as is happening in the South today, where Frozen Suckers are in some towns in their third season.

On the subject of advertising, keep in mind that all low-priced confection specialties, which the entire public buys, must be widely advertised. Examples are gum, candy bars and beverages. Frozen Suckers come into this class and cannot realize full sales possibilities unless advertised in a way comparable to these other competitors for the public's nickels.

Posterettes and other display material should always be kept up wherever Frozen Suckers are sold, just as the beverage and candy makers keep up their signs. When a person goes into a store to buy a drink, see that an ad hits him in the eye inviting him to quench his thirst with a Frozen Sucker.



Newspaper space should be used generously, two to three insertions a week, to keep the Frozen Sucker idea before the public, and also to play up the quality, flavor and purity. Advertising of this nature will create a general acceptance of the Frozen Sucker in any territory which will maintain sales on a steady plane long after the first novelty of Frozen Suckers has worn off. Your sales should stabilize to a place as steady and sure as those of the beverage maker. This cannot be accomplished without advertising.

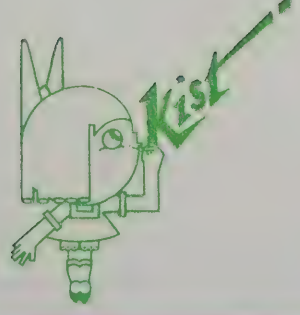
Kist

REG. U. S. PAT. OFF.

AND CONSISTENT NECESSARY TO KEEP SALES STEADY

THE KIST PROPOSITION

We have tried to combine in the Kist proposition the two important elements of quality flavors and adequate advertising. It has been highly gratifying to us to merit the wonderful list of customers that have long been using Kist flavors in Brick and Bulk Specials, and this year in Frozen Suckers. Included among our customers are a high percentage of the leading firms, large and small, in this country. But we are seeking representation in all cities and towns, and if there is not already a Kist manufacturer in your town, we urge you to get in touch with us at once.



You can make Kist Frozen Suckers at a material cost, including everything, of less than 7c per dozen. We have made everything available for our customers in the shortest possible time—molds, wrappers, formulas, advertising, plans for freezing equipment—all complete to the finest detail.

If interested, write, wire or phone and your inquiry will be completely handled the same day it is received.

Fifteen Thousand Suckers a Day in St. Louis Territory

Sixteen Manufacturers Making Suckers in Southwestern Metropolis, with Gross Daily Receipts of Approximately $6,000

A STUDY of the situation in the St. Louis territory impresses the belief that the frozen sucker is serving a useful purpose. Sixteen manufacturers in St. Louis proper, who engaged in this business on May 20, three weeks later were virtually agreed in their statements as to the success of the sucker business.

It is estimated that approximately $12,000 worth of suckers, figuring on the basis of wholesale price, were sold on May 20 in the city of St. Louis. Virtually all of the manufacturers engaged in the sucker business were

One of the ads that helped to sell thousands of suckers.

selling from one thousand to twelve hundred dozen suckers a day each, three weeks later.

"The only reason we did not sell more than 1,500 dozen suckers the first day," said Will A. Schwindeler of the Carpenter Ice Cream Co., "is because we did not have the capacity to make more. Our business has held up around 1,200 dozen suckers a day since the product was introduced. We are increasing production capacity to 2,500 dozen suckers a day. We did not do any newspaper advertising, but gave our dealers window strips and co-operated with them in every way we could. The future of the sucker business looks very promising to me; from results so far I believe it will become the greatest thing ever introduced in the ice cream industry."

Mr. Schwindeler could not see any injury to the regular ice cream business through the sucker. On the other hand, he could not see that the sucker was helping increase ice cream consumption. But when it was suggested that the sucker might be the means of winning over new customers to the ice cream "habit," he said he "saw possibilities."

THE frozen sucker business at this time is principally a business among children. Possibilities of developing greater consumption among adults were not commented upon by St. Louis manufacturers beyond the opinion that such development seems reasonable.

Seventy-five per cent of the Carpenter Ice Cream Co.'s trade were handling suckers on June 20. This represented the stores in the city neighborhoods, around the schools, parks, etc. The bulk of the sales for that company, therefore, are among the children, and the same condition seems to hold good for the other St.

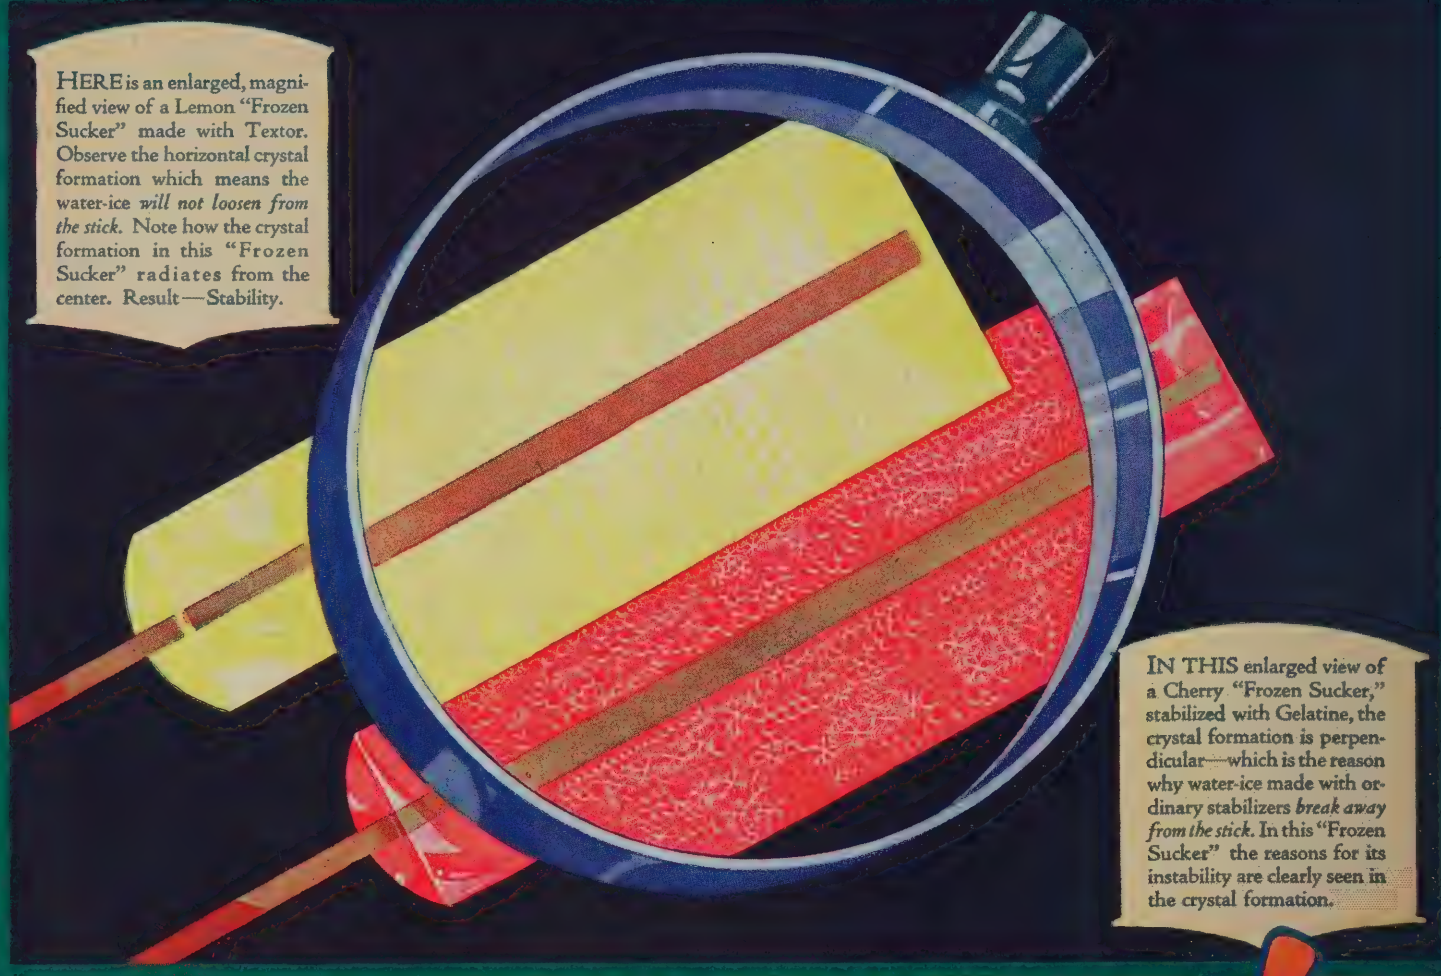
now! Double Duty Flavors

They Flavor as They Color — Better, too, the GUMPERT WAY

WITH the new Gumpert Frozen Sucker Flavors *you color and flavor at the same time—the color controls the flavor.* Every batch of mix is uniform in color and in flavor. You make Frozen Suckers perfect in taste, brilliant in color this new way. Over 30 years' experience in making flavors of finest quality is back of the superior quality of these new Gumpert Frozen Sucker Flavors. That's why Frozen Suckers, flavored the Gumpert way, *look better, taste better and sell better.*



Six ounces of Gumpert's Frozen Sucker Flavors *will both flavor and color 10 gallons of mix.* You can obtain them in Orange, Lemon, Lime, Grape, Cherry and Fruit Punch flavors. Gumpert's Frozen Sucker Flavors come packed six one-gallon bottles to a case—assorted flavors if desired.

We will be glad to send a case of assorted flavors on trial, or if you prefer, a 12-ounce sample of any or all flavors will be sent you on request, without cost or obligation. One 12-ounce sample is sufficient to flavor and color 20 gallons of mix. Try these superior flavors. Write today!

Gumpert's Frozen-Sucker Flavors

A Product of S. Gumpert Co. *Inc.* Brooklyn, N. Y.

HERE is an enlarged, magnified view of a Lemon "Frozen Sucker" made with Textor. Observe the horizontal crystal formation which means the water-ice *will not loosen from the stick.* Note how the crystal formation in this "Frozen Sucker" radiates from the center. Result—Stability.

IN THIS enlarged view of a Cherry "Frozen Sucker," stabilized with Gelatine, the crystal formation is perpendicular—which is the reason why water-ice made with ordinary stabilizers *break away from the stick.* In this "Frozen Sucker" the reasons for its instability are clearly seen in the crystal formation.

Here's The Proof!

Scientific Reasons Why You Make Better and More Profitable "Frozen Suckers" with TEXTOR

SCIENTIFIC experiment has shown that when the popular "Frozen Suckers" are made with ordinary stabilizers, the water-ice separates easily from the stick. This is due to the fact that *the crystal formations run perpendicularly, which allows the water-ice to break away from the stick. With gelatine stabilizers this is especially true.*

But *with Gumpert's* TEXTOR, *science has shown that the crystal formations run horizontally. Thus they hold the entire mass in one homogeneous unit.*

In addition, TEXTOR eliminates the formation of coarse ice crystals—insures smooth, velvety texture.

Compare "Frozen Suckers" made with ordinary stabilizers and those made with TEXTOR.

TRIAL OFFER

We will ship you a 60-pound drum of Textor, at 70c per pound, or a barrel at 65c per pound. Use 10 pounds, and if you are not perfectly satisfied, return the rest to us. Try Textor NOW!

FIFTEEN THOUSAND SUCKERS A DAY IN ST. LOUIS TERRITORY.

(Continued from page 90)

Louis manufacturers, as well as for manufacturers in other cities. The Carpenter company late in June had not placed the suckers with the downtown stores.

The cost of producing suckers, St. Louis manufacturers agree, is around 7 and 8 cents a dozen; all were sure it is less than 10 cents a dozen.

Among the companies in that city promoting the sucker in June were:

The Arctic Ice Cream Co., Carpenter Ice Cream Co., Banner Ice Cream Co., St. Louis Ice Cream Co., Union Ice Cream Co., Purity Ice Cream Co., Kirkwood Ice Cream Co., Larmore Ice Cream Co., Arrow Ice Cream Co., Jersey Farms Dairy Co., Kramer Ice Cream Co., Liberty Ice Cream Co., Wellston Ice Cream Co., Baden Ice Cream Co., Blue Ribbon Ice Cream Co., and the Southside Ice Cream Co.

FROZEN suckers were not introduced by manufacturers of East St. Louis and Alton, Ill., just across the river from St. Louis, until June 13. On that day the Home Ice Cream Co., East St. Louis, sold about 2,500 dozen suckers. The average daily sales of that company now have settled down to about a thousand dozen suckers a day, according to Claude H. Ozier, secretary-treasurer of the firm. "It looks like good business to me," stated Mr. Ozier. "I can't see anything wrong with a proposition that enables most any manufacturer to pick up several thousand dollars worth of business a month that would not be reached otherwise. None of us can say how well the consumption of the product will hold up, but so far it has stood up well for us. If it should vanish entirely we could have no complaint.

"Our cone business has fallen off slightly, but no matter how many suckers we sell, our regular ice cream business keeps on growing."

The Highland Ice Cream Co., East St. Louis, is making an average of 300 dozen suckers a day. The manager of the Highland company would make no comment for publication. There was no evidence of any dissatisfaction with the sucker business.

THE three ice cream manufacturers of Alton, Ill., were making suckers in June. It is estimated that approximately 2,500 dozen suckers are made there every day.

The Walnut Grove Dairy Co. and the Noll Baking & Ice Cream Co. were taking care of a large part of the sucker trade in that vicinity, with a third company holding up its end of the business. Alton is largely an industrial city, and the local manufacturers believe there are possibilities of developing sucker consumption there.

* * *

The Larmore Ice Cream Co., St. Louis., has one of the best equipped and best organized frozen sucker departments of any company in the country.

The Gem City Ice Cream Co., Dayton, Ohio, was host to more than 60 employees at a dinner given in the Broadway M. E. church. The dinner was followed by a meeting at the employees' club room at the West Third St. plant. L. E. Ellis and George Antrim, proprietors of the company, delivered short addresses. Other speakers were A. Welty, superintendent; E. Warwick, sales manager; S. M. Sloman, advertising manager, and John Smith, treasurer.

Frozen Sucker Meets Soft Drink Competition

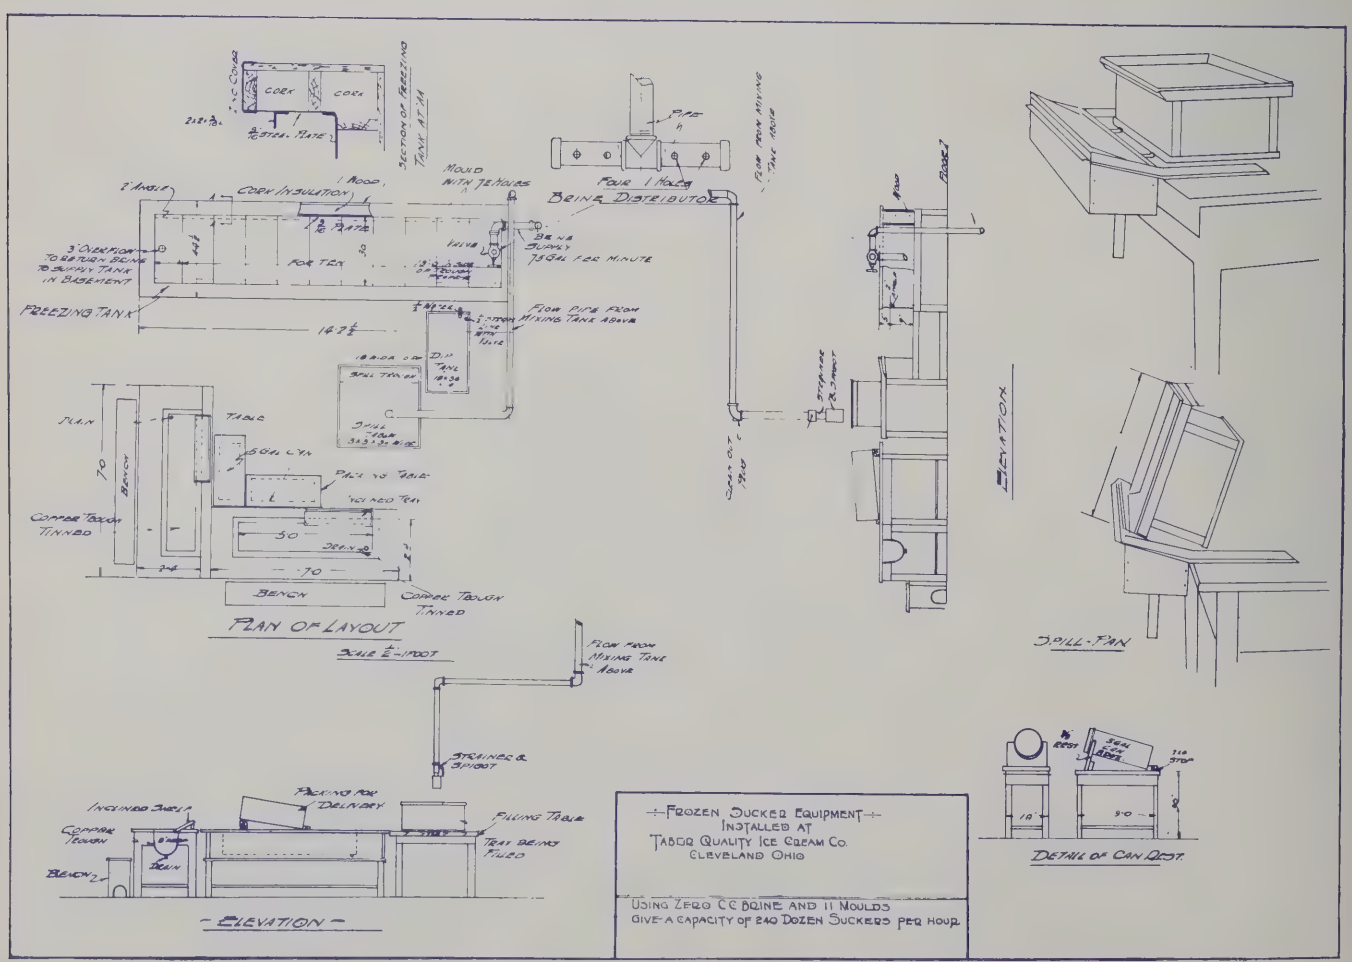
Washington, D. C., Firm Finds That Suckers Attract New Business Without Injuring Regular Ice Cream Sales

THE frozen sucker has splendid possibilities toward enabling the ice cream manufacturer to meet soft drink competition, it is shown by the experiences of the Carry Ice Cream Co., Washington, D. C., which company markets frozen suckers under the name of "Carries." Although this name is not descriptive of the goods, it helps "to tie them up to our business." Thus the frozen sucker is individualized.

As for the money-making propensities of this product, it is, "with any sort of quality production, the best money-maker we know of harmonizing with ice cream," to quote E. H. Daniel, president of the company. The only difficulties thus far encountered, according to Mr. Daniel, are those difficulties "such as will naturally arise from increased volume of business."

After manufacturing these goods for a week, the following figures of production were compiled:

Beginning May 16, 3,409 dozen "Carries" were sold. The company sold, the following day, 4,128 dozens; the next day, 2,317 dozens; the next day, 1,963 dozen; the next day, 1,880 dozens; the next day, 1,749 dozens; the next day, 1,849 dozens; the next day, 2,305 dozens; and on the ninth day, 2,277 dozens.



Mr. Daniel is of the opinion that sales will increase during the summer.

"We already notice the encouraging effect of a little hot weather," he says.

THE frozen sucker, from this firm's experience, will have no effect upon the sale of regular ice cream. Mr. Daniel declares that it "certainly does not decrease the sale of ice cream. However, our dealers report that the sale of 'Carries' materially decrease the sale of candies and soft drinks." Just the same, though, he reports that the frozen suckers are welcomed by the dealers.

His company finds it convenient to deliver frozen suckers with the regular deliveries of ice cream.

As for efforts to increase sales, the company has run newspaper ads, and has provided strips for auto drivers, and window strips. The auto strips were put on automobiles and were driven all over the city, "arousing a great deal of interest." This was all done before the sales began, however, and the company has done no advertising since that time.

The Frozen Sucker Has Been Nationalized

In Nine Months This Most Salable and Profitable of all Novelties Has Spread to Virtually All Plants in America*

ROSZELL of Peoria is a conservative firm. Roszell advertises stably. Roszell is not easily budged from the straight and narrow road leading to the safe goal in business. Yet Roszell, the end of May, introduced frozen suckers by publishing a huge introductory ad **in no less than 150 central Illinois papers.**

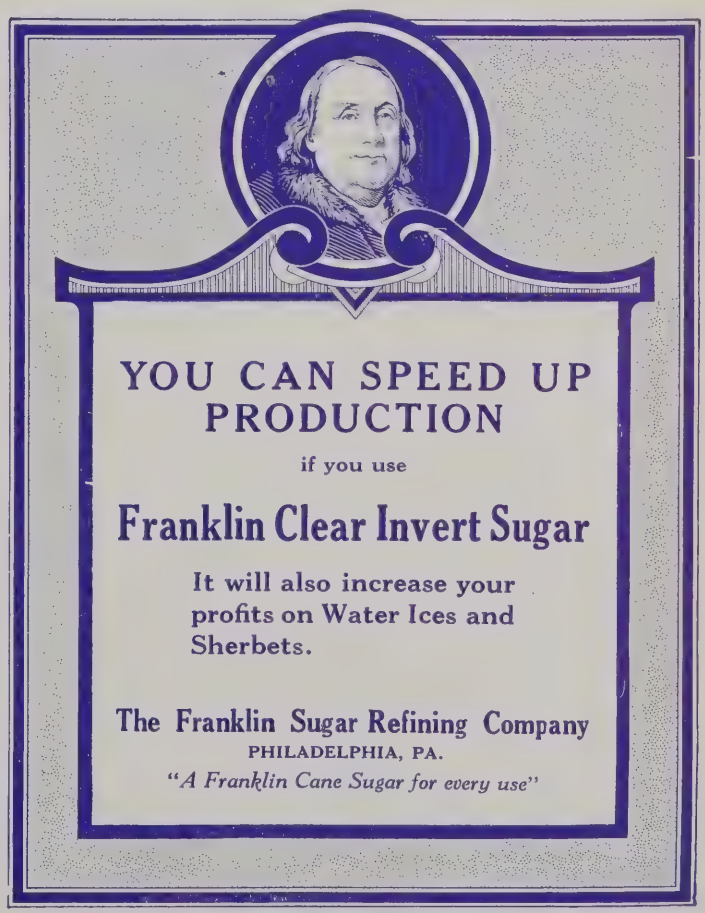
National Dairy Products Corp. has been in the throes of great organization during the past nine months. James G. Lewis, general manager, with the other executives, have had big things to consider—the biggest things so far known in the industry. Comparatively, the frozen sucker seems trivial—lowly. Yet, way back in February, Rieck-McJunkin, Pittsburgh, commenced to turn

them out—and in great volume, too, even though the weather was chilly. At present, all the numerous plants which are a part of the National Dairy Corporation—Hydrox (both Chicago and New York), Castles, Hoffman-Runk, Erie Dairy Milk Association, and the rest of them—are making frozen suckers, and advertising them, selling them, **and cashing in on them.**

French-Bauer, Cincinnati, decided to take them on in February, then decided not to in April, then decided favorably again in May, and finally made a start on Wednesday, May 13. They phoned for more supplies. The muster showed: Wednesday, sold 4,380 dozens; Thursday, sold 6,375 dozens; Friday, sold 5,738 dozens. More than 16,000 dozens those first three days, with the demand only partially supplied, and the switchboard operators almost ready for the hospital.

CARRY of Washington, piloted by a far-seer, D. H. Daniels, ran a big bunch of teaser ads in all the Washington papers for a week prior to May 16 and then blossomed out with a full page one day in May—a wonderful, compelling ad. In a moment, it seemed, frozen suckers were over in the District of Columbia. Carry delivered 4,000 dozen for the first day. Physical limitations on such a new venture prevented more.

E. W. Schlegel, president of the Cleveland Ice Cream Company, says the profits he made during the first three days entirely paid for his 22-mold brine tank and all equipment installed to make frozen suckers. In Cleveland today every plant is making frozen suckers. The equipment in the Tabor plant alone will turn out 7,500 dozen each 10 hours.



Yes, I hate novelties.

But the frozen sucker—is it different?

It is—in two very interesting respects: First, it is a natural seller; second, it permits a remarkable profit. This combination has never before been seen in the ice cream industry, and in very few other industries either.

The frozen sucker just simply sells. You don't have to educate people to buy it or want it; you don't have to wheedle them or coax them or offer them any inducement whatever. They just buy them—that's all. Day in and day out, even in cool weather, the demand and volume are ever surprising. And we can now add, year in and year out, too, for in some of the Texas plants the frozen sucker is now in its **third** season.

MANY persons have tried to analyze why the frozen sucker is such an easy, a large and a permanent seller. They argue that everyone likes lollypops, and the frozen sucker is similar; or they advance the theory

* Contributed to The Ice Cream Review.

To All Of You Who Are Making, And Who Intend To Make,

Popsicles --- Frozen Suckers

IT IS SAID:

"There never was anything made but what someone else could make it worse and sell it for less."

Just as true is the fact that the man who makes a thing "best" and sells it for a fair profit is the one who overcomes cheap competition, stays in the "game" and is recompensed therefor by operating a profitable business.

Read This Letter:

A Little Coloring, a **Lot of Acid** and **Some Flavoring** mixed into **Cheap Simple Syrup** will **Not** win the business for you against keen competition. The users of our fruit syrups will gain and keep more business than their competitors.

The **Three Biggest Selling Soft Drinks** are **Orange, Lemon** and **Grape.** You will find this also true with "frozen suckers."

Imperial Fruit Products Co.,
3725 Central Ave.,
Los Angeles. Calif.

"It may be of interest to you to know that since using your **Orange Juice Syrup** for two weeks, in the manufacture of Popsicles, we have found it to be everything you claimed for its quality, and that it makes a very satisfactory product. Before purchasing your orange syrup, we had tried several of the best known orange syrups on the market and none of them proved at all satisfactory in comparison with yours.

"Furthermore, in connection with your **Lemon Juice Syrup:** We have been making Popsicles with this syrup and have found it to be positively the best lemon juice syrup we have ever used.

"We also find that your **Italian Red** Citrus Fruit Punch with Grape Flavor has proven to be a favorite as a Popsicle, and perfectly satisfactory from a manufacturing point of view."

(Signed) CALIFORNIA POPSICLE COMPANY.

PROFIT?

When buying small quantities, a 1-ounce "sucker" will cost you less that ½c.

Samples of these wonderful syrups, as FULL OF FRUIT as they can be made, syrups that will NOT ferment in transit or storage, that are delicious beyond comparison, will cost you NOTHING.

WRITE FOR THEM!

These are the famous "**Cold Fruit**" brand of citrus fruit syrups, made by the manufacturers of the "**Eatem**" brand of fruit confections.

They Make Wonderful Sherbets.

When using our syrups, you will be making the best kind of suckers. You will be using products approved as to formula by the **United States Bureau of Chemistry,** and you will be selling the "kiddies" suckers that will not eat the lining from their little "tummies" but suckers made of frozen fruit juices (real orangeade and lemonade) that are **Delicious** and **Healthful.**

Imperial Fruit Products Company

3725 Central Avenue :: Los Angeles, California

that sucking ice is a primitive instinct; or they cite the frozen drink idea as the real reason. I do not believe the surprising salability of this novelty is capable of analysis. It sells, "just because ————" and there you almost have to stop. We can only be sure of this much —its universal salability, and enormous volume everywhere, are now proved absolutely.

And how sweet the profit! The chocolate-coated bar

Another View of Frozen Sucker Department in Roszell Ice Cream Co.'s Plant.

was a natural seller, but when made a five cent item became a serious problem to the ice cream manufacturer from a profit standpoint. No such problem with the frozen sucker. With materials costing less than seven cents a dozen, and every other cost you could think of less than fifteen cents more, there is a generous, **desirable** net.

The profit on the volume which is so quickly and easily attained by any plant is so unusual and so alluring as to be unbelievable. Yet we have seen the figures over and over again during the past few months. This is going to be a good year for a lot of ice cream firms in this old U. S. A. (Canada, too, for many Canadian plants are making 'em now.)

Ask Roszell. Ask Telling. Ask Sansing of the Gate City Ice Cream Co., Atlanta. Ask Horn of Baltimore. Ask Brown, New Orleans. Ask Brown, Chattanooga. They all know, for they have all used a lot of this strong and attractive material.

⚜

HAS THIS HAPPENED TO YOU?

"It's awful! Can't understand why that batch went wrong!" The speaker was an ice cream manufacturer unburdening his soul to a Reyam salesman.

It developed that he had been using crushed peach with good results. Then he bought a quantity of peach extract with a laudable ambition of "making it a little bit better." The result was depressing, to say the least. The flavoring extract had neutralized the natural peach flavor; the extract had taken the "kick" out of the ice cream.

Do not, under any circumstances, add extracts to crushed fruits. Strawberry extract will not blend with nor help strawberries; it will ruin their flavor. If you feel it necessary to have more flavor in your cream, use three quarts instead of two to a batch.

Occasionally we hear of a manufacturer using vanilla in addition to crushed strawberry in making strawberry ice cream. Even though the result is passable, it's wasteful; for vanilla kills the best part of the true fruit flavor. Use vanilla for vanilla ice cream and chocolate ice cream—but in no others.—The Reyam News.

How Suckers Are Not Sold

Some Manufacturers Give Excellent Ideas on How Frozen Suckers Are to be Handled—If You Don't Want to Sell 'Em

THE ICE CREAM REVIEW has made an exhaustive study of possibilities of the frozen sucker; that is, of the various products now being featured that come under this classification. There is no special wish to sponsor this product, but to give the readers of this publication an insight into possibilities through this newcomer. If the frozen sucker is not to the best interest of the ice cream manufacturer, it is nothing to the interest of this publication, but if the possibilities are all that some manufacturers believe them to be, there is every reason why the industry should be made acquainted with the facts in the case.

Different sales ideas are touched upon in this issue concerning the suckers. As a general rule the methods employed are pretty much the same; the sucker is advertised in the newspapers, the dealers are given window and poster material, the matter is explained to the dealers, and every effort is made to co-operate in getting these products over the dealer's counter. Different manufacturers, however, introduce individual ideas that help sales.

Manufacturers in some parts of the country give us some very excellent ideas on this subject; they give us a thorough understanding of how the frozen sucker should be handled and distributed—if you don't want to sell it.

There could not be a better demonstration of how not to capitalize upon a specialty than the practices that have been employed in certain parts of the country, and it is just as important to our readers that they be made acquainted with the other side of the picture.

IN THE first place some manufacturers have not been sold on the frozen suckers. They have been induced to give the idea a trial—a "thorough" trial, they term it—but they really never have been persuaded that there are any possibilities to this business. That is the spirit in which the proposition has been launched at certain points. It is very likely that they will succeed in their plan—if their plan is to keep frozen suckers from being sold in their communities, which seems to be the case.

The first step in the art of how not to sell a product is to convince yourself that you don't like the idea; to sell yourself on the thought that you are not going to gain on this proposition. The next is to make careful plans about your newspaper advertising; to be sure that you keep your product a secret—not to let the public know anything about it. It also is advisable, in following the high art of how not to sell, to take pains to see that the dealers are not given any encouragement and are not allowed to put their hands on advertising ma-

VALENTINE FROZEN SUCKER MOLDS

have been accepted by the leading Ice Cream Manufacturers of this country as the ONLY rapid, sanitary and satisfactory method of making Frozen Suckers!

When freezing, the tubes of the Valentine Frozen Sucker Mold are completely submerged. No syrup can get into and spoil the brine — nor can any brine by any possibility get into the syrup.

"You can't go wrong with Valentine Equipment"

(*Continued from preceding page*)

that genuine Valentine Molds and Spill-drains are as easy to get, cost no more and are safer to buy.

The illustrations on these pages picture the story of the equipment and method better than words. Could anything be simpler or more fool-proof? Only a few molds are required—two or three in small plants, up to thirty or forty in the very largest.

Valentine Molds are not standing still. The *basic principle* of the Valentine Method is worthy of the finest materials and workmanship known in the Ice Cream Industry, and this goal is rapidly being reached. Perfection of equipment of this kind takes time, experience and large facilities. Before another

The speed, simplicity and uniform excellence of the Valentine method is absolute. It takes less than 15 seconds to defrost the Mold and dump the Suckers on the wrapping table.

"You can't go wrong with Valentine Equipment"

season rolls around, plans already under way will bring special new materials and unusual workmanship into the construction of both Molds and Spill-drains which will insure a matching of the quality of the equipment with the excellence of the Valentine Method. Announcements of these noteworthy improvements will be made later.

At present, immediate deliveries of Valentine Molds and Spill-drains will be made on all orders. The price for Molds is $29.50 each; Spill-drains, $8.50 each; F. O. B. Chicago. Terms 2% 10 days, net 30 days. One Spill-drain will take care of from twenty to thirty Molds. Write or wire your order.

VALENTINE MACHINERY & SUPPLY CO.

552 Wrigley Building - - - CHICAGO, ILLINOIS

HOW SUCKERS ARE NOT SOLD.

(Continued from page 102)

terial which may tip off some members of the public to the secret that there are some frozen suckers behind that counter which the dealer will be duty bound reluctantly to pass over the counter and sell if the customer insists.

WE GET these impressions from different manufacturers who are doing their best to keep frozen suckers from being sold. They are good ice cream manufacturers. They make excellent ice cream—some of the best made in this country. They have built up splendid businesses in their several communities. They are loyal association workers—none better. They play fair with each other—they keep faith.

For this reason who is there to quarrel with them in their campaign to keep from selling frozen suckers.

In one part of the country the suckers were introduced on one of the coldest, wettest, dreariest days of the year, almost as dreary as some of the winter days. Each manufacturer released to a small number of his dealers—less than half—a small volume of frozen suckers. There was no newspaper advertising, no particular instructions, no particular encouragement. It was sort of —

"Here you are. You see 'em. Put 'em behind the counter. Somebody may come along and call for 'em."

As a matter of fact, a few people did "come along," but the mystery of the thing is, how in the world did they ever think to call for 'em! It sounds like free advertising for the frozen sucker when we make it clear that somebody did call for them. But, oh, well, the best laid plans o' mice and men aft gane astray, as Robert Burns partly said.

You can't always depend upon a secret being kept. Somebody was bound to find out that there were frozen suckers to be sold, and since the customer did not exactly have to use a jimmy and a black jack to get at them, the dealers sold a few dozen suckers—actually sold a few!

But these manufacturers accomplished their purpose well. They started out with the thought that they didn't like the idea and that they were not going to do much with it—and the chances are they won't.

They are good high-grade business men, too, and who is to say whether they are right or wrong in their plan?

They may be right as rain, so far as this observer can definitely say, but this discussion has nothing to do with what is right; it has nothing to do with whether frozen suckers are worth-while in the ice cream industry; it has nothing to do with whether you ought to take hold and try to promote frozen suckers.

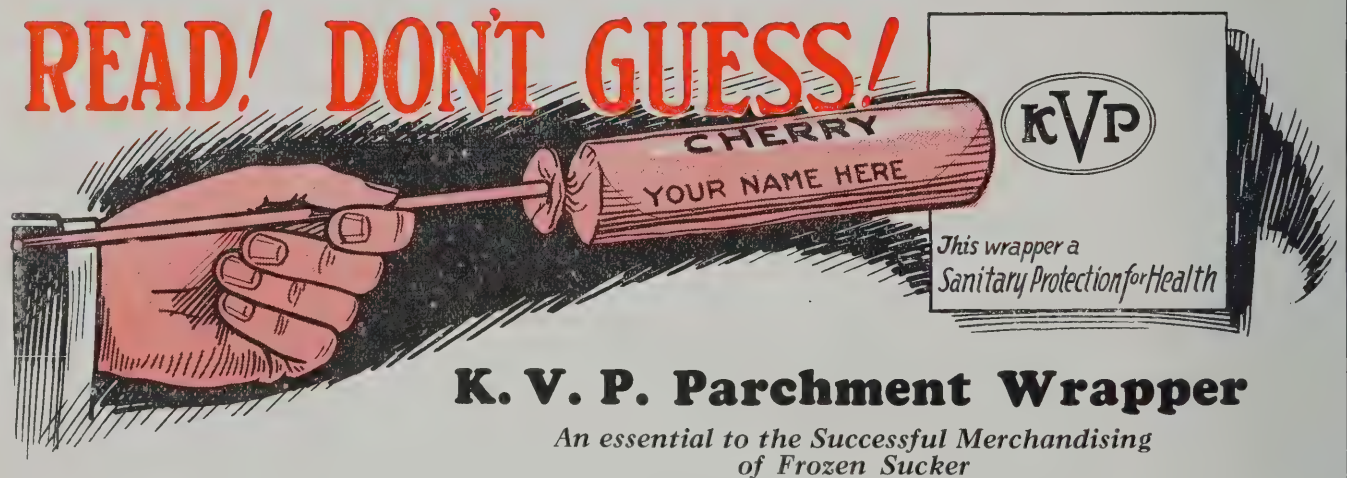
This discussion simply regards the gentle art of how not to sell.

⚜

PENNSYLVANIA SHORT COURSE DATE CHANGED.

May 28, 1925.

In sending out the announcements for the dairy supply salesmen short course of the Pennsylvania State College, the date was given as August 15 to 18. Announcement was made recently that the course will start on Monday, August 17, and continue until August 28.



Very truly yours,

W. H. MARTIN,

Associate Professor of Dairy Manufacturing.

Mansfield, Ohio

Sucker History Dates Back to 1872

Introduced in its Present Form in 1923. Sucker Has Become Popular In Mexico, Panama, South America and Australia

THE history of today's frozen sucker goes back to June, 1923. Credit for the idea goes to W. M. Thompson of the National Ice Cream Co. of Los Angeles, who called in a man to look at some glass test tubes in which a sugar and water solution was being frozen around a stick for a handle. The glass tubes were not proving exactly satisfactory and Mr. Thompson wanted to know if someone could make up some tubes out of tin that would serve the same purpose.

E. H. Radford and the Original Frozen Sucker Mold.

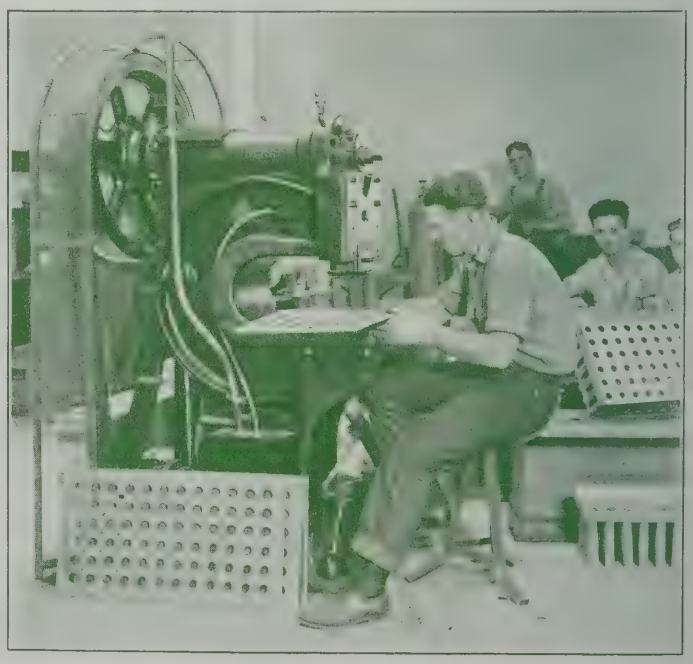
The first order for these tubes was small, but required the development of special machinery to make them, according to Leonard D. Radford, E. H. Radford Sheet Metal Works, which company undertook this assignment. "We spent about three times more money for getting up the special machinery for making the tubes than we obtained for the first order," says Mr. Radford, who describes the early mold as follows:

"At first the tubes were placed in holes bored in a large flat board; the next step was placing the tubes in a small crate built of light wood strips a great deal like the present milk bottle crate. The frozen sucker became so popular in a very short space of time that a faster method of production soon became an absolute necessity.

"The next step was the arrangement of a series of tubes in a metal frame and the development of a pan whereby the tubes could be quickly filled. From the time we made our first tin molds, we experimented with continuous changes and improvements until the first real frozen sucker mold was delivered in December, 1923. At that time we produced about 20 mold units which were placed in service by the Hughes Ice Cream Co. of Los Angeles.

"Our next step was an effort to interest the rest of the southern California ice cream manufacturers in the frozen sucker proposition but in this we were very much disappointed as we failed to interest any of them to the slightest extent. The general opinion being that frozen suckers were only a temporary novelty and would soon die out."

MEETING with such poor success locally, the company was "just about to give up any further development of the proposition." But then—



"A. B. McLendon, president of the M-B Ise Kream Co. of Dallas and Waco, Tex., one of the largest and most prominent and progressive ice cream companies in the country, came out to Los Angeles on a vacation and during his stay here visited several of the local ice cream plants. When out at the Hughes plant, Mr. McLendon saw the frozen sucker molds and the next day placed a large order for equipment for both his plants at Dallas and Waco. The order was for immediate express shipment.

"Mr. McLendon's order caused considerable excitement around the shop and succeeded in waking us up to the future possibilities of frozen suckers. The equipment had only been in the M-B plants and in use for about a week when orders and inquiries began to come from all over Texas. At that time Harry Benners of New Orleans, one of the best known ice cream supply men of the country and connected with the industry for over 25 years, saw our molds in the M-B plant and got in connection with us regarding the sales.

"We lost no time in making sales connections with Mr. Benners, with the result that, through his efforts, the frozen sucker soon became known over the entire southern section of the United States. More than to anyone else, the credit for the popularity and rapid development of the sucker proposition must go to Mr. Benners."

At first a great many ice cream men were very much skeptical regarding the sucker and its possibilities. For the first time in history suckers were served at the convention of the National Association of Ice Cream Manufacturers at New Orleans last November. Prior to the national convention, frozen suckers were shown and distributed at the convention of the Southern Association of Ice Cream Manufacturers.

During convention week in New Orleans more than 10,000 frozen suckers were distributed to the visiting delegates and their wives and families, it is estimated.

Punch Press Department

The frozen sucker, according to this source of information—

"...has opened up an entirely new field for the stick and skewer manufacturers. One hardwood stick manufacturer reports that the frozen sucker supply division of his business is now the most important department and is doing

This Sucker was wrapped in WEST CARROLLTON GENUINE VEGETABLE PARCHMENT and delivered to the ULTIMATE CONSUMER in a Clean, Sanitary and appetizing condition.

More Suckers are wrapped in WEST CARROLLTON Genuine Vegetable Parchment than all other makes or grades combined. It costs no more to get the best.

WEST CARROLLTON, OHIO

more business than the butcher and candy stick supply combined. This has also been a big opportunity for the manufacturers and dealers of parchment paper wrappers. It has been a golden opportunity to the ice cream manufacturer for progress and profits and a pleasing and delicious novelty to the public, especially the children."

THE business of making the sucker molds had an extremely modest beginning. From a remodeled barn in a back yard with three workmen to a $50,000 plant employing more than 50 skilled workmen is the story of progress told by Radford officials, who add:

Shipping Department

"One year ago, ice cream manufacturers who would not touch the frozen sucker proposition with a ten-foot pole are now sending in their orders by extra special rush telegrams. One year ago, two or three frozen sucker outfits were shipped by freight each week. Now, a large shipment of frozen sucker equipment for all points of the United States are rushed to the express office several times a day."

Although we think of the frozen sucker in its present form as a product of 1923, the actual origin of the idea goes back as far as a half century. Two men doing business as Ross & Robbins in 1872 produced a confection frozen on a stick which was then known as the hokey pokey. A great many of the old-timers will recall the hokey pokey with extreme pleasure.

In Mexico sherbet is frozen on a stick and has been sold there in that form on the streets for a good many years. However, the first knowledge of the frozen sucker as being frozen in a mold was from the National Creamery Co. in June, 1923. To the best of the knowledge of the Radford Company, this was the very first company to use the name frozen suckers.

The fame and popularity of this wonderful novelty is not confined to the United States alone, we are told as—

"At this time our export department has shipped frozen sucker outfits to England, Australia, South America, Mexico and Panama.

"The little ice cream manufacturer, located in a country cross-roads town where the trains stop only on signal and who has only one freezer, is just as enthusiastic over the frozen sucker division of his business as the large ice cream and dairy corporation of the larger cities whose production of frozen suckers is numbered by the millions."

How Long Will The Frozen Sucker Last?

Is It a Novelty or a Staple? If a Staple, What Must Be Done to Maintain Permanent Sales With Resulting Profits to the Ice Cream Industry?

By ERIC SCUDDER*

HOW long will the frozen sucker last? Just about every ice cream manufacturer in America is interested in that question at this time. Never was a "novelty" known to go over as quickly. Never was the profit on a "novelty" as excellent and desirable. A money-maker; a volume seller; a natural hit; how long will it last?

The response of the public during the days of introduction of the frozen sucker in most cities has been beyond belief.

ERIC SCUDDER

Take Cincinnati, for example: French Bros.-Bauer sold 36,000 dozen the first week.

From the Cleveland Ice Cream Co., Cleveland, O., comes this statement:

"Figuring a net profit of 25 cents per dozen gives us over $3,100 for five days."

Frank B. Tabor, president of the Tabor Ice Cream Co., Cleveland, O., published the following advertisement April 28, 1925, in the Cleveland Plain Dealer - Press and News:

"In the first three days of its introduction last week, a total of 605,712 frozen suckers were marketed from the Tabor ice cream plant."

The following enthusiastic message was sent by Carry Ice Cream Co., Washington, D. C.:

"Everybody happy! Sold over 4,000 dozen suckers first day—one Woolworth store sold 305 dozen May 16, 1925."

The Crystal Ice & Cold Storage Co., Portland, Ore., wired:

"Put suckers on market Saturday, sales to Monday night were over eleven thousand dozen, consider this phenomenal when weather conditions are considered, rained almost continually."

The same sort of weather—with the same sort of results on frozen sucker sales—was encountered by Ashley Ice Cream Co., of Charleston, S. C. They say:

"Put suckers on market Saturday (June 13th). Literally poured rain all day. Sold over two thousand dozen, biggest thing ever hit the South."

The Rieck-McJunkin Dairy Co., of Pittsburgh, Pa., released frozen suckers on March 11, 1925. They say:

"Our sales first day ran over 8,000 dozen." They have since installed equipment to produce 20,000 dozen per day.

The Gate City Dairy & Ice Cream Co., of Atlanta, Ga., installed improved freezing facilities and operate twenty-four hours daily, enabling them to produce 4,000 dozen each day, to meet the steadily increasing demand.

THE Carpenter Ice Cream Co., of St. Louis, Mo., make this statement: "We have built up business on our suckers, which is increasing every day and this in spite of the fact that practically all of the large ice cream manufacturers are making them." It is interesting to note that the Carpenter Ice Cream Co. put frozen suckers on the market May 15, and on May 16 were having a hard time explaining to their dealers why they could not make and supply enough.

The Horn Ice Cream Co. of Norfolk, Va., put out frozen suckers in Newport News, Saturday, May 9, 1925. Sales for Saturday and Sunday amounted to 3,500 dozen.

These examples are typical. There is something about the frozen sucker which causes it to make an instant hit with the public. It goes over without any forcing, and with a minimum of advertising and introductory effort. Where most new commodities take weeks, months, and even years to get over with the public, it takes only hours—or rather minutes—for the frozen sucker to obtain almost universal acceptance in a community.

Inasmuch as we have one or more customers making and advertising frozen suckers in nearly every city and town in the United States, we have been in a particularly good position to observe and study the actions and re-

COLORED FOIL

Adds the crowning quality touch

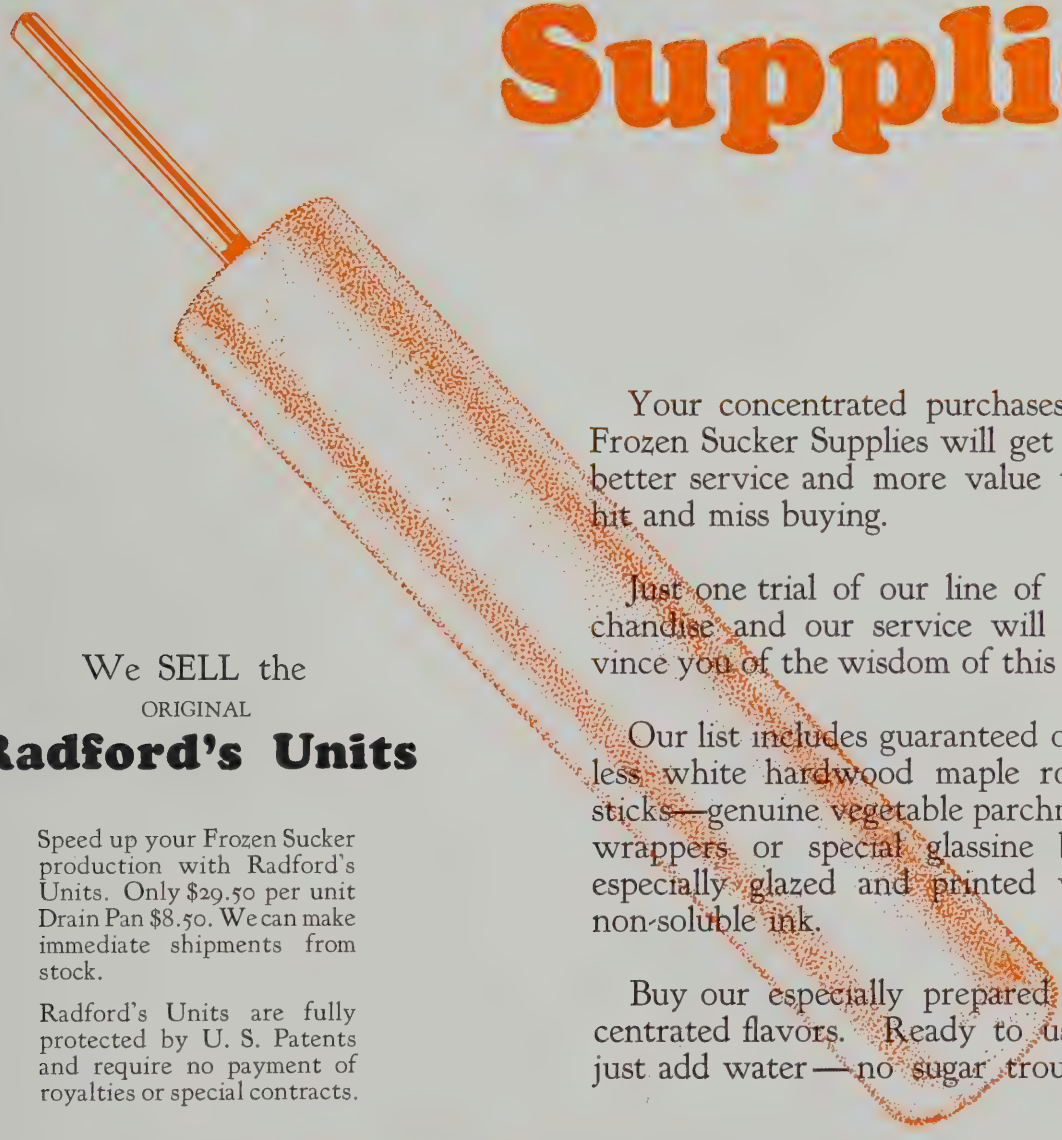
actions in the marketing and advertising of this great specialty. The facts developed during the past year point to this unmistakable conclusion: **Although the amazing novelty of the frozen sucker wears off after a few weeks, yet volume sales can be sustained week in and week out during the warm season through the consistent application of a reasonable amount of sales and advertising effort.**

This ad has been used by several different manufacturers in introducing the frozen sucker.

WHAT are the facts? Last year, the frozen sucker made its national start in certain cities in Texas and other Southern states—in cities like Waco, Dallas, Houston, New Orleans and others. Sales started off big in these cities and were later sustained to some extent by advertising. While there were some reactions on cool days, yet taking the season through, right up to the latter part of the fall, sales were uniformly excellent, usually up to the utmost capacity of production of the plants making the novelty. Hundreds of dozens per day, month in and month out, were sold in each of these towns, and before the end of the season, the frozen sucker had taken its place as a consistent, advertised staple.

In these same Southern cities, frozen suckers started off on their 1925 career many weeks ago. While there have been no startling sales sensations, neither has there been any diminution in sales as compared with 1924. The advertising has been better organized and more consistently carried out. On warm days the demand has been greater; on cool days the sales have fallen off somewhat; but the total has been surprisingly steady and gratifying, and the year's sales will undoubtedly average up much better than 1924. Because of the excellent profit, this regular demand and sale of frozen suckers will be leading factors in the annual profits of these firms.

Let us turn to the North, for other examples. Although the frozen sucker is primarily a summer item, yet many plants in the North, both large and small, started making and advertising frozen suckers during the cold days of spring. Some started as early as February and March. At first, despite the cold weather, the novelty of the frozen sucker created immense interest among young and old, and sales were unbelievably large. (The wonder is that they sold at all on such raw days.) Then, after the first curiosity had been satisfied, sales fell off to some extent, especially during the cool days of spring after the furnace fires had been put out and before the sun's warmth really amounted to anything. But when the advertising was continued, sales have come back on every reasonably warm day with astounding volume, and from one end of the country to the other the industry has breathed a deep satisfaction, **and welcomed a big bunch of new profits which have never come the way of the ice cream man before.**



WHAT does all this call to mind? The soft drink business! We may as well put this frozen sucker in its proper class right at the start of its national career, and call it a soft drink—only a soft drink attractively and appetizingly frozen into an icicle. A soft drink more refreshing, more delicious, more appealing, more cooling and more convenient than any yet known. That's what the frozen sucker is, and it simply means that the ice cream industry, almost in spite of itself, has been precipitated headlong into the soft drink business.

Not so bad, either, when it is considered that the competition of the frozen sucker is with soft drinks, and not with ice cream. A person buys and eats a frozen sucker—not when he wants ice cream—**but when he wants a drink.** That is why this great volume of frozen suckers now being turned out daily in this country is not interfering with ice cream sales, but actually increasing them because of the greater contact with the dealer resulting from the frequent delivery of frozen suckers.

Probably the average ice cream man has no conception whatever of the magnitude of the beverage industry. There are 14,000 bottlers of carbonated beverages in the United States, selling to more than 200,000 retail dealers. There are more than 100,000 soda fountains. The sale of bottled beverages alone, computed by Dr. W. W. Skinner of the U. S. bureau of chemistry, was nine billion bottles in 1924—a per capita of nearly 90 for every man, woman and child in the country. Soda fountains probably enjoyed twice this volume. One beverage alone —Coca Cola—averages six million drinks per day.

And now, all of a sudden, almost without trying, the ice cream man is getting a share of this vast volume, just because he is offering a drink in a form which everyone

likes—the form of an icicle. Nothing new, to be sure, but now universally available, universally sold and universally liked.

THE nationalizing of frozen suckers has really been the adaptation of approved soft-drink marketing methods to the ice cream industry. A great many vistas are at once open to our gaze. We can draw several accurate conclusions and make several accurate predictions. We can chart a course which will lead us just

This is a particularly attractive sucker ad.

about as safely to our goal of profits as the courses which have been so profitably and successfully laid out by the soft drink men ever since Coca Cola was a weak little infant 'way back in 1886.

The conclusions we can safely draw are: First, that the frozen sucker is and will remain principally a hot-weather item, just as soft drinks; second, that the demand for frozen suckers is going to remain universal among all classes of people (not just children) as in the case of soft drinks; third, that if the frozen sucker is to get its share of the soft drink business, it will have to be advertised and merchandised along the same splendid, constructive lines which have built the beverage business to what it now is. (Need I mention such successes as Coca Cola, Orange-Crush, Blue Bird, Cliquot and Canada Dry—all the direct result of some of the finest advertising and merchandising known in this country?)

THE predictions we can safely make are: First, that if the **quality** is maintained up to the standard of the best soft drinks, the frozen sucker can remain a permanent factor in America; second, the permanency will be in direct proportion to the consistency and intelligence with which the frozen sucker is advertised and merchandised; third, the ice cream firm that sells and advertises the quality frozen sucker most thoroughly is going to get the largest share of business and profits in each territory.

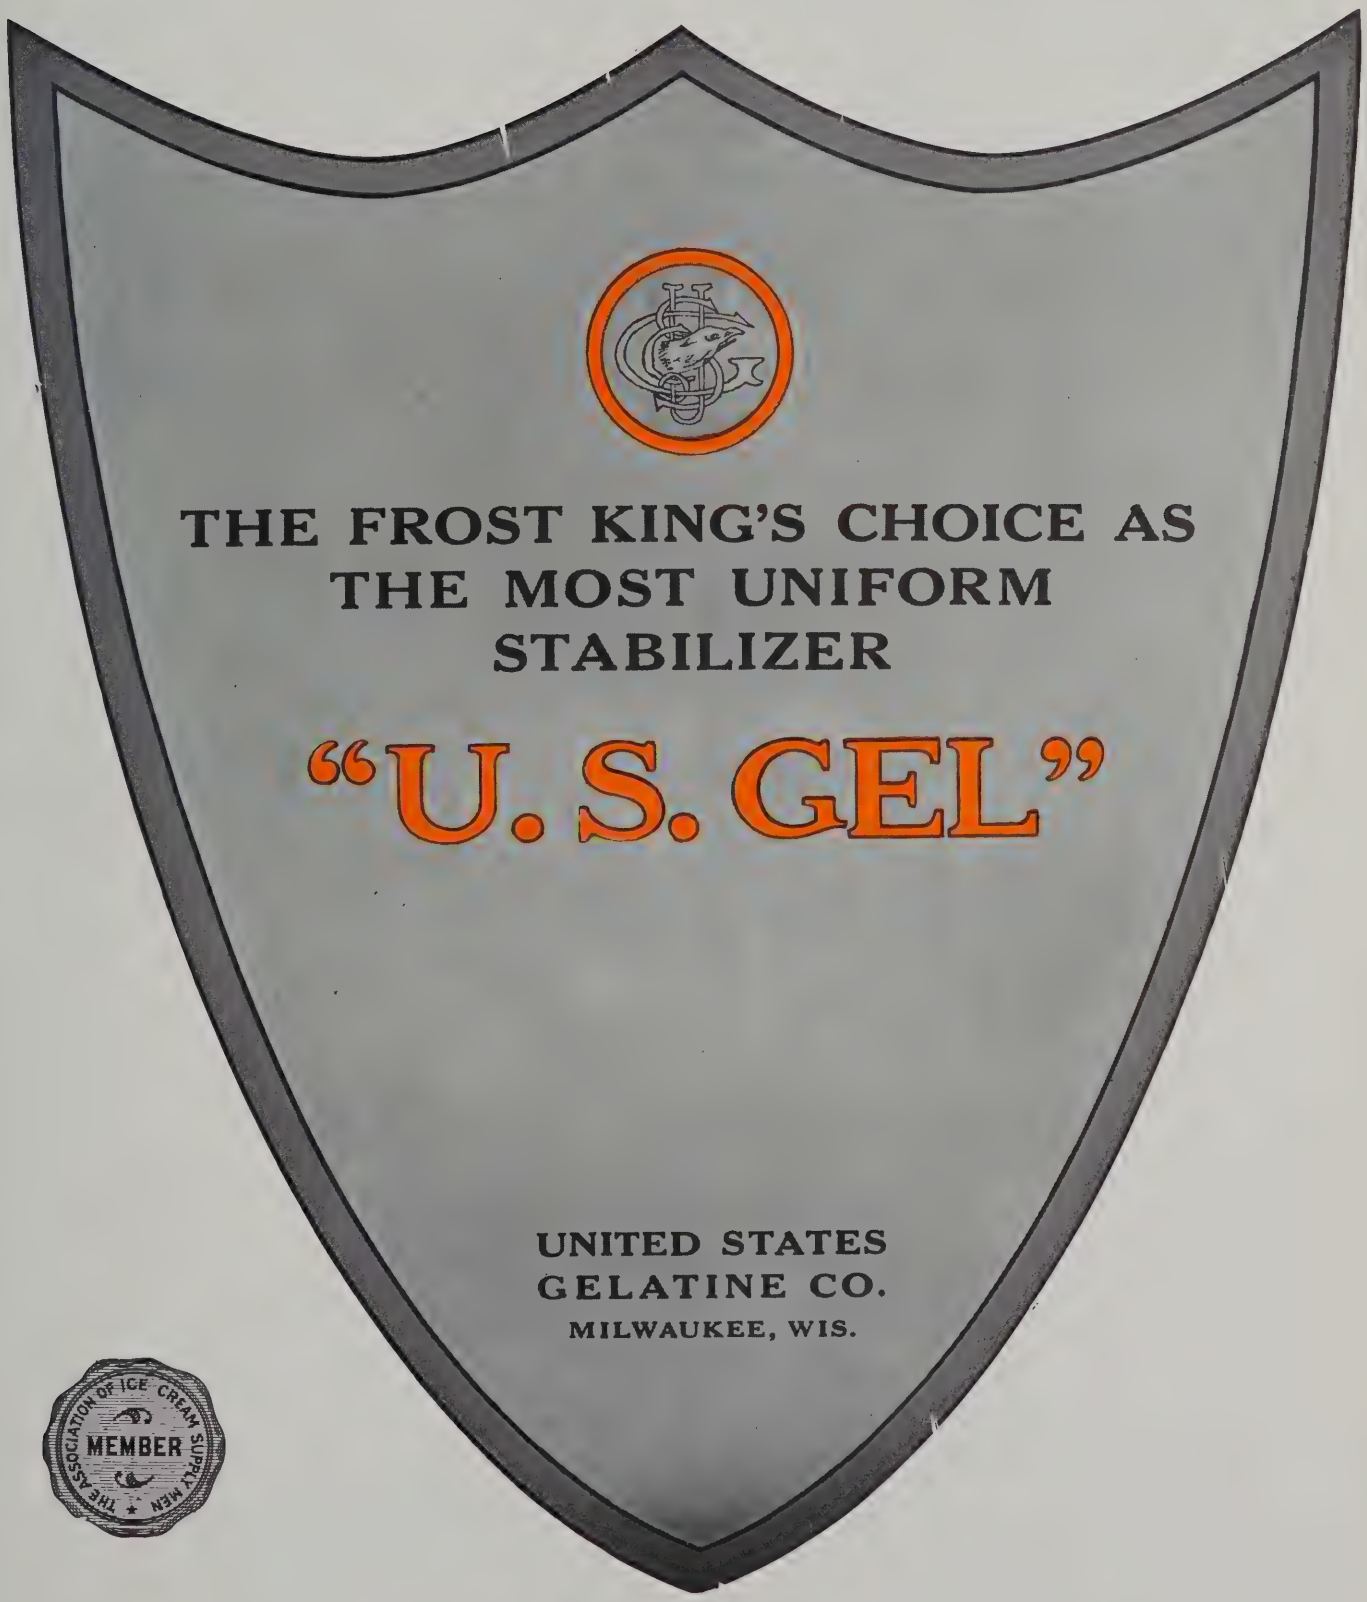
By recognizing the frozen sucker for what it is—a soft drink—we can immediately turn to a world of interesting precedents in advertising and selling—sure fire plans which have made certain beverages in this country as stable and widely used as wheat. There will be opportunity to present some of these plans in greater detail after this heavy pioneering work is over—and, if one will observe, some of these plans are in effect already.

All that can be attempted in this short article is to lay down the indispensable fundamentals in soft drink marketing without which no beverage ever has been successful, either locally or nationally. These cardinals are:

First: A good display of advertising matter inside and outside every place in which the drinks are sold. This is the absolute foundation stone of beverage advertising, especially the bottling end, which the frozen sucker much more nearly resembles than the soda fountain. Using Coca Cola as an example again, this has been the principal reason for its unparalleled success. No matter where one goes for a drink, he is met with an inviting Coca Cola sign just as the place he is ready to pass over his nickel. Other national beverages have done and are doing likewise—and frozen suckers must follow suit if they wish their share of the business on a permanent basis;

Second: A good campaign each season of general advertising, utilizing such mediums as the newspaper and the billboard. While these forms of advertising are not as indispensable as the place-of-sale advertising, yet no successful drink has gone over in this country without them. The choice today seems to be in favor of the newspaper simply because the average person, be he rich or poor, goes out of his way every day to buy and read a newspaper, and an attractive ad, run consistently, simply cannot be missed;

Third: Active, vigorous, intelligent sales effort, comparable to that put forth by the numerous successful bottlers in America. In other words, as time goes along, the frozen sucker must be sold just as hard as any other competitive "soft drink" on the market;



Fourth: Above all, quality, purity, sanitation, neatness and attractiveness as a never failing rule.

TO COME back to the question at the head of this article, "How Long Will the Frozen Sucker Last," the answer would seem to be "As long as soft drinks, provided quality and merchandising are maintained as has been done with the successful soft drinks.

All novelties wear off.

The frozen sucker is a novelty **at first** and **as such,** tends to wear off. But in place of the **novelty** comes a delicious and desirable soft drink staple in frozen form —a commodity which is bound to take its place as a distinctive feature of the great **beverage** industry—only with the ice cream men this time on the profit end.

The career of the frozen sucker to date proves the truth of the foregoing estimate. The only prerequisites are to make, sell and advertise the frozen suckers for what they are.

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS — READ THEM.

FROZEN SUCKER HAILED AS THE MISSING LINK OF THE ICE CREAM INDUSTRY.

(Continued from page 85)

make for habit-forming—that intangible quality that makes for a desire for more. Many advertising experts have pointed out that a very large number of people are not ice cream customers for the reason that they never have developed the habit, the custom, the inclination.

"Developing the ice cream habit through advertising ice cream alone—its food value, deliciousness, etc.—means many years of the most earnest and most carefully regulated sort of advertising efforts," points out one manufacturer in a southern Illinois city. "We have been coming to this matter of national advertising for some time, and it is work that surely must be done. The frozen sucker, I firmly believe, will be an important auxiliary force in winning more people to frozen products—it will be a great supplementary agent in our efforts toward exploiting our industry."

IS THE sucker profitable in every community—in every part of the country? The effort to answer this question brought forth nothing of a definite nature. It is partly answered, however, by the fact that the investigation of The Ice Cream Review did not bring to light any manufacturer who had abandoned the manufacture of suckers as an unprofitable venture.

One manufacturer in southern Illinois was frank to say that his fondest hopes were not realized. He was selling more than 500 dozen suckers a day. This volume, he admitted, made his sucker business quite profitable—"very, very good business." He had hoped, however, that the business would prove "extraordinarily profitable."

A little arithmetic shows that his net profit is something more than $200 a day. His city is less than 100,000 in population. Near him, in a city much smaller, was found a manufacturer selling approximately one-half this amount of suckers who was "tickled to death and praying for it to keep up."

This is related simply for what information it may be to manufacturers debating as to whether it is worth while to engage in the sucker business. What some of us call exceptionally good business may be regarded as "just pretty good" by others; there doesn't seem to be any standard yardstick for measuring net profits in the ice cream industry. Other manufacturers are doing considerably more business in suckers than are the manufacturers just mentioned. No manufacturer interviewed considered that he had made a mistake by making suckers.

In the upper part of the Middle West, north of Illinois and Missouri, were encountered some manufacturers who, two days after introducing the suckers, would not express any opinion as to their expectations. They did not advertise and did not give the dealer any special co-operation. They stated, however, that they had sold many more than they had expected—"several of them." They had no sales figures.

A MANUFACTURER in a large Middle Western city whose company had settled down to a business of approximately a thousand dozen suckers a day was of the opinion that it "is the greatest thing that ever struck the ice cream industry." Virtually the same statement was echoed by other manufacturers in his city.

A manufacturer in another city was sure that it "is the only nickel seller that has been worth a hill of beans

Make This Test

We know, as do many of the country's best candy and ice cream makers, how reliable and yet how economical is Atlantic Super-Clarified Gelatine. We want you to know.

Make this test. Let us send you, on memo order, a barrel of Atlantic Super-Clarified Gelatine. Note its clarity—test its high viscosity and purity—note that the price is lower than that charged for gelatines of so-called corresponding grades. Then use five or fifteen pounds in your production. Watch results closely. If it doesn't measure up to our claims for it—if it doesn't satisfy you absolutely—send the unused portion back. We will pay the freight both ways and your test will have cost you nothing.

We believe that you, too, will standardize on Atlantic Super-Clarified Gelatine after this test, as have many of the best candy and ice cream manufacturers.

to the ice cream industry, with the exception of the cone."

It is generally agreed by those in the business that the net profits in the frozen sucker are all that could be desired.

A noticeable feature in the investigation was the fact that no price troubles have arisen over the sucker.

Frozen Sucker Notes

ADVERTISING Manager Martin of the Roszell Ice Cream Co., Peoria, which firm seems to have made "a killing" on the suckers, was discussing the merit of the product when he suddenly paused for a moment and then added with a sigh:

"I'm just hoping that some darn fool doesn't come along and advertise the food value of them."

He was thinking about the fat people who won't eat ice cream.

Frozen sucker exhibit at Southern convention last December.

Charlie Stewart will begin the manufacture of frozen suckers at Decatur, Ill., July 4, together with several other manufacturers in that part of Illinois. Equipment has been purchased. The Capitol City Ice Cream Co., Springfield, Ill., has had its brine tank and equipment on hand for several weeks and, late in June, had been too busy taking care of increasing ice cream business to engage in the manufacture of suckers.

* * *

Will Schwindeler of the Carpenter Ice Cream Co., St. Louis, Mo., at all times a most conservative man, is surprisingly frank in voicing his views on frozen suckers.

"There seems to be every reason to believe they will be the greatest proposition in the way of a novelty we have ever had," he said. "The future? I can't say about that; I'm too much concerned with the present. We are doing a bigger business this year than ever before. When we are selling more ice cream than in the past, and then find a very profitable business in something that is merely a sideline, we have every reason to be happy with the present. Next year will take care of itself."

* * *

A. P. Holly, the erstwhile popular secretary of the Indiana Association of Dairy Products Manufacturers, is well entrenched in his duties at the City Dairies, St.

Louis, to which post he was drafted more than a year ago. His company has not yet engaged in the manufacture of suckers, but it has made a surprising growth in business since Mr. Holly's connection.

* * *

Charley Vahlkamp, formerly president of the Kentucky Dairy Products Manufacturers, expects to begin the manufacture of suckers at his plant at Paducah, Ky., "right away."

"I'm moving cautiously," Mr. Vahlkamp told The Ice Cream Review staff man. "I've seen novelties before and have been stung my share. But if the frozen sucker is all that other manufacturers claim for it, I owe it to my business to go into the matter. It looks good to a lot of good men, and it looks good to me."

* * *

"I didn't have anything to lose," declared Claude H. Ozier, secretary of the Home Ice Cream Co., East St. Louis, Ill. "It's no risk at all getting into the frozen sucker business, and I was sure that there was no way to get hurt even if I didn't sell anything. The very beauty of the thing is the fact that there is no heavy investment, no worrying about what results will be, and no conflicting with the regular run of business. I don't see any reason to quarrel while my business holds up to around 800 dozen suckers a day. If there is any catch to it, I haven't found it. It hits the cone business a little, no doubt, but the cone has stood up in the face of everything new that has come about in the last several years. It will stand up in the future, and in the meantime, the sucker is giving us some very nice new business." This company does a large ice cream business in its territory.

* * *

The Telling-Belle-Vernon Co., Cleveland, leads the ice cream manufacturers of the country in the number of frozen sucker molds purchased. This firm late in June had installed 243 molds. This makes it possible to freeze 1,498 dozen suckers at one time.

* * *

Canada is entering the frozen sucker business. The western part of the dominion was the first to order the most molds, but the eastern manufacturers were maklarger orders in June.

* * *

"Whatta mean something new?" queries Ben C. Brown of New Orleans. The New Orleans Ice Cream Co. has been manufacturing frozen suckers for three years. Mr. Brown, one of the pioneers in the business, served frozen suckers at the New Orleans convention last year.

* * *

The bottlers of soft drinks don't think much of the sucker. At Peoria, Ill., salesmen of bottled beverages began to tease their dealers—druggists and fountain men—about this product, declaring that others had been stung on the proposition. The Roszell Ice Cream Co. only had to refer to records to reassure their dealers as to how many dozens of suckers were being sold every day by different dealers.

But it remained for the dealers in an Ohio city to furnish the best evidence of the frozen sucker's competition with soft drinks. Dealers in that city who did not have suckers began pouring beverage goods into test tubes, placing them in ice cream cabinets to be frozen around a stick, thus making an effort to hold some of the trade they were losing to the dealers with suckers. The cost of this sort of business, however, does not indicate that it could last long.

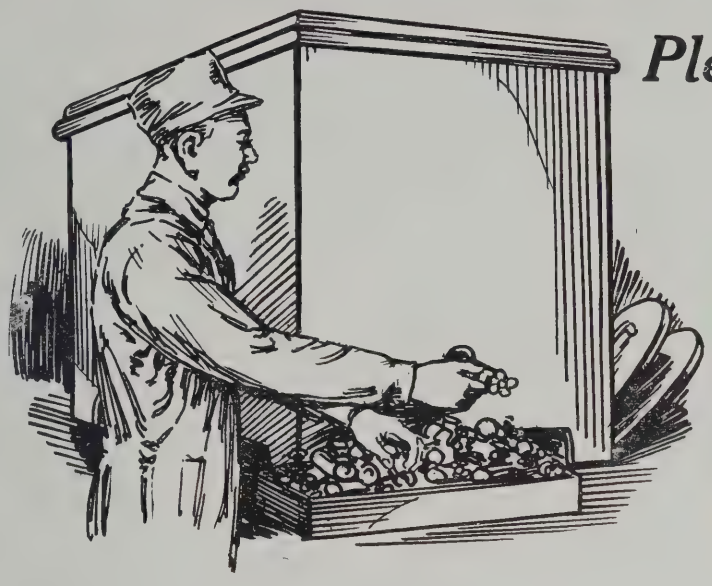
A LITTLE CHAT ABOUT STICKS.

The sticks commonly used in the making of frozen suckers are not born, neither do they grow on trees or vines and collect themselves nicely in bundles and cartons in the form they reach the frozen sucker manufacturer. John M. Allen, president of the Maine Skewer & Dowel Company, Vienna, Maine, manufacturers of skewers, dowels and confectionery sticks, recently made a few interesting remarks regarding the making of frozen sucker sticks.

"It is hard to imagine," said Mr. Allen, "what great logs we have to cut and the effort required to collect together 1,000 cords of wood, which is our average yearly consumption, and all this to make some very small sticks. Then, too, little is realized of the amount of labor involved in the process of manufacture, as the log must be cut and recut, and eventually the sticks are dried, polished, sorted and packed, going through many departments.

"The manufacturer of frozen suckers can get an idea of what a task it is to keep unruly sticks in order at some time when a carton of a thousand or more is thrown on the floor and the sticks become scattered. A great deal of time is required to replace them in the package in their proper order. Try to imagine converting large logs into such sticks, sorting them, packing them, etc."

Mr. Allen's company is at present making and selling five different sizes of sticks, each requiring a different size carton and case. Standardization of sizes required would greatly facilitate matters among the stick manufacturers and probably reduce cost. It would enable the rendering of better service. A stick three-sixteenths by six inches is recommended as being heavy enough for practically all purposes and requiring less timber to manufacture which naturally reduces the price. The cost to manufacture the smaller sticks, so far as labor, handling, packing, etc., is concerned, is practically the same.



CO-OPERATION.

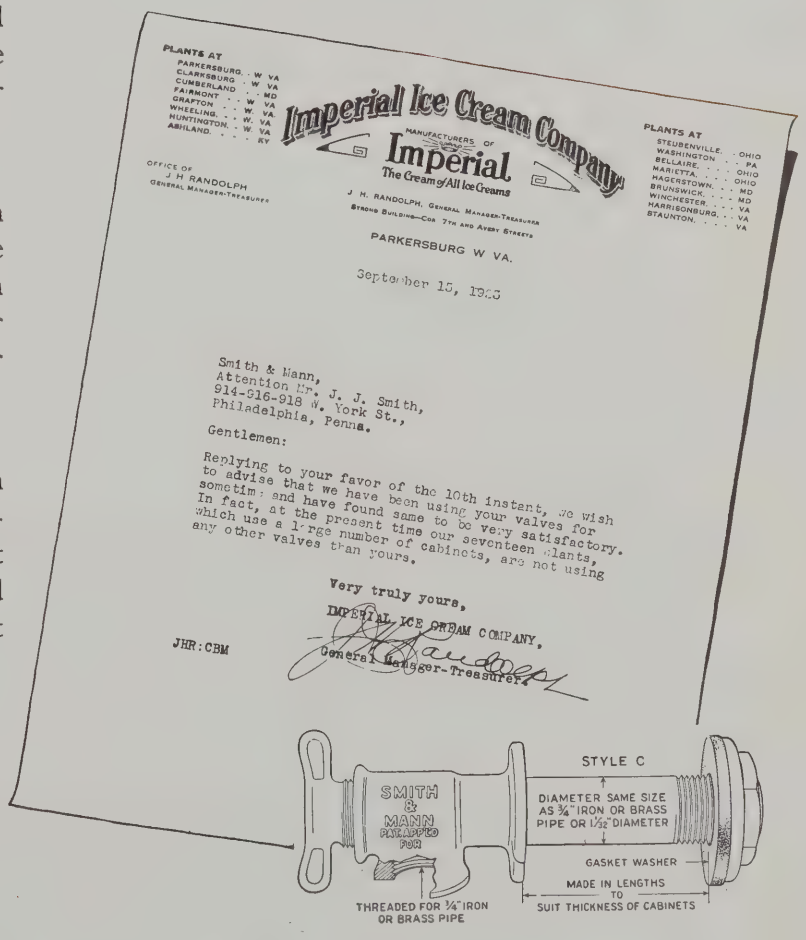
Today business organization is moving strongly toward co-operation. There are in the co-operative tendencies great hopes that we can even gain in individuality, equality of opportunity and an enlarged field for initiative and at the same time reduce many of the great wastes of over-reckless competition in production and distribution. Those who either congratulate themselves, or those who fear that co-operation is an advance towards socialism need neither rejoice nor worry.

Co-operation in its current economic sense represents the initiative of self-interest blended with a sense of service, for nobody belongs to a co-operative who is not striving to sell his products or services for more or striving to buy from others for less, or striving to make his income more secure. This phase of development of our individualism promises to become the dominant note of its twentieth century expansion. But it will thrive only insofar as it can construct leadership and a sense of service, and so long as it preserves the initiative and safeguards the individuality of its members.—Herbert Hoover.

Authorization of a vigorous campaign asking Congress to remove the special wartime excise taxes on motor vehicles was voted by the National Automobile Chamber of Commerce meeting on June 4.

Plenty of VALVE Parts Yet None Will Fit!

STANDARDIZE



on SMITH & MANN One Piece Cabinet Valves

Start Now to Eliminate this Common Trouble

The longer you keep on buying all sorts of valves the more trouble you are wishing on to your repair department.

You hesitate buying an auto from a maker out of business because parts may not be obtainable when needed most, yet finding repair parts to odd valves is just as poor policy.

While repair parts to Smith & Mann one piece valves are seldom necessary, they are standardized so that all parts are interchangeable and always carried in stock for prompt delivery.

Make The Frozen Sucker Permanent

Success of New Product Depends Upon Fairly Consistent Advertising

By E. STEVENSON*

THE future success of the frozen sucker, like all new products, depends upon the forethought given its presentation to the public.

If its sponsors are indifferent to the opinion the public will form, if they depend upon the novelty of the idea, its success will be short-lived. If, on the other hand, a vigorous effort is made to win the good opinion of the public and to emphasize its good qualities, it is bound to grow from year to year.

If presented shabbily, its reception will, of course, be shabby for the public is quick to judge new products by its advertising. Advertising agencies, whose business it is to put new products before the public, know full well the value of first impressions on the public mind. If this new confection is, as it should be, presented as a delectable ice, dainty enough for the most fastidious, its desirability is not only increased, but its market, the number of its potential buyers, is at once enlarged.

Such frozen sucker advertising as we have seen so far has merely been the announcement that it is a drink on a stick. The mere mention of the name and its repetition is not enough. Its enjoyment by people of different ages and classes should be illustrated as well as its use under different circumstances, such as picnics, parties and the like. The novelty of it must eventually wear off and unless an effort is made to sustain public interest and maintain continuous sales by suggesting new uses, it will be smothered by the continuous advertising of the ice cream maker.

Its life, therefore, depends upon its advertising. The most logical need is displays at the point of sale that will continue to advertise day in and day out, that will make an appeal not alone to novelty, but to daily usefulness. Its purity should be emphasized, its daintiness stressed, its delightful cooling and refreshing enjoyment shown in as many ways as possible.

It is true such advertising is expensive, but failure is more costly and advertising that lasts is always profitable. The same principles that have made successes of such ordinary products as beans, soups or macaroni can be applied with equal force to frozen suckers—with the added advantage that every normal child is an enthusiastic missionary salesman.

Whether it will make serious inroads into the business of the ice cream manufacturer depends entirely on how he meets this new competition, but there seems to be plenty of room for both. Being a plain ice, without nutritive value, it is a cooling agent only and does not necessarily displace ice cream which has in addition to coolness, nutrition and a social use and prestige which frozen suckers in their present shape cannot possibly displace.

The frozen sucker people have a real golden opportunity ahead of them. If snowballs—a cup of shaved ice and a spoonful of syrup, served on a torn piece of wrapping paper—can be successfully sold, who can tell what success will attend frozen suckers put out with organized effort and intelligently applied advertising?

Just now the frozen sucker is only in its swaddling clothes. Sooner or later a far-seeing individual will bring them out in all the colors of the rainbow, with scintillating moulds that rival Jell-O, with a name that will be much more euphonious and with a well equipped selling and advertising organization. And he will find a pot of gold.

Undoubtedly they will succeed, but intelligent and sustained advertising is the most important contribution to its success.

OPEN HOUSE HERE.

The Northern Creamery Co. recently held open house at its plant at 314-318 Third Ave., Great Falls, Mont. The public was invited to inspect the plant as a means of demonstrating the scope of activities carried on at the new plant, it was announced by the management. The inspection program follows the installation of $15,000 worth of new equipment, which became necessary to accommodate the business after a year and a half of operation.

Among the new equipment that that was installed is a 1,200-pound churn, a 400-gallon forewarmer, flash pasteurizer, and ripening vat, which is glass-lined and of 1,350-gallon capacity. The company also doubled its capacity for manufacturing ice cream, having put in another hardener. The new storage rooms have a capacity of 10 cars of eggs, 10 cars of butter, two cars of cheese and one car of poultry.

Suckers on the Coast—and Elsewhere

California Manufacturer Says Sucker Has Little or No Effect on Sale of Ice Cream

IT WOULD seem likely that the frozen sucker would have made more progress on the coast than in other sections, since it was in that territory that it was first introduced. In some of the large Eastern cities, however, available statistics show sales to be highest.

The Gloria Ice Cream Co., Stockton, Cal., has found that the gross margin of profit is "very good."

L. Diamond, manufacturing superintendent of that company's plant, advises The Ice Cream Review that the sucker does not interfere with his regular run of business, "aside from occupying some part of our hardening room space. He continued:

"Figuring on the basis of 100 dozens for the first week, our sales have continued to remain at this figure. We believe that the sales will increase during the summer, as each exceptionally warm day has materially increased the sales.

"The frozen sucker has little or no effect on the sale of ice cream. We believe that it materially affects the sale of soft drinks, especially when purchased by adults. Our dealers seem to welcome frozen suckers, as there is no trouble in dispensing them to the consumer.

"The frozen suckers remain in very good condition in all of our cabinets at the temperature cold enough for bulk ice cream. As to delivery of the suckers we have found no inconveniences to date.

"To increase sales we are using newspaper space and window strips."

A GENTLEMAN in St. Louis made a discovery concerning the frozen sucker that was startling:

"Want a ice cream sucker," said one of his children while he and his family were driving through the city.

"Well, that's cheaper than buying four dishes of ice cream," this man thought, and he bought the suckers. After they had been eaten and the drive had been continued for a few minutes this gentleman discovered that he had a craving for a dish of ice cream. The other members of his family, surprisingly enough, felt the same way about it, although they had only a few minutes before each eaten a frozen sucker. They stopped at a drug store and bought ice cream.

"I don't know whether there is anything to the thought that suckers actually create an ice cream appetite," this man explained to a member of The Ice Cream Review's staff, "but I certainly can say it does not cut down the ice cream appetite."

NORTH DAKOTA PLANT NEARS COMPLETION.

The new factory of the Advance Ice Cream Co. is now under construction at Fargo, N. D. The plant is being erected, at a cost of $12,000, on First Avenue and Fourteenth street.

The new plant will be 56 feet wide and 58 feet long, a one-story structure, fireproof throughout. The ice cream plant is being erected on a lot next to the bottling works, which the company purchased from the American Bottling Works last fall.

MISSOURI PLANT CHANGES HANDS.

The Barnes Ice Cream Co. of Blytheville, Mo., has taken over the Lawson ice cream factory and is now operating that plant at Caruthersville, Mo., as a hardening and storage plant. Most of the machinery from the Lawson plant has been moved to Blytheville, but the freezing and hardening rooms have been left intact.

We cannot be ostriches and hide our heads in the sand when trouble comes to us.—John Cunningham.

Three 500-gallon Pfaudler ice-cream mix tanks insulated with 3 inches of Nonpareil Corkboard plastered, canvassed and painted. National Ice Cream Company, San Francisco, Calif.

Insulation de Luxe

The picture shows how insulation can be "dressed up" when used where a sanitary, spick-and-span appearance is desired.

These mixers are insulated with three inches of Armstrong's Nonpareil Corkboard, plastered, then covered with canvas and painted white. The Nonpareil Cork Covering on the lines is also canvassed and painted.

Armstrong's Nonpareil will take this kind of finish and *keep it* because its high insulating value prevents condensation, and because it is so perfectly nonabsorbent that, when applied properly, there will be no warping, bulging or staining due to moisture or frost.

This canvas and paint finish—clean, fresh and sanitary—is especially effective in dairy and ice cream plants. It is a finish you can safely use on Armstrong's Nonpareil Corkboard and Cork Covering because the insulation under it is permanently efficient and moisture-proof.

For All Cold Storage Rooms

FROZEN SUCKER NOTES.

(Continued from page 124)

Harry Helmar and S. A. Sansing have been very busy young men at Atlanta, Ga., after beginning production of frozen suckers at the Gate City Ice Cream Co. Three shifts were necessary to supply the demand.

* * *

The French Bros.-Bauer Co., Cincinnati, takes a place high among the leaders in promoting frozen suckers. With proper advertising and encouragement for the dealers, this company for a time was selling 36,000 dozen suckers a week, a gross business of $14,400 a week.

* * *

Orange and lemon lime seem to be the most popular sucker flavors in the Middle West while the grape flavor is more in demand in the South. However, much of the orange is made in the South and much of the grape is made in the West.

* * *

The Clover Farms Ice Cream Co., Memphis, Tenn., has brought out ice cream suckers this season, many flavors and designs in block ice cream and chocolated milk products.

* * *

As in all other products of the ice cream trade the sale of frozen suckers depends upon its attractive appearance to the customer but more important than that must be its purity. Most any kind of a frozen sucker will sell once but for it to be a repeater, the quality and flavor must be kept up to the highest point at all times.

* * *

One other most important point in the production of frozen suckers is the use of the stick which serves as a handle. The highest quality of sticks should be used at all times. A pure sweet gum stick or hardwood stick is to be preferred because this type of stick is light colored and attractive in appearance and does not impart a woody flavor to the sucker.

* * *

The relation of the production cost of frozen suckers to the selling cost and the comparison of the net profit thereof is quite interesting. Unless the ice cream manufacturer is going into the frozen sucker production on a large scale, the amount of overhead charges is seldom taken into serious consideration.

* * *

In the majority of plants the employees of the cutting and wrapping department (that is in the brick and Eskimo pie and cup division of the business) have considerable time to spare and this time can easily be utilized in the wrapping of the frozen suckers.

* * *

It has been our experience that the majority of the manufacturers do not charge any overhead against the storage, delivery and selling of frozen suckers as they report that no extra sales effort is required and also that they have been successful in marketing a large number of frozen suckers without the addition of extra help or extra trucks.

* * *

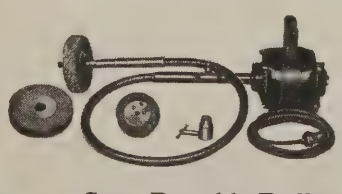
The average cost for the material for producing frozen suckers is approximately seven or eight cents a dozen while the selling price to the dealers is from 35 to 40 cents a dozen. A comparison of these figures will show the enormous profit possibilities.

⚜

PERMANENT INEXPENSIVE SIGNS.

A suggestion for inexpensive lettering or pictorial designs of frozen suckers for wagons, trucks, windows, etc., is made by S. B. Gorham, vice-president of Palm, Fechteler & Company, 67 5th Ave., New York.

Decalcomanie transfers can be used for this purpose without a great deal of expense, giving a uniformity of design which is of great importance. It is especially adapted for large ice cream companies employing a fleet of fifteen or more trucks. They will save a good deal each year by using the wagon transfers. Skilled labor is not required to apply them and there is no necessity of laying up the wagons or trucks to have the work done. Because of the brilliant colors used the designs stand out attractively and they are impervious to weather conditions and fading.



These transfers make it possible for ice cream manufacturers to use interesting advertising effects for frozen suckers or for ice cream, providing good general publicity and acquainting the public with the new product.

A similar method is used for putting identification on dealers' windows and have the like quality of being easily applied and very durable. This is one of the most effective "dealer helps."

⚜

AS REGARDS SIZES.

Sticks varying in size from five-thirty-seconds of an inch to nine-thirty-seconds of an inch, and varying in length from four and one-half to six inches are being offered by the F. W. Peterson Company, 113 Greene St., New York, at prices varying from 50c to 70c per thousand in lots of twenty-five thousand. These sticks are packed in cases of twenty-five to one hundred thousand in a case. This company is manufacturing a great variety of small wood products.

A SATISFACTORY MIX FOR THE SUCKER

THE question of a satifstory mix has been put before a number of ice cream manufacturers now making frozen suckers. As in everything else there is divergence of opinion, just as their divergence in taste, one section of the country having a highly developed taste for orange flavors, while in another vicinity the orange does not look so good, grape or lemon lime being preferred.

But the question of a mix can be brought down to a point applicable to a manufacturer in most any part of the country, and in the July issue of the Business Builder, a house organ giving considerable interesting information on the sucker, we find the following mix has been found to be quite satisfactory to a large number of ice cream manufacturers:

10 gallons water.
15 pounds granulated sugar.
6 ounces **Kist** flavor (Orange Kist, Lemon Kist, Lime Kist, Grape Kist and Cherry Kist are favorites).
10 ounces standard acid solution.
5 ounces gelatine.

This batch will make about thirty-eight dozen Kist flavored frozen suckers.

It is explained that the sugar should be dissolved at the outset in nine and one-half gallons of water, and then, to quote from the aforementioned publication—

"The gelatine is soaked in a small amount of cold water, it will swell up and soften, gradually absorbing from five to ten times its own weight of water. Then add enough hot water to dissolve, making one-half gallon of solution. The gelatine solution is now added to the sugar water. This solution will be slightly warm, allow it to cool and add the ice cream compound and, last of all, the acid.

"It is important to remember that the compound should not be added to a warm solution, also that the acid is the last item added.

"The frozen sucker should be thoroughly agitated in a mixing tank. (Do not run it through your freezer). It should be noted that the frozen sucker mix is a cold mix throughout the entire operation. After thoroughly being agitated and mixed it is ready to pour into the molds."

ATTENTION

Machinery and Equipment Concerns

I have a good position now, one which I am not anxious to give up quickly, but one which has no future.

I would like the opportunity to take charge of a branch in the eastern territory for some good ice cream machinery or equipment concern, or, I am interested in establishing my own business and handle Sales, Service and Installation on several different kinds of equipment.

I have had much experience along these lines, and have proven my ability as manager of a prominent concern selling to ice cream manufacturers. I have had considerable refrigerating and mechanical engineering education and operating experience.

I can handle an organization, or, I can get together an organization, if necessary, in a very short time, of men with a number of years of experience along these lines.

Address: R 415, The Ice Cream Review.

Filling the mold calls for pouring the flavored mix into the top pan. It instantly flows into the 72 tubes.

The size of the plant and the equipment available are to be considered regarding the method of filling. A regular milk can to pour the syrup in the mould is used by some manufacturers. With others it is preferred to use a hose connected with a tank or can suspended at a higher level. Some manufacturers use a pipe and valve connected with large 500 and 1,000-gallon tanks containing the mix.

When the tubes are full, and care should be taken to fill them slowly, the mold is grasped firmly by the sides and slowly tilted toward the operator, and then, according to the Business Builder—

"The runner on the bottom of the mold engages with the stops at the ends of the two metal strips projecting from the spill-drain.

"The operator continues to tilt the mold until it automatically comes to a rest at a fixed invariable position which allows just enough excess liquid to run out of each tube to insure the uniform length of five and one-half inches for each frozen sucker. The excess liquid runs over the ingenious, dripless, pouring edge of the top pan into the spill-drain and runs therefrom to a milk can or similar receptacle for later use without contamination or waste.

"The mold is then tilted back to its original position on the table or bench."

THERE IS SOMETHING IN THE NAME.

Various other names for frozen suckers have been suggested to clients by Barker, Duff & Morris, according to Wyn B. Morris, one of the officers of the company. He states that clients of theirs are now using such names as "Rieckies" for the Rieck-McJunkin Dairy Company of Pittsburgh, "Hoffies" for the Hoffman Ice Cream Company of Tyrone, "Hy-Bos" for the Hydrox Company of Chicago, "O'Carry's" for the Carry Ice Cream Company of Washington, D. C., and "Imps" for the Imperial Ice Cream Company of Clarksburg and their many branches.

Mr. Morris is not particularly fond of the name Frozen Suckers, although his company has recommended their clients that they begin manufacturing them at once. They believe the name has a sort of vulgar sound, but regard this prejudice as personal opinion which may not mean anything so far as sales are concerned. The frozen suckers sold under the various names seem to sell just as vigorously as they do under the name of suckers.

This company believes that the frozen sucker is a perfectly logical and natural sort of thing, a first class, well frozen ice without any ingredient that would be harmful to children and as no great amount of special machinery is required, if the demand falls off the ice cream manufacturer is not holding the bag with a supply of special equipment on hand to eat up the profits which may have been made.

Clients of this company have found the frozen suckers very easy to advertise. They have found it only necessary to put out a supply of window streamers and let Nature and the inclination of the small boy do the rest.

TIMES HAVE CHANGED.

Leave it to those St. Louis fellows to yell about St. Louis. J. Will Carpenter of the Haines-Carpenter Company and the rest of the city surrounded by the United States are claiming—but let J. Will tell about it himself:

"A Thought for the Frozen Sucker Section: P. T. Barnum once said 'There is a sucker born every minute.' Just showing how times have changed since Barnum's day, will say there are several thousand suckers made in St. Louis alone, today."

We not only satisfy our customers but we aim to furnish products of such high quality that they satisfy our customers' customers

Every ice cream plant can greatly cut down the bacteria count with the simple, inexpensive B-K flush. A few cents a day means purified equipment from storage tank to freezer cans. Sterilizes completely in places like the freezing machines that cannot stand steam.

A New Day in Ice Cream Making

Health officials are beginning to give the attention to ice cream factories that they did to milk plants a few years back. Adopt a sure plan of sanitation now. Purified equipment is assured with the B-K flush.

Write for Bulletin of Information.

General Laboratories, Dept. 11R MADISON WISCONSIN

B-K Bacili-Kil

R. J. Flick, leader in the Ice Cream Industry, says, "We start through and rinse everything throughout with a solution of B-K—piping, freezers, everything."

Dr. G. S. Bote, U. S. Public Health Service, says, "Then a solution of B-K was run through before starting to freeze. The results were a finished product with the bacterial count per cc. reduced 98½%."

At Dairy Supply Houses

Putting It Over at Peoria

Starting Off With Sales of 7,500 Dozen Suckers on First Day, Roszell Ice Cream Co. By Wide-spread Newspaper Advertising Has Held Up Sales to Around 750 Dozen Suckers a Day

IT COULDN'T be done; that was a cinch. But it just had to be done—no other way out of it. So it was done. That's what happened when the Roszell Ice Cream Co., Peoria, introduced the frozen sucker. Everything was set for the grand opening—on May 30. But along about the middle of May company officials began to turn over reasons why May 23 was the real time to get under way. But May 23 was close by. It was impossible—but had to be done. What to do?

That was the situation just a few days before May 23. Telegrams were sent out hot off the typewriter.

"Roszell suckers must sell on May 23, with introductory newspaper advertising placed in advance."

Probably that was not the exact wording of any of the telegrams, but the sense of the situation is expressed in those words.

One hundred and fifty newspapers were selected to carry introductory announcements that frozen suckers would go on sale at Peoria and other cities in Illinois. When this announcement was made to the Chicago company co-operating in getting the newspaper cuts together, that company thought there was some mistake.

"You'll never be able to use more than 15 or 20 of these plates," the Roszell people were told. "One hundred are entirely too many."

"Not one hundred plates," replied the Roszells, "but one hundred and fifty. That's our program. We're going to take it through all the way. Little speed, please."

THE speed and the plates were forthcoming. Advertising Manager Martin of the Roszell company immediately took hold of the instruction sheet from the "front office," and began inserting advertisements, and newspaper stories about suckers in all the small dailies and weeklies circulating in the company's territory.

In 150 different towns besides Peoria the frozen suckers were introduced by the Roszell company at one time—on May 23. To make the first day's sales go over strong the company made an introductory price of two suckers for a nickel. This resulted in the sale of 7,500 dozen suckers the first day.

The extraordinary feature of the undertaking was the fact that the Roszell dealers did not know what was being sent them until the hour the frozen sucker shipments actually arrived, with explanatory sales literature, window advertisements, etc. This well illustrates the confidence that the company has established for itself among its dealers.

One dealer was given eight dozen suckers. The next

Make Your FROZEN SUCKERS Hard to Compete with!!

cXc

LEMON-ORANGE LIMES

The Original Terpeneless Citrus Concentrates

These citrus flavors are unlike any others because they are made by an exclusive process which isolates, UNCHANGED, the natural, delicate fresh fruit flavors. Double the strength of ordinary flavors results in economy that matches their unique excellence.

FLAVOR—the smallest item in the making of "frozen suckers"—is the one outstanding thing from the sales point of view. Carefully read the descriptions, then try any of the flavors listed here and you will see why we say they will make your "frozen suckers" mighty hard to compete with. They are extremely economical too!

Write for prices and ask about our guarantee of satisfaction.

cXc

CHERRYTONE

Long a favorite for ices and "Specials" because it combines in a most distinctive flavor the characteristics of wild and tame cherries.

cXc

SPECIAL No. 5

A splendid flavor for "grape suckers." Like all other cXc flavors, guaranteed both for quality and economy.

delivery was 24 dozen suckers, and the third amounted to 30 dozen.

THE advertising assured the success of the undertaking. Something like five or six hundred dollars was spent in this advertising. Form letters also played an important part. Here's the way the company apprised its dealers of the coming of the suckers, surrounding the event with the greatest mystery:

The Hottest Little Frozen Specialty that ever hit your town is coming Saturday, May 23.

It's all a mystery to you, but take our word for it—IT'S GOOD! You are going to be so busy handing out these frozen novelties and raking in nickels next Saturday that you will need another set of hands and arms.

All local newspapers are going to run big ads telling the world that next Saturday between 10:00 and 12:00 o'clock

Frozen Suckers

Here it is—the Frozen Sucker—the greatest treat you ever tasted—a luscious frozen ice on a stick. Each one individually wrapped to protect it's purity—a thousand delights on a stick—pure, sweet, wholesome—refreshing. Manufactured under most sanitary conditions. Treat yourself—treat the boys and girls—five cents—that's all—everywhere.

FREE
Frozen Suckers

It's our treat Saturday. To show you how wonderfully good this new, delicious frozen dainty really is we are going to give hundreds away on Saturday. One FREE FROZEN SUCKER for every one you buy. Send all the children and come yourself. One coupon is good for the whole family. Remember—one free with every sucker purchased Saturday morning—5 cents each after Saturday noon.

Free Coupon

Bring this coupon and only FIVE CENTS to us, between 10 and 12 o'clock next Saturday morning and get TWO mouth-watering FROZEN SUCKERS for the price of one—ONLY FIVE CENTS.

E. G. HODGES

This is a portion of one of the ads placed in 150 newspapers by the Roszell Ice Cream Co.

only that two of these mysterious delights may be obtained for five cents by presenting the coupon cut from this ad—after that they're a nickel straight. Not a one is to be sold before 10:00 a. m., and believe us, you're going to have a bunch of kids (and some grown-ups) in front of your store waiting for the 10:00 o'clock bell. The coupon cut from the paper entitles the purchaser to "2 for 5 cents" during these hours only.

To avoid disappointed patrons you will, of course, sell at this price all day, beginning at 10:00 o'clock, but don't let this information out in advance.

Next Saturday, May 23, these world beating frozen specialties will be supplied to you at 20 cents per dozen so you can sell them at two for 5 cents. After Saturday they will be 40 cents per dozen net, a straight 5-cent seller.

Estimate the number of kids in your neighborhood and order at least two for every kid and then throw in some extras. If one of our salesmen cannot get to you, simply phone your order in.

You'll wish you had ordered more. The mystery will be solved when you get your order, as each can will have window pasters enclosed giving the name of this new wonder, which has far outsold any 5-cent specialty that has ever been put on the market. On the window paster which you will receive or on your window just above the paster write, "2 for 5 cents, 10:00 to 12:00 Saturday only."

Don't pass this opportunity for more free advertising and sales building publicity than you ever had on an article before.

Shoot the card right back now so ad can be released.

The small newspapers in the company's territory immediately warmed up to the subject when copies of the following letters were received:

May 18, 1925.

Gentlemen:

A display advertisement, four columns by 12½ inches, is all ready to send to you for insertion next week as soon as the J. D. Roszell Company hears from the ice cream dealer listed below.

This 50-inch display advertisement is an announcement of a brand new, record-breaking frozen confection that sells for five cents each.

TEAMWORK DOES IT.

Behind the story of the success of the Roszell Ice Cream Co. in introducing frozen suckers is a feature of the greatest importance to selling anything—suckers, ice cream or what not. It is the story of a close lockstep between manufacturer and dealer—merchandising co-operation.

It was because of the faith that Roszell dealers have in the Roszell Ice Cream Co. that this organization was enabled to take time by the forelock and introduce suckers in its territory—a week earlier than had been planned. Everything was in readiness for the new product to go to market at a certain time. Then—bingo! the time was moved up a week. It made day and night work, two shifts, a flock of telegrams, and many telephone calls—but it went over.

Roszell dealers have confidence in the Roszell company; they have that faith and good-will which come only from constructive co-operation. They put up window advertisements, road signs advertising Roszell ice cream, counter displays, etc., simply because the Roszell company wants them up.

While many manufacturers of the country are forever complaining that "our dealers are hard-headed, pay no attention to us," Roszell officials have no such complaint.

That is one of the reasons why the sucker business has gone over so well for the Roszell Ice Cream Co.

They know their dealers.

Their dealers know them.

That sort of teamwork will sell suckers or anything else merchandisable.

To introduce this with lightning-like speed, the J. D. Roszell Company wants its dealer in your city to sell these next Saturday morning, from 10 to 12, at 2 for 5 cents in place of 5 cents each. The Roszell company assumes the loss on the cut in price and pays, through us, for the 50-inch display advertisement announcing this special offer.

As soon as the Roszell company gets an order for this new specialty, from the dealer below, we will send the 50-inch advertisement to you.

The firm below is the regular Roszell company dealer and knows all about this special plan. But if they forget to send in the order you lose this 50-inch advertisement. Go see this dealer right away. As soon as the order goes into the J. D. Roszell Company we will send our order and cut to you. Please take care of this at once as the time is mighty short.

Yours very truly,
MACE ADVERTISING AGENCY.

The J. D. Roszell Company dealer is
Pepper Restaurant and Mr. Bower.

Then, after the whole thing was launched, the kiddies were taken in the company's confidence. They

The Arctic Ice Machine Co., Canton, Ohio

were told all about the deliciousness of this new product in the following circular letter:

Carload of Orange Juice used in two days at Roszell's making Delicious New Frozen Novelty.

Big time, kids! Not since our young days when we first got pink lemonade at the circus have we had quite such a thrill! It was all brought about when we casually dropped into the big Roszell plant, where there is almost always something new of newsy interest sure to be going on, and discovered a large force mighty busily engaged in making the latest thing out—a "frozen sucker."

Words can hardly describe it, but it tasted to us something like this—a luscious frozen orange ice on a stick, each one individually wrapped to protect its purity, a stick of a thousand delights, pure, sweet, wholesome and refreshing, a boon on hot days. And it was all made under scrupulously sanitary conditions, shining utensils, big white enamel tables at which a bevy of pretty girls attired in spotless white were putting parchment wrappers on the frozen suckers with nimble fingers.

Over 100,000 of these new delights are in the hands of Roszell dealers in Peoria and a hundred central Illinois communities for the big opening day, Saturday, May 23, when the Roszells are going to celebrate the occasion by making it possible for thousands of youngsters to get **two** of these big treats for only one lone nickel. After Saturday they'll be one for five cents straight, and more than worth the price.

OHIO ASSOCIATION IN NEW QUARTERS.

The headquarters of the Ohio Dairy Products Association, of which the Ohio Association of Ice Cream Manufacturers is a division, have been moved to Room 906, No. 5 East Long St., Columbus, O., it has been announced by General Secretary W. A. Wentworth.

Don't limit your exercise to jumping to conclusions.

Packing the Suckers

An excellent method of packing the frozen suckers has been described by the Horn Ice Cream Co., Baltimore. By this company the suckers are packed one dozen to the box. This carton, similar to a cake box, is made of Manilla lined, 28 pound chip board and folds. They are placed in small wooden crates, eight to the crate, being easy to handle.

This method has enabled the Horn company to do away with tying up many ice cream cans, and officials add that this also saves in the time and labor that would be required to wash the cans.

There is perfect control of the output through the carton method of packing. There also is a saving in time of delivery. Packing is made easier. It keeps the dealer's brick cabinets full and the dealer also has it made easy for him to feature sales to parties in dozen lots.

It is advisable, of course, to have the size of the carton fit the brick cans in the dealers' cabinets. The Horn company uses a carton 8½ x 3¾ x 4¼ inches. The average cost is around $8.50 a thousand.

OUR DEBT TO DOLLY MADISON.

The American ice cream business owes a big debt to Dolly Madison. She made ice cream popular and fashionable in the United States. It was introduced into the United States by a Philadelphia caterer named Bosia in 1800, but never became really popular until Mrs. Madison was mistress of the White House.

NATIONAL ADVERTISING PROGRAM SCORES BIG TRIUMPH AT WALDENWOODS.

(Continued from page 28)

of the country, with some of the leading associations pledging their support and with others holding back.

But there is no holding back at this time, according to Executive Secretary Fred E. Rasmussen, who, after taking over this post last spring, immediately threw his strength into the balance in favor of nation-wide publicity for ice cream and the industry as a whole.

This meeting, according to Mr. Rasmussen, "has assured beyond any doubt the success of the great co-operative movement."

DELEGATES to the conference, who represent the association in every part of the country, pledged themselves personally and individually to work to secure pledges of financial support from those manufacturers who have not yet joined the movement.

COMPETITION MEANS WORK TOGETHER.

Competition is good. The old adage has it: "Competition is the life of trade," and I think the proverb is sound; but did you ever think of what competition means? It is an interesting word. My high school Latin is a little rusty, but the English dictionary tells me that it comes, through the French, from two words, "com" meaning with, and "peters" (if that is the way you pronounce it) meaning to seek—the root from which we get the word "petition." Competition, therefore, in its primary sense means "to seek with each other," to work together. I compete with the men who are working with me toward the same end. There is rivalry among us, to be sure, as to which will serve the public with the best newspapers, the best ice cream or the best automobiles or what not, but we are all seeking the same big thing. How foolish, then, how inhuman, how uneconomic it is to strive to pull down the other fellow.—From remarks by U. S. Senator Arthur Capper before national association directors at Waldenwoods meeting.

The last outline of the advertising program, prior to the Waldenwoods conference, was as follows:

One-half the required gallonage has been pledged to the advertising committee of the national association.

That through the office of the secretary of the association, Fred Rasmussen, the Telegraph Bldg., Harrisburg, Pa., an aggressive campaign is being inaugurated to obtain the balance.

That the total amount being sought, one-half of which has already been obtained, as above, is the amount of one-half-cent a gallon on 40 per cent of the 1923 gallonage of the National Association of Ice Cream Manufacturers.

That it has been agreed by the executive committee of the national association that individual contributions of ice cream supply men shall be accepted, although the campaign shall not be dependent upon any definite amount of such contributions.

That no definite plan has been decided upon in connection with the advertising—whether to use The Saturday Evening Post or not—to use billboards or not—to use this or that or any other medium or not.

THERE could be no mistaking the overwhelming sentiment in favor of national advertising evinced at Waldenwoods. Men who had honestly opposed the plan were given the views of the matter in a new light by splendid speeches in which it was shown that the continued advancement of the ice cream industry hinges upon the matter of getting the story of the industry and its product to prospective consumers.

"For the good of the industry," many men put

down individual preferences and prejudices and stood shoulder-to-shoulder for united, harmonious work.

"The greatest meeting I ever attended," one director said when his baggage had been loaded up for the departure from Waldenwoods. "I have attended conventions at which good and honest men have worked hard to get concerted action on matters for the good of the industry, but for getting right down into the hearts of men and appealing to that which is big and fine and splendid, this Waldenwoods meeting has created within all of us new sensibilities of what we can do to build up our industry to the plane to which it is entitled. I am leaving here with a new idea of the meaning of co-operation, of brotherly good-will, and I am sure others feel the same way."

Expressions of others did bear out this conviction. "Truly inspirational," was the term most frequently used by officials and directors in commenting upon results of the conference.

WINNING PUBLIC CONFIDENCE.

It is no exaggeration to say to you that we do not today enjoy public confidence. Turn where you will, in any city with which I am familiar, to people in most any walk of life, and you will find the opinion that ice cream contains corn starch, and that the commercial manufacturer makes his product in the cheapest way possible. You will hear about the ice cream that was bought at night, and the unused portion had not melted down the next morning. Such a condition is a challenge to the leaders of this industry—I would like to know what you are going to do about it.

I believe, and you believe, that 100 per cent of the ice cream made by our members is wholesome and nourishing, and that we would be very glad to have our children eat it 365 days in the year. We believe in our product, while the public distrusts it, and yet, in spite of this lack of confidence, we can sell 270,000,000 gallons a year.

If we can sell 270,000,000 gallons a year when our product gets ten words of criticism to one word of praise, what, in your honest judgment, can we sell if we can sell to the public the idea that ice cream is just as wholesome as milk, that it is much more nourishing, and that it is the best possible investment in health for our children. We have all this to say regarding our product, and I have confidence that our executive committee, with the aid of the advertising committee, would be conservative in choosing avenues for educational publicity that would give us value for our money, and that would effectively change the present public opinion regarding ice cream.

From remarks by President Vernon F. Hovey, before national association directors at Waldenwoods meeting.

PUTTING aside the veneer of business crust that the average business man foolishly thinks is a regular part of his life, the gentlemen at Waldenwoods opened up their hearts and talked straight from the shoulder. Men who have stood by the varying fortunes of the ice cream industry for many years' understand better than anybody else the true meaning of the simple statement in Executive Secretary Rasmussen's announcement that "there was not a dry eye in the room" when the conference was adjourned.

"Friendly association for whole-hearted service" was the motto at Waldenwoods, where the ice cream men were the guests of J. Robert Crouse, whose hospitality was the subject of many enthusiastic testimonials. Beautiful Waldenwoods was a fitting setting for this most constructive conference, which was presided over

This truck holds 96-3 gal. cans and covers.

The Quick Way!

DURING the summer rush empty ice cream cans are handled quickly and systematically in many leading plants. The moment the motor trucks or wagons come in the empties are unloaded directly onto a

Nutting

Ice Cream Can Truck

Next they are rolled to the washer. Then the cleaned cans are again loaded right onto the Nutting Truck, ready for storing or use. And they won't fall off the truck. **Note the big capacity:** 102 2-gal.; 96 3-gal. or 78 5-gal. cans, including covers. Price, 30-in. size with rail, $52, F.O.B. Faribault or Chicago. Write for Bulletin C-6, or ask your jobber.

Nutting Truck Co.

1218 Division St., FARIBAULT, MINN.

Floor Truck Specialists Since 1891

by Vernon F. Hovey, president of the National Association of Ice Cream Manufacturers.

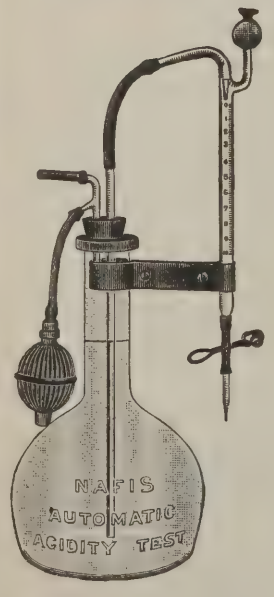
AFTER opening the meeting President Hovey made it plain that the conference was not to continue with any regular program. A striking feature was the presence of Senator Arthur W. Capper; Honorable James H. McLafferty, assistant to Secretary of Commerce Hoover, and Dr. C. W. Larson, chief of the bureau of dairying. This was the first time in history that the legislative and administrative branches of the government ever recognized the importance of the ice cream industry.

THE possibility that as many as 2,000 people will attend each of the future meetings of the association was pointed out by President Hovey. For this reason, he felt and thought the gentlemen present would agree, important lines of action cannot be placed before such a body with a reasonable expectation that a majority vote can be expected to be depended upon to represent the carefully considered judgment of the substantial interests whose support we must have if proposed activities are to be carried through successfully. President Hovey recommended making it an annual occasion for officers and directors to "get together." He said:

"I believe that supervision of protective activities such as the work in connection with standards, express rates and unfair legislation, can very properly be left to your officers," said the executive officer. "But it is my careful considered opinion that major activities, having to do with constructive work for the industry, and depending for their success upon the active support of individuals, should be presented to our board of directors before being placed before the entire membership. It is reasonable to assume that the board of directors will be made up of our largest manufacturers and leaders in the industry, and, if constructive activities such as uniform accounting and national advertising are first decided upon by that body, it is a reasonable conclusion that their support will pretty definitely insure the success of any work they endorse, and also that there will be no chance in wasting money or energy on any work which lacks their approval.

"You cannot expect the national association will ever be in a position to send a representative direct to your plants to explain or solicit your support of any activity that may need your support. Neither national advertising, nor any other activity can be put across if it becomes necessary to visit your plants, to gain your support. It is so easy to let the other fellow do the job—so easy to shift responsibility—that we allow procrastination to keep us from doing many of the real things that we ought to do.

"Gentlemen, you are the officers of this association. No activities should be attempted without your approval, but, when we have your approval, you should be the ones to sell the proposition to others. You should not procrastinate, but should assume the responsibility to the industry that is yours, and give this industry the advantage of initiative and leadership we have a right to expect from you. You have a concrete case before you, in the question of national advertising, and, gentlemen, I want you to consider this statement as a suggestion to you, that we should have definite methods of procedure in deciding upon our activities. It is accordingly my definite recommendation that our directors get together once a year to pass upon all matters of importance, and that such matters should not be placed before the general body of our convention except with the approval of the board of directors."



I think one of the greatest developments and one of the greatest goods that has come to this country in recent years has been the improvement in the milk supplies of our cities and the knowledge that those products are good and pure and the fact that they are good and pure, doctors and everyone know it. Recently a Scotchman, who is a large dairyman in his country, visited me and he said, "The most remarkable thing I have seen here is, I have been in New York and Philadelphia, and the fact that I can go to any hotel and restaurant and get good, clean milk." He says, "I can't do that in my own country, and it is remarkable." The remarkable thing is we all have faith in it and why shouldn't we have the same faith in our ice cream, a product made from pure milk products, in sanitary factories, and served in a sanitary condition to our people. There is nothing to hide but there is a lot to tell and they haven't told it. I think the greatest opportunity before this convention today is the education of our people of the food value of ice cream and the actual truth and facts as to the constituents of that product.—From remarks by Dairy Chief C. W. Larson, at Waldenwoods ice cream conference.

This, he pointed out, was another way of saying he believes the board of directors and the national association, "with such other men prominent in the industry as we might care to invite to our meetings," can insure the success of any work or movement that they may endorse. He very much doubted if the association should, in the future, attempt to function in any other way. Explaining this, he said:

"Gentlemen, this is an important question that is going to have its effect upon the future of our association, and our industry, and deserves your careful consideration. You have been good enough to come here this time at your own expense. This is an evidence of your desire to serve your industry and yourselves, and you deserve credit. If, in the future, we are to have yearly directors' meetings, it is a question if we should not ask the state associations to pay the expenses of their own directors, and that the national association should pay the expenses of the directors-at-large.

"In the remarks that I have made, you have part of the answer to our invitation to you to be at Waldenwoods. I

Ask the Men Who Use It

am very anxious to make this association an efficient association, and I am satisfied that we are not going to function efficiently, unless our activities are approved and enthusiastically supported by the members of our board of directors. I hope, very sincerely, that the precedent established by this meeting will prove to be a milestone in the history of this industry. At New Orleans, Mr. Hendler made the remark that the directors were not called upon to render any service, and you now have evidence that I feel there was some good basis for his criticism. I have confidence and faith in the ability of the men gathered here to solve the problems of the industry, and solve them right."

The value of advertising was brought out by John Knobbe, well known Chicago manufacturer, who stated that Chicago manufacturers are not waiting for the national program to take care of them, but had put on an advertising book at a cost of $30,000 backed by the board of health.

"It is put up advertising ice cream—and it isn't advertising Cunningham or Hydrox," said Mr. Knobbe. Chicago manufacturers will back the national program, the delegates were assured.

Senator Arthur Capper spoke on "The Human and Economic Value of Commercial Co-operation."

EDUCATIONAL publicity is the greatest problem before the industry, declared President Hovey in one of his addresses. When the matter was put to vote, 70 members of the gathering went on record in favor of an educational publicity campaign to be conducted through the National Association of Ice Cream Manufacturers. Fifty-six of the 70 pledged for their companies, representing approximately 116 plants. Fourteen members were unable to commit their companies, but stated they were in favor of the movement and would aid it.

Many tributes were paid to the ice cream manufacturers' gracious host, J. Robert Crouse. The sentiment of the visitors regarding Mr. Crouse is best described in the words of Executive Secretary Rasmussen, who in making a statement concerning the meeting said:

"This meeting was held at Waldenwoods, the summer home of J. Robert Crouse, by his special invitation. He met his guests at the Book-Cadillac Hotel in Detroit and transported them to Waldenwoods, which is 55 miles out of Detroit, entertained them Saturday, Sunday and Monday and returned them to Detroit. For their entertainment Mr. Crouse provided a musical program consisting of a band, the string orchestra from the Book-Cadillac Hotel at Detroit, and an unusually excelent girl violinist.

"When the Monday session was over and the guests were ready to depart they gathered around J. Robert Crouse and sang, 'For He's a Jolly Good Fellow.' The feeling of those members of our industry who were present on this great occasion were beautifully voiced by a farewell address delivered to Mr. Crouse by William Palmer of the Hoefler Ice Cream Company, Buffalo, N. Y. His final words of 'Farewell Waldenwoods' found an echo in the hearts of all those present and there was hardly a dry eye in the house."

Mr. Crouse had provided a program of sports. Many matched skill in horseshoe pitching and keen rivalry resulted. The prize in this sport was won by "Bob" Larmore of the Larmore Ice Cream Co., St. Louis, Mo. A beautiful loving cup was presented to Mr. Larmore; this loving cup was assembled in the Detroit Iron Foundry and consisted of a rusty, battered two-quart ice cream can with the standard and handles made out of a decrepit, discarded soda fountain bracket2—2all artistically and tastefully assembled with plumbers' solder. Mr. Larmore stated that he would prefer this prize to the most chaste and elegantly finished metal cup because what he did receive was more indicative of a gathering of ice cream manufacturers than any other one thing that could be presented to him. He further stated that

THE priceless ingredient of any product is the honor and integrity of its maker. If you can depend on the reliability of the House from which you buy, you can be assured of satisfaction.

Into the composition of DERYCOTE Tub and Can Enamel, The National Paint & Varnish Co., has put that dependability and reputation achieved from twenty-one years of satisfactory service, and distribution of "paints for specific purposes."

THE NATIONAL PAINT & VARNISH COMPANY

8709 Kinsman Rd. **Cleveland, O., U. S. A.**

Sanitary Ice Cream Truck

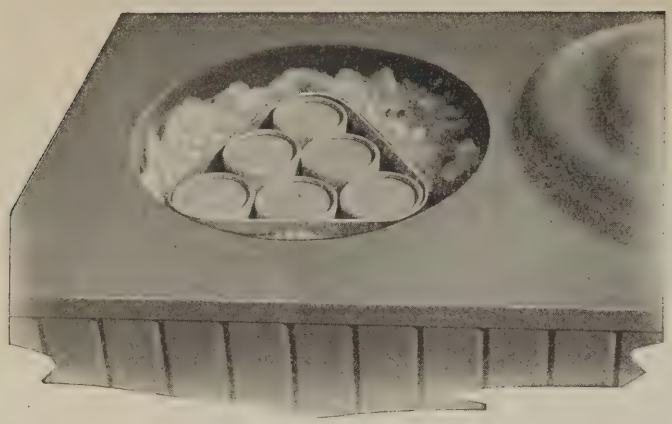
The Sanitary Ice Cream Truck facilitates handling cream from freezers to hardening room.

Will handle any size can in common usage. Avoids accidents in handling, as the operator does not touch the cans until he reaches the hardening rooms.

One man with truck will handle the cream from the freezers as fast as it will flow, no helper being necessary.

Substantially built to stand usage, nothing to get out of order. Can container revolves on a thrust roller bearing and is easily turned.

Style	Diameter	Capacity	Freezer Opening	F.O.B. Price
A	28½ in.	6 cans	30 in.	$50.00
B	23 in.	4 cans	24 in.	45.00
C	34 in.	8 cans	36 in.	62.50
D	40 in.	10 cans	42 in.	75.00



Two or three can containers, placed so that two or three freezers can discharge at one time, can be mounted on one truck, increasing capacity, making less trips to the hardening room necessary. Prices for these special trucks made on application, specifications required.

One regular size truck will be shipped, acceptance on approval.

GUARD YOUR CREAM

The most essential ingredient of your product needs an efficient watchman to guard it against any mishap on its journey through your plant.

A slip-up on the temperature as your cream goes through its paces may cause your finished product to be "off flavor" and flavor is about 90% reason why people buy YOUR product. Can you afford to jeopardize your reputation for flavor through lack of a sufficient guard over your cream?

BRISTOL'S
The most extensive line of recording instruments in the world, including — Pressure, Liquid Level, Temperature, Electricity, Motion, Speed, Humidity, etc. Ask for our catalogs.

BRISTOL RECORDING THERMOMETERS

at critical temperature points thruout your plant will make an indelible chart of the temperature variations of the cream. They will tell you any instant, a day or a month from now just what happened. They help you profit by mistakes.

The Bristol Tube guarantees accurate long range recording because outside temperatures do not affect its mechanical precision.

Let us tell you how you can use "Bristols" to greatest advantage.

CO-OPERATION MEANS ICE CREAM INDUSTRY'S SALVATION.

(Continued from page 64)

association, recognizing as they must do that their program depends upon the progress of the industry.

The state experiment stations and a few other research institutions are conducting experimental and research work on the manufacture of ice cream. Except in a very few instances the research and experimental work, as it relates to ice cream, is not very well developed. On the whole the available experimental and research data relating to the manufacture and distribution of ice cream is as yet very limited, and very much less than the available data, for instance, on the manufacture and distribution of butter and cheese. Many of these institutions have neither the men, the equipment nor the funds to enlarge upon the teaching and research work. It is probably safe to say that a great deal of the experimental work in the ice cream industry is only preliminary and its greatest value is perhaps the fact that it will lay the foundation for more fundamental work in the future.

THE national association should keep in close touch with every public institution giving instruction and doing research work relating to the ice cream industry. It should encourage and assist wherever possible. The most pressing problems of the industry should be tabulated and made known to the research workers in our public institutions and an effort made to have each problem worked out in the place where the men and facilities are available for handling that particular subject most efficiently. Many of the problems can best be worked out in some commercial plant. In such case, there is an opportunity for co-operative work with some public institution. The industry is entitled to a proportional part of the public funds appropriated for dairy development, and those in the industry should help to make the best use of such funds, which can only be done through co-operation with the manufacturers. In addition to money already appropriated by federal and state governments for experimental work, Congress at the last session passed a bill which appropriated $20,000 a year with an increase of $10,000 annually until the amount reaches $60,000 annually to each state agricultural experiment station for experimental and research work in agriculture and home economics.

The research and experimental work in the ice cream industry may, for general purposes of consideration by this association, be divided into two groups:

1. Research and experimentation, dealing with the manufacture and distribution of ice cream, including all products entering into its manufacture and problems dealing with ice cream as a food.

2. Tests of equipment and supplies used in the manufacture and distribution of ice cream, such as is carried on at the present time by the ice and salt committee of the national association, and such work as has been done by the committee of mechanically refrigerated cabinets and soda fountains of the Minnesota State Association of Ice Cream Manufacturers.

IN THE interest of the future development of the ice cream industry this association should, wherever possible, encourage and create interest in research and experimentation. Several industries, notably the canning industry and the packing industry, have established research laboratories as one of the major activities of their national association. Whether or not the ice cream industry at a later date may establish a laboratory is a question for future consideration. At the present time, however, it appears best for this association to confine

its activities to encouraging and creating research and experimentation in institutions established and maintained by federal and state aid, such as the bureau of dairying, department of agriculture, the various state agricultural experiment stations, and other institutions or organizations undertaking research work.

Through the office of the national association the following work should be conducted:

1. Survey of all literature published on experimental and research work dealing with the ice cream industry; the information gathered to be classified under appropriate divisions.
2. Obtain, as far as possible, information on all research and experimental work now under way in public and private institutions, some to be classified and listed under appropriate headings.
3. Questionnaires should be sent to ice cream manufacturers to obtain information on all problems for which they have no adequate solution.
4. The information obtained under "1," "2" and "3" should be properly tabulated to be submitted to a research committee of the association. This committee should formulate a list of important problems upon which research and experimental work is needed, and if possible make a general outline of experiments to be conducted.
5. When a list of problems, with outlines, have been prepared an effort should be made to have such problems worked out at the different experiment stations and other research institutions which would be in position to handle particular problems. Many such institutions are not in close

WHAT ABOUT IT?

National Association of Ice Cream Manufacturers
Office of Executive Secretary
Telegraph Building, Harrisburg, Pa.

Bulletion No. 9. June 8, 1925

New York Times Tells 1,208,000 People that "Eats Ice Cream, Dies"

"Child's Death and Illness of Others Brings Poison Inquiry."

"Trenton, N. J., May 28—Seven-year-old Elizabeth Meisner is dead and several other children are recovering while the city health authorities are investigating to determine whether 'hokey-pokey' ice cream being sold from push carts here is poisonous.

"The Meisner girl died within forty-eight hours after she had eaten shaved ice flavored with an extract of wintergreen, and the other boys and girls who were made ill had also eaten the product."

Three sad things about this—

1. A sweet, little child is dead.
2. 1,208,000 people get ANOTHER wrong impression.
3. We can not do anything about it.

You will note that this is not ice cream at all, but shaved ice purchased by some ignorant vendor no one knows where.

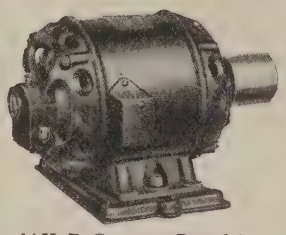
Because people do not know what our product really is; anything that is cold, whether it has food value or not, is called ice cream.

Bring this home to your own community to the people who know who have little children in whom their whole lives are wrapped up.

Can you not imagine that they will be actually afaid to give their children ice cream.

Can we, as an industry, afford to let statements such as this go unprotested?

If we do, are we realizing the obligation we owe ourselves, our industry and the country at large in allowing the public to remain ignorant of the story we have to tell?



The Public Confidence Building Program on which we are at work will make statements of this kind impossible.

Do you not think we should be at it today?

If you have not signed your pledge, do so at once and send it in.

Co-operatively yours,
NATIONAL ASS'N OF ICE CREAM MANUFACTURERS, Fred Rasmussen, Executive Sec'y.

½ H. P. Century Repulsion-StartInduction Single-Phase Motors.

Why?

Why are Century Repulsion-start Induction Single-phase Motors being supplied for the operation of the majority of all refrigerating machines being manufactured today and operated by fractional horse power motors?

BECAUSE:—Among Other Things

(1) Their reliability has been proven by more than 10 years' service operating household and commercial refrigerating machines.
(2) Uniform quietness in operation.
(3) Lubrication is assured for at least one year even if the oil wells are not filled when the installation is made. The bearings are large enough for a lifetime of service.
(4) The brushes are in service only during the period of starting.
(5) They are insulated to successfully withstand dampness of basements or humid tropical climates.

These and other outstanding Century Type RS features are fully covered in the complete series of folders on Century Repulsion-start Induction Single-phase Motors. Send for your copies now.

enough touch with the ice cream industry to know the problems whch are pressing for solution, and, under this plan, the industry itself would bring its important problems to the attention of the research workers.

6. Industrial Research Fellowship. As an expression of the interest of the national association in the training of young men in scientific work and a full appreciation of the fact that scientific work is the foundation upon which we must build the ice cream industry, this association should, at an early date, give some consideration to the establishing of one or more industrial research fellowships.

As lacking as we are in fundamental industrial research as regards our manufacturing problems, we are still further behind in the development of commercial research, as it applies to distribution. In view of the fact that the cost of distribution is far in excess of the cost of the manufacture of our products, there appear to be great opportunities for savings to the industry and to the public by a study of the details and fundamental principles underlying our distribution problems.

THE federal government, as well as every state in the Union, have some laws and regulations dealing with milk and ice cream or ingredients used in its manufacture. In addition, there are many municipal regulations for the protection of public health governing the sale of food products within the respective communities.

Last week your president and secretary appeared before the Association of Weights and Measures at their annual conference in Washington to present the viewpoint of the ice cream manufacturer on the sale of ice cream by weight. One-half day was given over to a discussion of this subject. The committee on definitions and standards of the U. S. Department of Agriculture is at present working upon the establishing of a federal standard for ice cream, and it is expected that such a standard will be promulgated before long. The Association of Dairy, Food and Drug Officials, at their annual meeting, to be held in Denver in July, will discuss regulation of the ice cream industry and the establishing of ice cream standards. Your association has been invited to present the view of the ice cream manufacturer. The International Association of Dairy and Milk Inspectors, at its last meeting, appointed a committee to draw up and recommend sanitary regulations for the ice cream industry. Such regulations, in addition to the general sanitary requirements, will undoubtedly deal with such subjects as compulsory pasteurization, temperature of pasteurization and bacterial content. The American Dairy Science Association, representing teachers and investigators of the dairy industry, also has a committee at work considering recommendations for standards for ice cream. Practically all the members of the organizations enumerated, except of the American Dairy Science Association, are public officials charged with the enforcing of laws for public protection. The public looks to

Don't Replace Your Tubs *Until* They Are Worn Out

Prevent the loss of your property by branding your tubs, cartons, packing boxes, tools, etc., with the Everhot Branding Tool. All doubt as to ownership is settled. Your name is put on to stay. The temptation to pick up and carry away your property is removed, for the Everhot Brand cannot be changed or erased.

And further, wherever your property is seen—on station platforms, in your dealers' stores, or on delivery trucks—your name will be a perpetual advertisement of your business.

The Everhot can also be used as a soldering iron or blow torch.

Write today for complete information!

The Everhot Tool can be used anywhere — any time. The fuel is ordinary gasoline. The flame will keep the brand hot for hours of continuous use. Cost of operation is very low.

Cincinnati, Ohio.

Gentlemen:-

I thought it might be interesting to you to know the results we have obtained from the "AMERICO" combination machine you installed in our plant as per order.

After thoroughly trying it out in the Pasteurization of milk, Ripening of cream for butter making, producing commercial buttermilk and useing it as a holder for fresh milk over night, I am thoroughly convinced it is entitled to the name you gave it, "The Four In One".

In all respects it has proven itself superior to any other Pasteurizer or Buttermilk machine we have ever used.

As soon as it is practical for us to do so, we will replace all our present Pasteurizers with the "AMERICO".

Yours very truly,

THE MATTHEWS SELECTED DAIRIES CO.

them for protection against fraud and for protection against the sale of food products of an unwholesome character. Theoretically, industries ought to be self-regulating but practically this is almost impossible. Fair and reasonable regulations and standards are a help to industry, rather than a hindrance. They have two advantages: (1) of establishing public confidence in the product and (2) preventing unfair competition. Any industry in which are found uneconomic and unfair practices sooner or later will meet public condemnation. Nearly all regulatory officials desire to do what is fair and right as they see it. The great difficulty is that they seldom know the problems of industries and frequently well-meaning officials appear arbitrary and unreasonable. It is far better for the ice cream industry to be in close contact with and co-operate with these organizations and furnish them with accurate facts of the industry rather than to let public officials come to their own conclusions about the industry based upon fragmentary information or misinformation obtained elsewhere.

The association can render a valuable service to the industry by working in close co-operation with regulatory officials, and furnishing facts and data for their guidance. To do this work successfully, the association must become a center at which information of the industry is constantly collected and tabulated. Federal and state legislators, as well as other public officials, are more and more coming to recognize and place confidence in the information obtained through trade associations. Speaking for a group, its influence is far greater than individuals can have.

The statistics and facts obtained through the national association should give a picture of your industry and it should not be difficult to anticipate conditions which may become subject for legislation and to make plans in advance to meet such legislation.

GREAT changes have taken place in the attitude of industries since the famous statement, "The public be damned." It is becoming increasingly evident and essential that the facts in regard to industry be understood. This is particularly true with products which are universally used, and especially food products. We believe ice cream is a health-giving valuable food which can, and should, be used freely by old and young. This we want the public to know and appreciate, so that complete confidence can be had in our products. There are three principal factors which will influence confidence in ice cream: (1) A complete understanding as to how ice cream is made, the conditions under which it is made, what it contains and its value as a food; (2) Confidence in the honesty and integrity of the people in the industry; (3) Suitable laws and regulations for the protection of the public against unscrupulous and dishonest practices.

Since beginning work with this association, the one thing above all others which has been brought constantly to my attention is the misconception people have in regard to the composition of commercial ice cream, and the suspicion with which many people look upon our product. When my connection with this association was announced a large metropolitan newspaper, in commenting upon my work, stated that I was to take "the gelatine and corn-starch out of commercial ice cream." I doubt whether a day has passed that through some article sent to our office or through conversation with some person evidence has not been brought to our attention of a lack of understanding and lack of confidence in ice cream as a food.

The following are abstracts from clippings from magazines and newspapers:

"Urges Ice Cream Selling Reform"—Capt. S. T. Griffith. Clipping from Baltimore News:

"A five-gallon can of ice cream contains a gallon of air, Captain Griffith says, and sale by the pound rather than by the quart would be more equitable, he declared."

"The Ice Cream Craze"—By Axel Emil Gibson, B. C.:

"From the standpoint of food, ice cream has no excuse in human dietary. Its nutritional value is negative, partly by its frigidity, and partly by the excess of sugar in it. Its presence in the stomach with other foods delays digestion, thus favoring decomposition; while taken alone, for the purpose of reducing fever or the distress of summer heat, its usefulness is perverted by the gelatine admixtures, starch and sugar, and cannot in any way be compared with the value of cool water, or fruit-ices."

"Certainly in Need of Improvement"—Clipping from the Brodhead Independent newspaper, Brodhead, Wis., April 29, 1925:

"There is something the matter with much of the commercial ice cream. The manufacturers of most ice cream are not anxious that knowledge of the content of ice cream be made public. It is known, however, that very little fresh milk or cream enters into the product, but that evaporated milk forms the bulk of the milk content. It is charged that gelatine is also used. * * Why not give the people of the state the same protection in ice cream that is demanded of foods and drugs? Every container of ice cream should bear a label or printed formula stating just what is used in its manufacture."

"Iced Pudding"—From "Health Talks," by William Brady, M. D. Taken from The Atlanta Constitution, Nov. 22, 1924:

"Is ice cream good for children in cold weather? Isn't there some danger of chilling the body? (Anxious Mother.)

Answer—There is no such danger. It is no worse for children in cold weather than in warm weather. The stuff so-called nowadays is not cream unless you have a very flexible imagination. It is mainly glucose, corn starch, gelatine, and maybe a dash of some powdered milk preparation. So-called ice cream is no longer a health food, in my opinion, though it is just as nutritious as substances used in making it."

A FEW days ago, in conversation with the secretary of internal affairs of the state of Pennsylvania, the following question was asked, "What do they make ice cream of nowadays? The other night we had a party and a brick was left in the kitchen on a plate during the night and it did not melt." The evidence of lack of confidence and lack of understanding of our product comes from all parts of the country and should be met by co-operative publicity telling the public the facts about the product. Individuals cannot carry on a national publicity campaign. This can only be done successfully by co-operation.

There is a need for sound publicity for the ice cream industry. I cannot see you have anything to wait for; I cannot see you can afford to let a day go before you interest yourselves in placing your product before the American people in the right light. I do not think you need any standard for your product more than you have today. It is not a question of establishing a certain standard, whether you are thinking of a standard by the federal government, or whether you are thinking about a quality standard. Educational publicity has been carried on with milk, telling the public of the food value of milk, and ice cream today is as standard a product as is milk. Who are you advertising to when you advertise nationally? To you, as a manufacturer, it is local advertising of a kind that you have been doing for many years.

From information gathered, ice cream manufacturers are spending from two to five cents a gallon in local advertising; probably some spend more. If we take only two cents per gallon as the cost of local advertising for the whole industry, it will amount to over $5,000,000 annually.

The cost of national publicity and advertising should

The Mark of Merit

High Temperatures —Rising Nozzles —High Pressure Do It

A Can Washer for both MILK and ICE CREAM CANS that really washes both cans and covers. Washes dirt, putrified casein, fat from open seams, cracks, and crevices.

JR. BORDEN
Greatest Advance in Can Washer Ever Made

Rising Spray Head shoots one hundred ninety degree water at one hundred sixty pounds pressure on and against every square inch of the surface of the can.

Cover and outside of can washed by same high pressure, high temperature water.

STERILIZED by live steam at boiler pressure—then by DRY STEAM from a RISING NOZZLE.

Two hundred fifty-five degree air from two rising ports assures positive DRYING.

A can and cover thoroughly washed, not merely rinsed on the surface, but every crack, seam and crevice dug out clean, then dried bone dry, is the only fit container for dairy products.

THE JR. BORDEN ACCOMPLISHES THESE RESULTS.

Write for detailed information and a personal interview.

Jensen Creamery Machinery Company

Builders of "Equipment of Practical Efficiency"

BLOOMFIELD, N. J. **OAKLAND, CALIF.**

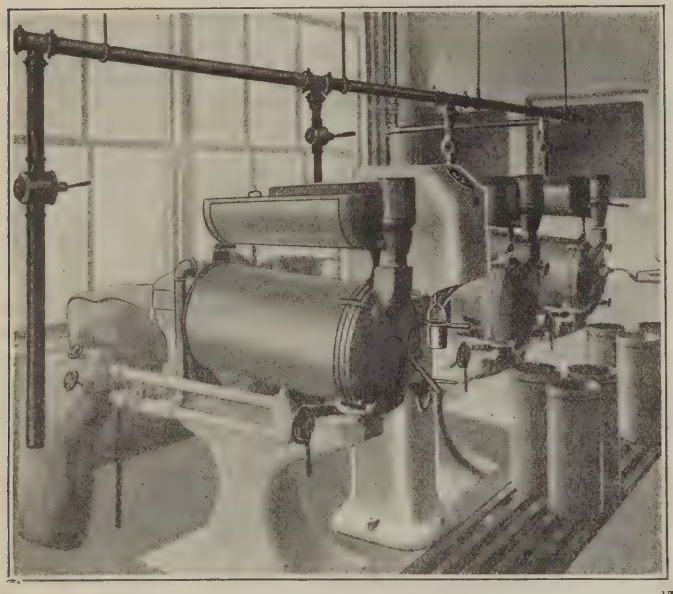
THE ICE CREAM REVIEW COVERS AMERICA LIKE THE DEW.

not be an additional expense to your business, as undoubtedly you know you can, without injury to your business, take half a cent per gallon from your advertising fund to be put into a common fund for national publicity. Remember that this fund, although spent in what we term national publicity, becomes local advertising to you, and by tying up your local advertising with the national advertising you will find your local advertising far more effective. This has been the experience in the history of all industries which advertised co-operatively.

A NATIONAL publicity campaign undoubtedly would be the best investment that this industry ever made. It is an investment for the future, not for tomorrow or next week. By national publicity you are laying the real foundation for your business, and by so doing you can bring to the American people the value of ice cream as a food and give them confidence in the people in this industry. Let it be known that you invite the public to know everything in regard to your product, to become acquainted with the composition of your product and the character of ingredients used. As an industry you ought to be proud of telling the American people about ice cream as a food.

When co-operative publicity becomes a reality there will be gathered together all the facts of interest and value about our product, and it will be a constant source of information.

The policy of this association in the past has been to send bulletins and information of our problems to the members of the association only. Most of our printed material should have a wider circulation. Our annual report contains a great deal of interest to the teachers and students in agricultural colleges, and copies should be sent to the libraries of agricultural colleges. Whenever we have information of a general character of value to ice cream manufacturers, it should be given the widest publicity to all manufacturers, whether members or not. The surest and quickest way to increase the membership of this association is to render service to the entire industry. Every effort possible should be made to improve the quality of ice cream and, if possible, reduce the cost of manufacture and distribution. There are no secrets worth while in the manufacture of ice cream that should prevent one manufacturer to openly discuss his methods or problems with another. The better quality ice cream made by everybody, the greater the consumption and the better for the industry.



The national association does not publish a trade journal and depends upon independent trade journals for a discussion and presentation of the problems of the ice cream industry. (The trade publications are the open book of the industry.) These journals are an important medium for an open and free discussion of the problems of the industry. This association is fortunate in having the most hearty co-operation of the trade journals and the free use of their columns for the promotion of its activities.

IN THE foregoing discussion, dealing primarily with our relations with other groups, there are, of course, touched upon problems which deal directly with the manufacture of ice cream. There are, however, numerous problems within the industry which are directly manufacturing, distributing or administrative problems. This association, at present, has committees at work for the establishing of a uniform cost accounting system for the study of the efficiency of ice and salt cabinets, for dealing with express and freight rates, and for the establishing of standards for ice cream. There are innumerable subjects which could be dealt with successfully through this association but a discussion of same will be left to a later date, as the association already has under way all the activities of this character which can be handled and financed at present.

One of the important problems of the ice cream manufacturer is the distribution of his products. A subject to which little attention has been given. No manufacturer can afford not to follow the manner in which his product is distributed after it leaves his factory and the satisfaction it gives to the public.

An industry like ours cannot progress if the public, year after year, receive less for their money. The surest way to progress in an industry is for the public each year to get more for their money either in increased quantity or quality of the product, or in better service, all of which tend to increase consumption and establish a permanent relation with customers. To accomplish this, the ice cream manufacturers must establish a better understanding and closer relation with the retailers.

Cerelose A Success in Ice Cream

CERELOSE is a pure white dextrose sugar made from corn. It is particularly adaptable for use in the manufacture of ice cream, blends naturally with cream and milk products, and improves the quality and healthfulness of the finished ice cream.

Cerelose is used in conjunction with granulated sugar, usually in the proportion of about 33⅓% of the total sugar content. It is added to the ice cream mix in the same manner as granulated sugar.

The points of advantage in using Cerelose are as follows:

1—Cerelose emphasizes the richness of the butter fat and the natural flavor of the cream.

2—It improves the texture and produces exceptional smoothness.

3—Cerelose is a dextrose sugar, a health product, which is directly assimilated by the blood. The use of Cerelose in ice cream adds to the healthfulness and digestive qualities of the cream and stimulates the consumption of larger quantities.

4—Cerelose is guaranteed to conform to all Federal and State Pure Food Laws and is recommended by prominent physicians especially as an article of diet for infants and invalids.

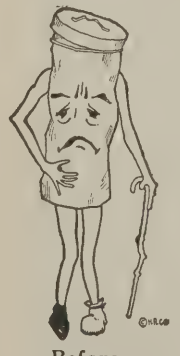
Quickly Pays for Itself.

IF THE work of the national association is to be successful and the association is to fill the place in the industry it should, it will require the financial support and co-operation of the members of the industry. Judging from the slowness with which dues are paid, it looks as if all the members have not come to realize the necessity of this association and its functions. Sometimes it appears as if the dues are paid in the same spirit as contributions are often made to charity—a sort of necessary evil. The national association is not a charitable association, it is a business organization. Every ice cream manufacturer who joins the association should look upon it as a department of his business organization. He should be interested and helpful in the work of the association the same as he is in the work of any of the individual departments of the business. He should recognize that the national association renders a service to him and to the industry which he, as an individual, cannot perform. It is an important business institution.

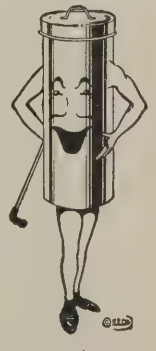
Herbert Hoover says, the trade association as a facility for the promotion and self-regulation of industry and commerce by reason of its scope and activities is an important American business institution.

To be successful, this association must be adequately financed; but it will take more than your money to make the association successful, it will require your personal interest and co-operation.



The value of this association will be in direct proportion to the degree to which you use it. From time to time you will receive questionnaires, dealing with special subjects. The more manufacturers who answer these questionnaires, the more accurately will the summary of these questionnaires express the true status of the industry. The questionnaire is not the only way in which you can furnish information to your association. Frequently problems of interest in public relation or specific problems in manufacture or distribution come to light upon which you may desire information. In such cases, write to your association office. We may not always have the answer to your question. If we cannot answer you immediately, do not think your question has been in vain, for we will search for the answer and it is only by learning what your problems are that we can make the office of your association a clearing house for the industry.

YOUR officers alone can do very little for you, but with your co-operation they can make the association a real fact center, and through them you can voice your sentiment and speak for the industry and you will progress and take your place with other industries in the proportion to which you work together. Individually, manufacturers cannot speak for the industry; this can only be done through collective actions through your association.



This is a co-operative meeting. Mr. Crouse has contributed in a material and spiritual way to this meeting in a manner which I have never seen or even dreamt of. He has given so much, and what he has given is something money cannot buy. You can't buy entrance into this place; but the whole-hearted spirit which permeates Mr. Crouse invites you here to share in everything. I think it is a wonderful tribute to Mr. Crouse and the principles in which he believes. Other people have contributed very much to this meeting. We have had Mr. MacLafferty from the department of commerce speak to us. We are going to hear from a United States Senator of great national reputation. Men you could not buy to come here, but men who will come here for nothing, because they believe in people getting together and working together; believe absolutely in the cause of co-operation. You men have added tremendously to this meeting. You have sacrificed of your time; you have stayed away from your business at a time when you know that every wheel in your plant is turning, and you have come here because you believe in the industry in which you are engaged. This is a perfect example of co-operation. Everyone who is participating has contributed a great deal. Yes, and this is the only way to real co-operation.

IN THE rural section in France was a priest who had served his community for twenty-five years. He was loved by all the parishioners, and the good people of the community decided that they would give him a surprise party to show their appreciation of his services and his help. It was essential that there should be some refreshments, and since this took place in one of the wine-growing sections, where everybody made their own wine (same as we do not in this country), and since it was a co-operative affair, each man was asked to bring a bottle of wine. It was arranged that a cask was to be placed under the big willow tree in the garden and then as each man came to the party in the evening he was asked to empty his bottle of wine in the cask. When the people had gathered, and they had had the presentation of their appreciation to the priest, and the time had come for opening the cask, the priest, in whose honor the party was given, was asked to draw the first glass of wine, and, to his great astonishment, it ran clear water. This is what happened: Each individual, thinking by himself, working by himself, said to himself: "One bottle of water in a great big cask of wine no one will ever discover."

HOO'S HOO AND HOW.

(Continued from page 30)

inheritance. His father was a skilled mechanic. But, of course, it is not as easily explained as that.

"I have always had a way of being able to draw something on paper and then seeing it stand right up, a completed building," Mr. Lewis said. "That is all I really am able to do. Because there is always the stone wall of lack of knowledge. I cannot get beyond it." He added:

"But I am not an admirer of a Jack-of-all-trades. A man has to be able to do one thing well, and then as many other things as he can manage easily. After the war, a great many men came to me and thought that they could do a good deal more than they were really capable of. I told them to go home and look into the looking glass, and then, if they wanted, to come back. Not so many came back.

"I think that the success of the Horton company is largely dependent on the kind of men it has always employed. We want men who can advance in the business into positions of responsibility. We always give first choice to our men, and very rarely do we find it necessary to take an outsider when a high position becomes vacant. Our drivers are graduated helpers; and usually our office staff is composed of men and women who have been advanced from factory positions. We require that our men who are to supervise others should take a three months' course in the factory. That is the only way to learn what they are about. They could never be successful otherwise."

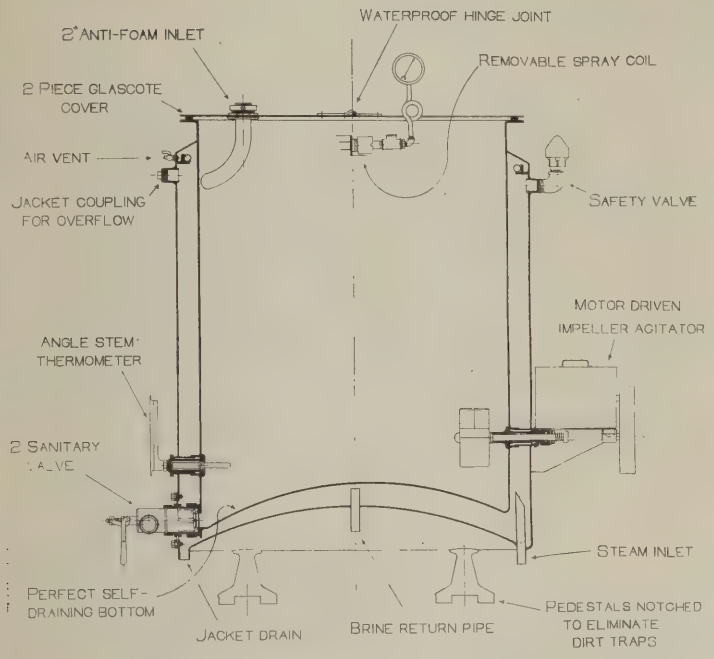
And that led to the subject of success. Mr. Lewis does not treat success lightly, and he has not the same definition for it that hundreds of other people have.

"I suppose if a man achieves a prominent position in a walk of life he can claim that he is successful," he said slowly. "But that is only success in a narrow way. A man must obtain the love and respect of his fellow men. If a man is honest with himself, he cannot be untrue to anyone.

"And there is no judge nor jury necessary to tell what is just and right. If you treat other people fair and square, with very few exceptions they will treat you the same way." He went on:

"For the last fifteen years, the manufacturers of this city have worked in better harmony than in any other city that I know of. I believe that this is so because they are making use of the theory that the Horton company has been trying to work on for many years: 'Live, and Let Live.' One company cannot do all the business in any city, even though it is a small one. They should only expect to do their rightful amount.

"While we have used this policy we have often had to eat crow. Sometimes we have had to eat so much of it that I have become fond of the old bird," Mr. Lewis smiled. "But things have been going very well recently.



"We always try to meet competition fairly. Our salesmen have orders that if they go into a store and find the retailer satisfied with the ice cream he is carrying, that they should turn square around and walk right out. But we are pretty hard workers when it comes to getting a new order. We do not like to see anyone getting ahead of us on those.

"I was very much pleased a short time ago. One of my competitors who gave me a good deal of trouble a few years back told a friend that there were 'no dirty trails behind the Horton company.' I think that the most important thing for a business man is to be able to look every other fellow square in the eye."

While he spoke, Mr. Lewis paced slowly up and down his office. He drove each one of his points home by pointing his finger directly at me. Mr. Lewis is more keenly interested in his work, and in the things that make for success, than any man to whom I have spoken for some time. This matter of success is no light affair to him. He won it by hard work: but by enjoyable work. Several times he was interrupted by telephone calls. One of them was a woman calling up to ask for a donation of ice cream for a church fair. Mr. Lewis told her crisply that the company would donate a quarter of what she bought.

WRIGHT-ZIEGLER CO.

BOSTON, MASS.

ONE of the newest policies of the Horton company is to wage an aggressive advertising campaign. The first advertisements of the company were printed three years ago, and the business had already been built up to an $8,000,000 a year proposition. Billboards, direct mail, theatre programs, and street cars are used to tell people about the quality of the Horton ice cream.

"We are going to spend $350,000 on advertising this year," Mr. Lewis said. "Every year, so far, our advertising budget has been increased. We find that we get wonderful results."

When plants have to be erected, Mr. Lewis is at the head of the work. And when advertisements have to be written, Mr. Lewis is at the head of that, too. He has planned every one of his advertising campaigns himself. Recently he prepared an exceptionally attractive direct mail series. This is one of them:

DO YOU REMEMBER THE FABLE OF THE TWO FRIENDS AND THE BEAR?

How they were traveling together through a wood when a bear rushed out upon them? One of the friends, who saw the bear first, quickly pulled himself up into a tree. The other, having no time to follow suit, threw himself on the ground and held his breath. The bear, after sniffing him over, shambled off, for bears do not touch dead meat. The man in the tree came down and laughing, asked, "What did Master Bruin whisper to you?" "He told me," said the other, "'NEVER TRUST A FRIEND WHO DESERTS YOU IN A PINCH'."

Confidence in HORTON'S IS NEVER MISPLACED. In times of stress and in every day need its policy never varies.

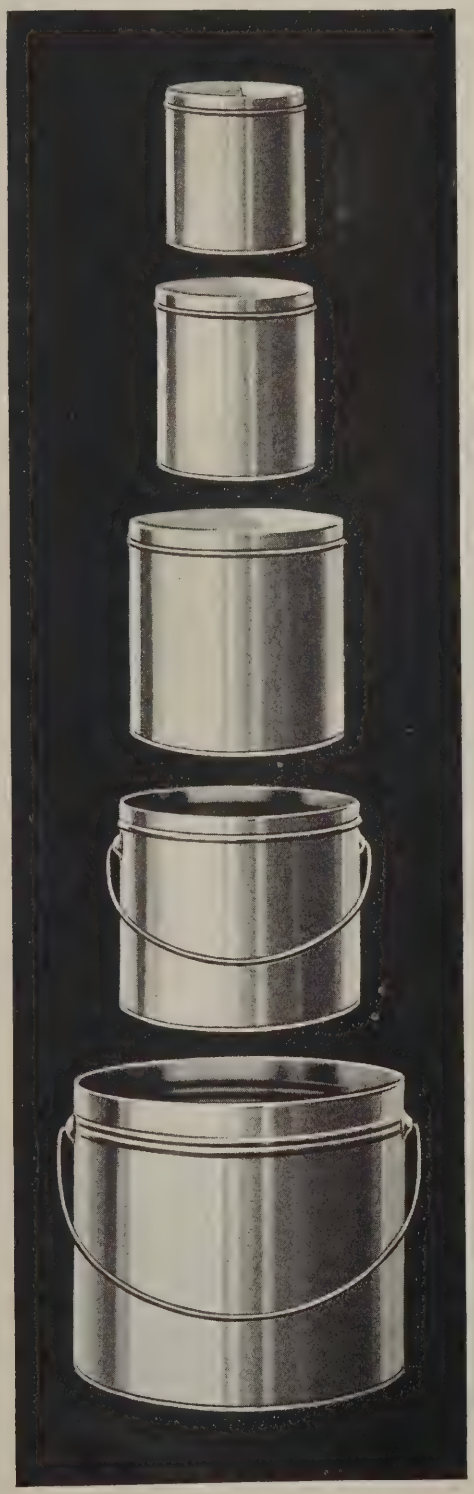
And then follows a description of the reliability of the service, the reputation, and the other benefits that the dealer gets. There are several folders in this series, and each one of them treats of a different problem. Mr. Lewis never had any other experience in writing advertising copy, but he had been able to take care of the needs of the Horton company.

"We are very proud of everything we have achieved," he admits.

He has good right to be. The company was founded in 1851, but it was not incorporated until 1873. Mr. Lewis remembers well the times when Mr. Horton used to go to the small park opposite the plant at 22nd St. and get a few men to turn the hand wheels. Now the company boasts a perfect system in its seven plants. It has 400 horses, and 150 automobile trucks. The Horton company supplies millions of people in New York and its suburbs and also many of the ships that sail to Europe and to the East Indies.

⚜

IVES COMPANY EXPANDING — FORTY-FIFTH ANNIVERSARY OBSERVED.



The Ives Ice Cream Co., Minneapolis, has purchased two lots and two buildings on Fourth St. N., St. Cloud, Minn. The buildings are of re-inforced concrete construction and will be remodeled and used for a branch distributing plant, according to Clifford A. Ives, vice-president and general manager of the company.

Frank H. Armstrong, city sales manager at Minneapolis, will be manager of the St. Cloud branch, Mr. Ives announced. A sales force will be organized and truck distributing service will be established for the city and surrounding territory.

The Ives Ice Cream Co., which is one of the oldest business concerns in Minneapolis, celebrated its 45th birthday by opening a handsome new plant at Second Ave. and University, S. E., Minneapolis. A. H. Ives, the owner, started in business with two men and a boy, in a small frame building. Now the plant occupies a city block. The payroll during the summer months includes 150 people.

Manufacturers, Individually, Can Help Advertise Ice Cream Nationally

President of Michigan Association Shows How to Attract Wide-Spread Public Attention to National Slogan by Displaying Slogan Design on Rear of Automobile

IN CONNECTION with advertising possibilities on a national scale, a thought now uppermost in the minds of ice cream manufacturers, it is interesting to take note of the many opportunities to exploit the industry's trade slogan and design. Ice cream manufacturers of different parts of the country have followed unique plans in putting the ice cream slogan before the public. Southern association officials use it on their letterheads, and manufacturers in various vicinities use it individually on their business letterheads.

A well-known supplyman last year put the slogan on a large piece of canvas that fitted within the rim of the spare tire on his automobile, driving from Pennsylvania to the dairy exposition at Milwaukee with the words "Serve it—and you please all" staring all onlookers squarely in the face as they gazed at the car en route.

L. S. Wilson, president of the Michigan Association of Ice Cream Manufacturers and head of the Wilson Ice Cream Co., Port Huron, Mich., draws much attention to ice cream by using a similar design on the spare tire at the back of his auto.

L. S. Wilson, president of Michigan Association, and his "traveling ad" for the national ice cream slogan.

"JUST think how many people could have their attention drawn to ice cream if even a reasonably good number of ice cream men were to adopt this or similar methods to remind them of the product," suggested Mr. Wilson at the Waldenwoods conference, where his industry-advertising car was noted with much interest by other directors and officials of the national association.

Ice cream has been advertised in the air and on the ground, but for steady, consistent advertising of a nature sure to attract attention, this plan seems to hold much merit. Everywhere the car goes the ice cream ad goes.

PEOPLE familiar with the power of suggestion will understand the wholesome impression this spare-tire ad gives. The average person buys that which is suggested to him, which he sees in actual form or which is represented to him by design.

A man sometimes never realizes what an appetite he has until some certain occasion when he may be passing a humble home set back from the road in a cluster of trees, from which issue the odors of frying bacon, steaming coffee or—Plebeian thought!—boiling cabbage.

Much ice cream is sold from virtually the same appeal. Men and women in a store to make other purchases see people eating ice cream, and then receive the suggestion to do likewise.

Complete details of the national advertising program have not been worked out, but the advertising of the slogan on the car is sure to serve in a way different from the ground to be covered by the national program.

IT MEANS a traveling ad—an advertisement on wheels—to have the national slogan on the back of the car where it will be seen wherever the car travels. Even when the manufacturer is at home, his ad will be seen when his car is parked in front of his plant, when he is passing the post office, the police station, the group on the porch at the leading local hotel; it will be seen by Judith O'Grady and the Colonel's lady—people in all walks of life.

If this plan should be adopted by manufacturers stretching over the continent, the ice cream industry's slogan, from this type of advertising alone, soon would be as well known as any of the famous trade slogans of the day, including "Say it with flowers," "Save the surface and you save all," etc.

One great merit is, it is inexpensive advertising, but best of all it is effective—it serves to get attention, to create interest. Those things lead to more sales of ice cream.

This helps spread their slogan and to awaken more interest in ice cream; it gives the men in the ranks the opportunity to help work for the success of national advertising of ice cream.

Here is the way another manufacturer, the proprietor of the Diamond Springs Ice Cream Co., Fergus Falls, Minn., advertises the national ice cream slogan—by displaying the design on the side of his plant.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

ICE CREAM FOR ALL.

As has been said before, milk is a perfect food. This may be taken to mean that it contains materials children need for growth; second, materials that young and old alike need for the repair of their body machinery, and third, materials that all need for fuel to provide them with the heat and energy necessary for work.

The three kinds of vitamines now recognized are found in milk and cream, which is one of the many reasons that ice cream is a good food.

A most eminent physician, and one who specializes in foods, says: "One of the best elements in the diet of both young and old is liberal amounts of properly made ice cream, especially in the summertime."

Ice cream should be recognized as a staple part of the diet. As wholesome a part as the whole wheat bread we insist on the small members of the family eating, and much easier to get them to eat.

Freezing our own ice cream is a bit of a job, but with the corner drug store and candy shop, it certainly is not difficult to purchase all one wants of very good quality at what is really a saving, when you count the cost of ice, ingredients and time taken to make it.—Prudence Penny, in New York American.

NEIGHBORS.

I think of this (ice cream) industry or association, it doesn't make any difference which term I use, as living in a neighborhood where there are neighbors, other associations, other goods. I think in that neighborhood we have some relatives, some close relatives and some distant relatives; some near neighbors and some far neighbors, and I cannot see any difference between the impression of the individual association in a neighborhood of that kind than I can see between the particular feelings of any individual man who lives in a community.—From remarks by Secretary Fred Rasmussen before national association at Waldenwoods meeting.

EAST.

DAIRY INDUSTRY IN SOUTH IS GROWING.

Wilmington, N. C.—An interesting insight into the development of Southern dairying was given in a recent issue of the Wilmington Star, as follows:

"The possibilities for dairying in this section are virtually illimitable. And the development work now in progress by E. L. White of the Wilmington Ice Cream Company, by the state and federal agricultural departments and the leading dairymen will continue to register notable and increased results each year."

That was the statement of R. C. Marine, rpresentative of Bessire & Company of Atlanta, who arrived yesterday and was in conference with Mr. White this morning. He is an authority upon the dairy, creamery and ice cream industry in the South and particularly in the Southeast. He agrees with Craddock Goins, associate editor of the big Olsen publications and easily the leading champion of Southern dairying, that this industry will more than triple in this section within the next ten years.

"The Wilmington Ice Cream Company this week is beginning the operation of its pasteurizing plant and will handle vast quantities of milk, affording a constant and stable market for the produce," continued Mr. Marine. "These improved methods assuring quality, together with consistent progress in the education of the public to the value of milk and ice cream as foods can mean nothing else than increased volume of business and prosperity. It is encouraging, too, that every section I have visited this spring has reported from a 30 to 50 per cent better business than at this time last year."

SOUTH.

Pioneer Firm Endured Many Hardships.

Tulsa, Okla.—The Purity Ice Cream Co. was established in Tulsa in 1908. It is one of the few ice cream plants to survive the hardships of pioneer days. Its early experiences were common to all the early settlers who struggled to establish a business here—irregular source of supplies; greatly fluctuating market; arbitrary prices; inexperienced help; careless dealers; but on top of all this—a continually growing business. The firm weathered its adversities and today maintains at least as high a ratio of development as the city itself.

In 1909 the Purity occupied 700 square feet of floor space on West Fourth street, on the alley back of the Majestic theater. The city's population was only 10,000 and the firm employed only five people. With one old-style freezer, a team of ponies and wagon to deliver the product with its farthest wholesale delivery 10 blocks, the quality of the ice cream was kept at the highest standard, with the final result, these 16 years later, of success.

In 1922 the company's product was awarded the blue ribbon for the state, and for the past three years has received the highest score over the state for quality and purity, from the A. & M. college's annual short course school.

J. B. Porter, president of the firm, is a pioneer of Tulsa and piloted his factory safely through storm and stress of early difficulties. Mr. Porter stands high in civic and fraternal circles, and is largely responsible in the establishment of the State Association of Ice Cream Manufacturers, now serving as its president and state representative to the national convention of ice cream manufacturers.

F. J. Bouvy is manager of the firm, and is also high in civic and fraternal circles. He has had many years of experience in salesmanship of cream products on the road and active management of some of the largest supply houses of the southwest.

The policy of the company has been constructive always, seeking to build up and protect rather than take advantage of conditions which might prove only a temporary profit.

Their product, the "Purebest" is sold extensively in Tulsa and for miles surrounding the city.

TRADE ACTIVE IN CENTRAL SOUTH.

Memphis, Tenn.—June has shown up in the central section and Southwest with hot weather, not quite so sweltering as reported in the East, but more seasonable and more conducive to trade in ice cream, sherbet and other dairy products lines. There has been much development in these lines since last season. The ice cream factories have enlarged their local and shipping facilities, one or two new ones have started. Several specialties not on the market last season have appeared and all the old favorites of former seasons. A number of new retail ice cream parlors and fountain stores, an additional park and roof garden trade has developed. The steamboat trade is also more brisk, with nightly excursions. The summer round of entertainment, weddings, conventions and banquets is inspiring the best with caterers and ice cream folk.

Two of Memphis' largest ice cream and dairy products consuming industries, the Colver Farms Dairy Co. and the Lilly Ice Cream Co., have become affiliated with the National Dairy Products Corporation, it is announced by Lem Banks and W. G. Dutlinger, presidents of the local companies. No changes in the personnel and plants operated at the same places. Both are very large plants here in Memphis. The Colver Farm people began to manufacture ice cream about a year ago and then greatly enlarged their plant with new structures and equipment. The Lilly place is on Madison Ave. and the Colver Farms is on Union Ave. and Walnut.

The Belle Meade Ice Cream Co. is a new factory in Memphis this season, well located in the south central business section, 325 East Calhoun St., a few blocks from the Union depot. The new buildings are of brick and concrete, mechanical equipment modern. M. A. Kaney, from Centralia, Ill., is at the head of the enterprise. The Belle Meade Creamery is located next door to the ice cream palace and is also new. An elaborate line of motorized trucks cover the city trade.

Mr. Surles of the office staff of the Lilly Ice Cream Co., Memphis, is taking a short vacation in the Rocky Mountains of Colorado. Mr. Surles for a number of years has been active with ice cream manufacturing industrials of Memphis and before that was a hotel man at the celebrated Lookout Mountain Inn, near Chattanooga.

The North Pole Ice Cream Co., 444 Beale Ave., Memphis, reports active trade in cones and bulk ice cream.

L. Collette & Co., on Poplar Ave. near Leath St., is a wholesale firm in the Memphis trade and features Supreme ice cream. The Sunbeam Ice Cream Co., Porter St., operates one of the smaller factories in Memphis.

The Crystal Ice Cream Co., South Wellington near Beale Ave., also is centrally located in Memphis and devotes its exclusive attention to the wholesaling of ice cream.

The Alco Cone Co., North Front St., near Adams Ave., is manufacturing cones and work a number of people, selling the product wholesale both in and out of Memphis.

The Magnolia Ice Cream Co., on Vance Ave., near Rayburn, Memphis, managed by Mr. Ingram, has enlarged its shipping trade.

The Lewisburg Ice Cream Co., Lewisburg, Tenn., is manufacturing and shipping ice cream in that section of middle Tennessee.

Smith Ice Cream Factory, Jackson, Tenn., is active in the wholesale trade and has two large retail places. They cover that section of west Tennessee widely.

The Union Ice Cream Co., Broadway, Nashville, Tenn., helped their fountain patrons with a good spring display of advertising this season. They have the most modern equipment in their new building. The harmonizer for mixing is also featured. The laboratory tests all milk products. The motto "Made its way by the way it's made" has won many friends.

IOWA PASSES ICE CREAM PASTEURIZATION LAW.

Des Moines, Ia.—The Iowa legislature has passed the following ice cream pasteurization law:

Section 1. That Section Three Thousand Seventy-six (3076) of the Code, 1924, be and the same is hereby repealed and the following enacted in lieu thereof:

"3076. Pasteurization of skimmed milk, ice cream or buttermilk. Every owner, manager, or operator of a creamery or ice cream factory shall, before delivering to any person any skimmed milk, ice cream or buttermilk, cause the cream or milk from which the same is derived to be pasteurized.

"3076-a1. Pasteurization defined. Pasteurization for the purpose of the preceding section shall be defined as follows:

"1. Milk, skimmed milk, ice cream and cream shall be deemed to have been efficiently pasteurized by the 'holding process' when it has been subjected to a temperature of one hundred forty-five (145) degrees Fahrenheit and held at that temperature for not less than twenty-five (25) minutes.

"2. Milk, skimmed milk, ice cream and cream shall be deemed to have been efficiently pasteurized by the 'flash heat process' when it has been subjected to a temperature of one hundred eighty-five (185) degrees Fahrenheit.

"30-76-a2. Record of pasteurization. Every owner, manager or operator of a creamery or ice cream factory shall equip each vat or pasteurizer with an accurate recording thermometer, and each temperature chart from such thermometer shall be dated and kept on file for inspection by the department, and it shall be unlawful to destroy any such chart without permission from the secretary of agriculture.

"3076-a2. Injunction. Any owner, manager, or operator of a creamery, or ice cream factory, violating any of the provisions of the three (3) preceding sections may be restrained by injunction from operating any such business. No injunction shall issue until after the defendant has had at least five (5) days' notice of the application therefor and the time fixed for hearing thereon."

Section 2. The provisions of this act shall not be effective until April 1, 1926.

WASHINGTON — MAINE

Notes From Far and Near

CALIFORNIA — FLORIDA

Brinkley, Ark.—An ice cream factory has been opened by Simpson and Perry.

Harrison, Ark.—New and modern equipment has been installed by W. S. Bennett in his plant on Spring St. for the manufacture of ice cream.

Lodi, Cal.—The ice cream plant at 500 East Oak St., operated by Angelo Palmero and Joe Mangusto, is being remodeled at a cost of about $2,000.

Los Angeles, Cal.—The Alfred Ice Cream Co., 817 East 18th St., is erecting a two story and basement, 45 by 100 feet, brick ice cream plant.

Ft. Lauderdale, Fla.—The Seminole Ice Cream Co., W. A. Perry, president, is erecting a plant here, to be completed early in August. The Seminole company recently completed a new modern plant at Miami, Fla.

Chicago, Ill.—The Healy Ice Company changed its name to the Wieland Ice Cream Co.

Indianapolis, Ind.—The new plant of the Braham and Camp Ice Cream Co. was opened recently at 1948 Park Ave.

Kennett, Mo.—The Kennett Ice Cream Co. recently began operations here.

Stanley, N. D.—Operations have been begun by the Stanley Ice Cream Co. The company plans to transport its product to surrounding towns.

Topeka, Kans.—The property at 214 East 8th Avenue was purchased by the Ziegler & Son Ice Cream Co. The company will be incorporated and will enlarge the plant and install new equipment.

Covington, Ky.—C. A. Smith has established a modern ice cream plant on his dairy farm, according to recent announcement. The machinery and equipment is thoroughly modern and the plant has a capacity of 400 gallons a day.

Hornell, N. Y.—The plant of the defunct Purity Ice Cream Co. will be used by the Hornell Ice Cream & Candy Co., of which Everett L. Copeland is president and Adelbert McDowell is secretary.

Ithaca, N. Y.—The Arctic Ice Cream and Milk Co. has made application for a charter. The company is capitalized at $50,000 and the incorporators are W. A. Luce, A. A. Schlotzhauer and N. Boulton.

Memphis, Tenn.—The Kaney Ice Cream Co. has changed its name to Belle Meade Ice Cream Co.

Breckenridge, Tex.—The Dillingham and Alexander Co. has been incorporated with $250,000 capital to manufacture ice cream. Incorporators are O. Dillingham, O. L. Alexander and A. R. Flowers.

Gainesville, Tex.—The Crystal Ice Cream Co. opened its plant recently. Wm. C. McKemie is manager.

Slaton, Tex.—H. C. Maxey, owner of the Maxey Dairy, has completed installation of equipment for a modern ice cream plant.

Taylor, Tex.—The Thompson Ice Cream Co. has purchased a plant at Cameron, Tex., which it will use as a storage plant for its product.

Waco, Tex.—The Lone Star Ice Cream Co. began operations at 211 N. 12th St. recently. L. Djernis and Frank Mathews are proprietors.

Fillmore, Utah—The Pahvant Valley Creamery Co. recently installed a $500 ice cream manufacturing plant.

El Paso, Tex.—The Arctic Ice Cream Co. has opened a new plant at 122 N. Piedras St. for the manufacture of ice cream, sherbets, and ices. W. B. Scott is president, G. N. Bailey, general manager, and G. W. Lhamon, secretary-treasurer.

Bristol, Va.—The Dixie Ice Cream Co. has let contract to R. F. Wagner for the erection of a new plant at Bristol and an addition to the company's plant at Abingdon. The new plant will be erected on Euclid and Commanwealth Aves. and will be two stories high, of brick and concrete construction. Compressors, freezers, milk condensers, pasteurizers and other equipment will be installed by the Creamery Package Mfg. Co.

South Boston, Va.—The South Boston Ice Co. will erect an addition to its plant for the manufacture of ice cream, with a daily output of 100 gallons. Paul C. Edmonds is secretary.

Evansville, Wis.—The Vanderbilt & Fleming Ice Cream Co.'s plant has been completed.

COW SENSE.

By Harry Halbisch, Chicago, Ill.

We sometimes feed our dairy cow and sometimes we do not, we let her forage what she can about the pasture lot. We howl when she begins to fail to give milk rich in fat and when the quantity grows less we threat to use the gat. And if she finds a morsel choice that tempts her appetite and garlic in our milk we taste we kick with all our might. Although we think we use our heads to figure whys and hows, we fail to heed that bossie needs more food than she can browse. So when she yields her golden flow and has no further debt, for what we are accountable we try to hold her yet. We blame her when the milk turns sour, we do not heed the rule that soon as she delivers it, ours is the job to cool and into sterile vessels put where dirt has had no show and under such conditions that bacteria cannot grow. And while we seek an alibi our fault to disavow, we stand condemned for cowardice to blame our faithful cow. For milk supplies can't be improved the board of health allows by merely spanking dairy maids or scolding dairy cows.

Will Study Sale of Ice Cream by Weight

National Weights and Measures Conference Discusses Subject at Bureau of Standards, Washington, D. C.

By GEORGE K. BURGESS*

COMPULSORY sale of ice cream by weight was one of the principal subjects for discussion at the recent meeting of the national conference on weights and measures, which was held at the bureau of standards, Washington, D. C., on May 25-28, and which was attended by weights and measures officials from all parts of the country. Arguments in favor of the weight method were advanced in a paper prepared by Joseph G. Rogers of the state weights and measures department of New Jersey, who contended that selling ice cream by weight offers the only solution for the difficulties now being experienced in dispensing this product. He pointed out that by the weight method it is possible to sell definite and accurate quantities at all times, something which cannot be done when selling by measure and using the paper bucket to determine the quantity dispensed. He also stated that a large part of the unfair and destructive competition which now exists in the retail trade would be eliminated by the weight method, and that dealers would be enabled for the first time to keep accurate cost records on ice cream sales.

E. A. G. Intemann, representing the New Jersey Retail Ice Cream and Candy Manufacturers' Association, agreed as to the very great abuses now existing, mentioning particularly in this connection the practice on the part of some dealers of buying ice cream of excessive overrun and then delivering very much overmeasure in their retail sales, thereby giving to the purchaser a false impression of the value he was receiving. Mr. Intemann emphasized the necessity of some action to relieve this situation but asked for sufficient delay before adopting any sales-by-weight recommendation to enable manufacturers and retailers to get together and solve the problem by mutual co-operation.

STRENUOUS opposition to any change of present methods was voiced by two members of the National Association of Ice Cream Manufacturers who were on the program of the conference. V. F. Hovey, president, and Fred Rasmussen, executive secretary of the association, both insisted that it was entirely impracticable for the wholesaler of ice cream to sell to the trade on a basis of weight on account of the extra time and labor which would be required to weigh and keep a record of all full and empty cans. They also emphasized their belief that the consuming public were not asking for any change and that if sales of ice cream by weight were to be required by law the public would be greatly dissatisfied because, on account of the variations in the volumes per unit of weight of different ice creams, they could no longer determine the amount of bulk of cream necessary to serve a given number of people.

The conference also listened to a paper prepared by Harry Klueter, assistant dairy and food commissioner of Wisconsin, in which he described the present regulation of sales of ice cream in that state, and concluded with a recommendation against any action by the conference looking toward mandatory sale by weight of ice cream. Dr. W. W. Skinner, chairman of the joint committee on definitions and standards, also addressed the meeting and spoke in favor of a standard weight per gallon for ice cream as already recommended by his committee with all sales to be based on volume rather than on weight.

AS A result of the presentation of this subject the national conference on weights and measures adopted the following resolution at its concluding session:

RESOLVED, That owing to the fact that there was but little discussion of the papers on "Shall Ice Cream Be Sold By Weight," this subject be made a special order of business at the nineteenth national conference to be held in 1926, and be it further

RESOLVED, That a committee be appointed to gather data for the purpose of presenting same to the next conference as a possible solution of the subject now confronting the weights and measures officials, manufacturers, and retailers, and be it further

RESOLVED, That this be one of the subjects recommended to be placed on the programs of state conferences during the coming year and to be discussed with industry and with their respective communities in accordance with the suggestion made by our president in his opening address to this conference.

The committee appointed under the terms of this resolution is composed of A. W. Schwartz, assistant state superintendent of weights and measures of New Jersey; George Warner, chief state inspector of weights and measures in Wisconsin, and Wm. Foster, city sealer of weights and measures of Springfield, Mass.

IT IS to be anticipated that this subject will be widely discussed by weights and measures officials during the coming year. It has already been considered seriously in New Jersey where a bill designed to make mandatory the selling of ice cream by weight was caused to be introduced into the last legislature by the state association of weights and measures officials. This bill failed of passage, but may be reintroduced at the next legislative session. The interest of the weights and measures officer in this question arises primarily through his obligation to see that full measure and full weight are given when any commodity is sold.

When investigating complaints of short measure sales of ice cream he frequently receives the excuse that the retailer cannot check between his purchases and his sales, the nominal amount sold always being less than the quantities purchased. Sales by weight would undoubtedly eliminate some of this trouble, but the question to be determined is whether the advantages of this method would more than offset the unavoidable disadvantages and complications which would inevitably ensue.

In general the weights and measures officials appear to be open-minded on the question at the present time as evidenced by their action in postponing any decision pending further study and investigation. Any questions or suggestions on the subject may be addressed to A. W. Schwartz, chairman of the special investigating committee, at Trenton, N. J., or to the Bureau of Standards, Washington, D. C., for transmittal to the committee.

* Director, Bureau of Standards, U. S. Department of Commerce.

Ice Cream Industry's National Relationship Discussed by Famous Statesman

Human and Economic Value of Co-operation

By U. S. SENATOR ARTHUR CAPPER*

WE DESTROYED $35,000,000,000 worth of wealth of this nation in the Great World War and you can't get a great country, powerful as it may be in untold riches, it can't give in to a great war like that and destroy billions and billions of wealth of the nation without, of course, feeling it and feeling it in a hard way. Now, we have all had our part in paying the bill and very few of us that could have gotten out of paying our share of it, but I really believe the farmer got it a little the worse hit—a little harder hit than any other because of his inability to organize himself, to take care of himself and to adjust himself to a new situation and he is still, to some extent, suffering from that situation, though he is making some progress and is better off today than he was a year ago. But most of us in business have been able to pass on our increased costs, for instance.

The farmer has found it very difficult to do that because he is the one man in business in this country who has absolutely nothing to say about the price that he is to receive for the product of his labors; who is compelled to accept what is offered him for his product and who at the same time is compelled to pay what every one else asks him for what he may want to buy of them. Now, there is no other business or industry in my mind that could survive for as much as a year on that sort of a basis and so that is what he has been up against in this re-adjustment period following the war, and co-operation, organizing himself in a way where this problem of marketing that he has can be solved to the extent that he will be able to get a fair return on his production—on the products of his labor. So I say out in our country we have been interested in co-operation from the farmer's standpoint and, of course, we are interested in it from your standpoint and it applies in just about as strong a way to the business man. I was pleased with Mr. Rasmussen when he included in his statement the importance of co-operating with the dairy industry and this is a big thing and you are absolutely right.

THE dairyman or the farmer wants no advantage of anyone else. All he wants is a fair price and I think that is the basis on which you are working and when we get together—when we understand these things and get around the table and come to have a better understanding of the other fellow's problems. We find that after all we are aiming pretty much in the same direction; we are all pretty much the same kind of people; all came from the same Adam and Eve and are all the same kind and all we want—we all want to do the right thing. I don't know—there are a million or more people actively engaged in business in this country and in my opinion 99 out of every 100, at least, are honest business men and want to do the right thing; not trying to put something over on their associates in the same business or on the public with which they are dealing, and I am glad to see this organization of yours take that high and lofty stand you are making now, and there hasn't been one word said here, nor in my mixing with you as individuals, one word as to your business or your industry that could not be published to the world; nothing that you have to conceal. As near as I can see the members of this industry, and I will say 99 out of 100 of all other business men in this country, I believe are four square men who want to play the game on the square; who are ready to lay their cards on the table and who appreciate the fact that that is the only way after all to do business and to me it is the gratifying thing that we have made, undoubtedly as business men, the very wonderful progress in that direction in the last 10 or 15 years. It is really remarkable the way that business—the higher standards that have been adopted are being carried into effect.

TO ME nothing is more gratifying than this increasing idealism in business; that there is something more in business now than simply the percentage of profits or what we can get by with in our business; what we are going to be able to put over on the public. It is to me, I say, the most gratifying and re-assuring as a business man, now that we have made tremendous progress in that direction and nothing has had so much to do with it as the getting together in organizations as you have here; bringing together and talking these things over and in a practical and constructive way working out ideas that are not only for the benefit of the industry but are for the benefit of the public. Now, the program committee has suggested to me a subject for discussion here having some bearing on our problems.

I started from Kansas at two o'clock day before yesterday on one of the hottest days I think we have had out there. The thermometer stood pretty close around 100 degrees; a blazing sun and we got into the car and I sat down in the drawing room and got busy trying to figure out what I should say on the subject that these folks had given me. The subject was, "The Human and Economic Value of Commercial Co-operation," and here I was working away there and I will say to you that even thinking of ice cream when the thermometer was around 100 and speeding over the dry prairies of Kansas—haven't had a rain there in several weeks, but here is what occurred to me under those conditions: Human society has come a long way from the tooth and claw stage when every man's hand was against his fellow; when every man was a strict individualist. This progress, this evolution, began at the moment when two men discovered that by working together they could accomplish that which was impossible for either of them to do alone and single handed. I think it is not too much to say that civilization had its birth upon the instant that men learned to co-operate. Co-operation, then, is the very basis of our civilization, of our social order, of all just government, of our religious life. Man would still be a mere brute had he not learned to work with his fellows. He would still be a savage had he not learned to exchange the fruits of his labor for the products of another's labor. Human progress has been made possible only by co-operation of one sort or another.

BUSINESS, commerce, industry, is no exception. Business has grown and developed in just the degree that men have been willing and able to work together. It has taken us a long time to recognize that fact. With

* Portion of remarks before national association directors at Waldenwoods.

the advent of the idea of human liberty there sprang up an individualism—a self-centered selfishness—a spirit of false independence which took no account of what society as a whole did for the individual nor of his obligations to it. This crass individualism—and we have by no means outgrown it—threatened for a time to wreck our whole social structure. We had developed a disregard of our fellows that would put to shame a South Sea Islander or an American aborigine who was a faithful, loyal, self-sacrificing member of his clan.

But we are learning. We are beginning to see that no man can live by himself alone. I—this individual—though I had the strength of Hercules and the wisdom of Solomon—which I haven't—am nevertheless almost wholly dependent upon society. Take the individuals in this gathering and set us down alone, without clothing, food or shelter, in the midst of a vast wilderness, and 99 per cent, yes, 99.99 per cent of us would perish in a few weeks. We owe our very existence to society. Well, now, I may be the most selfish human being ever born, I may be an ingrate, I may be by nature a blood-sucking parasite, who seeks to get and to get and to get and to give nothing, but nevertheless if I have three grains of common sense I must know that my own personal benefit from society depends upon the individual contributions of every member of society.

So duty, which is not a pleasant word to the most of us, is after all a matter of selfish interest. I must give if I expect to get. Society rests upon a give-and-take policy; upon human co-operation. And this recognition of our inter-dependence, it seems to me, is the big idea that has come into business in recent years.

Most men—even those who are critical of business—will agree that business standards are higher today and business practices more clearly ethical than they were a generation ago. Yet I doubt if human nature has changed very much in that time. I doubt if the men of today are more honest, or more honorable, or inherently any better than their fathers were, but I believe we know a little more. We are beginning to see that certain practices which were common enough in the 19th century are not good business practices in the 20th century. They don't pay. So we have raised our standards and revised our practices. Nor has this enlightenment come to us through any phenomenal increase in human intelligence. We probably are no wiser than our fathers; we simply have learned a few things by experience.

BUSINESS is a very different process than it was a generation ago. Conditions have changed. Life has become more complex and business more intricate and complicated. We not only do business on a larger scale but immeasurably more factors enter into it. Contrast your own establishments, your own equipment, your own business practices and their wide-spread ramifications, with the methods and ideas of the ice cream maker—he could hardly be called a manufacturer—of 1890. When I was a boy it was commonly said that any journeyman printer with a shirt-tail full of type could start a newspaper. Now the would-be publisher must be able to command the aid and co-operation of scores of manufacturers to supply him with the tools and machinery and equipment of his business. And it is so in every line. While the small business is by no means a thing of the past, the small business is dependent upon big business for materials, transportation, and the utilities which make business possible. Even the purchase of a penny box of matches from a street vendor must have been preceded by the employment directly or indirectly of millions of capital and thousands of workmen.

And our idea of the purpose and function of business has changed, too. Business men of the better type no longer regard maximum profits regardless of the means by which they are attained, as the chief purpose of business. Business has a wider responsibility than that. There are four parties concerned in all business; the investors or owners; the management; the workers; and the customers; and the business must be so conducted that all four are benefited.

Hard-headed, practical, shrewd business men who are intent upon making profits and paying dividends have at last come to see that the customer must be benefited. Satisfied customers are the greatest assets of any business. We all know we cannot charge our customers more than the traffic will bear, although it took us a good many years to discover that fact. It has taken several generations to eradicate the "public-be-damned" idea from business, but we are doing it. At least theoretically. The trouble is that while we all recognize the principle, we are nevertheless inclined at times to feel that maybe we can ignore it this one time and get away with it, forgetting that by so doing we are helping to kill the goose that lays the golden egg. The prosperity of your business depends upon the well-being of the whole people, and we ought to have the good sense to see that it is wise to recognize the solidarity of human society. That's good business and sound ethics.

Shrewd business men are beginning to see, too, that satisfied workers make for increased efficiency and greater profits. They recognize as never before that labor has a very real interest in business, and that a business cannot thrive if it is torn by dissensions and hampered by constant friction between the workers and the management.

ON THE other hand, thinking labor leaders are getting away from the false idea that labor is the only factor which enters into the production of wealth. They are willing to recognize today that invested capital is absolutely essential to the conduct of business and are willing to admit that capital so invested must be rewarded. They recognize, too, that management is a factor of equal importance with capital and labor and that management must be adequately compensated. We have not yet reached the point where investors and manufacturers and laborers are agreed upon the exact division of profits, but we have taken a long step forward when the capitalist, the business engineers, and the labor leaders all agree that business is a co-operative enterprise. A noted steel man was once asked which was the most important factor in his business, capital, management or labor. His answer was: "Which is the most important leg on a three-legged stool?" When we accept the fact of this interdependence, this fundamental necessity of co-operation, not only in theory, but in practice, we will have gone a long way towards solving our industrial problems; and a long way, I think, too, toward checking the spread of unsound and dangerous economic and political theories.

I am not one of those who lie awake at night fearing that this country will turn Red. I do not fear a reign of bolshevism in America. Our people have too much common sense for that. But I do recognize that unrest will grow and may become a menace to our institutions unless the producer on the farm, the machine-tender in the factories, the laborer on the streets, the builders and the workers of every class, are made to feel that they are co-operating with capital and management in the production of wealth. It must become possible for us all to feel that we are co-operating toward the same end.

SO MUCH for the broad theory of co-operation in society and in industry. I have attempted to establish that a nation, and indeed, human society itself, is merely

a co-operative association. I believe that that society is most perfect which most nearly approaches the ideal of practical co-ordination and perfect co-operation among its individual members. If this is true of society and of a nation, why is it not true of an industry? It assuredly is. The day of cut-throat competition, of "every man for himself and the devil take the hindmost," has passed, and I believe it is gone forever. Business men realize today as never before that they cannot play a lone hand. It is not only that they owe something, from the viewpoint of fairness, and decency, and honor to the public, to their employees, and to their fellow business men, but we are beginning to see that we are all in the same boat, that we need each other's help, that anything which hurts a single member of the industry in which we are engaged, eventually and inevitably hurts every member of that industry.

THE NEXT INTERNATIONAL DAIRY CONGRESS IN 1926.

On May 9, 1925, the Bureau of the Permanent International Dairy Federation held a meeting in Brussels, Belgium, where, among other things, the question of the next world's dairy congress was discussed, and it was decided that future world dairy congresses be held in accordance with the following schedule: 1926—Paris, France. 1928—London, England. 1930—Brussels, Belgium.

While last year it was announced that a world's dairy congress would be held in Paris this year (1925), that plan had to be abandoned on account of delay in the approval of financial appropriations for the congress in 1925 by the French government.

The Success of your Ice Cream Depends Much on the Way in Which it is Served

New Markets for Ice Cream

By A. L. McDONALD in The Arctic Circle

THE normal growth of a child from eight to ten years of age is eight ounces per month. It has been found that when children are not up to normal weight they are likely to be below normal in everything else. Most cities are making an effort to bring under-weight children up to normal by feeding them milk and other easily assimilated foods, generally giving this food at ten o'clock in the morning.

Only recently has any thought been given to the possibilities of feeding ice cream to children who are underweight, although some exhaustive tests have been made as to its possibilities as an infant food. During the year of 1924 a number of nutriment tests were carried on and I will refer briefly to one of them conducted in New London, Conn. Six hundred and sixty-three children were selected, all of whom were at least five pounds under-weight. Each child was fed one-fifth of a quart of ice cream five days a week for a period of six weeks. Only 36 showed no gain, 106 were brought up to what the health authorities designated as normal weight. One making a gain of 12 pounds, the gains ranging from 12 pounds down to one-quarter pound. In addition, the following taken from a letter written by Viola M. Whiteside, supervising nurse, shows that the ice cream diet might have other advantages. "My co-workers feel as I do, that the practical demonstration you made possible has been successful in many ways. Usually we have to use a great deal of persuasion to make the children do anything to improve their health. In this case no persuasion was necessary."

All of this goes to show that there are some new markets for ice cream still to be developed. The American public last year consumed about 300,000,000 gallons of ice cream, which makes about two and one-half gallons per capita. That is not enough! Ice cream is an economical food and people can and should eat more of it. After a nutriment test conducted in New Orleans it was figured that the added weight cost 60 cents a pound. What is a child worth? I have two you could not buy for 60 cents a pound, except on very rare occasions.

* * *

Interesting figures are revealed in "The Round-Up," the official bi-monthly paper of Western High School, Detroit. We reprint the article by permission:

"Students of Western, do you know that your ravenous appetites make you consume 1600 pretzels, 375 pies, 225 pounds of frankfurts, together with 200 dozen rolls, which make up the ever popular 'hot dog,' and 4,080 pieces of ice cream in a single week? Well, you do, and that is not all. Ten bushels of potatoes are peeled weekly, 1,000 sandwiches are made, 375 pies are baked in the lunch room ovens, and 64 pounds of soup bone are used to make 100 gallons of appetizing soup. And you eat every bit of it, too! On Friday not a crumb of the 30 cakes, not a particle of the 200 pounds of meat is left.

"Western also has a sweet-tooth. The candy counter takes in from $75 to $90 each week from the sale of chocolate bars and other sweets.

"Quick figuring will give the average per term of 81,600 pieces of ice cream, 32,000 pretzels, $1,600 worth of candy, 2,400 rolls and 1,800 'hot dogs.' O, what appetites!"

DIXIE PLANT IN OPERATION.

The Dixie Ice Cream Co., Bristol, Va., a newly organized firm, with capital of $50,000, is now manufacturing ice cream at Bristol, and has a branch plant at Abingdon, Va.

The officers of the new company are W. L. Gemmell, president; E. C. Hamilton, vice-president and secretary, and S. S. Smith, general manager. These men have all had wide experience in the ice cream manufacturing business, as well as in the manufacture of butter, ice and all milk products.

The company's plant at Abingdon is reported as being new, modernly equipped and running at capacity production. Temporary quarters are now in operation at Bristol, but a new factory is under construction on Euclid Ave. The building will be of attractive design, built of brick and concrete and will be thoroughly modern and sanitary in every respect, officials advise.

NEW STATION FOR SMITH & CLARK CO.

The Smith & Clark Co., with headquarters in Scranton, Pa., recently erected a modern station on North St., Monticello, N. Y. The structure is of the latest type, 30x50 feet, and is constructed of concrete, tile and steel. C. J. Long of the Smith & Clark Co. advises that this plant will take care of the company's business in that section of Sullivan county.

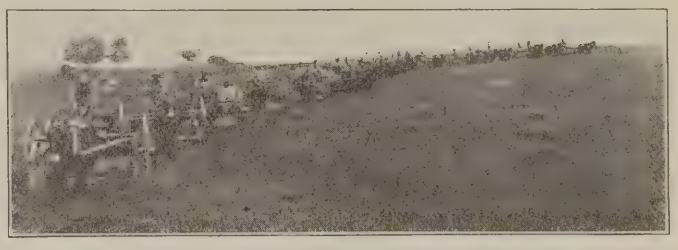
This firm also has plants at Port Jervis, Middletown and Newburg, in New York, and Scranton, Wilkes-Barre, Hazleton, Hawley and Stroudsburg, Pa. The company's product is distributed under the trade name, "The Cream of Perfection."

SEYMOUR OPENS PLANT AT NASHVILLE.

Jack Seymour, formerly vice-president of the Brown Ice Cream Co., Baton Rouge, La., has opened the Delicia Ice Cream Co. at Nashville, Tenn. Mr. Seymour for some years was secretary of the Louisiana Association of Ice Cream Manufacturers.

"——AS A WHOLE."

It is reasonable to expect that your business and my business is pretty well going to follow the trend of the industry, either in growth or lack of growth. Consequently, in considering national activities, I beg of you to reach your conclusions only after you have thought of the industry as a whole.



From remarks by President Vernon F. Hovey before national directors at Waldenwoods meeting.

LEXINGTON IS CENTER OF BLUE GRASS REGION.

By Carlton Ball.*

The truth of the old proverb, "As the soil, so the people," is revealed distinctly in the Blue Grass region of Kentucky. This accounts for the fact that Lexington, the scene of the 1925 convention of the Southern Association of Ice Cream Manufacturers, has become famous for agricultural and natural advantages. While fairly represented with industrial enterprises, the city is more often associated with large farms, colonial homes, unexcelled live stock, all-year pastures and unsurpassed tobacco lands.

Lexington is the center of the Blue Grass region proper, which covers an area of about 1,000 square miles.

Working in the blue grass near Lexington.

The region rests on the apex of a dome geologically known as the Cincinnati—Geanticline. This singular structure is due to a contraction of the earth's crust which forced through the overlying strata a deep sea deposit, shells that cannot be detected with the unaided eye. These give to the surface soil its rich, chocolate color and a phosphorous content equal to the amount of that element contained in some complete fertilizers.

The Blue Grass pastures, which are more profitable than corn fields, have merited the reputation of being America's greatest section for spring lambs and export beef cattle finished on grass. Tobacco raising has brought Lexington renown as the world's largest loose-leaf tobacco market. Required for this market are eighteen mammoth loose-leaf warehouses, whose floor spaces can be more easily described by the acre than by the square foot.

Excepting phosphate mines, nowhere else in America can be found a soil to excel that of the Blue Grass. Whatever fame Lexington and the Blue Grass region have enjoyed must ultimately be attributed to its peculiar soil formation which is responsible for all superior benefits of beauty, fertility and wealth.

* General secretary, The Dairy Products Association of Kentucky.

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

NEW ICE CREAM CHOCOLATE.

Horine & Bowey Co., 401 W. Superior St., Chicago, has developed a special ice cream chocolate which is prepared especially for the manufacture of chocolate ice cream. They state that never before have they attained such a high degree of perfection in combining a rich, delicious chocolate flavor with sufficient color to produce ice cream that not only has the true natural chocolate flavor, but also looks like chocolate ice cream. Richness of color and taste can, of course, be easily governed by the amount of ice cream chocolate used to each batch of mix.

They will be glad to give further information and prices to any of our readers who are interested.

Incidentally, this ice cream chocolate is also very excellent for making chocolated milks. Horine & Bowey Co. can supply formulas for this purpose.

FRUIT HEADQUARTERS "STEPS OUT."

The "Reyam News" made its official bow to the ice cream industry last month. This is a house organ published by The Cincinnati Extract Works of Cincinnati. In his leading editorial the editor of Reyam News says, in part: "With no advertisement other than a little trade paper space and their own unmatchable quality, Reyam cold packed fruits have achieved an insistent demand throughout the world. They are used from New York to New Zealand and from Portland to Panama, and they make good everywhere. They could command a good price premium on the basis of their flavor and keeping qualities, but we prefer to 'beat the band' on price, too."

BRANCH PLANT FOR McLAREN.

Announcement has been made that the McLaren Products Co., with headquarters at Dayton, Ohio, will establish a branch plant at Springfield, Mass. Machinery and equipment has been received at the plant, to be located in the concrete building at the foot of Margaret St. Production is scheduled to begin soon. About 50 workers will be employed, it is announced, with present plans calling for day and night forces in the near future.

Trade Literature

SPIRIT OF AMERICAN INDUSTRIES.

The spirit of American industry, our diversities of industries and limitless resources are portrayed in the handsome calendar for 1925-26, recently issued by the General American Tank Car Corp., parent organization of the General American Car Co., with offices in New York, Detroit, Washington, St. Louis and other cities.

"Purity from Pasture to Table" is the company's slogan. Officials have set forth that General refrigerated, glass-lined tank cars make important savings while in operation. Through these tank cars, we are told, there is in effect a saving in money, a saving in equipment on can depreciation, milk can washers, freight charges and labor cost; a time-saving in loading and unloading, handling in traveling on route, space, saving in space required for can storage put in country plants; increased radius by buying in an extended supply area and receiving the benefit and all advantages; increased sales through the liberal supply of safe milk, the advertising value of safe milk—"safe in glass all the way."

The general offices of the company are in the Illinois Merchants' Bank Building, Chicago.

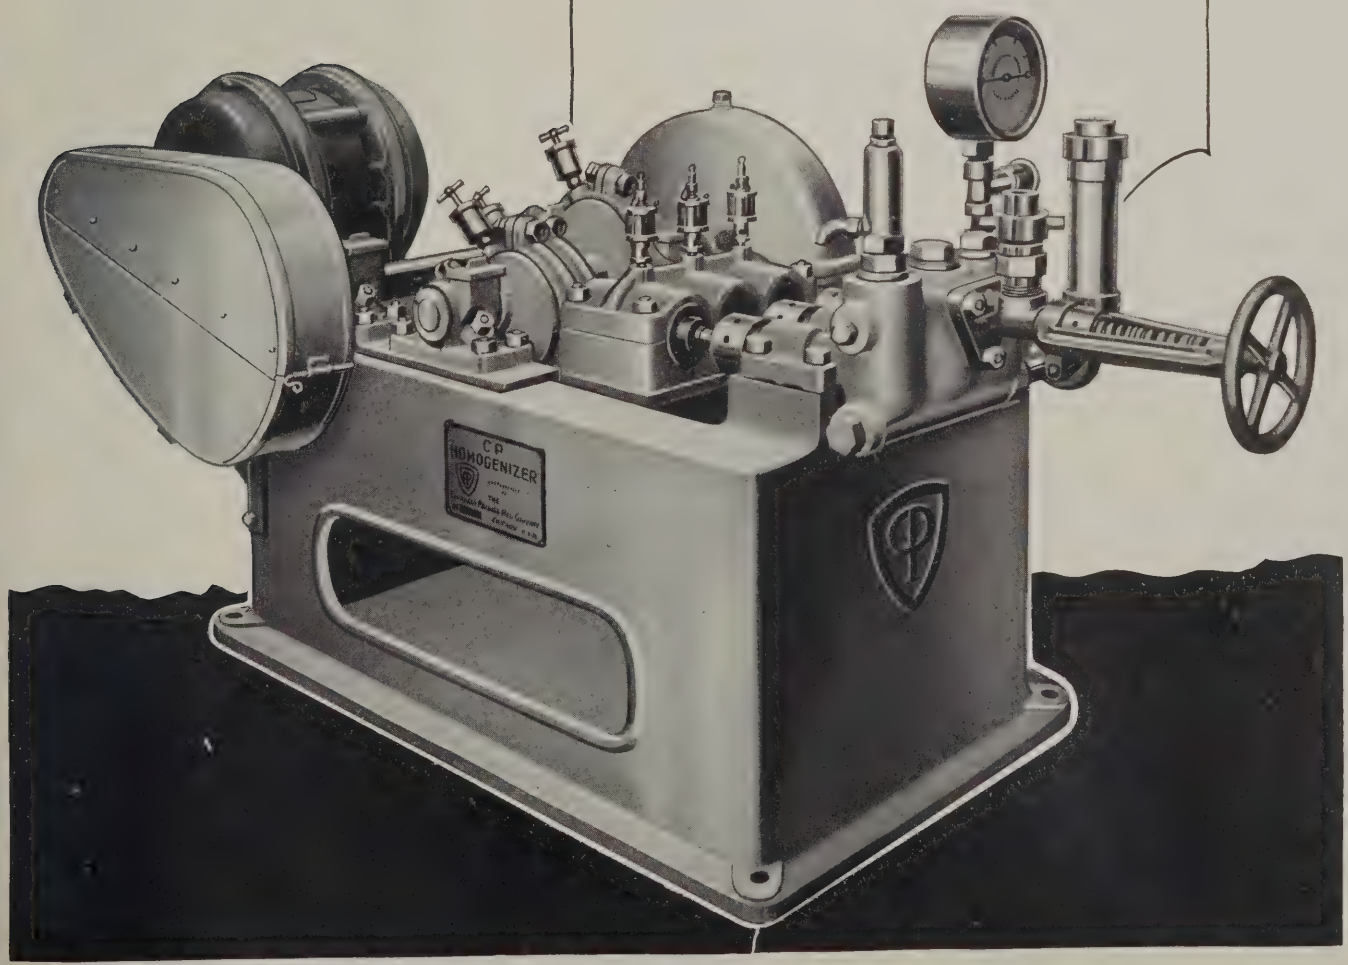
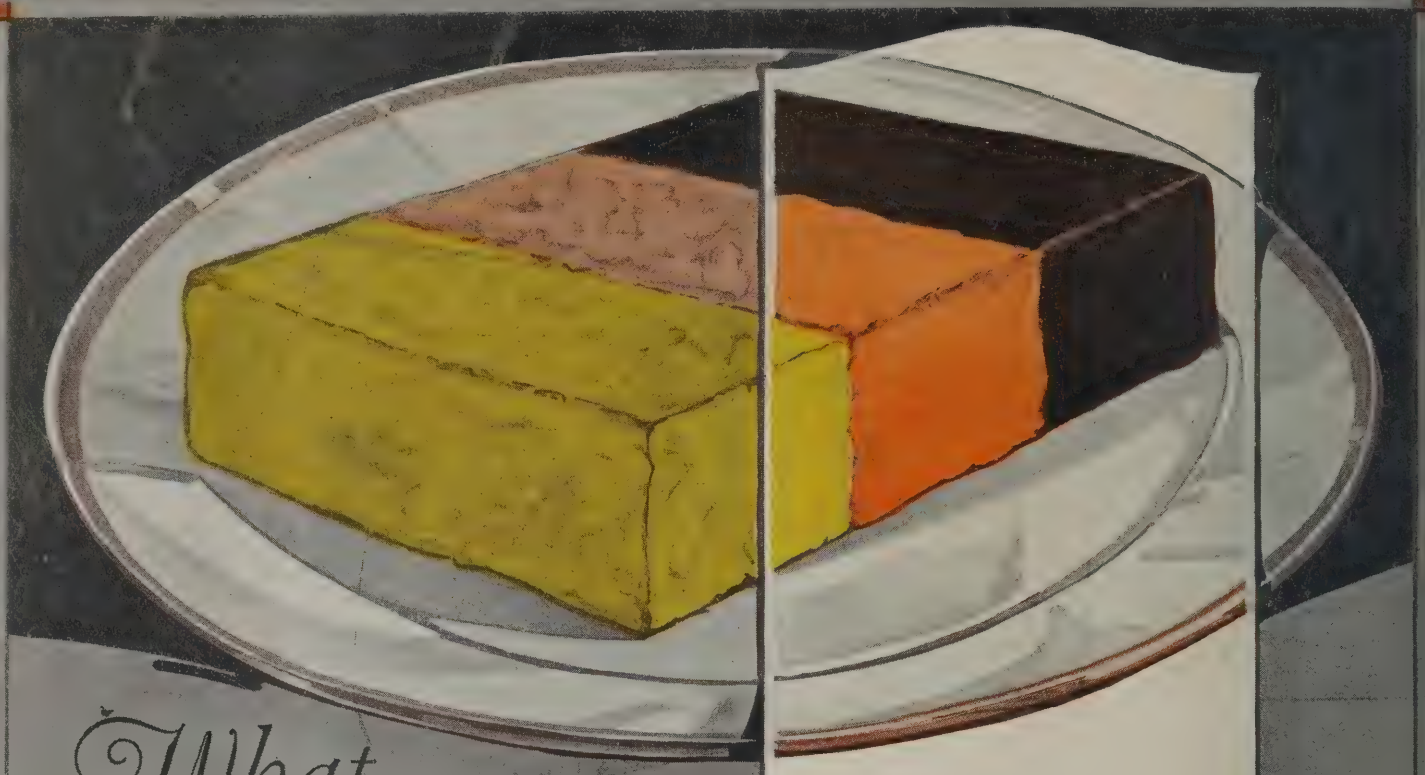
THAT RICH CREAMY TASTE

Quality ice cream is partly due to the ingredients but more to the way you handle it. For example, the impression of richness which can be heightened by proper and complete homogenization of the mix.

The *CP* HOMOGENIZER with Spring Type Valve



will so thoroughly combine the ingredients and smooth out the product that you get all the benefit of the richness you put into it.



No makeshift machine will do. The *CP* operates at pressures high enough to do the job right. The rugged construction with spring valve makes it safe to operate at any pressure desired.

The Creamery Package Mfg. Company

61-67 W. Kinzie St. Chicago, Ill.

What is a Perfect Water-Ice?

IT is a water-ice that is as velvety smooth in texture as ice-cream—a water-ice that delights the taste with its exquisite flavor of fresh fruit.

Such water-ices are favorites with everyone; they are in demand; they bring a good profit. But to make them *a perfect stabilizer is essential. Such a stabilizer is TEXTOR.* It binds the water-ice ingredients into a homogeneous combination. Leading manufacturers use it. It means better water-ices.

Send for a sample of *TEXTOR.* See for yourself the difference it makes in your product.

A smooth

perfectly made water-ice adds to the deliciousness of your ice cream brick. It increases its weight, too. And it combines perfectly with the ice cream to please every palate by its blend of tart taste with ice cream sweetness. But quality water-ices, made with fresh fruit and sugar must be used. Now you can make these delicious water-ices, as satiny smooth as the ice cream itself—with TEXTOR—

the perfect stabilizer.
